101 query current alarms by filters

Resource Identifier	Type	Description
	- board-shelf-mismatch : board type and shelf type mismatch - fcs-thresh-exceed : FCS counter threshold exceeded	
defaultaid	Parameter type: <Alarm::queryDefaultAid> Format: all Possible values: - all : default AID parameter	the default AID param is all
severity	Parameter type: <Alarm::querySeverity> Format: (indeterminate warning minor major critical all) Possible values: - indeterminate : alarm severity is indeterminate - warning : alarm severity is warning - minor : alarm severity is minor - major : alarm severity is major - critical : alarm severity is critical - all : all alarm severity	severity level of an alarm for reporting
servaff	Parameter type: <Alarm::queryServAffect> Format: (service-affecting noservice-affecting all) Possible values: - service-affecting : query alarm service affecting - noservice-affecting : query alarm not service affecting - all : query service affecting and not affecting alarms	serviceaffecting no serviceaffecting

Command Output

Table 101.140-2 "show current alarm by filters" Display parameters

Specific Information		
name	Type	Description

descript	Parameter type: <Alarm::AddInfoString> - additional alarm information	alarm description <i>This element is only shown in detail mode.</i>

101.141 show current alarm by filters

Command Description

show current alarms by filters

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm query hgu-tr069 [ (name) [ severity <Alarm::querySeverity> ] [ servaff <Alarm::queryServAffect> ]  
[ ont <Gpon::OntIndex> ] ]
```

Command Parameters

Table 101.141-1 "show current alarm by filters" Resource Parameters

Resource Identifier	Type	Description

101.142 show current alarm by filters

Command Description

show current alarms by filters

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm query eqpt-psu [ (name) [ severity <Alarm::querySeverity> ] [ servaff <Alarm::queryServAffect> ] [ shelf <Equipm::Shelf> ] ]
```

Command Parameters

Table 101.142-1 "show current alarm by filters" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: (psu-fail-crit psu-a-fail-presence psu-a-fail-vin-ac-nok psu-a-fail-vin-uv psu-a-fail-vin-ov psu-a-fail-vout-uv psu-a-fail-vout-ov psu-a-fail-iout-oc psu-a-fail-overtemp psu-b-fail-presence psu-b-fail-vin-ac-nok psu-b-fail-vin-uv psu-b-fail-vin-ov psu-b-fail-vout-uv psu-b-fail-vout-ov psu-b-fail-iout-oc psu-b-fail-overtemp all) Possible values: - psu-fail-crit : Power Supply failure - psu-a-fail-presence : Power Supply A is not present - psu-a-fail-vin-ac-nok : Power Supply A has Vin AC fault - psu-a-fail-vin-uv : Power Supply A has Vin undervoltage - psu-a-fail-vin-ov : Power Supply A has Vin overvoltage - psu-a-fail-vout-uv : Power Supply A has Vout undervoltage - psu-a-fail-vout-ov : Power Supply A has Vout overvoltage	alarm name of eqpt-psu

Resource Identifier	Type	Description
	- psu-a-fail-iout-oc : Power Supply A has Iout overcurrent - psu-a-fail-ovtemp : Power Supply A has over temperature - psu-b-fail-presence : Power Supply B is not present - psu-b-fail-vin-ac-nok : Power Supply B has Vin AC fault - psu-b-fail-vin-uv : Power Supply B has Vin undervoltage - psu-b-fail-vin-ov : Power Supply B has Vin overvoltage - psu-b-fail-vout-uv : Power Supply B has Vout undervoltage - psu-b-fail-vout-ov : Power Supply B has Vout overvoltage - psu-b-fail-iout-oc : Power Supply B has Iout overcurrent - psu-b-fail-ovtemp : Power Supply B has over temperature - all : eqpt-psu related alarms	
severity	Parameter type: <Alarm::querySeverity> Format: (indeterminate warning minor major critical all) Possible values: - indeterminate : alarm severity is indeterminate - warning : alarm severity is warning - minor : alarm severity is minor - major : alarm severity is major - critical : alarm severity is critical - all : all alarm severity	severity level of alarm for reporting
servaff	Parameter type: <Alarm::queryServAffect> Format: (service-affecting noservice-affecting all) Possible values: - service-affecting : query alarm service affecting - noservice-affecting : query alarm not service affecting - all : query service affecting and not affecting alarms	serviceaffecting no serviceaffecting
shelf	Parameter type: <Equipm::Shelf> Format: <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	the shelf identifier of alarm

101.143 show current alarm by filters

Command Description

show current alarms by filters

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm query secondary-megaco-term [ (name) [ severity <Alarm::querySeverity> ] [ servaff
<Alarm::queryServAffect> ] [ port <Itf::MegacoPotsLine> ] ]
```

Command Parameters

Table 101.143-1 "show current alarm by filters" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: (meg-unknown-sub-sec line-showering-sec all) Possible values: - meg-unknown-sub-sec : The Megaco subscriber exists in voice signaling board but not in media gateway controller. - line-showering-sec : A subscriber line exceeds 20 off-hook / on-hook events / minute. - all : show all secondary megaco termination alarm	alarm name of secondary megaco term
severity	Parameter type: <Alarm::querySeverity> Format: (indeterminate warning minor major critical all) Possible values: - indeterminate : alarm severity is indeterminate - warning : alarm severity is warning - minor : alarm severity is minor - major : alarm severity is major - critical : alarm severity is critical - all : all alarm severity	severity level of an alarm for reporting
servaff	Parameter type: <Alarm::queryServAffect> Format: (service-affecting	serviceaffecting no

101 query current alarms by filters

Resource Identifier	Type	Description
	noservice-affecting all) Possible values: - service-affecting : query alarm service affecting - noservice-affecting : query alarm not service affecting - all : query service affecting and not affecting alarms	
port	Parameter type: <Itf::MegacoPotsLine> Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	the number of the port

101.144 show current alarm by filters

Command Description

show current alarms by filters

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm query link-agg [ (name) [ severity <Alarm::querySeverity> ] [ servaff <Alarm::queryServAffect> ] [ group <If::LaGroupIndex> ] ]
```

Command Parameters

Table 101.144-1 "show current alarm by filters" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: (la-down la-standby-na la-switch-fail la-degrade all) Possible values: - la-down : Link aggregation link-status is down - la-standby-na : Cross-lt lag on standby slot part is not available - la-switch-fail : Cross-lt lag fail to do switchover - la-degrade : Link aggregation group degrade - all : show all Link aggregation group alarm	alarm name of link-agg
severity	Parameter type: <Alarm::querySeverity> Format: (indeterminate warning minor major critical all) Possible values: - indeterminate : alarm severity is indeterminate - warning : alarm severity is warning - minor : alarm severity is minor - major : alarm severity is major - critical : alarm severity is critical - all : all alarm severity	severity level of an alarm for reporting

101 query current alarms by filters

Resource Identifier	Type	Description
servaff	Parameter type: <Alarm::queryServAffect> Format: (service-affecting noservice-affecting all) Possible values: - service-affecting : query alarm service affecting - noservice-affecting : query alarm not service affecting - all : query service affecting and not affecting alarms	serviceaffecting no serviceaffecting
group	Parameter type: <Itf::LaGroupIndex> Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	lag group index

101 query current alarms by filters

name	Type	Description
	- secondary-megaco-term : secondary megaco termination related alarms - secondary-sip-term : secondary sip termination related alarms - cas-r2-channel : CAS R2 channel related alarms - lldpmed : lldpmed alarms - pseudo-wire : pseudo Wire related alarms - link-agg : Link aggregation related alarms - fcs-exceed : FCS auto-recovery related alarms - e1t1-interface : E1/T1 physical interfaces related alarms	
name	Parameter type: <Alarm::alarmTypeLinkGroup> (la-down la-standby-na la-switch-fail la-degrade all) Possible values: - la-down : Link aggregation link-status is down - la-standby-na : Cross-lt lag on standby slot part is not available - la-switch-fail : Cross-lt lag fail to do switchover - la-degrade : Link aggregation group degrade - all : show all Link aggregation group alarm	alarm name that are active <i>This element is only shown in detail mode.</i>
severity	Parameter type: <Alarm::AlarmSeverity> (indeterminate warning minor major critical) Possible values: - indeterminate : alarm severity is indeterminate - warning : alarm severity is warning - minor : alarm severity is minor - major : alarm severity is major - critical : alarm severity is critical	the alarms severity level <i>This element is only shown in detail mode.</i>
servaff	Parameter type: <Alarm::alarmServAffect> ((service-affecting yes) (noservice-affecting no)) Possible values: - service-affecting : make this alarm service affecting - yes : make this alarm service affecting - noservice-affecting : make this alarm not service affecting - no : make this alarm not service affecting	alarms affect service or not <i>This element is only shown in detail mode.</i>
time	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	time in seconds when alarm was updated <i>This element is only shown in detail mode.</i>
descript	Parameter type: <Alarm::AddInfoString> - additional alarm information	alarm description <i>This element is only shown in detail mode.</i>

101.145 show current alarm by filters

Command Description

show current alarms by filters

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm query fcs-exceed [ (name) [ severity <Alarm::querySeverity> ] [ servaff <Alarm::queryServAffect> ]
[ board <Equipm::EqptSlotIndex> ] ]
```

Command Parameters

Table 101.145-1 "show current alarm by filters" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: (fcs-thresh-exceed all) Possible values: - fcs-thresh-exceed : FCS counter threshold exceeded - all : show all FCS exceed alarm	alarm name of fcs-exceed
severity	Parameter type: <Alarm::querySeverity> Format: (indeterminate warning minor major critical all) Possible values: - indeterminate : alarm severity is indeterminate - warning : alarm severity is warning - minor : alarm severity is minor - major : alarm severity is major - critical : alarm severity is critical - all : all alarm severity	severity level of alarm for reporting
servaff	Parameter type: <Alarm::queryServAffect> Format: (service-affecting noservice-affecting all) Possible values: - service-affecting : query alarm service affecting	serviceaffecting no

101 query current alarms by filters

Resource Identifier	Type	Description
	- noservice-affecting : query alarm not service affecting - all : query service affecting and not affecting alarms	
board	Parameter type: <Equipm::EqptSlotIndex> Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	the physical number of the slot

102.2 Alarm Log Status Command

Command Description

This command displays the alarm log entries.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log table [(index)]

Command Parameters

Table 102.2-1 "Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.2-2 "Alarm Log Status Command" Display parameters

102 Alarm Log Status Commands

name	Type	Description
	- alarm-table : alarm table related alarms - auto-switch : auto-switch related alarms - channel-pair : channel pair related alarms - ont-cfg-dld : ont configure file download related alarms - olt-chpair-tc-tca : OLT CHANNELPAIR TC TCA related alarms - hgu-tr069 : hgu tr069 related alarms - eqpt-psu : equipment psu alarms - ont-protection : ONT protection related alarms - secondary-megaco-term : secondary megaco termination related alarms - secondary-sip-term : secondary sip termination related alarms - cas-r2-channel : CAS R2 channel related alarms - lldpmed : lldpmed alarms - pseudo-wire : pseudo Wire related alarms - link-agg : Link aggregation related alarms - fcs-exceed : FCS auto-recovery related alarms - e1t1-interface : E1/T1 physical interfaces related alarms	
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>

Only Show Details: alarm log table related information		
name	Type	Description
last-entry-index	Parameter type: <SignedInteger> - a signed integer	index of the last entry that was added to the log table. <i>This element is only shown in detail mode.</i>
log-was-reset-on	Parameter type: <Sys::Time> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	time when the alarm log was last reset. <i>This element is only shown in detail mode.</i>
log-buffer-size	Parameter type: <UnsignedSignedInteger> - an unsigned integer	size of the internal log buffer. <i>This element is only shown in detail mode.</i>
log-overflowed	Parameter type: <Alarm::OverflowStatus> (yes no) Possible values: - yes : buffer has overflowed - no : no buffer overflow	specifies whether log table is overflowed or not. <i>This element is only shown in detail mode.</i>

102.3 Equipment Alarm Log Status Command

Command Description

This command displays the equipment alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log equipment [(index)]

Command Parameters

Table 102.3-1 "Equipment Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.3-2 "Equipment Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
cf-error	Parameter type: <Alarm::cfError> ((error cfError) (no-error cfNoError)) Possible values: - error : CF access error - cfError : CF access error - no-error : CF no access error - cfNoError : CF no access error	Compact flash read or write error occurred <i>This element is only shown in detail mode.</i>
board-with-cf-error	Parameter type: <Equipm::EqptNtSlotIndexOrNone> (nt-a nt-b nt <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId>	Board identification with cf-error <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	none none) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - none : board not specified - none : board not specified Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::EqSlotId> - the equipment slot number	
nt-disk	Parameter type: <Alarm::ntDiskSpace> ((nintyfive-perc 95%-full) (less-nintyfive-perc less-than-95%)) Possible values: - nintyfive-perc : NT disk space is 95% full - 95%-full : NT disk space is 95% full - less-nintyfive-perc : NT disk space usage less that 95% - less-than-95% : NT disk space usage less that 95%	current status of nt disk space is 95% full or less than that <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ntDiskSpace> ((nintyfive-perc 95%-full) (less-nintyfive-perc less-than-95%)) Possible values: - nintyfive-perc : NT disk space is 95% full - 95%-full : NT disk space is 95% full - less-nintyfive-perc : NT disk space usage less that 95% - less-than-95% : NT disk space usage less that 95%	status of nt disk space with its previous logged value. <i>This element is only shown in detail mode.</i>
persist-data	Parameter type: <Alarm::persistDataLoss> (lost not-lost) Possible values: - lost : persistant data is lost - not-lost : persistant data is not lost	current status specifying persistant data is lost or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::persistDataLoss> (lost not-lost) Possible values: - lost : persistant data is lost - not-lost : persistant data is not lost	status of persist-data with its previous logged value. <i>This element is only shown in detail mode.</i>
sntp-comm	Parameter type: <Alarm::sntpCommLoss> (lost not-lost) Possible values: - lost : SNTP communication lost - not-lost : SNTP communication is not lost	current status of sntp communication is lost or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sntpCommLoss> (lost not-lost) Possible values: - lost : SNTP communication lost - not-lost : SNTP communication is not lost	status of sntp communication with its previous logged value. <i>This element is only shown in detail mode.</i>
preferred-mode short name: pref-mode	Parameter type: <Alarm::clkPrefMode> (not-available available)	current status of preferred timing mode <i>This element is only shown in</i>

name	Type	Description
	Possible values: - not-available : Preferred timing mode is not available - available : Preferred Timing mode available	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::clkPrefMode> (not-available available) Possible values: - not-available : Preferred timing mode is not available - available : Preferred Timing mode available	status of preferred timing mode with its previous logged value. <i>This element is only shown in detail mode.</i>
timing-reference short name: time-ref	Parameter type: <Alarm::clkFreeMode> (failed available) Possible values: - failed : System is in holdover or free-run mode - available : System is not in holdover or free-run mode	current status of timing reference <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::clkFreeMode> (failed available) Possible values: - failed : System is in holdover or free-run mode - available : System is not in holdover or free-run mode	status of timing reference with its previous logged value <i>This element is only shown in detail mode.</i>
connection-lost short name: conn-lost	Parameter type: <Alarm::ShubLoc> (lost not-lost) Possible values: - lost : NT shub communication lost - not-lost : NT shub communication intact	current status of nt shub communication is lost or intact <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ShubLoc> (lost not-lost) Possible values: - lost : NT shub communication lost - not-lost : NT shub communication intact	status of nt shub communication with its previous logged value. <i>This element is only shown in detail mode.</i>
back-pnl-inv short name: bpnl-inv	Parameter type: <Alarm::BackPnlInv> (invalid valid) Possible values: - invalid : BackPanel-type Invalid - valid : BackPanel-type Valid	current status of BackPanel-type Invalid alarm. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BackPnlInv> (invalid valid) Possible values: - invalid : BackPanel-type Invalid - valid : BackPanel-type Valid	status of BackPanel-type Invalid alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
shub-conf-lost short name: conf-lost	Parameter type: <Alarm::SHubCfgLost> (lost not-lost) Possible values: - lost : SHub configuration loss - recent changes lost - not-lost : SHub configuration up to date	actual shub configuration may differ from lanx database on nt <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SHubCfgLost> (lost not-lost) Possible values: - lost : SHub configuration loss - recent changes lost - not-lost : SHub configuration up to date	status of shub configuration lost with its previous logged value. <i>This element is only shown in detail mode.</i>

102.4 Equipment Holder Alarm Log Status Command

Command Description

This command displays the equipment holder alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log eqpt-holder [ (index) ]
```

Command Parameters

Table 102.4-1 "Equipment Holder Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.4-2 "Equipment Holder Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
rack-power	Parameter type: <Alarm::rackPower> (failing ok) Possible values:	current status of rack power alarm, indicating fuse is broken or intact <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	- failing : the fuse is broken - ok : the fuse is intact	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::rackPower> (failing ok) Possible values: - failing : the fuse is broken - ok : the fuse is intact	status of rack power alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
fan-unit1 short name: fan1	Parameter type: <Alarm::fanUnit1> ((failing fail) ok) Possible values: - failing : fan unit 1 is failing - fail : fan unit 1 is failing - ok : fan unit 1 is ok	current status of fan-unit1 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::fanUnit1> ((failing fail) ok) Possible values: - failing : fan unit 1 is failing - fail : fan unit 1 is failing - ok : fan unit 1 is ok	status of fan-unit1 with its previous logged value. <i>This element is only shown in detail mode.</i>
fan-unit2 short name: fan2	Parameter type: <Alarm::fanUnit2> ((failing fail) ok) Possible values: - failing : fan unit 2 is failing - fail : fan unit 2 is failing - ok : fan unit 2 is ok	current status of fan-unit2 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::fanUnit2> ((failing fail) ok) Possible values: - failing : fan unit 2 is failing - fail : fan unit 2 is failing - ok : fan unit 2 is ok	status of fan-unit2 with its previous logged value. <i>This element is only shown in detail mode.</i>
shelf-mismatch	Parameter type: <Alarm::shelfTypeMismatch> (mismatch no-mismatch) Possible values: - mismatch : installed and planned shelf types are different - no-mismatch : installed and planned shelf types are the same	current status specifies installed and planned shelf types are different <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::shelfTypeMismatch> (mismatch no-mismatch) Possible values: - mismatch : installed and planned shelf types are different - no-mismatch : installed and planned shelf types are the same	status of shelf-mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>
ext-chain-instl	Parameter type: <Alarm::extChainInstl> ((consistancy-problem inconsistant) (no-consistancy-problem ok)) Possible values: - consistancy-problem : consistency problem detected for installation of extension chain - inconsistant : consistency problem detected for installation	current alarm status of consistency problem detected for installation of extension chain <i>This element is only shown in detail mode.</i>

name	Type	Description
	of extension chain - no-consistency-problem: no consistency problem - ok : no consistency problem	
prev-status	Parameter type: <Alarm::extChainInstl> ((consistency-problem inconsistent) (no-consistency-problem ok)) Possible values: - consistency-problem : consistency problem detected for installation of extension chain - inconsistent : consistency problem detected for installation of extension chain - no-consistency-problem: no consistency problem - ok : no consistency problem	status of consistency problem with its previous logged value. <i>This element is only shown in detail mode.</i>
shelf-missing	Parameter type: <Alarm::shelfMissing> (missing not-missing) Possible values: - missing : detected shelf now missing - not-missing : detected shelf was missing, now reinserted	current status specifies once inserted shelf has gone missing <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::shelfMissing> (missing not-missing) Possible values: - missing : detected shelf now missing - not-missing : detected shelf was missing, now reinserted	status of shelf-missing with its previous logged value. <i>This element is only shown in detail mode.</i>
shelf-install-missing	Parameter type: <Alarm::shelfInstall> (yes no) Possible values: - yes : shelf now installed - no : shelf now not installed	log status specifies shelf is planned but not installed <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::shelfInstall> (yes no) Possible values: - yes : shelf now installed - no : shelf now not installed	status of shelf-install-missing alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
door	Parameter type: <Alarm::door> ((failing fail) ok) Possible values: - failing : the cabinet door is opened - fail : the cabinet door is opened - ok : the cabinet door is closed	current status of door alarm, indicating the cabinet door is opened <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::door> ((failing fail) ok) Possible values: - failing : the cabinet door is opened - fail : the cabinet door is opened - ok : the cabinet door is closed	status of door power alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
ac-power-fail short name: ac-pwr	Parameter type: <Alarm::acPowerFail> ((failing fail) ok) Possible values: - failing : system AC power fails - fail : system AC power fails	current status of AC power failure alarm, indicating the AC Power is broken <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- ok : the system AC power works properly	
prev-status	Parameter type: <Alarm::acPowerFail> ((failing fail) ok) Possible values: - failing : system AC power fails - fail : system AC power fails - ok : the system AC power works properly	status of AC power failure alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102.5 Equipment Holder Extended Alarm Log Status Command

Command Description

This command displays the equipment holder extended alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log eqpt-holder-ext [ (index) ]
```

Command Parameters

Table 102.5-1 "Equipment Holder Extended Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.5-2 "Equipment Holder Extended Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
ctl-com-fail	Parameter type: <Alarm::ctlComFail> ((failing fail) ok) Possible values:	current status of shelf controller communication failure. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- failing : shelf controller communication is failing - fail : shelf controller communication is failing - ok : shelf controller communication is ok	
prev-status	Parameter type: <Alarm::ctlComFail> ((failing fail) ok) Possible values: - failing : shelf controller communication is failing - fail : shelf controller communication is failing - ok : shelf controller communication is ok	status of shelf controller communication failure. <i>This element is only shown in detail mode.</i>
bat-a-fail	Parameter type: <Alarm::batAFail> (yes no) Possible values: - yes : Power Source Battery A Failure - no : Power Source Battery A is OK	current status of shelf power source battery A failure. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::batAFail> (yes no) Possible values: - yes : Power Source Battery A Failure - no : Power Source Battery A is OK	status of shelf power source battery A failure. <i>This element is only shown in detail mode.</i>
bat-b-fail	Parameter type: <Alarm::batBFail> (yes no) Possible values: - yes : Power Source Battery B Failure - no : bfd stale entry not present	current status of shelf power source battery B failure. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::batBFail> (yes no) Possible values: - yes : Power Source Battery B Failure - no : bfd stale entry not present	status of shelf power source battery B failure. <i>This element is only shown in detail mode.</i>
water-seepage-in-box	Parameter type: <Alarm::waterSeepageInBox> (detected not-detected) Possible values: - detected : detected water seepage in the enclosure - not-detected : no water seepage detected in the enclosure	current status of detected water seepage in the enclosure <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::waterSeepageInBox> (detected not-detected) Possible values: - detected : detected water seepage in the enclosure - not-detected : no water seepage detected in the enclosure	status of detected water seepage in the enclosure <i>This element is only shown in detail mode.</i>
sealed-box-open	Parameter type: <Alarm::sealedBoxOpen> (detected not-detected) Possible values: - detected : detected open sealed box - not-detected : closed sealed box	current status of detected open sealed box <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sealedBoxOpen> (detected not-detected) Possible values: - detected : detected open sealed box	status of detected open sealed box <i>This element is only shown in detail mode.</i>

name	Type	Description
	- not-detected : closed sealed box	

102.6 Plug-in Unit Alarm Log Status Command

Command Description

This command displays the plug-in unit alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log plug-in-unit [(index)]

Command Parameters

Table 102.6-1 "Plug-in Unit Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.6-2 "Plug-in Unit Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
board-position	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E/FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot - iont : an nt applique slot - lp : an lt applique slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::LtAppliqueSlotId> - the LT Applique slot number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	

Only Show Details: current and previous alarm log status		
name	Type	Description
board-mismatch	Parameter type: <Alarm::boardMismatch> (yes no) Possible values: - yes : planned and plugged-in types are different - no : planned and plugged-in types are same	alarm specifying the planned and plugged-in types are different <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::boardMismatch> (yes no) Possible values: - yes : planned and plugged-in types are different - no : planned and plugged-in types are same	status of board-mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>
sw-download	Parameter type: <Alarm::swStatus> (waiting completed) Possible values: - waiting : not able to download all the applicable SW files - completed : download completed	alarm specifying download of the software is completed or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::swStatus> (waiting completed) Possible values: - waiting : not able to download all the applicable SW files - completed : download completed	status of sw-download with its previous logged value. <i>This element is only shown in detail mode.</i>
temperature	Parameter type: <Alarm::tempStatus> (above-thres	alarm specifying board temperature is crossed the

102 Alarm Log Status Commands

name	Type	Description
	below-thres) Possible values: - above-thres : temperature threshold on board exceeded - below-thres : board temperature within threshold	threshold or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::tempStatus> (above-thres below-thres) Possible values: - above-thres : temperature threshold on board exceeded - below-thres : board temperature within threshold	status of board temperature with its previous logged value. <i>This element is only shown in detail mode.</i>
sem-power-fail	Parameter type: <Alarm::extPowerStatus> (sem-power-fail sem-power-ok) Possible values: - sem-power-fail : SEM external power failure - sem-power-ok : SEM external power ok	alarm specifying SEM external power failure. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::extPowerStatus> (sem-power-fail sem-power-ok) Possible values: - sem-power-fail : SEM external power failure - sem-power-ok : SEM external power ok	status of SEM external power with its previous logged value. <i>This element is only shown in detail mode.</i>
sem-ups-fail	Parameter type: <Alarm::powerSupplyStatus> (sem-ups-fail sem-ups-ok) Possible values: - sem-ups-fail : SEM external power supply failure - sem-ups-ok : SEM external power supply ok	alarm specifying SEM external power supply failure. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::powerSupplyStatus> (sem-ups-fail sem-ups-ok) Possible values: - sem-ups-fail : SEM external power supply failure - sem-ups-ok : SEM external power supply ok	status of SEM external power supply with its previous logged value. <i>This element is only shown in detail mode.</i>
temp-shutoff	Parameter type: <Alarm::tempShutoffStatus> (board-switched-off board-switched-on) Possible values: - board-switched-off : board switched off - excess temperature - board-switched-on : board switched on	alarm specifying board is switched off because of excess temperature. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::tempShutoffStatus> (board-switched-off board-switched-on) Possible values: - board-switched-off : board switched off - excess temperature - board-switched-on : board switched on	status of temp-shutoff with its previous logged value. <i>This element is only shown in detail mode.</i>
board-present	Parameter type: <Alarm::boardPresence> (missing yes) Possible values: - missing : board was present, but now missing - yes : board present	indicates the presence of the board. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::boardPresence> (missing yes)	status of board-present with its previous logged value. <i>This element is only shown in</i>

name	Type	Description
	Possible values: - missing : board was present, but now missing - yes : board present	<i>detail mode.</i>
board-inserted	Parameter type: <Alarm::boardInsertion> (never-inserted inserted) Possible values: - never-inserted : board was never inserted - inserted : board was inserted	indicates the status of board was inserted or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::boardInsertion> (never-inserted inserted) Possible values: - never-inserted : board was never inserted - inserted : board was inserted	status of board-inserted with its previous logged value. <i>This element is only shown in detail mode.</i>
board-init	Parameter type: <Alarm::boardInit> (failed completed) Possible values: - failed : board initialization failed - completed : board initialization completed	specifies board initializaion is sucessful or failed. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::boardInit> (failed completed) Possible values: - failed : board initialization failed - completed : board initialization completed	status of board-init with its previous logged value. <i>This element is only shown in detail mode.</i>
board-reset-cf	Parameter type: <Alarm::boardResetCommFail> (yes ok) Possible values: - yes : board reset/communication failure occurred - ok : no board reset/communication failure	indicates there has been a reset and/or communication failure of the board. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::boardResetCommFail> (yes ok) Possible values: - yes : board reset/communication failure occurred - ok : no board reset/communication failure	status of board-reset-cf with its previous logged value. <i>This element is only shown in detail mode.</i>
shub-uplink	Parameter type: <Alarm::lanxuplinkbrkdwn> (failure ok) Possible values: - failure : lanx uplink breakdown or removal - ok : no breakdown or removal of lanx uplink	indicates that lanx uplink breakdown or removal. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lanxuplinkbrkdwn> (failure ok) Possible values: - failure : lanx uplink breakdown or removal - ok : no breakdown or removal of lanx uplink	status of shub-uplink with its previous logged value. <i>This element is only shown in detail mode.</i>
backplane-data-failure	Parameter type: <Alarm::BackplaneMismatch> (yes no) Possible values: - yes : LT backplane ports data failure - no : LT backplane ports data normal	indicates the lt backplane data status <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
prev-status	Parameter type: <Alarm::BackplaneMismatch> (yes no) Possible values: - yes : LT backplane ports data failure - no : LT backplane ports data normal	status of the lt backplane data with its previous logged value <i>This element is only shown in detail mode.</i>

102.7 ATM Alarm Log Status Command

Command Description

This command displays the ATM alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log atm [ (index) ]
```

Command Parameters

Table 102.7-1 "ATM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.7-2 "ATM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Equipm::AtmIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
vpi-vci	Parameter type: <Alarm::VpiVciValues> - the vpi and vci value (vpi/vci)	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

Only Show Details: current and previous alarm log status		
name	Type	Description
cell-dis-up	Parameter type: <Alarm::CellDiscardUpstream> (discarded no-discard) Possible values: - discarded : ATM cell discarded in upstream direction - no-discard : no ATM cell discarded in upstream direction	specifies ATM cell is discarded or not in upstream direction. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::CellDiscardUpstream> (discarded no-discard) Possible values: - discarded : ATM cell discarded in upstream direction - no-discard : no ATM cell discarded in upstream direction	status of cell-dis-up with its previous logged value. <i>This element is only shown in detail mode.</i>
cell-dis-down	Parameter type: <Alarm::CellDiscardDownstream> (discarded no-discard) Possible values: - discarded : ATM cell discarded in downstream direction - no-discard : no ATM cell discarded in downstream direction	specifies ATM cell is discarded or not in downstream direction. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::CellDiscardDownstream> (discarded no-discard) Possible values: - discarded : ATM cell discarded in downstream direction - no-discard : no ATM cell discarded in downstream direction	status of cell-dis-down with its previous logged value. <i>This element is only shown in detail mode.</i>

102.8 Ethernet Interface Alarm Log Status Command

Command Description

This command displays the ethernet interface alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ether-itf [ (index) ]
```

Command Parameters

Table 102.8-1 "Ethernet Interface Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.8-2 "Ethernet Interface Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ether-ifindex	Parameter type: <Ether::InterfaceIndex> - index of the collision interface - range: [0...2147483647]	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
prev-status	Parameter type: <Alarm::EtherLinkStatus> (yes no) Possible values: - yes : board switched off - excess temperature - no : board switched on	status of link-down with its previous logged value. <i>This element is only shown in detail mode.</i>

102.9 Software Management Alarm Log Status Command

Command Description

This command displays the software management Alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sw-mgmt [ (index) ]
```

Command Parameters

Table 102.9-1 "Software Management Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.9-2 "Software Management Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>)	identifies the physical position of the slot <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	

Only Show Details: current and previous alarm log status		
name	Type	Description
sw-rollback	Parameter type: <Alarm::SwRollback> (yes no) Possible values: - yes : implicit software rollback performed - no : no implicit software rollback	specifies implicit software rollback is performed or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SwRollback> (yes no) Possible values: - yes : implicit software rollback performed - no : no implicit software rollback	status of sw-rollback with its previous logged value. <i>This element is only shown in detail mode.</i>
db-rollback	Parameter type: <Alarm::DbRollback> (yes no) Possible values: - yes : implicit database rollback performed - no : no implicit database rollback	specifies implicit database rollback is performed or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DbRollback> (yes no) Possible values: - yes : implicit database rollback performed - no : no implicit database rollback	status of db-rollback with its previous logged value. <i>This element is only shown in detail mode.</i>
xvps-inv-dbase	Parameter type: <Alarm::XvpsInvalidDataBase> (invalid valid) Possible values: - invalid : invalid xvps dbbase is detected - valid : xvps dbbase is valid	specifies implicit xvps dbase is valid or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::XvpsInvalidDataBase> (invalid valid) Possible values:	status of xvps-inv-dbase with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- invalid : invalid xvps dbbase is detected - valid : xvps dbbase is valid	
inv-cde-file	Parameter type: <Alarm::XvpsInvalidCDEFile> (invalid valid) Possible values: - invalid : invalid xvps cde file is detected - valid : xvps cde file is valid	specifies implicit xvps dbase is valid or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::XvpsInvalidCDEFile> (invalid valid) Possible values: - invalid : invalid xvps cde file is detected - valid : xvps cde file is valid	status of inv-cde-file with its previous logged value. <i>This element is only shown in detail mode.</i>
miss-cde-file	Parameter type: <Alarm::MissingCDEProfile> (yes no) Possible values: - yes : cde profile is missed - no : cde profile is exist	specifies cde profile is missed or not. <i>This element is only shown in detail mode.</i>

102.10 Temporal Filter Alarm Log Status Command

Command Description

This command displays the temporal filter alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log temporal [(index)]

Command Parameters

Table 102.10-1 "Temporal Filter Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.10-2 "Temporal Filter Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
tmp-filter1	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	current status of temporal filter1 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	status of temporal filter1 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter2	Parameter type: <Alarm::almFilter2>	current status of temporal filter2

name	Type	Description
	(yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter2> (yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	status of temporal filter2 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter3	Parameter type: <Alarm::almFilter3> (yes no) Possible values: - yes : derived filter3 alarm - no : not derived filter3 alarm	current status of temporal filter3 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter3> (yes no) Possible values: - yes : derived filter3 alarm - no : not derived filter3 alarm	status of temporal filter3 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter4	Parameter type: <Alarm::almFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	current status of temporal filter4 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	status of temporal filter4 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter5	Parameter type: <Alarm::almFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	current status of temporal filter5 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	status of temporal filter5 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter6	Parameter type: <Alarm::almFilter6> (yes no) Possible values: - yes : derived filter6 alarm - no : not derived filter6 alarm	current status of temporal filter6 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter6> (yes no) Possible values:	status of temporal filter6 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : derived filter6 alarm - no : not derived filter6 alarm	
tmp-filter7	Parameter type: <Alarm::alarmFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	current status of temporal filter7 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	status of temporal filter7 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter8	Parameter type: <Alarm::alarmFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	current status of temporal filter8 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	status of temporal filter8 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter9	Parameter type: <Alarm::alarmFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	current status of temporal filter9 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	status of temporal filter9 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter10	Parameter type: <Alarm::alarmFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	current status of temporal filter10 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	status of temporal filter10 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter11	Parameter type: <Alarm::alarmFilter11> (yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	current status of temporal filter11 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter11>	status of temporal filter11 alarm

name	Type	Description
	(yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter12	Parameter type: <Alarm::almFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	current status of temporal filter12 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	status of temporal filter12 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter13	Parameter type: <Alarm::almFilter13> (yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	current status of temporal filter13 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter13> (yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	status of temporal filter13 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter14	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	current status of temporal filter14 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	status of temporal filter14 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter15	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	current status of temporal filter15 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	status of temporal filter15 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter16	Parameter type: <Alarm::almFilter16> (yes no) Possible values:	current status of temporal filter16 alarm is derived or not <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : derived filter16 alarm - no : not derived filter16 alarm	
prev-status	Parameter type: <Alarm::almFilter16> (yes no) Possible values: - yes : derived filter16 alarm - no : not derived filter16 alarm	status of temporal filter16 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter17	Parameter type: <Alarm::almFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	current status of temporal filter17 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	status of temporal filter17 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter18	Parameter type: <Alarm::almFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	current status of temporal filter18 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	status of temporal filter18 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter19	Parameter type: <Alarm::almFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	current status of temporal filter19 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	status of temporal filter19 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter20	Parameter type: <Alarm::almFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	current status of temporal filter20 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	status of temporal filter20 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter21	Parameter type: <Alarm::almFilter21>	current status of temporal filter21

name	Type	Description
	(yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter21> (yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	status of temporal filter21 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter22	Parameter type: <Alarm::almFilter22> (yes no) Possible values: - yes : derived filter22 alarm - no : not derived filter22 alarm	current status of temporal filter22 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter22> (yes no) Possible values: - yes : derived filter22 alarm - no : not derived filter22 alarm	status of temporal filter22 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter23	Parameter type: <Alarm::almFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	current status of temporal filter23 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	status of temporal filter23 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter24	Parameter type: <Alarm::almFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	current status of temporal filter24 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	status of temporal filter24 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter25	Parameter type: <Alarm::almFilter25> (yes no) Possible values: - yes : derived filter25 alarm - no : not derived filter25 alarm	current status of temporal filter25 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter25> (yes no) Possible values:	status of temporal filter25 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : derived filter25 alarm - no : not derived filter25 alarm	
tmp-filter26	Parameter type: <Alarm::alarmFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	current status of temporal filter26 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	status of temporal filter26 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter27	Parameter type: <Alarm::alarmFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	current status of temporal filter27 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	status of temporal filter27 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter28	Parameter type: <Alarm::alarmFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	current status of temporal filter28 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	status of temporal filter28 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter29	Parameter type: <Alarm::alarmFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	current status of temporal filter29 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	status of temporal filter29 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter30	Parameter type: <Alarm::alarmFilter30> (yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	current status of temporal filter30 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter30>	status of temporal filter30 alarm

name	Type	Description
	(yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	with its previous logged value. <i>This element is only shown in detail mode.</i>
tmp-filter31	Parameter type: <Alarm::almFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	current status of temporal filter31 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	status of temporal filter31 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102.11 Spatial Filter Alarm Log Status Command

Command Description

This command displays the spatial filter alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log spatial [ (index) ]
```

Command Parameters

Table 102.11-1 "Spatial Filter Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.11-2 "Spatial Filter Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
spa-filter1	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	current status of spatial filter1 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	status of spatial filter1 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter2	Parameter type: <Alarm::almFilter2>	current status of spatial filter2

name	Type	Description
	(yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter2> (yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	status of spatial filter2 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter3	Parameter type: <Alarm::almFilter3> (yes no) Possible values: - yes : derived filter3 alarm - no : not derived filter3 alarm	current status of spatial filter3 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter3> (yes no) Possible values: - yes : derived filter3 alarm - no : not derived filter3 alarm	status of spatial filter3 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter4	Parameter type: <Alarm::almFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	current status of spatial filter4 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	status of spatial filter4 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter5	Parameter type: <Alarm::almFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	current status of spatial filter5 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	status of spatial filter5 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter6	Parameter type: <Alarm::almFilter6> (yes no) Possible values: - yes : derived filter6 alarm - no : not derived filter6 alarm	current status of spatial filter6 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter6> (yes no) Possible values:	status of spatial filter6 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : derived filter6 alarm - no : not derived filter6 alarm	
spa-filter7	Parameter type: <Alarm::alarmFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	current status of spatial filter7 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	status of spatial filter7 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter8	Parameter type: <Alarm::alarmFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	current status of spatial filter8 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	status of spatial filter8 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter9	Parameter type: <Alarm::alarmFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	current status of spatial filter9 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	status of spatial filter9 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter10	Parameter type: <Alarm::alarmFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	current status of spatial filter10 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	status of spatial filter10 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter11	Parameter type: <Alarm::alarmFilter11> (yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	current status of spatial filter11 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter11>	status of spatial filter11 alarm

name	Type	Description
	(yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter12	Parameter type: <Alarm::almFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	current status of spatial filter12 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	status of spatial filter12 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter13	Parameter type: <Alarm::almFilter13> (yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	current status of spatial filter13 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter13> (yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	status of spatial filter13 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter14	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	current status of spatial filter14 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	status of spatial filter14 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter15	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	current status of spatial filter15 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	status of spatial filter15 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter16	Parameter type: <Alarm::almFilter16> (yes no) Possible values:	current status of spatial filter16 alarm is derived or not <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : derived filter16 alarm - no : not derived filter16 alarm	
prev-status	Parameter type: <Alarm::alarmFilter16> (yes no) Possible values: - yes : derived filter16 alarm - no : not derived filter16 alarm	status of spatial filter16 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter17	Parameter type: <Alarm::alarmFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	current status of spatial filter17 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	status of spatial filter17 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter18	Parameter type: <Alarm::alarmFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	current status of spatial filter18 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	status of spatial filter18 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter19	Parameter type: <Alarm::alarmFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	current status of spatial filter19 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	status of spatial filter19 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter20	Parameter type: <Alarm::alarmFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	current status of spatial filter20 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	status of spatial filter20 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter21	Parameter type: <Alarm::alarmFilter21>	current status of spatial filter21

name	Type	Description
	(yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter21> (yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	status of spatial filter21 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter22	Parameter type: <Alarm::almFilter22> (yes no) Possible values: - yes : derived filter22 alarm - no : not derived filter22 alarm	current status of spatial filter22 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter22> (yes no) Possible values: - yes : derived filter22 alarm - no : not derived filter22 alarm	status of spatial filter22 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter23	Parameter type: <Alarm::almFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	current status of spatial filter23 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	status of spatial filter23 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter24	Parameter type: <Alarm::almFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	current status of spatial filter24 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	status of spatial filter24 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter25	Parameter type: <Alarm::almFilter25> (yes no) Possible values: - yes : derived filter25 alarm - no : not derived filter25 alarm	current status of spatial filter25 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter25> (yes no) Possible values:	status of spatial filter25 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : derived filter25 alarm - no : not derived filter25 alarm	
spa-filter26	Parameter type: <Alarm::alarmFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	current status of spatial filter26 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	status of spatial filter26 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter27	Parameter type: <Alarm::alarmFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	current status of spatial filter27 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	status of spatial filter27 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter28	Parameter type: <Alarm::alarmFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	current status of spatial filter28 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	status of spatial filter28 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter29	Parameter type: <Alarm::alarmFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	current status of spatial filter29 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	status of spatial filter29 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter30	Parameter type: <Alarm::alarmFilter30> (yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	current status of spatial filter30 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::alarmFilter30>	status of spatial filter30 alarm

name	Type	Description
	(yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	with its previous logged value. <i>This element is only shown in detail mode.</i>
spa-filter31	Parameter type: <Alarm::almFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	current status of spatial filter31 alarm is derived or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	status of spatial filter31 alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102.12 xDSL Common Alarm Log Status Command

Command Description

This command displays the xDSL common alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log xdsl misc [ (index) ]
```

Command Parameters

Table 102.12-1 "xDSL Common Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.12-2 "xDSL Common Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
line-config	Parameter type: <Alarm::LineConfig> (config-error	specifies whether line configuration data is used or not.

name	Type	Description
	config-ok) Possible values: - config-error : line configuration data cannot be used - config-ok : Line configuration data OK	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LineConfig> (config-error config-ok) Possible values: - config-error : line configuration data cannot be used - config-ok : Line configuration data OK	status of line-config with its previous logged value. <i>This element is only shown in detail mode.</i>
line-capacity	Parameter type: <Alarm::LineCapacity> (below-requirement meets-requirement) Possible values: - below-requirement : line capacity not enough to set up requested profile - meets-requirement : line capacity enough to set up requested profile	specifies whether line capacity is set up or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LineCapacity> (below-requirement meets-requirement) Possible values: - below-requirement : line capacity not enough to set up requested profile - meets-requirement : line capacity enough to set up requested profile	status of line-capacity with its previous logged value. <i>This element is only shown in detail mode.</i>
xdsl-init	Parameter type: <Alarm::Initialization> (failed successful) Possible values: - failed : initialization unsuccessful due to communication problem - successful : initialization successful	specifies xdsl line initialization is successful or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::Initialization> (failed successful) Possible values: - failed : initialization unsuccessful due to communication problem - successful : initialization successful	status of xdsl-init with its previous logged value. <i>This element is only shown in detail mode.</i>
peer-modem	Parameter type: <Alarm::PeerModem> (no yes) Possible values: - no : no peer modem detected - yes : peer modem detected	specifies whether peer modem detected or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::PeerModem> (no yes) Possible values: - no : no peer modem detected - yes : peer modem detected	status of peer-modem with its previous logged value. <i>This element is only shown in detail mode.</i>
tpstc-mis	Parameter type: <Alarm::TpstcMis> (yes no) Possible values: - yes : mismatch between the configured tps-tc mode and the	mismatch between the configured tps-tc mode and the mode supported by the connected cpe <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	mode supported by the connected cpe - no : no mismatch between the configured and the tpstc mode supported by connected cpe	
prev-status	Parameter type: <Alarm::TpstcMis> (yes no) Possible values: - yes : mismatch between the configured tps-tc mode and the mode supported by the connected cpe - no : no mismatch between the configured and the tpstc mode supported by connected cpe	status of tpstc mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>
forced-rtx-init	Parameter type: <Alarm::ForcedRtxInit> (failed successful) Possible values: - failed : initialization unsuccessful due to forced retransmission - successful : initialization successful	specifies forced rtx initialization is successful or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ForcedRtxInit> (failed successful) Possible values: - failed : initialization unsuccessful due to forced retransmission - successful : initialization successful	status of forced-rtx-init with its previous logged value <i>This element is only shown in detail mode.</i>

102.13 xDSL Near-end Alarm Log Status Command

Command Description

This command displays the xDSL near-end alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log xdsl near-end [ (index) ]
```

Command Parameters

Table 102.13-1 "xDSL Near-end Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.13-2 "xDSL Near-end Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	Specifies where the alarm occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
los	Parameter type: <Alarm::NearEndLOS> (yes	specifies near end loss of signal occurred or not.

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : near end loss of signal occurred - no : no near end loss of signal	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndLOS> (yes no) Possible values: - yes : near end loss of signal occurred - no : no near end loss of signal	status of los with its previous logged value. <i>This element is only shown in detail mode.</i>
lof	Parameter type: <Alarm::NearEndLOF> (yes no) Possible values: - yes : near end loss of frame occurred - no : no near end loss of frame	specifies near end loss of frame occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndLOF> (yes no) Possible values: - yes : near end loss of frame occurred - no : no near end loss of frame	status of lof with its previous logged value. <i>This element is only shown in detail mode.</i>
lom	Parameter type: <Alarm::NearEndLOM> (yes no) Possible values: - yes : near end loss of margin occurred - no : no near end loss of margin	specifies near end loss of margin occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndLOM> (yes no) Possible values: - yes : near end loss of margin occurred - no : no near end loss of margin	status of lom with its previous logged value. <i>This element is only shown in detail mode.</i>
ese	Parameter type: <Alarm::NearEndESE> (yes no) Possible values: - yes : near end excessive severe errors occurred - no : no near end excessive severe errors occurred	specifies near end excessive severe errors occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndESE> (yes no) Possible values: - yes : near end excessive severe errors occurred - no : no near end excessive severe errors occurred	status of ese with its previous logged value. <i>This element is only shown in detail mode.</i>
bitrate	Parameter type: <Alarm::NearEndBRthres> (below-plan meets-plan) Possible values: - below-plan : upstream planned bitrate not reached after initialization - meets-plan : upstream planned bitrate reached	specifies whether upstream planned bitrate reached or not after initialization. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndBRthres> (below-plan meets-plan) Possible values:	status of bitrate with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- below-plan : upstream planned bitrate not reached after initialization - meets-plan : upstream planned bitrate reached	
ncd	Parameter type: <Alarm::NearEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no near end cell delineation - cell-deline-occurred : near end cell delineation occurred	specifies whether near end cell delineation is occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no near end cell delineation - cell-deline-occurred : near end cell delineation occurred	status of ncd with its previous logged value. <i>This element is only shown in detail mode.</i>
lcd	Parameter type: <Alarm::NearEndLCD> (yes no) Possible values: - yes : loss of near end cell deliniation - no : no loss of near end cell deliniation	specifies whether loss of near end cell deliniation is occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndLCD> (yes no) Possible values: - yes : loss of near end cell deliniation - no : no loss of near end cell deliniation	status of lcd with its previous logged value. <i>This element is only shown in detail mode.</i>
vect-dle	Parameter type: <Alarm::NearEndVectDle> (yes no) Possible values: - yes : loss of us signal due to disorderly leaving event - no : no disorderly leaving detected	specifies whether a disorderly leaving event occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndVectDle> (yes no) Possible values: - yes : loss of us signal due to disorderly leaving event - no : no disorderly leaving detected	status of vect-dle with its previous logged value. <i>This element is only shown in detail mode.</i>

102.14 xDSL Far-end Alarm Log Status Command

Command Description

This command displays the xDSL far-end alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log xdsl far-end [ (index) ]
```

Command Parameters

Table 102.14-1 "xDSL Far-end Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.14-2 "xDSL Far-end Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies where the alarm occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
los	Parameter type: <Alarm::FarEndLOS> (yes	specifies whether far end loss of signal occurred or not.

name	Type	Description
	no) Possible values: - yes : far end loss of signal occurred - no : no far end loss of signal	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLOS> (yes no) Possible values: - yes : far end loss of signal occurred - no : no far end loss of signal	status of los with its previous logged value. <i>This element is only shown in detail mode.</i>
lof	Parameter type: <Alarm::FarEndLOF> (yes no) Possible values: - yes : far end loss of frame occurred - no : no far end loss of frame	specifies whether far end loss of frame occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLOF> (yes no) Possible values: - yes : far end loss of frame occurred - no : no far end loss of frame	status of lof with its previous logged value. <i>This element is only shown in detail mode.</i>
lpr	Parameter type: <Alarm::FarEndLPR> (yes no) Possible values: - yes : far end loss of power detected - no : no far end loss of power	specifies whether far end loss of power detected or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLPR> (yes no) Possible values: - yes : far end loss of power detected - no : no far end loss of power	status of lpr with its previous logged value. <i>This element is only shown in detail mode.</i>
lol	Parameter type: <Alarm::FarEndLOL> (yes no) Possible values: - yes : far end loss of link detected - no : no far end loss of link	specifies whether far end loss of link detected or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLOL> (yes no) Possible values: - yes : far end loss of link detected - no : no far end loss of link	status of lol with its previous logged value. <i>This element is only shown in detail mode.</i>
lom	Parameter type: <Alarm::FarEndLOM> (yes no) Possible values: - yes : far end loss of margin occurred - no : no far end loss of margin	specifies whether far end loss of margin occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLOM> (yes no) Possible values: - yes : far end loss of margin occurred	status of lom with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : no far end loss of margin	
ese	Parameter type: <Alarm::FarEndESE> (yes no) Possible values: - yes : far end excessive severe errors occurred - no : no far end excessive severe errors occurred	specifies whether far end excessive severe errors occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndESE> (yes no) Possible values: - yes : far end excessive severe errors occurred - no : no far end excessive severe errors occurred	status of ese with its previous logged value. <i>This element is only shown in detail mode.</i>
bitrate	Parameter type: <Alarm::FarEndBRthres> (below-plan meets-plan) Possible values: - below-plan : downstream planned bitrate not reached after initialization - meets-plan : downstream planned bitrate reached	specifies whether downstream planned bitrate reached or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndBRthres> (below-plan meets-plan) Possible values: - below-plan : downstream planned bitrate not reached after initialization - meets-plan : downstream planned bitrate reached	status of bitrate with its previous logged value. <i>This element is only shown in detail mode.</i>
ncd	Parameter type: <Alarm::FarEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no far end cell delineation - cell-deline-occurred : far end cell delineation occurred	specifies whether far end cell delineation occurred or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no far end cell delineation - cell-deline-occurred : far end cell delineation occurred	status of ncd with its previous logged value. <i>This element is only shown in detail mode.</i>
lcd	Parameter type: <Alarm::FarEndLCD> (yes no) Possible values: - yes : loss of far end cell deliniation - no : no loss of far end cell deliniation	specifies there is loss of far end cell deliniation or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLCD> (yes no) Possible values: - yes : loss of far end cell deliniation - no : no loss of far end cell deliniation	status of lcd with its previous logged value. <i>This element is only shown in detail mode.</i>
upbo-vio	Parameter type: <Alarm::FarEndUPBO> (yes no) Possible values: - yes : UPBO violation - no : no UPBO violation	UPBO violation <i>This element is only shown in detail mode.</i>

name	Type	Description
cpe-pol	Parameter type: <Alarm::FarEndActFail> (yes no) Possible values: - yes : activation failure due to CPE policing - no : no activation failure due to CPE policing	activation failure due to CPE policing <i>This element is only shown in detail mode.</i>
mis-peer-35b	Parameter type: <Alarm::FarEndMismatchPeer35B> (yes no) Possible values: - yes : VDSL2 35b opmode mismatch between XTU-C and XTU-R - no : No VDSL2 35b opmode mismatch between XTU-C and XTU-R	VDSL2 35b opmode mismatch between XTU-C and XTU-R <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndMismatchPeer35B> (yes no) Possible values: - yes : VDSL2 35b opmode mismatch between XTU-C and XTU-R - no : No VDSL2 35b opmode mismatch between XTU-C and XTU-R	status of mismatch-peer-35b with its previous logged value. <i>This element is only shown in detail mode.</i>

102.15 TCA xDSL Alarm Log Status Command

Command Description

This command displays the xDSL threshold cross alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log xdsl-tca [ (index) ]
```

Command Parameters

Table 102.15-1 "TCA xDSL Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.15-2 "TCA xDSL Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies where the alarm occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
errored-secs	Parameter type: <Alarm::ErroredSeconds> (above-thres	number of errored seconds exceeded or below threshold

name	Type	Description
	below-thres) Possible values: - above-thres : number of errored seconds exceeded threshold - below-thres : number of errored seconds below threshold	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of errored seconds exceeded threshold - below-thres : number of errored seconds below threshold	status of errored-secs with its previous logged value. <i>This element is only shown in detail mode.</i>
es-in-a-day	Parameter type: <Alarm::ErroredSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of errored seconds in a day, exceeded threshold - below-thres : number of errored seconds in a day, below threshold	errored seconds in a day exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ErroredSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of errored seconds in a day, exceeded threshold - below-thres : number of errored seconds in a day, below threshold	status of es-in-a-day with its previous logged value. <i>This element is only shown in detail mode.</i>
severely-es	Parameter type: <Alarm::SeverelyErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds exceeded threshold - below-thres : number of severely errored seconds below threshold	number of severely errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SeverelyErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds exceeded threshold - below-thres : number of severely errored seconds below threshold	status of severely-es with its previous logged value. <i>This element is only shown in detail mode.</i>
severely-es-in-a-day	Parameter type: <Alarm::SevErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds in a day, exceeded threshold - below-thres : number of severely errored seconds in a day, below threshold	number of severely errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SevErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds in a day,	status of severely-es-in-a-day with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	exceeded threshold - below-thres : number of severely errored seconds in a day, below threshold	
unavail-secs	Parameter type: <Alarm::UnavailableSeconds> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds exceeded threshold - below-thres : number of unavailable seconds below threshold	number of unavailable seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::UnavailableSeconds> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds exceeded threshold - below-thres : number of unavailable seconds below threshold	status of unavail-secs with its previous logged value. <i>This element is only shown in detail mode.</i>
unavail-secs-in-a-day	Parameter type: <Alarm::UnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds in a day, exceeded threshold - below-thres : number of unavailable seconds in a day, below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::UnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds in a day, exceeded threshold - below-thres : number of unavailable seconds in a day, below threshold	status of unavail-secs-in-a-day with its previous logged value. <i>This element is only shown in detail mode.</i>
es	Parameter type: <Alarm::FarEndErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds exceeded threshold - below-thres : number of far end errored seconds below threshold	number of far end errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds exceeded threshold - below-thres : number of far end errored seconds below threshold	status of es with its previous logged value. <i>This element is only shown in detail mode.</i>
fe-severely-es	Parameter type: <Alarm::FarEndSevErroredSecs> (above-thres below-thres) Possible values: - above-thres : number of far end severely errored seconds exceeded threshold	number of far end severely errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
	- below-thres : number of far end severely errored seconds below threshold	
prev-status	Parameter type: <Alarm::FarEndSevErroredSecs> (above-thres below-thres) Possible values: - above-thres : number of far end severely errored seconds exceeded threshold - below-thres : number of far end severely errored seconds below threshold	status of fe-severely-es with its previous logged value. <i>This element is only shown in detail mode.</i>
fe-sev-es/day	Parameter type: <Alarm::FarEndSevErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end severely errored seconds in a day, exceeded threshold - below-thres : number of far end severely errored seconds in a day, below threshold	number of far end severely errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndSevErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end severely errored seconds in a day, exceeded threshold - below-thres : number of far end severely errored seconds in a day, below threshold	status of fe-sev-es/day with its previous logged value. <i>This element is only shown in detail mode.</i>
fe-unavail-secs	Parameter type: <Alarm::FarEndUnavailSecs> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds exceeded threshold - below-thres : number of far end unavailable seconds below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndUnavailSecs> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds exceeded threshold - below-thres : number of far end unavailable seconds below threshold	status of fe-unavail-secs with its previous logged value. <i>This element is only shown in detail mode.</i>
fe-unavail-sec/day	Parameter type: <Alarm::FarEndUnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds in a day, exceeded threshold - below-thres : number of far end unavailable seconds in a day, below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndUnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds in a day, exceeded threshold - below-thres : number of far end unavailable seconds in a	status of fe-unavail-sec/day with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	day, below threshold	
fe-es-in-a-day	Parameter type: <Alarm::FarEndErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds in a day, exceeded threshold - below-thres : number of far end errored seconds in a day, below threshold	number of far end errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds in a day, exceeded threshold - below-thres : number of far end errored seconds in a day, below threshold	status of fe-es-in-a-day with its previous logged value. <i>This element is only shown in detail mode.</i>
leftrs	Parameter type: <Alarm::LeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds exceeded threshold - below-thres : number of low error free throughput seconds below threshold	number of low error free throughput seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds exceeded threshold - below-thres : number of low error free throughput seconds below threshold	status of leftrs with its previous logged value <i>This element is only shown in detail mode.</i>
leftrs-in-a-day	Parameter type: <Alarm::LeftrSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds in a day, exceeded threshold - below-thres : number of low error free throughput seconds in a day, below threshold	number of low error free throughput seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LeftrSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds in a day, exceeded threshold - below-thres : number of low error free throughput seconds in a day, below threshold	status of leftrs-in-a-day with its previous logged value <i>This element is only shown in detail mode.</i>
fe-leftrs	Parameter type: <Alarm::FarEndLeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end low error free throughput seconds exceeded threshold - below-thres : number of far end low error free throughput seconds below threshold	number of far end low error free throughput seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
prev-status	Parameter type: <Alarm::FarEndLeftSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end low error free throughput seconds exceeded threshold - below-thres : number of far end low error free throughput seconds below threshold	status of fe-lefts with its previous logged value <i>This element is only shown in detail mode.</i>
fe-lefts-in-a-day	Parameter type: <Alarm::FarEndLeftSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end low error free throughput seconds in a day, exceeded threshold - below-thres : number of far end low error free throughput seconds in a day, below threshold	number of far end low error free throughput seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndLeftSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end low error free throughput seconds in a day, exceeded threshold - below-thres : number of far end low error free throughput seconds in a day, below threshold	status of fe-lefts-in-a-day with its previous logged value <i>This element is only shown in detail mode.</i>
xtca-auto-port-reset	Parameter type: <Alarm::AutoPortResetInAweek> (above-thres below-thres) Possible values: - above-thres : number of auto-port-resets reached threshold with in a week - below-thres : number of auto-port-resets below threshold	number of auto port resets reached threshold in a week <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::AutoPortResetInAweek> (above-thres below-thres) Possible values: - above-thres : number of auto-port-resets reached threshold with in a week - below-thres : number of auto-port-resets below threshold	status of xtca-auto-port-reset with its previous logged value <i>This element is only shown in detail mode.</i>
reinit	Parameter type: <Alarm::Reinit> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	number of Reinitialization count in 15min, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::Reinit> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	status of reinit with its previous logged value <i>This element is only shown in detail mode.</i>
reinit-in-a-day	Parameter type: <Alarm::ReinitInAday> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	number of Reinitialization count in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ReinitInAday>	status of reinit-in-a-day with its

102 Alarm Log Status Commands

name	Type	Description
	(above-thres below-thres) Possible values: - above-thres : number of renint counter exceeded threshold - below-thres : number of reinit counter below threshold	previous logged value <i>This element is only shown in detail mode.</i>

102.16 Protection Group Alarm Log Status Command

Command Description

This command displays the protection group alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log olt-gen [ (index) ]
```

Command Parameters

Table 102.16-1 "Protection Group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.16-2 "Protection Group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Gpon::PonId> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	

Only Show Details: current alarm log status		
name	Type	Description
olt-pon-comm	Parameter type: <Alarm::OltPonComm> ((failing fail) ok) Possible values: - failing : OLT port communication is failing - fail : OLT port communication is failing - ok : port protection is ok	current status of PON Communication failure on OLT Port <i>This element is only shown in detail mode.</i>
olt-gen-tf	Parameter type: <Alarm::OltGenTf> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of transmit failure on OLT port <i>This element is only shown in detail mode.</i>
olt-new-ont	Parameter type: <Alarm::OltNewOnt> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of unprovisioned ont appearance <i>This element is only shown in detail mode.</i>
olt-pon-mea	Parameter type: <Alarm::OltPonMea> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of pon provision failure. <i>This element is only shown in detail mode.</i>
olt-pon-loss	Parameter type: <Alarm::OltPonLoss> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of pon loss. <i>This element is only shown in detail mode.</i>
pon-rogue-test	Parameter type: <Alarm::PonRogueTest> ((failing fail) ok) Possible values: - failing : Rogue ONT detection mechanism effective is failing - fail : Rogue ONT detection mechanism effective is failing - ok : Rogue ONT detection mechanism effective is ok	current status of diagnostic tests <i>This element is only shown in detail mode.</i>
onu-loid-conflict	Parameter type: <Alarm::OnuLoidConflict> ((failing fail)	current status of loid conflict ont. <i>This element is only shown in</i>

name	Type	Description
	ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	<i>detail mode.</i>
onu-loid-pwd-err	Parameter type: <Alarm::OnuLoidPwdErr> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of loid password error. <i>This element is only shown in detail mode.</i>
stk-laser-dis	Parameter type: <Alarm::StkLaserDis> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of stuck laser disabled. <i>This element is only shown in detail mode.</i>
pon-alien-test	Parameter type: <Alarm::PonAlienTest> ((failing fail) ok) Possible values: - failing : Alien ONT detection mechanism is active - fail : Alien ONT detection mechanism is active - ok : Alien ONT detection mechanism is not active	current status of alien diagnostic tests <i>This element is only shown in detail mode.</i>
pon-alien-detect	Parameter type: <Alarm::AlienDetected> ((failing fail) ok) Possible values: - failing : Alien ONT detected - fail : Alien ONT detected - ok : No alien ONT detected	current status of alien detect <i>This element is only shown in detail mode.</i>
pon-rng-mismatch	Parameter type: <Alarm::PonRngMismatch> ((failing fail) ok) Possible values: - failing : ranging mismatch detection mechanism effective is failing - fail : ranging mismatch detection mechanism effective is failing - ok : ranging mismatch detection mechanism effective is ok	current status of ranging mismatch <i>This element is only shown in detail mode.</i>
pon-sfp-mismatch	Parameter type: <Alarm::PonSfpMismatch> ((failing fail) ok) Possible values: - failing : pon sfp mismatch is failing - fail : pon sfp mismatch is failing - ok : pon sfp mismatch is ok	current status of sfp mismatch <i>This element is only shown in detail mode.</i>
deactont-high-tca	Parameter type: <Alarm::DeactOntHighTca> (failing ok) Possible values: - failing : pon deactivated ont amount exceed high threshold occurred - ok : pon deactivated ont amount is less than high threshold occurred	current status of deactont high tca <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
deactont-low-tca	Parameter type: <Alarm::DeactOntLowTca> (failing ok) Possible values: - failing : pon deactivated ont amount exceed low threshold occurred - ok : pon deactivated ont amount is less than low threshold occurred	current status of deactont low tca <i>This element is only shown in detail mode.</i>
datapath-integ	Parameter type: <Alarm::DataPathInteg> (failing ok) Possible values: - failing : number of ONTs with SIPREGTO alarm exceeds threshold - ok : number of ONTs with SIPREGTO alarm does not exceed the threshold	current status of PON Data Path Integrity <i>This element is only shown in detail mode.</i>
pon-ddr-fault	Parameter type: <Alarm::DdrFault> (failing ok) Possible values: - failing : pon failure due to ddr fault - ok : ddr ok	pon failure due to ddr fault <i>This element is only shown in detail mode.</i>

102.17 Vectoring Line Alarm Log Status Command

Command Description

This command displays the vectoring line alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log vect-line [ (index) ]
```

Command Parameters

Table 102.17-1 "Vectoring Line Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.17-2 "Vectoring Line Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	specifies where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
xtc-variation-vict	Parameter type: <Alarm::VectXtcVariation> (excessive	excessive : abnormal amplitude variation in xtc coefficients

102 Alarm Log Status Commands

name	Type	Description
	normal) Possible values: - excessive : abnormal amplitude variation in xtc coefficients - normal : no excessive xtc coefficients variation	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectXtcVariation> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc coefficients - normal : no excessive xtc coefficients variation	status of xtc-variation-vict with its previous logged value <i>This element is only shown in detail mode.</i>
xtc-variation-dist	Parameter type: <Alarm::VectXtcVariationDist> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc coefficients - normal : no excessive xtc coefficients variation	specifies if excessive disturber crosstalk coefficient variation occurred or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectXtcVariationDist> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc coefficients - normal : no excessive xtc coefficients variation	status of xtc-variation-dist with its previous logged value <i>This element is only shown in detail mode.</i>
corrupted-errf	Parameter type: <Alarm::VectCorptErrf> (yes no) Possible values: - yes : at least 10% corrupted or missing errorf samples received - no : received errorf samples ok	specifies if corrupted or at least 10% missing errorf samples received occurred or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectCorptErrf> (yes no) Possible values: - yes : at least 10% corrupted or missing errorf samples received - no : received errorf samples ok	status of corrupted-errf with its previous logged value <i>This element is only shown in detail mode.</i>
vect-cpe-cap-mismatch	Parameter type: <Alarm::VectCpeCapMism> (yes no) Possible values: - yes : not allowed Vectoring CPE connected - no : allowed Vectoring CPE connected	specifies if an allowed Vectoring CPE is connected or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectCpeCapMism> (yes no) Possible values: - yes : not allowed Vectoring CPE connected - no : allowed Vectoring CPE connected	status of vect-cpe-cap-mismatch with its previous logged value <i>This element is only shown in detail mode.</i>
vect-conf-not-feas	Parameter type: <Alarm::VectConfNotFeas> (yes no) Possible values: - yes : vectoring configuration not feasible	specifies if the vectoring configuration is feasible <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : vectoring configuration feasible	
prev-status	Parameter type: <Alarm::VectConfNotFeas> (yes no) Possible values: - yes : vectoring configuration not feasible - no : vectoring configuration feasible	status of vect-conf-not-feas with its previous logged value <i>This element is only shown in detail mode.</i>

102.18 Vectoring Board Alarm Log Status Command

Command Description

This command displays the vectoring board alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log vect-board [ (index) ]
```

Command Parameters

Table 102.18-1 "Vectoring Board Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.18-2 "Vectoring Board Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
board-index	Parameter type: <Equipm::EqptVpSlotIndex> (ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	specifies where the alarm has occurred. <i>This element is only shown in detail mode.</i>
vp-link-index	Parameter type: <Alarm::VectVpLinkId2>	this is the vplink id. This index

name	Type	Description
	- specifies the soft-link or the vp-link on the vp-board, or zero - range: [0,1...16]	has value zero when it is not used <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
vp-lt-mismatch	Parameter type: <Alarm::VectVpLtMism> (yes no) Possible values: - yes : mismatch between expected and actual vp-lt mapping or incompatible sw version on vp and lt - no : expected and actual vp-lt in line or vp and lt have compatible sw versions, OR autodiscovery enabled on vp, autodiscovery disabled on lt	specifies if a mismatch between expected and actual vp-lt mapping OR incompatible sw version on vp and lt is detected or not. In case vplt-autodiscovery disabled on vp, failure reported on vp-board. In case vplt-autodiscovery enabled on lt, failure reported on lt-board. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectVpLtMism> (yes no) Possible values: - yes : mismatch between expected and actual vp-lt mapping or incompatible sw version on vp and lt - no : expected and actual vp-lt in line or vp and lt have compatible sw versions, OR autodiscovery enabled on vp, autodiscovery disabled on lt	status of vp-lt-mismatch with its previous logged value <i>This element is only shown in detail mode.</i>
qsfp-id	Parameter type: <Alarm::VectQsfpInvalidNokiaID> (invalid valid) Possible values: - invalid : QSFP does not have valid Nokia ID - valid : QSFP has valid Nokia ID OR no QSFP detected.	specifies if detected QSFP of the frontcable has a valid Nokia ID or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectQsfpInvalidNokiaID> (invalid valid) Possible values: - invalid : QSFP does not have valid Nokia ID - valid : QSFP has valid Nokia ID OR no QSFP detected.	status of qsfp-id with its previous logged value <i>This element is only shown in detail mode.</i>
vp-lt-link	Parameter type: <Alarm::VPLTLINKFAIL> (linkdown linkup) Possible values: - linkdown : vp-lt link problem - linkup : vp-lt link ok or no lt-expected OR autodiscovery enabled on vp, autodiscovery disabled on lt	specifies if a VP-LT link failure is detected or not. In case vplt-autodiscovery disabled on vp, failure reported on vp-board when an lt was expected but no valid connection between vp-lt. In case vplt-autodiscovery enabled on lt, failure reported on lt-board when no valid connection between vp-lt. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VPLTLINKFAIL> (linkdown linkup) Possible values: - linkdown : vp-lt link problem - linkup : vp-lt link ok or no lt-expected OR autodiscovery enabled on vp, autodiscovery disabled on lt	status of VP-LT Link Failure with its previous logged value <i>This element is only shown in detail mode.</i>
vect-no-gain-at-init	Parameter type: <Alarm::VECTNOGAINATINIT>	vectoring gain-at-init mode is not

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : Lines cannot train in gain-at-init mode - no : Lines can train in gain-at-init mode	feasible due to excessive number of non-FDPS capable CPEs <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VECTNOGAINATINIT> (yes no) Possible values: - yes : Lines cannot train in gain-at-init mode - no : Lines can train in gain-at-init mode	status of vect-no-gain-at-init with its previous logged value <i>This element is only shown in detail mode.</i>

102.19 Electrical-to-Optical Conversion Alarm Log Status Command

Command Description

This command displays the electrical-to-optical conversion alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log eo-conversion [(index)]

Command Parameters

Table 102.19-1 " Electrical-to-Optical Conversion Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.19-2 " Electrical-to-Optical Conversion Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <SignedInteger> - a signed integer	identifies where the alarm occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
loss-of-signal	Parameter type: <Alarm::EoConvLOS> (yes no) Possible values:	specifies whether loss of signal detected or not in the EO conversion module <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : loss of signal detected in the EO conversion module - no : no loss of signal detected in the EO conversion module	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::EoConvLOS> (yes no) Possible values: - yes : loss of signal detected in the EO conversion module - no : no loss of signal detected in the EO conversion module	status of loss-of-signal with its previous logged value. <i>This element is only shown in detail mode.</i>
transmission	Parameter type: <Alarm::EoConvTx> (faulty ok) Possible values: - faulty : transmission fault in the EO module - ok : transmission OK	specifies whether transmission fault is occurred or not in the EO module <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EoConvTx> (faulty ok) Possible values: - faulty : transmission fault in the EO module - ok : transmission OK	status of transmission with its previous logged value. <i>This element is only shown in detail mode.</i>

102.20 Authentication Alarm Log Status Command

Command Description

This command displays the authentication-related alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log authentication [(index)]

Command Parameters

Table 102.20-1 "Authentication Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.20-2 "Authentication Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
uni	Parameter type: <Itf::BridgePortItf> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> ng2 : <Eqpt::ChannelGroupId> /	specify which uni the alarm occurred on. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE	

Only Show Details: current and previous alarm log status		
name	Type	Description
vlan-assignment short name: vlan-assign	Parameter type: <Alarm::VLANassignment> (failed successful) Possible values: - failed : failure to assign a VLAN for a user session - successful : assigned a VLAN for a user session	specifies whether a VLAN for a user session is assigned or failed <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VLANassignment> (failed successful) Possible values: - failed : failure to assign a VLAN for a user session	status of vlan-assignment with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- successful : assigned a VLAN for a user session	
vsa-info-invalid short name: vsa-invalid	Parameter type: <Alarm::VSAValid> (yes no) Possible values: - yes : invalid VSA info alarm from RADIUS - no : valid VSA info from RADIUS and no alarm	specifies whether vsa information valid or not from RADIUS server. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VSAValid> (yes no) Possible values: - yes : invalid VSA info alarm from RADIUS - no : valid VSA info from RADIUS and no alarm	status of vsa-info-invalid with its previous logged value. <i>This element is only shown in detail mode.</i>
mac-conflict short name: mac-cflict	Parameter type: <Alarm::MACConflict> (yes no) Possible values: - yes : status of auth-mac-conflict alarm occurred - no : no status of auth-mac-conflict alarm occurred	specifies whether mac conflict occurred or not in mac based authentication. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::MACConflict> (yes no) Possible values: - yes : status of auth-mac-conflict alarm occurred - no : no status of auth-mac-conflict alarm occurred	status of mac-conflict with its previous logged value. <i>This element is only shown in detail mode.</i>
user-pwd-fault short name: usrpwd-falt	Parameter type: <Alarm::USRPWDFault> (yes no) Possible values: - yes : invalid user or password alarm occurred - no : valid user and password and no alarm	specifies whether user or password valid or not in mac based authentication. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::USRPWDFault> (yes no) Possible values: - yes : invalid user or password alarm occurred - no : valid user and password and no alarm	status of user-pwd-fault with its previous logged value. <i>This element is only shown in detail mode.</i>

102.21 xDSL Bonding Alarm Log Status Command

Command Description

This command displays the xDSL bonding-related alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log bonding-group [ (index) ]
```

Command Parameters

Table 102.21-1 "xDSL Bonding Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.21-2 "xDSL Bonding Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
group	Parameter type: <Xdsl::BondingInterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the bonding group interface index <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
up-plan-bitrate	Parameter type: <Alarm::UpPlannedBitrate> (failure	specifies whether the actual group upstream bit rate is above

name	Type	Description
	ok) Possible values: - failure : actual group bitrate is above the minimum upstream bitrate but below the group upstream planned bitrate - ok : actual group bitrate is above the group upstream planned bitrate	the group upstream planned bit rate or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::UpPlannedBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum upstream bitrate but below the group upstream planned bitrate - ok : actual group bitrate is above the group upstream planned bitrate	status of up-plan-bitrate with its previous logged value. <i>This element is only shown in detail mode.</i>
down-plan-bitrate	Parameter type: <Alarm::DownPlanBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum downstream bitrate but below the group downstream planned bitrate - ok : actual group bitrate is above the group downstream planned bitrate	specifies whether the actual group downstream bit rate is above the group downstream planned bit rate or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DownPlanBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum downstream bitrate but below the group downstream planned bitrate - ok : actual group bitrate is above the group downstream planned bitrate	status of down-plan-bitrate with its previous logged value. <i>This element is only shown in detail mode.</i>
up-min-bitrate	Parameter type: <Alarm::UpMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group upstream minimum bitrate - ok : actual group bitrate is above the group upstream minimum bitrate	specifies whether the actual group upstream bit rate is above the group upstream minimum bit rate or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::UpMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group upstream minimum bitrate - ok : actual group bitrate is above the group upstream minimum bitrate	status of up-min-bitrate with its previous logged value. <i>This element is only shown in detail mode.</i>
down-min-bitrate	Parameter type: <Alarm::DownMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group downstream minimum bitrate - ok : actual group bitrate is above the group downstream	specifies whether the actual group downstream bit rate is above the group downstream minimum bit rate or not <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	minimum bitrate	
prev-status	Parameter type: <Alarm::DownMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group downstream minimum bitrate - ok : actual group bitrate is above the group downstream minimum bitrate	status of down-min-bitrate with its previous logged value. <i>This element is only shown in detail mode.</i>
up-config	Parameter type: <Alarm::UpConfig> (not-feasible feasible) Possible values: - not-feasible : upstream configuration not feasible - feasible : upstream configuration feasible	specifies whether the upstream configuration is feasible or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::UpConfig> (not-feasible feasible) Possible values: - not-feasible : upstream configuration not feasible - feasible : upstream configuration feasible	status of up-config with its previous logged value. <i>This element is only shown in detail mode.</i>
down-config	Parameter type: <Alarm::DownConfig> (not-feasible feasible) Possible values: - not-feasible : downstream configuration not feasible - feasible : downstream configuration feasible	specifies whether the downstream configuration is feasible or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DownConfig> (not-feasible feasible) Possible values: - not-feasible : downstream configuration not feasible - feasible : downstream configuration feasible	status of down-config with its previous logged value. <i>This element is only shown in detail mode.</i>
bond-cpe-conn	Parameter type: <Alarm::BondCPE> (not-connected connected) Possible values: - not-connected : bonding cpe modem not connected - connected : bonding cpe modem connected	specifies whether a bonding CPE modem is connected or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BondCPE> (not-connected connected) Possible values: - not-connected : bonding cpe modem not connected - connected : bonding cpe modem connected	status of bond-cpe-conn with its previous logged value. <i>This element is only shown in detail mode.</i>
multiple-cpes	Parameter type: <Alarm::BgConnCPE> (true false) Possible values: - true : bonding group has multiple cpe modems connected - false : bonding group has one cpe modem connected	specifies whether the lines of a bonding group are connected to multiple CPEs or only one <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BgConnCPE> (true false) Possible values: - true : bonding group has multiple cpe modems connected - false : bonding group has one cpe modem connected	status of bg-conn-cpes with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
register	Parameter type: <Alarm::BgRegFail> (failure ok) Possible values: - failure : bonding group discovery or aggregation register failure detected - ok : bonding group discovery or aggregation register failure not detected	specifies whether a discovery or aggregation failure is encountered or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BgRegFail> (failure ok) Possible values: - failure : bonding group discovery or aggregation register failure detected - ok : bonding group discovery or aggregation register failure not detected	status of bg-reg-fail with its previous logged value. <i>This element is only shown in detail mode.</i>
group-incomplete	Parameter type: <Alarm::BgNotCompl> (true false) Possible values: - true : bonding group is incomplete - false : bonding group is complete	specifies whether all configured lines of the bonding group are part of the bonding group <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BgNotCompl> (true false) Possible values: - true : bonding group is incomplete - false : bonding group is complete	status of bg-not-compl with its previous logged value. <i>This element is only shown in detail mode.</i>

102.22 Redundancy Alarm Log Status Command

Command Description

This command displays the redundancy alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log redundancy [(index)]

Command Parameters

Table 102.22-1 "Redundancy Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.22-2 "Redundancy Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
loss-swo-cap	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	identify the swichover capability in a redundant system. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	status of the swichover capability with its previous logged value. <i>This element is only shown in detail mode.</i>
ping-check	Parameter type: <Alarm::PingCheck>	identify the ping check in a

name	Type	Description
	(failure successful) Possible values: - failure : system failure of ping check - successful : system successful of ping check	redundant system. <i>This element is only shown in detail mode.</i>

102.23 Custom Alarm Log Status Command

Command Description

This command displays the custom alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log custom [ (index) ]
```

Command Parameters

Table 102.23-1 "Custom Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.23-2 "Custom Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
custom-alarm1	Parameter type: <Alarm::custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm1 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm1 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm2	Parameter type: <Alarm::custom2> (yes no)	identify the customizableAlarm2 . <i>This element is only shown in</i>

name	Type	Description
	Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm2 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm3	Parameter type: <Alarm::custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm3. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm3 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm4	Parameter type: <Alarm::custom4> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm4. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom4> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm4 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm5	Parameter type: <Alarm::custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm5. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm5 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm6	Parameter type: <Alarm::custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm6. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm6 with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
custom-alarm7	Parameter type: <Alarm::custom7> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm7 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom7> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm7 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm8	Parameter type: <Alarm::custom8> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm8 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom8> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm8 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm9	Parameter type: <Alarm::custom9> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm9 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom9> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm9 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm10	Parameter type: <Alarm::custom10> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm10 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom10> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm10 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm11	Parameter type: <Alarm::custom11> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm11 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom11> (yes no)	status of customizableAlarm11 with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	<i>detail mode.</i>
custom-alarm12	Parameter type: <Alarm::custom12> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm12 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom12> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm12 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm13	Parameter type: <Alarm::custom13> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm13 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom13> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm13 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm14	Parameter type: <Alarm::custom14> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm14 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom14> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm14 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm15	Parameter type: <Alarm::custom15> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm15 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom15> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm15 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm16	Parameter type: <Alarm::custom16> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm16 . <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
prev-status	Parameter type: <Alarm::custom16> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm16 with its previous logged value. <i>This element is only shown in detail mode.</i>
custom-alarm17	Parameter type: <Alarm::custom17> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm17 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::custom17> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of customizableAlarm17 with its previous logged value. <i>This element is only shown in detail mode.</i>

Only Show Details: host expansion shelves customizable alarms		
name	Type	Description
shelf	Parameter type: <Equipm::HolderId> (<Eqpt::RackId> / <Eqpt::ShelfId> not-applicable) Possible values: - not-applicable : not applicable Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	this is the shelf id (equipment holder id) for host expansion alarms, otherwise it is the rack ID <i>This element is only shown in detail mode.</i>
he-custom-alarm1	Parameter type: <Alarm::he-custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm1 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::he-custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of the host expansion shelf's customizableAlarm1 with its previous logged value. <i>This element is only shown in detail mode.</i>
he-custom-alarm2	Parameter type: <Alarm::he-custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm2 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::he-custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of the host expansion shelf's customizableAlarm2 with its previous logged value. <i>This element is only shown in detail mode.</i>
he-custom-alarm3	Parameter type: <Alarm::he-custom3> (yes no) Possible values:	identify the host expansion shelf's customizableAlarm3 . <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	
prev-status	Parameter type: <Alarm::he-custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of the host expansion shelf's customizableAlarm3 with its previous logged value. <i>This element is only shown in detail mode.</i>
he-custom-alarm4	Parameter type: <Alarm::he-custom4> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm4 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::he-custom4> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of the host expansion shelf's customizableAlarm4 with its previous logged value. <i>This element is only shown in detail mode.</i>
he-custom-alarm5	Parameter type: <Alarm::he-custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm5 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::he-custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of the host expansion shelf's customizableAlarm5 with its previous logged value. <i>This element is only shown in detail mode.</i>
he-custom-alarm6	Parameter type: <Alarm::he-custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm6 . <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::he-custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	status of the host expansion shelf's customizableAlarm6 with its previous logged value. <i>This element is only shown in detail mode.</i>

102.24 SFP Alarm Log Status Command

Command Description

This command displays the SFP alarm log status.

For Expander card SFP alarms, the remote LT slot-identifier that corresponds to the SFP is displayed in the output parameter "alarm index 1", and not the SFP faceplate cage-number identifier.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sfp [ (index) ]
```

Command Parameters

Table 102.24-1 "SFP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.24-2 "SFP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
alarm index 1	Parameter type: <Alarm::SfpAlarmIdx1Type> (<Alarm::SfpAlarmIdx1> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - lt : the lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::SfpAlarmIdx1> - the host port faceplate number or the equipment slot-id for	this is the host sfp faceplate number for host alarms or it is the equipment slot id for expansion shelf alarms <i>This element is only shown in detail mode.</i>

name	Type	Description
alarm index 2	expansion shelf alarm Parameter type: <Ihub::EthernetPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> not-applicable lt-slot : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - lt-slot : the port in lt slot - not-applicable : no port Possible values: - sfp : SFP port - xfp : XFP port - eth : RJ45 or lemi port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number	this is the ethernet port id or LT slot for host alarms. this index is not used for expansion shelf alarms <i>This element is only shown in detail mode.</i>

Only Show Details: host shelf alarms		
name	Type	Description
host-sfp-loss	Parameter type: <Alarm::hostSFPLOS> (failing ok) Possible values: - failing : host downlink SFP loss of signal - ok : host downlink SFP signal ok	current status host downlink SFP loss of signal <i>This element is only shown in detail mode.</i>
host-sfp-tx	Parameter type: <Alarm::hostSFPTxFail> (failing ok) Possible values: - failing : host downlink SFP tx failure - ok : host downlink SFP tx ok	status host downlink SFP tx failure <i>This element is only shown in detail mode.</i>
host-sfp-pres	Parameter type: <Alarm::hostSFPMissing> (not-present present) Possible values: - not-present : host downlink SFP not present - present : host downlink SFP present	current status host downlink SFP not present <i>This element is only shown in detail mode.</i>
host-sfp-id	Parameter type: <Alarm::hostSFPInvalidNokiaID>	status host downlink SFP does

102 Alarm Log Status Commands

name	Type	Description
	(invalid valid) Possible values: - invalid : host downlink SFP does not have valid Nokia ID - valid : host downlink SFP has valid Nokia ID	not have valid Nokia ID <i>This element is only shown in detail mode.</i>
host-sfp-ctrl	Parameter type: <Alarm::hostSFPControlFail> (failing ok) Possible values: - failing : host downlink SFP control failure - ok : host downlink SFP control ok	status host downlink SFP control failure <i>This element is only shown in detail mode.</i>
host-sfp-rmtlt	Parameter type: <Alarm::hostSFPUnexpectedRemoteLT> (yes no) Possible values: - yes : host shelf SFP unexpected remote LT plug-in - no : host shelf SFP expected remote LT plug-in	host downlink SFP unexpected remote plug-in <i>This element is only shown in detail mode.</i>
host-sfp-mismatch	Parameter type: <Alarm::hostSFPAssignmentMismatch> (yes no) Possible values: - yes : host shelf SFP assignment does not match reported rack/shelf/slot - no : host shelf SFP assignment matches reported rack/shelf/slot	host downlink SFP assignment does not match reported rack/shelf/slot <i>This element is only shown in detail mode.</i>
host-sfp-incompt	Parameter type: <Alarm::hostSFPIncompatibleShelf> (yes no) Possible values: - yes : host shelf SFP incompatible shelf type detected - no : host shelf SFP compatible shelf type detected	host downlink SFP incompatible shelf type detected <i>This element is only shown in detail mode.</i>

Only Show Details: expansion shelf alarms		
name	Type	Description
exp-sfp-los	Parameter type: <Alarm::expansionShelfSFPLos> (failing ok) Possible values: - failing : expansion shelf downlink SFP loss of signal - ok : expansion shelf downlink SFP signal ok	current status expansion side downlink SFP loss of signal <i>This element is only shown in detail mode.</i>
exp-sfp-tx	Parameter type: <Alarm::expansionShelfSFPTxFail> (failing ok) Possible values: - failing : expansion shelf host downlink SFP tx failure - ok : expansion shelf downlink SFP tx ok	status expansion shelf downlink SFP tx failure <i>This element is only shown in detail mode.</i>
exp-sfp-pres	Parameter type: <Alarm::expansionShelfSFPMissing> (not-present present) Possible values: - not-present : expansion shelf downlink SFP not present - present : expansion shelf downlink SFP present	current status expansion shelf downlink SFP not present <i>This element is only shown in detail mode.</i>

exp-sfp-1-los	Parameter type: <Alarm::expansionShelfSFP1Los> (failing ok) Possible values: - failing : expansion shelf downlink SFP1 loss of signal - ok : expansion shelf downlink SFP1 signal ok	current status expansion side downlink SFP1 loss of signal <i>This element is only shown in detail mode.</i>
exp-sfp-2-los	Parameter type: <Alarm::expansionShelfSFP2Los> (failing ok) Possible values: - failing : expansion shelf downlink SFP2 loss of signal - ok : expansion shelf downlink SFP2 signal ok	current status expansion side downlink SFP2 loss of signal <i>This element is only shown in detail mode.</i>

102.25 Custom External Alarm Log Status Command

Command Description

This command displays the customizable external alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log custom-ext-alarm [(index)]

Command Parameters

Table 102.25-1 "Custom External Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.25-2 "Custom External Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify where the alarm has occurred. <i>This element is always shown.</i>

102.26 SFP RSSI for NT Alarm Log Status

Command

Command Description

This command displays the SFP RSSI alarm log status.

For NT card SFP alarms, the remote LT slot-identifier that corresponds to the SFP is displayed in the output

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sfrssi [ (index) ]
```

Command Parameters

Table 102.26-1 "SFP RSSI for NT Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.26-2 "SFP RSSI for NT Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>

temp-low-warn	Parameter type: <Alarm::NTNTIOTEMPELOWARN> (yes no) Possible values: - yes : temperature is too high than the configured warning low threshold - no : temperature is ok	current status temperature is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>

102.27 PPP Cross-Connect Engine TCA Alarm Log Status Command

Command Description

This command displays the PPP cross-connect engine TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log pppcc-engine-tca [ (index) ]
```

Command Parameters

Table 102.27-1 "PPP Cross-Connect Engine TCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.27-2 "PPP Cross-Connect Engine TCA Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
engine	Parameter type: <Vlan::StackedVlanSigned> (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndex> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndex> - service vlan identity	this is the ppp-cc engine number <i>This element is only shown in detail mode.</i>

alarm index 1	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2 vlt : <Eqpt::RackId> / <Eqpt::ShelfId> /	this is the nt/ntio slot id for host alarms. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	<Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E/FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot - iont : an nt applique slot - lp : an lt applique slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::LtAppliqueSlotId> - the LT Applique slot number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
alarm index 2	Parameter type: <Alarm::e1t1Port> (sfp : <Alarm::E1t1FramerPort> xfp : <Alarm::E1t1FramerPort>) Possible values: - sfp : e1t1 sfp port - xfp : e1t1 xfp port Field type <Alarm::E1t1FramerPort> - value - range: [0...35]	this is the host sfp faceplate number <i>This element is only shown in detail mode.</i>

Only Show Details: e1t1 sfp clock alarms		
name	Type	Description
dsx1-serdes-fail	Parameter type: <Alarm::DSX1SERDESFAIL> (yes no) Possible values: - yes : SERDES clock failure alarm - no : SERDES Clock no failure	SERDES clock failure alarm <i>This element is only shown in detail mode.</i>
dsx1-tributary1-fail	Parameter type: <Alarm::DSX1TRIB1FAIL> (yes no) Possible values: - yes : Tributary 1 clock failure alarm - no : Tributary 1 clock no failure	tributary 1 clock failure alarm <i>This element is only shown in detail mode.</i>
dsx1-tributary2-fail	Parameter type: <Alarm::DSX1TRIB2FAIL> (yes no) Possible values: - yes : Tributary 2 clock failure alarm - no : Tributary 2 clock no failure	tributary 2 clock failure alarm <i>This element is only shown in detail mode.</i>

name	Type	Description
dsx1-los-fail	Parameter type: <Alarm::DSX1LOSFAIL> (yes no) Possible values: - yes : All selected tributaries in Loss Of Signal - no : No All selected tributaries in Loss Of Signal	all selected tributaries in loss of signal <i>This element is only shown in detail mode.</i>
dsx1-ais-sync	Parameter type: <Alarm::DSX1AISFAIL> (yes no) Possible values: - yes : Alarm Indication Signal on the tributary selected sync source - no : No Alarm Indication Signal on the tributary selected sync source	alarm indication signal on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-lof-sync	Parameter type: <Alarm::DSX1LOFSYNCFAIL> (yes no) Possible values: - yes : Loss of Frame on the tributary selected sync source - no : No Loss of Frame on the tributary selected sync source	loss of frame on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-los-sync	Parameter type: <Alarm::DSX1LOSSYNCFAIL> (yes no) Possible values: - yes : Loss of Signal on the tributary selected sync source - no : No Loss of Signal on the tributary selected sync source	loss of signal on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-deg-fail	Parameter type: <Alarm::DSX1DEGFAIL> (yes no) Possible values: - yes : Signal degrade alarm - no : Signal degrade alarm	signal degrade alarm <i>This element is only shown in detail mode.</i>

102.30 2xE1/DS1 SFP Framer Alarm Log Status Command

Command Description

This command displays the 2xE1/DS1 SFP Framer alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sfpe1t1-framer [ (index) ]
```

Command Parameters

Table 102.30-1 "2xE1/DS1 SFP Framer Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.30-2 "2xE1/DS1 SFP Framer Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
alarm index 1	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2 vlt : <Eqpt::RackId> / <Eqpt::ShelfId> /	this is the nt/ntio slot id for host alarms. <i>This element is only shown in detail mode.</i>

name	Type	Description

crc4-threshold-from-liu	Parameter type: <Alarm::DSX1CRC4THLIU> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from LIU - no : No e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from LIU	cyclic redundancy check 4 threshold alarm from LIU <i>This element is only shown in detail mode.</i>
ais-from-liu	Parameter type: <Alarm::DSX1AISLIU> (yes no) Possible values: - yes : e1t1 sfp Alarm Indication Signal alarm from LIU - no : No e1t1 sfp Alarm Indication Signal alarm from LIU	alarm indication signal alarm from LIU <i>This element is only shown in detail mode.</i>
los-from-liu	Parameter type: <Alarm::DSX1LOSLIU> (yes no) Possible values: - yes : e1t1 sfp Loss of signal alarm from LIU - no : No e1t1 sfp Loss of signal alarm from LIU	loss of signal alarm from LIU <i>This element is only shown in detail mode.</i>
lof-from-liu	Parameter type: <Alarm::DSX1LOFLIU> (yes no) Possible values: - yes : e1t1 sfp Loss of frame alarm from LIU - no : No e1t1 sfp Loss of frame alarm from LIU	loss of frame alarm from LIU <i>This element is only shown in detail mode.</i>
lomf-from-liu	Parameter type: <Alarm::DSX1LOMFLIU> (yes no) Possible values: - yes : e1t1 sfp Loss of multi frame alarm from LIU - no : No e1t1 sfp Loss of multi frame alarm from LIU	loss of multi frame alarm from LIU <i>This element is only shown in detail mode.</i>
rei-from-iwf	Parameter type: <Alarm::DSX1REIIWF> (yes no) Possible values: - yes : e1t1 sfp Remote Error Indication Alarm from IWF - no : No e1t1 sfp Remote Error Indication Alarm from IWF	remote error indication alarm from IWF <i>This element is only shown in detail mode.</i>
rdi-from-iwf	Parameter type: <Alarm::DSX1RDIIWF> (yes no) Possible values: - yes : e1t1 sfp Remote Defect Alarm from IWF - no : No e1t1 sfp Remote Defect Alarm from IWF	remote defect indication alarm from IWF <i>This element is only shown in detail mode.</i>
crc6-from-iwf	Parameter type: <Alarm::DSX1CRC6IWF> (yes no) Possible values:	cyclic redundancy check 6 from IWF <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : e1t1 sfp Cyclic Redundancy Check 6 from IWF - no : No e1t1 sfp Cyclic Redundancy Check 6 from IWF	
crc4-from-iwf	Parameter type: <Alarm::DSX1CRC4IWF> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 from IWF - no : No e1t1 sfp Cyclic Redundancy Check 4 from IWF	cyclic redundancy check 4 from IWF <i>This element is only shown in detail mode.</i>
crc4-threshold-from-iwf	Parameter type: <Alarm::DSX1CRC4THIWF> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from IWF - no : No e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from IWF	cyclic redundancy check 4 threshold alarm from IWF <i>This element is only shown in detail mode.</i>
ais-from-iwf	Parameter type: <Alarm::DSX1AISIWF> (yes no) Possible values: - yes : e1t1 sfp Alarm Indication Signal alarm from IWF - no : No e1t1 sfp Alarm Indication Signal alarm from IWF	alarm indication signal alarm from IWF <i>This element is only shown in detail mode.</i>
los-from-iwf	Parameter type: <Alarm::DSX1LOSIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of signal alarm from IWF - no : No e1t1 sfp Loss of signal alarm from IWF	loss of signal alarm from IWF <i>This element is only shown in detail mode.</i>
lof-from-iwf	Parameter type: <Alarm::DSX1LOFIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of frame alarm from IWF - no : No e1t1 sfp Loss of frame alarm from IWF	loss of frame alarm from IWF <i>This element is only shown in detail mode.</i>
lomf-from-iwf	Parameter type: <Alarm::DSX1LOMFIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of multi frame alarm from IWF - no : No e1t1 sfp Loss of multi frame alarm from IWF	loss of multi frame alarm from LIU <i>This element is only shown in detail mode.</i>

102.31 Plug In Unit Extended Alarm Log Status Command

Command Description

This command displays the plug-in unit extended alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log plug-in-unit-ext [(index)]

Command Parameters

Table 102.31-1 "Plug In Unit Extended Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.31-2 "Plug In Unit Extended Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>)	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
fan-alarm	Parameter type: <Alarm::pluginFan> (yes no) Possible values: - yes : fan alarm - no : no fan alarm	current status specifying fan alarm is present or not <i>This element is only shown in detail mode.</i>
dc-a-alarm	Parameter type: <Alarm::plugin-dc-a> (yes no) Possible values: - yes : dc a failure alarm - no : no dc a failure alarm	current status specifying dc-a failure alarm is present or not <i>This element is only shown in detail mode.</i>
dc-b-alarm	Parameter type: <Alarm::plugin-dc-b> (yes no) Possible values: - yes : dc b failure alarm - no : no dc b failure alarm	current status specifying dc-b failure alarm is present or not <i>This element is only shown in detail mode.</i>
dg-alarm	Parameter type: <Alarm::plugin-dg> (yes no) Possible values: - yes : dying gasp alarm - no : no dying gasp alarm	current status specifying dying gasp alarm is present or not <i>This element is only shown in detail mode.</i>
apsf-alarm	Parameter type: <Alarm::pluginApsf> (yes no) Possible values: - yes : apsf failure alarm - no : no apsf failure alarm	applique power supply failure yes or no <i>This element is only shown in detail mode.</i>
ntr-a-loss	Parameter type: <Alarm::NTRALoss> (yes no) Possible values: - yes : ntr-a signal unavailable - no : ntr-a signal available	log status specifying NTR-A loss alarm is present or not <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
ntr-b-loss	Parameter type: <Alarm::NTRBLoss> (yes no) Possible values: - yes : ntr-b signal unavailable - no : ntr-b signal available	log status specifying NTR-B loss alarm is present or not <i>This element is only shown in detail mode.</i>
xvps-conf-loss	Parameter type: <Alarm::XvpsConfLoss> (yes no) Possible values: - yes : implicit xvps configuration loss. - no : no implicit xvps configuration loss.	implicit xvps configuration loss or not. <i>This element is only shown in detail mode.</i>
mac-entry-nofree	Parameter type: <Alarm::MacNofree> (nofree free) Possible values: - nofree : no free mac entry in the mac table on the lt board. - free : file transfer server available.	current status specifying no free mac entry in the mac table on the lt board. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::MacNofree> (nofree free) Possible values: - nofree : no free mac entry in the mac table on the lt board. - free : file transfer server available.	current status specifying no free mac entry in the mac table on the lt board. <i>This element is only shown in detail mode.</i>
fibre-conn-mismatch	Parameter type: <Alarm::FibreConnMismatch> (yes no) Possible values: - yes : REM fibre connection mismatch alarm - no : no REM fibre connection mismatch alarm	current status specifying fibre connection mismatch on detected control card. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FibreConnMismatch> (yes no) Possible values: - yes : REM fibre connection mismatch alarm - no : no REM fibre connection mismatch alarm	status of fibre connection mismatch alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
link-cap-mismatch	Parameter type: <Alarm::LinkCapMismatch> (yes no) Possible values: - yes : actual link speed is not inline with the end-to-end link capability between NT and LT - no : actual link speed is inline with the end-to-end link capability between NT and LT	log-status specifies that the actual link speed is not in line with the end-to-end link capability between NT and LT. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LinkCapMismatch> (yes no) Possible values: - yes : actual link speed is not inline with the end-to-end link capability between NT and LT - no : actual link speed is inline with the end-to-end link capability between NT and LT	status of link-cap-mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>
eqpt-cap-mismatch	Parameter type: <Alarm::EqptCapMismatch> (yes no) Possible values: - yes : not all equipment between NT and LT can support the	log-status specifies that not all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed.

name	Type	Description
	speed that NT and LT can support within the configured MaxLinkSpeed. - no : all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed.	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EqptCapMismatch> (yes no) Possible values: - yes : not all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed. - no : all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed.	status of eqpt-cap-mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>
ctrl-dnld-failure	Parameter type: <Alarm::CtrlDownloadFailure> (yes no) Possible values: - yes : The downloading of the Software image to the controller card failed.. - no : The downloading of the Software image to the controller card passed.	log-status specifies that the downloading of the Software image to the controller card failed. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::CtrlDownloadFailure> (yes no) Possible values: - yes : The downloading of the Software image to the controller card failed.. - no : The downloading of the Software image to the controller card passed.	status of ctrl-dnld-failure with its previous logged value. <i>This element is only shown in detail mode.</i>
melt-hw-issue	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue - no : No Board hardware issue.	log-status specifies that MELT hardware issue. <i>This element is only shown in detail mode.</i>
melt-board-reset	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue - no : No Board hardware issue.	log-status specifies that MELT board got reset. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue - no : No Board hardware issue.	status of board hardware issue with its previous logged value. <i>This element is only shown in detail mode.</i>
board-shelf-mismatch	Parameter type: <Alarm::boardShelfMismatch> (yes no) Possible values: - yes : plugged-in board and shelf type are mismatch - no : plugged-in board and shelf type are match	alarm specifying the shelf type and plugged-in board types are mismatch. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::boardShelfMismatch> (yes	status of shelf-board-mismatch with its previous logged value.

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : plugged-in board and shelf type are mismatch - no : plugged-in board and shelf type are match	<i>This element is only shown in detail mode.</i>
single-fan-fail	Parameter type: <Alarm::SINGLEFANFAILURE> (yes no) Possible values: - yes : single fan failure` - no : no single fan failure	log-status of single fan failure, indicating single fan failed. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SINGLEFANFAILURE> (yes no) Possible values: - yes : single fan failure` - no : no single fan failure	status of FAN failure with its previous logged value. <i>This element is only shown in detail mode.</i>
multi-fan-fail	Parameter type: <Alarm::MULTIFANFAILURE> (yes no) Possible values: - yes : more than one fan failed - no : NO MULTIPLE fans are failed	log-status of multi fan failure, indicating multiple fan failed. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::MULTIFANFAILURE> (yes no) Possible values: - yes : more than one fan failed - no : NO MULTIPLE fans are failed	status of FAN failure with its previous logged value. <i>This element is only shown in detail mode.</i>
fan-tray-missing	Parameter type: <Alarm::FANTRAYMISSING> (yes no) Possible values: - yes : fan tray missing - no : fans tray is present	log-status of fan-tray-missing, indicating fan tray is missing. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FANTRAYMISSING> (yes no) Possible values: - yes : fan tray missing - no : fans tray is present	status of FAN failure with its previous logged value. <i>This element is only shown in detail mode.</i>

102.32 SIP Server Alarm Log Status Commands

Command Description

This command displays the SIP server alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log sip-server [(index)]

Command Parameters

Table 102.32-1 "SIP Server Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.32-2 "SIP Server Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
transport-mismatch	Parameter type: <Alarm::transportMismatch> (yes no) Possible values: - yes : mismatch - no : not mismatch	specifies isamv and server transport mismatch or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::transportMismatch> (yes no) Possible values: - yes : mismatch - no : not mismatch	status of specifies transport mismatch with its previous logged value <i>This element is only shown in detail mode.</i>
dns-lookup-failure	Parameter type: <Alarm::dnsLookUpFailure> (yes no) Possible values: - yes : fail - no : not fail	specifies dns look up fail or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::dnsLookUpFailure>	status of specifies dns look up fail

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : fail - no : not fail	with its previous logged value <i>This element is only shown in detail mode.</i>

102.33 SIP VSP Alarm Log Status Commands

Command Description

This command displays the SIP vsp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sip-vsp [ (index) ]
```

Command Parameters

Table 102.33-1 "SIP VSP Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.33-2 "SIP VSP Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
none-dns-srv	Parameter type: <Alarm::noneDNSSRV> (yes no) Possible values: - yes : none of dns server give reply to to DNS look up - no : dns server give reply to to DNS look up	specifies none of dns server give reply to to DNS look up or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::noneDNSSRV> (yes no) Possible values: - yes : none of dns server give reply to to DNS look up - no : dns server give reply to to DNS look up	status of specifies none of dns server give reply to DNS look up with its previous logged value <i>This element is only shown in detail mode.</i>
no-dns-srv	Parameter type: <Alarm::noDNSSRV> (yes no) Possible values: - yes : no dns server configured when sip request - no : dns server configured when sip request	specifies no dns server configured when sip request or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::noDNSSRV>	status of specifies no dns server

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : no dns server configured when sip request - no : dns server configured when sip request	configured when sip request with its previous logged value <i>This element is only shown in detail mode.</i>
none-srv	Parameter type: <Alarm::noneSRV> (yes no) Possible values: - yes : none sip server give reply when send sip request - no : sip server give reply when send sip request	specifies none sip server give reply when send sip request or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::noneSRV> (yes no) Possible values: - yes : none sip server give reply when send sip request - no : sip server give reply when send sip request	status of specifies none sip server give reply when send sip request with its previous logged value <i>This element is only shown in detail mode.</i>
no-srv	Parameter type: <Alarm::noSRV> (yes no) Possible values: - yes : no sip proxy server configured when send sip request - no : sip proxy server configured when send sip request	specifies no sip proxy server configured when send sip request or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::noSRV> (yes no) Possible values: - yes : no sip proxy server configured when send sip request - no : sip proxy server configured when send sip request	status of specifies no sip proxy server configured when send sip request with its previous logged value <i>This element is only shown in detail mode.</i>
reg-srv-unreach	Parameter type: <Alarm::noRegSRV> (yes no) Possible values: - yes : no sip register server give reply when send sip register - no : sip register server give reply when send sip register	specifies no sip register servers give reply when send sip register or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::noRegSRV> (yes no) Possible values: - yes : no sip register server give reply when send sip register - no : sip register server give reply when send sip register	status of specifies no sip register servers give reply when send sip register with its previous logged value <i>This element is only shown in detail mode.</i>
prxy-srv-unreach	Parameter type: <Alarm::noPrxySRV> (yes no) Possible values: - yes : no sip proxy server give reply when send sip request - no : sip proxy server give reply when send sip request	specifies no sip proxy servers give reply when send sip request or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::noPrxySRV> (yes no) Possible values: - yes : no sip proxy server give reply when send sip request - no : sip proxy server give reply when send sip request	status of specifies no sip proxy servers give reply when send sip request with its previous logged value <i>This element is only shown in detail mode.</i>
fo-trigger	Parameter type: <Alarm::foTrigger> (yes	specifies fail-over is triggered or not.

name	Type	Description
	no) Possible values: - yes : fail over triggered - no : fail over is not triggered	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::foTrigger> (yes no) Possible values: - yes : fail over triggered - no : fail over is not triggered	status of specifies fail-over is triggered with its previous logged value <i>This element is only shown in detail mode.</i>
fb-trigger	Parameter type: <Alarm::fbTrigger> (yes no) Possible values: - yes : fail back triggered - no : fail back is not triggered	specifies fail-back is triggered or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::fbTrigger> (yes no) Possible values: - yes : fail back triggered - no : fail back is not triggered	status of specifies fail-back is triggered with its previous logged value <i>This element is only shown in detail mode.</i>
du-trigger	Parameter type: <Alarm::duTrigger> (yes no) Possible values: - yes : deliberate update triggered - no : deliberate update is not triggered	specifies deliberate-update is triggered or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::duTrigger> (yes no) Possible values: - yes : deliberate update triggered - no : deliberate update is not triggered	status of specifies deliberate-update is triggered with its previous logged value <i>This element is only shown in detail mode.</i>
ssp-missing	Parameter type: <Alarm::sspMissing> (yes no) Possible values: - yes : SSP missing in CDE - no : SSP exist in CDE	specifies ssp missing in cde or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sspMissing> (yes no) Possible values: - yes : SSP missing in CDE - no : SSP exist in CDE	status of specifies ssp missing in cde with its previous logged value <i>This element is only shown in detail mode.</i>
dns-pool-exceed	Parameter type: <Alarm::dnsPoolExceed> (yes no) Possible values: - yes : Number of different SG associated DNS pools exceed - no : Number of different SG associated DNS pools exceed	specifies Number of different SG associated DNS pools exceed or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::dnsPoolExceed> (yes no) Possible values: - yes : Number of different SG associated DNS pools exceed	status of specifies Number of different SG associated DNS pools exceed with its previous logged value <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : Number of different SG associated DNS pools exceed	<i>detail mode.</i>
lsa-fo-trigger	Parameter type: <Alarm::lsaFoTrigger> (yes no) Possible values: - yes : SIP voice service degraded - fail-over to LSA server - no : fail-over to LSA server is not triggered	specifies lsa-fail-over is triggered or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lsaFoTrigger> (yes no) Possible values: - yes : SIP voice service degraded - fail-over to LSA server - no : fail-over to LSA server is not triggered	status of specifies lsa-fail-over is triggered with its previous logged value <i>This element is only shown in detail mode.</i>

102.34 SIP Dial Plan Alarm Log Status Commands

Command Description

This command displays the SIP dial plan alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log sip-dial-plan [(index)]

Command Parameters

Table 102.34-1 "SIP Dial Plan Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.34-2 "SIP Dial Plan Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
bad-digitmap	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	specifies sip digitmap usable or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	status of specifies sip digitmap with its previous logged value <i>This element is only shown in detail mode.</i>

102.35 SIP User Agent Alarm Log Status Commands

Command Description

This command displays the SIP user agent alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log sip-user-agent [(index)]

Command Parameters

Table 102.35-1 "SIP User Agent Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.35-2 "SIP User Agent Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
bad-digitmap	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	specifies sip digitmap usable or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	status of specifies sip digitmap with its previous logged value <i>This element is only shown in detail mode.</i>
dhcp-unreach	Parameter type: <Alarm::dhcpUnreach> (yes no) Possible values:	specifies the DHCP server is unreachable or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : The DHCP server is unreachable - no : The DHCP server is reachable	
prev-status	Parameter type: <Alarm::dhcpUnreach> (yes no) Possible values: - yes : The DHCP server is unreachable - no : The DHCP server is reachable	status of specifies the DHCP server is unreachable with its previous logged value <i>This element is only shown in detail mode.</i>
dhcp-no-srv	Parameter type: <Alarm::dhcpNoSrv> (yes no) Possible values: - yes : The address in DHCP reply is NULL - no : The address in DHCP reply is not NULL	specifies the address in DHCP reply is NULL or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::dhcpNoSrv> (yes no) Possible values: - yes : The address in DHCP reply is NULL - no : The address in DHCP reply is not NULL	status of specifies the address in DHCP reply is NULL with its previous logged value <i>This element is only shown in detail mode.</i>
dhcp-inv-srv	Parameter type: <Alarm::dhcpInvSrv> (yes no) Possible values: - yes : The address in DHCP reply is invalid - no : The address in DHCP reply is OK	specifies the address in DHCP reply is invalid or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::dhcpInvSrv> (yes no) Possible values: - yes : The address in DHCP reply is invalid - no : The address in DHCP reply is OK	status of specifies the address in DHCP reply is invalid with its previous logged value <i>This element is only shown in detail mode.</i>

102.36 SIP Slot Alarm Log Status Commands

Command Description

This command displays the SIP slot alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sip-plugin-unit [ (index) ]
```

Command Parameters

Table 102.36-1 "SIP Slot Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.36-2 "SIP Slot Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
short-res	Parameter type: <Alarm::shortResource> (yes no) Possible values: - yes : short call resource - no : have call resource	sepcifies the call resource short or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::shortResource> (yes no) Possible values: - yes : short call resource - no : have call resource	status of specifies call resources with its previous logged value <i>This element is only shown in detail mode.</i>
norpniewwithsoftdsp	Parameter type: <Alarm::noRpniEWithSoftDsp> (yes no) Possible values: - yes : plan / plug-in RPNI-E board with SoftDsp SW image - no : no plan / plug-in RPNI-E board with SoftDsp SW image	sepcifies if plan / plug-in RPNI-E board with SoftDsp SW image or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
prev-status	Parameter type: <Alarm::noRpniEWithSoftDsp> (yes no) Possible values: - yes : plan / plug-in RPNI-E board with SoftDsp SW image - no : no plan / plug-in RPNI-E board with SoftDsp SW image	status of specifies plan / plug-in RPNI-E board with SoftDsp SW image with its previous logged value <i>This element is only shown in detail mode.</i>

102.37 SIP Termination Alarm Log Status Commands

Command Description

This command displays the SIP termination alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log sip-termination [(index)]

Command Parameters

Table 102.37-1 "SIP Termination Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.37-2 "SIP Termination Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
unknown-sub	Parameter type: <Alarm::unknownSubscriber> (yes no) Possible values: - yes : wrong subscriber - no : right subscriber	specifies the sip subscriber unknow or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::unknownSubscriber> (yes no) Possible values: - yes : wrong subscriber - no : right subscriber	status of specifies subscribers with its previous logged value <i>This element is only shown in detail mode.</i>
ground-key	Parameter type: <Alarm::groundKey> (yes no) Possible values:	status of the ground key. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : current to ground - no : current not to ground	
prev-status	Parameter type: <Alarm::groundKey> (yes no) Possible values: - yes : current to ground - no : current not to ground	status of specifies ground key with its previous logged value <i>This element is only shown in detail mode.</i>
port-hightemp	Parameter type: <Alarm::highTemperature> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of the port temperature. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::highTemperature> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of specifies temperature with its previous logged value <i>This element is only shown in detail mode.</i>
l1-act-failure	Parameter type: <Alarm::l1ActFailure> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of the layer 1 activation. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::l1ActFailure> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of specifies layer 1 activation with its previous logged value <i>This element is only shown in detail mode.</i>
port-overcurrent	Parameter type: <Alarm::overCurrent> (yes no) Possible values: - yes : over current - no : not over current	status of the port current <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::overCurrent> (yes no) Possible values: - yes : over current - no : not over current	status of specifies current with its previous logged value <i>This element is only shown in detail mode.</i>
port-jbfltca	Parameter type: <Alarm::jbflTca> (yes no) Possible values: - yes : high jb fill level - no : not high jb fill level	status of the port jitter buffer fill level tca. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::jbflTca> (yes no) Possible values: - yes : high jb fill level - no : not high jb fill level	status of specifies jbfl tca with its previous logged value <i>This element is only shown in detail mode.</i>
reg-domainname	Parameter type: <Alarm::regdomainname>	status of resolving domain name

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	(register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-auth	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-timeout	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-srvfailresp	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-domainname	Parameter type: <Alarm::invdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invdomainname> (yes no) Possible values:	status of resolving domain name (invite) with its previous logged value <i>This element is only shown in</i>

name	Type	Description
	- yes : invite - resolving domain name failed - no : invite - resolving domain name successful	<i>detail mode.</i>
inv-auth	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-timeout	Parameter type: <Alarm::invtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-srvfailresp	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-srvfailresp	Parameter type: <Alarm::subssrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subssrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-domainname	Parameter type: <Alarm::subsdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsdomainname>	status of resolving domain name

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	(subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-auth	Parameter type: <Alarm::subsauth> (yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	status of authentication (subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsauth> (yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	status of authentication (subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-refreshfail	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received (refresher subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received (refresher subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-inittimeout	Parameter type: <Alarm::subsintimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout (initial subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsintimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout (initial subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
emergency-call	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call with its previous logged value <i>This element is only shown in detail mode.</i>

102.38 Secondary SIP Termination Alarm Log Status Command

Command Description

This command displays the secondary SIP termination alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log secondary-sip-term [(index)]

Command Parameters

Table 102.38-1 "Secondary SIP Termination Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.38-2 "Secondary SIP Termination Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
reg-domainname-sec	Parameter type: <Alarm::regdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-auth-sec	Parameter type: <Alarm::regauth> (yes no) Possible values:	status of authentication (register). <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : register - authentication failed - no : register - authentication successful	
prev-status	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-timeout-sec	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-srvfailresp-sec	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-domainname-sec	Parameter type: <Alarm::invdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-auth-sec	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-timeout-sec	Parameter type: <Alarm::invtimeout>	status of message timeout

name	Type	Description
	(yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	(invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-srvfailresp-sec	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-srvfailresp-sec	Parameter type: <Alarm::subsrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-domainname-sec	Parameter type: <Alarm::subdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-auth-sec	Parameter type: <Alarm::subsauth> (yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	status of authentication (subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsauth> (yes no) Possible values:	status of authentication (subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : Subscribe - authentication failed - no : Subscribe - authentication successful	<i>detail mode.</i>
subs-refreshfail-sec	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received (refresher subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received (refresher subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
subs-inittimeout-sec	Parameter type: <Alarm::subsinittimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout (initial subscribe). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::subsinittimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout (initial subscribe) with its previous logged value <i>This element is only shown in detail mode.</i>
emergency-call-sec	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call with its previous logged value <i>This element is only shown in detail mode.</i>

102.39 SIP Termination Alarm Log Status Commands

Command Description

This command displays the SIP termination alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log e1-sip-termination [(index)]

Command Parameters

Table 102.39-1 "SIP Termination Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.39-2 "SIP Termination Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
reg-domainname	Parameter type: <Alarm::isdnregdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnregdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-auth	Parameter type: <Alarm::isdnregauth> (yes no) Possible values:	status of authentication (register). <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : register - authentication failed - no : register - authentication successful	
prev-status	Parameter type: <Alarm::isdnregauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-timeout	Parameter type: <Alarm::isdnregtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnregtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register) with its previous logged value <i>This element is only shown in detail mode.</i>
reg-srvfailresp	Parameter type: <Alarm::isdnregsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnregsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-domainname	Parameter type: <Alarm::isdninvdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdninvdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-auth	Parameter type: <Alarm::isdninvauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdninvauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-timeout	Parameter type: <Alarm::isdninvtimeout>	status of message timeout

name	Type	Description
	(yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	(invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdninvttimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
inv-srvfailresp	Parameter type: <Alarm::isdninvsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdninvsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite) with its previous logged value <i>This element is only shown in detail mode.</i>
emergency-call	Parameter type: <Alarm::isdnemercencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnemercencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call with its previous logged value <i>This element is only shown in detail mode.</i>
ais-signal	Parameter type: <Alarm::isdnaissignal> (yes no) Possible values: - yes : Alarm Indication Signal detected at E1 interface - no : no Alarm Indication Signal detected at E1 interface	status of Alarm Indication Signal. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnaissignal> (yes no) Possible values: - yes : Alarm Indication Signal detected at E1 interface - no : no Alarm Indication Signal detected at E1 interface	status of Alarm Indication Signal with its previous logged value <i>This element is only shown in detail mode.</i>
los-signal	Parameter type: <Alarm::isdnlossignal> (yes no) Possible values: - yes : Loss Of Signal detected at E1 interface - no : no Loss Of Signal detected at E1 interface	status of Loss Of Signal Alarm. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnlossignal> (yes no) Possible values:	status of Loss Of Signal Alarm with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : Loss Of Signal detected at E1 interface - no : no Loss Of Signal detected at E1 interface	
rai-signal	Parameter type: <Alarm::isdnraisignal> (yes no) Possible values: - yes : Remote Alarm Indication detected at E1 interface - no : no Remote Alarm Indication detected at E1 interface	status of Remote Alarm Indication. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::isdnraisignal> (yes no) Possible values: - yes : Remote Alarm Indication detected at E1 interface - no : no Remote Alarm Indication detected at E1 interface	status of Remote Alarm Indication with its previous logged value <i>This element is only shown in detail mode.</i>
e1sip-misconfig-mgc10	Parameter type: <Alarm::sipmiscfgmgc10> (yes no) Possible values: - yes : Configuration not conform with the core network entity - no : no Configuration not conform with the core network entity	status of config error when connect to mgc10. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sipmiscfgmgc10> (yes no) Possible values: - yes : Configuration not conform with the core network entity - no : no Configuration not conform with the core network entity	status of config error when connect to mgc10 with its previous logged value <i>This element is only shown in detail mode.</i>
e1sip-nsmprf-missed	Parameter type: <Alarm::sipnsmprofmis> (yes no) Possible values: - yes : The SIP termination requires a NSM profile - no : no The SIP termination requires a NSM profile	status of requires a NSM profile. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sipnsmprofmis> (yes no) Possible values: - yes : The SIP termination requires a NSM profile - no : no The SIP termination requires a NSM profile	status of requires a NSM profile with its previous logged value <i>This element is only shown in detail mode.</i>

102.40 E1/T1 Interface Alarm Log Status Commands

Command Description

This command shows the E1/T1 interface alarm log status

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log e1t1-interface [ (index) ]
```

Command Parameters

Table 102.40-1 "E1/T1 Interface Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.40-2 "E1/T1 Interface Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
e1t1itf-recv-ais	Parameter type: <Alarm::itfaissignal> (yes no) Possible values: - yes : Alarm Indication Signal received at interface - no : no Alarm Indication Signal received at interface	status of Alarm Indication Signal received at interface <i>This element is only shown in detail mode.</i>
e1t1itf-recv-los	Parameter type: <Alarm::itflossignal> (yes no) Possible values: - yes : Loss Of Signal received at interface - no : no Loss Of Signal received at interface	status of Loss Of Signal Alarm received at interface <i>This element is only shown in detail mode.</i>
e1t1itf-recv-rai	Parameter type: <Alarm::itfraissignal> (yes no) Possible values:	status of Remote Alarm Indication received at interface <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : Remote Alarm Indication received at interface - no : no Remote Alarm Indication received at interface	

102.41 SIP Termination Alarm Log Status Commands

Command Description

This command displays the SIP termination alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log cas-r2-channel [ (index) ]
```

Command Parameters

Table 102.41-1 "SIP Termination Alarm Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.41-2 "SIP Termination Alarm Log Status Commands" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
exp-seizureack	Parameter type: <Alarm::ExpSeizureAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the SEIZURE ACK signal - no : Channel was not blocked due to failure in the reception of the SEIZURE ACK signal	status of seizure ack signal <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ExpSeizureAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the SEIZURE ACK signal - no : Channel was not blocked due to failure in the reception of the SEIZURE ACK signal	status of seizure ack signal with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
exp-disconack	Parameter type: <Alarm::ExpDisconnectAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the DISCONNECTION ACK signal - no : Channel was not blocked due to failure in the reception of the DISCONNECTION ACK signal	status of disconnect ack signal <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ExpDisconnectAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the DISCONNECTION ACK signal - no : Channel was not blocked due to failure in the reception of the DISCONNECTION ACK signal	status of disconnect ack signal with its previous logged value <i>This element is only shown in detail mode.</i>
exp-forcerelack	Parameter type: <Alarm::ExpForceRelAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal - no : No Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal	status of forced release ack signal <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ExpForceRelAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal - no : No Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal	status of forced release ack signal with its previous logged value <i>This element is only shown in detail mode.</i>

102.42 Pseudo Wire Alarm Log Status Command

Command Description

This command displays alarm log status of the Pseudo Wire.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log pseudo-wire [(index)]

Command Parameters

Table 102.42-1 "Pseudo Wire Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.42-2 "Pseudo Wire Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
packet-loss	Parameter type: <Alarm::PacketLoss> (yes no) Possible values: - yes : Pseudo Wire entered the Packet loss state - no : Pseudo Wire not entered the Packet loss state	specifies the packet loss status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::PacketLoss> (yes no) Possible values: - yes : Pseudo Wire entered the Packet loss state - no : Pseudo Wire not entered the Packet loss state	status of the packet loss with its previous logged value <i>This element is only shown in detail mode.</i>
remote-packet-loss	Parameter type: <Alarm::RemotePacketLoss> (yes no) Possible values: - yes : Remote Packet loss detected - no : Remote Packet loss not detected	specifies the remote packet loss status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::RemotePacketLoss>	status of the remote packet loss

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : Remote Packet loss detected - no : Remote Packet loss not detected	with its previous logged value <i>This element is only shown in detail mode.</i>
no-dsp-resource	Parameter type: <Alarm::NoDspResource> (yes no) Possible values: - yes : DSP resource allocation failed - no : DSP resource allocation failed	specifies the no DSP resource status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NoDspResource> (yes no) Possible values: - yes : DSP resource allocation failed - no : DSP resource allocation failed	status of no DSP resource with its previous logged value <i>This element is only shown in detail mode.</i>

102.43 E1 Alarm Log Status Command

Command Description

This command displays the E1 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log e1 [ (index) ]
```

Command Parameters

Table 102.43-1 "E1 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.43-2 "E1 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::E1Line> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
rx-rai	Parameter type: <Alarm::E1RxRai> (yes	recieving RAI <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : recieving RAI - no : no recieving RAI	detail mode.
prev-status	Parameter type: <Alarm::E1RxRai> (yes no) Possible values: - yes : recieving RAI - no : no recieving RAI	status of rx-rai with its previous logged value <i>This element is only shown in detail mode.</i>
tx-rai	Parameter type: <Alarm::E1TxRai> (yes no) Possible values: - yes : transmitting RAI - no : no transmitting RAI	transmitting RAI <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::E1TxRai> (yes no) Possible values: - yes : transmitting RAI - no : no transmitting RAI	status of tx-rai with its previous logged value <i>This element is only shown in detail mode.</i>
rx-ais	Parameter type: <Alarm::E1RxAis> (yes no) Possible values: - yes : recieving AIS - no : no recieving AIS	recieving AIS <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::E1RxAis> (yes no) Possible values: - yes : recieving AIS - no : no recieving AIS	status of rx-ais with its previous logged value <i>This element is only shown in detail mode.</i>
tx-ais	Parameter type: <Alarm::E1TxAis> (yes no) Possible values: - yes : transmitting AIS - no : no transmitting AIS	transmitting AIS <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::E1TxAis> (yes no) Possible values: - yes : transmitting AIS - no : no transmitting AIS	status of tx-ais with its previous logged value <i>This element is only shown in detail mode.</i>
lof	Parameter type: <Alarm::E1LOF> (yes no) Possible values: - yes : loss of frame - no : no loss of frame	loss of frame <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::E1LOF> (yes no) Possible values: - yes : loss of frame	status of lof with its previous logged value <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no loss of frame	
los	Parameter type: <Alarm::E1LOS> (yes no) Possible values: - yes : loss of signal - no : no loss of signal	loss of signal <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::E1LOS> (yes no) Possible values: - yes : loss of signal - no : no loss of signal	status of los with its previous logged value <i>This element is only shown in detail mode.</i>
loopback	Parameter type: <Alarm::E1Loopback> (yes no) Possible values: - yes : facility in loopback - no : facility not in loopback	facility in E1 loopback <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::E1Loopback> (yes no) Possible values: - yes : facility in loopback - no : facility not in loopback	status of loopback with its previous logged value <i>This element is only shown in detail mode.</i>

102.44 Shdsl Alarm Log Status Command

Command Description

This command displays the Shdsl alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log shdsl [ (index) ]
```

Command Parameters

Table 102.44-1 "Shdsl Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.44-2 "Shdsl Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
wire-pair	Parameter type: <Alarm::LinkDeviceValuesHigh> - identify where the alarm occurred	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>

name	Type	Description
unit	Parameter type: <Alarm::LinkDeviceValuesLow> - identify where the alarm occurred	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
loop-act-net	Parameter type: <Alarm::LoopbackActiveNetwork> (yes no) Possible values: - yes : loopback active - no : no loopback active	loopback active at the network side <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LoopbackActiveNetwork> (yes no) Possible values: - yes : loopback active - no : no loopback active	status of loop-act-net with its previous logged value <i>This element is only shown in detail mode.</i>
loop-act-cus	Parameter type: <Alarm::LoopbackActiveCustom> (yes no) Possible values: - yes : loopback active - no : no loopback active	loopback active at the custom side <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LoopbackActiveCustom> (yes no) Possible values: - yes : loopback active - no : no loopback active	status of loop-act-cus with its previous logged value <i>This element is only shown in detail mode.</i>
config-error	Parameter type: <Alarm::ConfigError> (yes no) Possible values: - yes : config error - no : no config error	configuration error <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ConfigError> (yes no) Possible values: - yes : config error - no : no config error	status of config-error with its previous logged value <i>This element is only shown in detail mode.</i>
loss-atm	Parameter type: <Alarm::LossATMCellDel> (yes no) Possible values: - yes : loss atm cell delineation - no : no loss atm cell delineation	loss of atm cell delineation <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LossATMCellDel> (yes no) Possible values: - yes : loss atm cell delineation - no : no loss atm cell delineation	status of loss-atm with its previous logged value <i>This element is only shown in detail mode.</i>
loss-pr	Parameter type: <Alarm::LossPowerSTUR> (yes no)	loss of power at stu-r <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - yes : loss power at stu-r - no : no loss power at stu-r	
prev-status	Parameter type: <Alarm::LossPowerSTUR> (yes no) Possible values: - yes : loss power at stu-r - no : no loss power at stu-r	status of loss-pr with its previous logged value <i>This element is only shown in detail mode.</i>
secu-error	Parameter type: <Alarm::UnableDisableSTUR> (yes no) Possible values: - yes : loss ability at stu-r - no : no loss ability at stu-r	loss of ability to disable stu-r access <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::UnableDisableSTUR> (yes no) Possible values: - yes : loss ability at stu-r - no : no loss ability at stu-r	status of secu-error with its previous logged value <i>This element is only shown in detail mode.</i>
dev-fault	Parameter type: <Alarm::DeviceFault> (yes no) Possible values: - yes : device fault - no : no device fault	fault of device <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DeviceFault> (yes no) Possible values: - yes : device fault - no : no device fault	status of dev-fault with its previous logged value <i>This element is only shown in detail mode.</i>
atm-ncd	Parameter type: <Alarm::ATMCellDel> (yes no) Possible values: - yes : no atm cell delineation - no : atm cell delineation	none of atm cell delineation <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ATMCellDel> (yes no) Possible values: - yes : no atm cell delineation - no : atm cell delineation	status of atm-ncd with its previous logged value <i>This element is only shown in detail mode.</i>

102.45 Shdsl Alarm Log Status Command

Command Description

This command displays the Shdsl alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log shdsl-isam [ (index) ]
```

Command Parameters

Table 102.45-1 "Shdsl Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.45-2 "Shdsl Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
unit	Parameter type: <Alarm::LinkDeviceValues> - a signed integer	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

Only Show Details: current and previous alarm log status		
name	Type	Description
loss-syn-net	Parameter type: <Alarm::LossSyncWordNetwork> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	loss of sync word at the network side on each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LossSyncWordNetwork> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	status of loss-syn-net with its previous logged value <i>This element is only shown in detail mode.</i>
loss-syn-cus	Parameter type: <Alarm::LossSyncWordCustom> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	loss of sync word at the custom side on each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LossSyncWordCustom> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	status of loss-syn-cus with its previous logged value <i>This element is only shown in detail mode.</i>
loop-att-net	Parameter type: <Alarm::LoopAttenuationNetwork> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	loop attenuation alarm at the network side on each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LoopAttenuationNetwork> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	status of loop-att-net with its previous logged value <i>This element is only shown in detail mode.</i>
loop-att-cus	Parameter type: <Alarm::LoopAttenuationCustom> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	loop attenuation alarm at the custom side on each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LoopAttenuationCustom> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	status of loop-att-cus with its previous logged value <i>This element is only shown in detail mode.</i>
snr-net	Parameter type: <Alarm::SNRNetwork> (yes no) Possible values: - yes : snr margin - no : no snr margin	snr margin alarm at the network side each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SNRNetwork> (yes	status of snr-net with its previous logged value

name	Type	Description
	no) Possible values: - yes : snr margin - no : no snr margin	<i>This element is only shown in detail mode.</i>
snr-cus	Parameter type: <Alarm::SNRCustom> (yes no) Possible values: - yes : snr margin - no : no snr margin	snr margin alarm at the custom side each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SNRCustom> (yes no) Possible values: - yes : snr margin - no : no snr margin	status of snr-cus with its previous logged value <i>This element is only shown in detail mode.</i>
dc-net	Parameter type: <Alarm::DCContinuityFaultNetwork> (yes no) Possible values: - yes : dc fault - no : no dc fault	dc continuity fault at the network side on each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DCContinuityFaultNetwork> (yes no) Possible values: - yes : dc fault - no : no dc fault	status of dc-net with its previous logged value <i>This element is only shown in detail mode.</i>
dc-cus	Parameter type: <Alarm::DCContinuityFaultCustom> (yes no) Possible values: - yes : dc fault - no : no dc fault	dc continuity fault at the custom side on each pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DCContinuityFaultCustom> (yes no) Possible values: - yes : dc fault - no : no dc fault	status of dc-cus with its previous logged value <i>This element is only shown in detail mode.</i>

102.46 Megaco Media Gateway Alarm Log Status Command

Command Description

This command displays the Megaco media gateway alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log megaco-media-gw [ (index) ]
```

Command Parameters

Table 102.46-1 "Megaco Media Gateway Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.46-2 "Megaco Media Gateway Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
mgc-unreachable	Parameter type: <Alarm::mgcUnreachable> (yes no) Possible values: - yes : media gateway controller is unreachable - no : media gateway controller is reachable	specifies the media gateway controller status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::mgcUnreachable> (yes no) Possible values: - yes : media gateway controller is unreachable - no : media gateway controller is reachable	status of specifies media gateway with its previous logged value <i>This element is only shown in detail mode.</i>
failover-to-esamgc	Parameter type: <Alarm::failovertoESAMGC> (yes no) Possible values:	specifies the esa mgc service status <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : failover to esa mgc - no : normal mgc is in service	
prev-status	Parameter type: <Alarm::failoverttoESAMGC> (yes no) Possible values: - yes : failover to esa mgc - no : normal mgc is in service	status of esa mgc service <i>This element is only shown in detail mode.</i>

102.47 Megaco Signaling Gateway Alarm Log Status Command

Command Description

This command displays the Megaco signaling gateway alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log megaco-sig-gw [ (index) ]
```

Command Parameters

Table 102.47-1 "Megaco Signaling Gateway Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.47-2 "Megaco Signaling Gateway Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
sgc-unreachable	Parameter type: <Alarm::sgcUnreachable> (yes no) Possible values: - yes : signalling gateway controller is unreachable - no : signalling gateway controller is reachable	specifies the signaling gateway controller status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sgcUnreachable> (yes no) Possible values: - yes : signalling gateway controller is unreachable - no : signalling gateway controller is reachable	status of specifies signaling gateway with its previous logged value <i>This element is only shown in detail mode.</i>

102.48 Megaco Plug Unit Alarm Log Status Command

Command Description

This command displays the Megaco plug unit alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log megaco-plug-unit [ (index) ]
```

Command Parameters

Table 102.48-1 "Megaco Plug Unit Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.48-2 "Megaco Plug Unit Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
lcard-unreach-srvcard	Parameter type: <Alarm::lineCardUnreachSrvCard> (yes no) Possible values: - yes : line card is unreachable with server card - no : line card is reachable with server card	specifies the line card with server card status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lineCardUnreachSrvCard> (yes no) Possible values: - yes : line card is unreachable with server card - no : line card is reachable with server card	status of line card and server card with its previous logged value <i>This element is only shown in detail mode.</i>
lcard-type-mismatch	Parameter type: <Alarm::lineCardTypeMismatchch> (yes no) Possible values:	specifies the line card type status <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : line card type is mismatch - no : line card type is match	
prev-status	Parameter type: <Alarm::lineCardTypeMismatchch> (yes no) Possible values: - yes : line card type is mismatch - no : line card type is match	status of line card type with its previous logged value <i>This element is only shown in detail mode.</i>

102.49 Megaco Termination Alarm Log Status Command

Command Description

This command displays the Megaco termination alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log megaco-term [(index)]

Command Parameters

Table 102.49-1 "Megaco Termination Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.49-2 "Megaco Termination Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
meg-unknown-sub	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	specifies the megaco subscriber status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	status of the megaco subscriber with its previous logged value <i>This element is only shown in detail mode.</i>
meg-ground-key	Parameter type: <Alarm::voicePortGroundKey> (yes no) Possible values:	specifies the voice port ground key status <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : voice port ground key - no : voice port not ground key	
prev-status	Parameter type: <Alarm::voicePortGroundKey> (yes no) Possible values: - yes : voice port ground key - no : voice port not ground key	status of the voice port ground key with its previous logged value <i>This element is only shown in detail mode.</i>
meg-high-temp	Parameter type: <Alarm::voicePortHighTemp> (yes no) Possible values: - yes : voice port high temperature - no : voice port not high temperature	specifies the voice port temperature status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::voicePortHighTemp> (yes no) Possible values: - yes : voice port high temperature - no : voice port not high temperature	status of the voice port temperature with its previous logged value <i>This element is only shown in detail mode.</i>
l1-act-fail	Parameter type: <Alarm::voicePortL1ActFail> (yes no) Possible values: - yes : voice port l1 act failure - no : voice port l1 act not failure	specifies the voice port l1 act status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::voicePortL1ActFail> (yes no) Possible values: - yes : voice port l1 act failure - no : voice port l1 act not failure	status of the voice port l1 act with its previous logged value <i>This element is only shown in detail mode.</i>
over-current	Parameter type: <Alarm::voicePortOverCurrent> (yes no) Possible values: - yes : voice port over current - no : voice port not over current	specifies the voice port over current status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::voicePortOverCurrent> (yes no) Possible values: - yes : voice port over current - no : voice port not over current	status of the voice port over current with its previous logged value <i>This element is only shown in detail mode.</i>
line-showering	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	specifies the line showering status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	status of the line showering with its previous logged value <i>This element is only shown in detail mode.</i>
low-qos-packetloss	Parameter type: <Alarm::lowQosPacketLoss>	specifies the megaco total packet

name	Type	Description
	(yes no) Possible values: - yes : the total packet loss has exceeded the configured threshold - no : the total packet loss has not exceeded the configured threshold	loss status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lowQosPacketLoss> (yes no) Possible values: - yes : the total packet loss has exceeded the configured threshold - no : the total packet loss has not exceeded the configured threshold	status of the megaco total packet loss value <i>This element is only shown in detail mode.</i>
low-qos-jitter	Parameter type: <Alarm::lowQosJitter> (yes no) Possible values: - yes : the rtp jitter has exceeded the configured threshold - no : the rtp jitter has not exceeded the configured threshold	specifies the megaco rtp jitter status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lowQosJitter> (yes no) Possible values: - yes : the rtp jitter has exceeded the configured threshold - no : the rtp jitter has not exceeded the configured threshold	status of the megaco rtp jitter value <i>This element is only shown in detail mode.</i>
low-qos-delay	Parameter type: <Alarm::lowQosDelay> (yes no) Possible values: - yes : the rtp delay has exceeded the configured threshold - no : the rtp delay has not exceeded the configured threshold	specifies the megaco rtp delay status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lowQosDelay> (yes no) Possible values: - yes : the rtp delay has exceeded the configured threshold - no : the rtp delay has not exceeded the configured threshold	status of the megaco rtp delay value <i>This element is only shown in detail mode.</i>

102.50 Secondary Megaco Termination Alarm Log Status Command

Command Description

This command displays alarm log status of the secondary Megaco termination.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log secondary-megaco-term [(index)]

Command Parameters

Table 102.50-1 "Secondary Megaco Termination Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.50-2 "Secondary Megaco Termination Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
meg-unknown-sub-sec	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	specifies the megaco subscriber status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	status of the megaco subscriber with its previous logged value <i>This element is only shown in detail mode.</i>
line-showering-sec	Parameter type: <Alarm::lineshowering> (yes no)	specifies the line showering status <i>This element is only shown in</i>

name	Type	Description
	Possible values: - yes : line showering - no : no line showering	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	status of the line showering with its previous logged value <i>This element is only shown in detail mode.</i>

102.51 Megaco Signaling Lt Alarm Log Status Command

Command Description

This command displays the Megaco signaling Lt alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log megaco-sig-lt [ (index) ]
```

Command Parameters

Table 102.51-1 "Megaco Signaling Lt Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.51-2 "Megaco Signaling Lt Alarm Log Status Command" Display parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
sig-brd-persist-loss	Parameter type: <Alarm::megacoSigBoardPersDataLoss> (yes no) Possible values: - yes : the voice signaling board persistenet data loss - no : the voice signaling board persistenet data not loss	specifies the voice signaling board persistenet data status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::megacoSigBoardPersDataLoss> (yes no) Possible values: - yes : the voice signaling board persistenet data loss - no : the voice signaling board persistenet data not loss	status of voice signaling board persistenet data with its previous logged value <i>This element is only shown in detail mode.</i>
sig-brd-disk-full	Parameter type: <Alarm::voiceSigBoard90PercentFull> (yes no) Possible values:	specifies the voice signaling board disk status <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : specifies the voice signaling board disk 90% full - no : specifies the voice signaling board disk no 90% full	
prev-status	Parameter type: <Alarm::voiceSigBoard90PercentFull> (yes no) Possible values: - yes : specifies the voice signaling board disk 90% full - no : specifies the voice signaling board disk no 90% full	status of voice signaling board disk with its previous logged value <i>This element is only shown in detail mode.</i>
sig-brd-db-roolback	Parameter type: <Alarm::sigBoardDBRollback> (yes no) Possible values: - yes : specifies the voice signaling board implicit db rollback - no : specifies the voice signaling board implicit db no rollback	specifies the voice signaling board implicit db status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::sigBoardDBRollback> (yes no) Possible values: - yes : specifies the voice signaling board implicit db rollback - no : specifies the voice signaling board implicit db no rollback	status of voice signaling board implicit db with its previous logged value <i>This element is only shown in detail mode.</i>
mg-overload	Parameter type: <Alarm::megMGOverLoad> (yes no) Possible values: - yes : specifies the mg overload - no : specifies the mg no overload	specifies the mg overload status <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::megMGOverLoad> (yes no) Possible values: - yes : specifies the mg overload - no : specifies the mg no overload	status of the mg overload with its previous logged value <i>This element is only shown in detail mode.</i>

102.52 Ima-Group Alarm Log Status Command

Command Description

This command displays the Ima-Group alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ima-group [ (index) ]
```

Command Parameters

Table 102.52-1 "Ima-Group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.52-2 "Ima-Group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Equipm::AtmImaIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
far-end-start	Parameter type: <Alarm::FarEndStartup> (yes	far-end starting up <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : far-end startup - no : no far-end startup	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndStartup> (yes no) Possible values: - yes : far-end startup - no : no far-end startup	status of far-end-start with its previous logged value <i>This element is only shown in detail mode.</i>
far-end-fconf	Parameter type: <Alarm::FarEndFailedConfig> (yes no) Possible values: - yes : far-end failed config - no : no far-end failed config	failed configuration of far-end <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndFailedConfig> (yes no) Possible values: - yes : far-end failed config - no : no far-end failed config	status of far-end-fconf with its previous logged value <i>This element is only shown in detail mode.</i>
near-end-fconf	Parameter type: <Alarm::NearEndFailedConfig> (yes no) Possible values: - yes : near-end failed config - no : no near-end failed config	failed configuration of near-end <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndFailedConfig> (yes no) Possible values: - yes : near-end failed config - no : no near-end failed config	status of near-end-fconf with its previous logged value <i>This element is only shown in detail mode.</i>
far-end-ins-lnk	Parameter type: <Alarm::FarEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at far-end - no : no insufficient number of links at far-end	insufficient number of links at far-end <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at far-end - no : no insufficient number of links at far-end	status of far-end-ins-lnk with its previous logged value <i>This element is only shown in detail mode.</i>
near-end-ins-lnk	Parameter type: <Alarm::NearEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at near-end - no : no insufficient number of links at near-end	insufficient number of links at near-end <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at near-end	status of near-end-ins-lnk with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : no insufficient number of links at near-end	
far-end-blk	Parameter type: <Alarm::FarEndBlocked> (yes no) Possible values: - yes : far-end blocked - no : no far-end blocked	status that far-end is blocked <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndBlocked> (yes no) Possible values: - yes : far-end blocked - no : no far-end blocked	status of far-end-blk with its previous logged value <i>This element is only shown in detail mode.</i>

102.53 Ima-Link Alarm Log Status Command

Command Description

This command displays the Ima-Link alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ima-link [ (index) ]
```

Command Parameters

Table 102.53-1 "Ima-Link Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.53-2 "Ima-Link Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
loss-ima-frm	Parameter type: <Alarm::LossImaFrame> (yes	loss of ima frame <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : loss ima frame - no : no loss ima frame	detail mode.
prev-status	Parameter type: <Alarm::LossImaFrame> (yes no) Possible values: - yes : loss ima frame - no : no loss ima frame	status of loss-ima-frm with its previous logged value <i>This element is only shown in detail mode.</i>
lods	Parameter type: <Alarm::LinkOutofDelaySynch> (yes no) Possible values: - yes : link out of delay - no : no link out of delay	link out of delay synchronization <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LinkOutofDelaySynch> (yes no) Possible values: - yes : link out of delay - no : no link out of delay	status of lods with its previous logged value <i>This element is only shown in detail mode.</i>
link-misc	Parameter type: <Alarm::LinkMisconnect> (yes no) Possible values: - yes : link misconnect - no : no link misconnect	link of misconnecting <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LinkMisconnect> (yes no) Possible values: - yes : link misconnect - no : no link misconnect	status of link-misc with its previous logged value <i>This element is only shown in detail mode.</i>
link-rfi	Parameter type: <Alarm::LinkRemoteFailureIndication> (yes no) Possible values: - yes : link remote failure indication - no : no link remote failure indication	link of remote failure indication <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LinkRemoteFailureIndication> (yes no) Possible values: - yes : link remote failure indication - no : no link remote failure indication	status of link-rfi with its previous logged value <i>This element is only shown in detail mode.</i>
link-fault	Parameter type: <Alarm::LinkFault> (yes no) Possible values: - yes : fault in link facility - no : no fault in link facility	fault of link <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LinkFault> (yes no) Possible values: - yes : fault in link facility	status of link-fault with its previous logged value <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no fault in link facility	
fe-tx-blk	Parameter type: <Alarm::FarEndTXBlocked> (yes no) Possible values: - yes : transmit blocked due to far-end - no : no transmit blocked due to far-end	transmit blocked due to far-end <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndTXBlocked> (yes no) Possible values: - yes : transmit blocked due to far-end - no : no transmit blocked due to far-end	status of fe-tx-blk with its previous logged value <i>This element is only shown in detail mode.</i>
fe-rec-blk	Parameter type: <Alarm::FarEndRXBlocked> (yes no) Possible values: - yes : receive blocked due to far-end - no : no receive blocked due to far-end	receive blocked due to far-end <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::FarEndRXBlocked> (yes no) Possible values: - yes : receive blocked due to far-end - no : no receive blocked due to far-end	status of fe-rec-blk with its previous logged value <i>This element is only shown in detail mode.</i>

102.54 Ether-Tca Alarm Log Status Command

Command Description

This command displays the Ether-Tca alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ether-tca [ (index) ]
```

Command Parameters

Table 102.54-1 "Ether-Tca Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.54-2 "Ether-Tca Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
etca-los	Parameter type: <Alarm::EthTcaLos> (yes	ethernet loss of signal <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : ethernet loss of signal errors exceeds - no : ethernet loss of signal errors normal	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::EthTcaLos> (yes no) Possible values: - yes : ethernet loss of signal errors exceeds - no : ethernet loss of signal errors normal	status of etca-los with its previous logged value <i>This element is only shown in detail mode.</i>
etca-fcs	Parameter type: <Alarm::EthTcaFcs> (yes no) Possible values: - yes : ethernet frame check sequence errors exceeds - no : ethernet frame check sequence errors normal	ethernet frame check sequence <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthTcaFcs> (yes no) Possible values: - yes : ethernet frame check sequence errors exceeds - no : ethernet frame check sequence errors normal	status of etca-fcs with its previous logged value <i>This element is only shown in detail mode.</i>
etca-rx-octets	Parameter type: <Alarm::EthTcaRxb> (yes no) Possible values: - yes : received octets exceeds - no : received octets normal	received octets <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthTcaRxb> (yes no) Possible values: - yes : received octets exceeds - no : received octets normal	status of etca-rx-octets with its previous logged value <i>This element is only shown in detail mode.</i>
etca-tx-octets	Parameter type: <Alarm::EthTcaTxb> (yes no) Possible values: - yes : transmitted octets exceeds - no : transmitted octets normal	transmitted octets <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthTcaTxb> (yes no) Possible values: - yes : transmitted octets exceeds - no : transmitted octets normal	status of etca-tx-octets with its previous logged value <i>This element is only shown in detail mode.</i>
etca-day-los	Parameter type: <Alarm::EthDayLos> (yes no) Possible values: - yes : ethernet day los errors exceeds - no : ethernet day los errors normal	ethernet day los <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthDayLos> (yes no) Possible values: - yes : ethernet day los errors exceeds	status of etca-day-los with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : ethernet day los errors normal	
etca-day-fcs	Parameter type: <Alarm::EthDayFcs> (yes no) Possible values: - yes : ethernet day fcs errors exceeds - no : ethernet day fcs errors normal	ethernet day fcs <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthDayFcs> (yes no) Possible values: - yes : ethernet day fcs errors exceeds - no : ethernet day fcs errors normal	status of etca-day-fcs with its previous logged value <i>This element is only shown in detail mode.</i>
etca-day-rx-octets	Parameter type: <Alarm::EthDayRxb> (yes no) Possible values: - yes : received octets day exceeds - no : received octets day normal	received octets <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthDayRxb> (yes no) Possible values: - yes : received octets day exceeds - no : received octets day normal	status of etca-day-rx-octets with its previous logged value <i>This element is only shown in detail mode.</i>
etca-day-tx-octets	Parameter type: <Alarm::EthDayTxb> (yes no) Possible values: - yes : transmitted octets day exceeds - no : transmitted octets day normal	transmitted octets <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthDayTxb> (yes no) Possible values: - yes : transmitted octets day exceeds - no : transmitted octets day normal	status of etca-day-tx-octets with its previous logged value <i>This element is only shown in detail mode.</i>

102.55 Ether-Sfp Alarm Log Status Command

Command Description

This command displays the Ether-Sfp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ether-sfp [(index)]

Command Parameters

Table 102.55-1 "Ether-Sfp Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.55-2 "Ether-Sfp Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
user-sfp-los	Parameter type: <Alarm::EthSfpLos> (yes	ethernet sfp loss of signal <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : ethernet sfp los error - no : ethernet sfp los normal	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpLos> (yes no) Possible values: - yes : ethernet sfp los error - no : ethernet sfp los normal	status of user-sfp-los with its previous logged value <i>This element is only shown in detail mode.</i>
user-sfp-tx-fail	Parameter type: <Alarm::EthSfpTxFail> (yes no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	ethernet sfp tx <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpTxFail> (yes no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	status of user-sfp-tx-fail with its previous logged value <i>This element is only shown in detail mode.</i>
user-sfp-not-prst	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	ethernet sfp presence <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	status of user-sfp-not-prst with its previous logged value <i>This element is only shown in detail mode.</i>
user-sfp-inv-id	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	ethernet sfp id validity <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	status of user-sfp-inv-id with its previous logged value <i>This element is only shown in detail mode.</i>
user-sfp-t-exceed	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed - no : ethernet sfp temperature normal	ethernet sfp temperature <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed	status of user-sfp-t-exceed with its previous logged value <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : ethernet sfp temperature normal	
user-sfp-mismatch	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	ethernet sfp type <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	status of user-sfp-mismatch with its previous logged value <i>This element is only shown in detail mode.</i>

102.56 Ether-Sfp Alarm Log Status Command

Command Description

This command displays the Ether-Sfp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log uplink-ether-sfp [ (index) ]
```

Command Parameters

Table 102.56-1 "Ether-Sfp Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.56-2 "Ether-Sfp Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
uplink-sfp-los	Parameter type: <Alarm::EthSfpLos> (yes	ethernet uplink sfp loss of signal <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : ethernet sfp los error - no : ethernet sfp los normal	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpLos> (yes no) Possible values: - yes : ethernet sfp los error - no : ethernet sfp los normal	status of uplink sfp-los with its previous logged value <i>This element is only shown in detail mode.</i>
uplink-sfp-tx-fail	Parameter type: <Alarm::EthSfpTxFail> (yes no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	uplink ethernet sfp tx <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpTxFail> (yes no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	status of uplink sfp-tx-fail with its previous logged value <i>This element is only shown in detail mode.</i>
uplink-sfp-not-prst	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	ethernet uplink sfp presence <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	status of uplink sfp-not-prst with its previous logged value <i>This element is only shown in detail mode.</i>
uplink-sfp-inv-id	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	ethernet uplink sfp id validity <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	status of sfp-inv-id with its previous logged value <i>This element is only shown in detail mode.</i>
uplink-sfp-t-exceed	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed - no : ethernet sfp temperature normal	ethernet uplink sfp temperature <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed	status of uplink-sfp-t-exceed with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : ethernet sfp temperature normal	
uplink-sfp-mismatch	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	uplink ethernet sfp type <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	status of uplink-sfp-mismatch with its previous logged value <i>This element is only shown in detail mode.</i>

102.57 Alarm Qos Slot Log Status Commands

Command Description

This command displays the Qos Slot alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log qos-slot [ (index) ]
```

Command Parameters

Table 102.57-1 "Alarm Qos Slot Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.57-2 "Alarm Qos Slot Log Status Commands" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify where the alarm has occurred. <i>This element is always shown.</i>

102 Alarm Log Status Commands

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	

Only Show Details: current and previous alarm log status		
name	Type	Description
up-overflow	Parameter type: <Alarm::up-overflow> (yes no) Possible values: - yes : up overflow alarm - no : no up overflow alarm	check LT load in upstream. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::up-overflow> (yes no) Possible values: - yes : up overflow alarm - no : no up overflow alarm	status of specifies up overflow with its previous logged value <i>This element is only shown in detail mode.</i>
dw-overflow	Parameter type: <Alarm::dw-overflow> (yes no) Possible values: - yes : down overflow alarm - no : no down overflow alarm	check LT load in downstream. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::dw-overflow> (yes no) Possible values: - yes : down overflow alarm - no : no down overflow alarm	status of specifies down overflow with its previous logged value <i>This element is only shown in detail mode.</i>
upobc-overflow	Parameter type: <Alarm::upobc-overflow> (yes no) Possible values: - yes : up to obc overflow alarm - no : no up to obc overflow alarm	check LT load to OBC in upstream. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::upobc-overflow> (yes no) Possible values: - yes : up to obc overflow alarm - no : no up to obc overflow alarm	status of specifies up to obc overflow with its previous logged value <i>This element is only shown in detail mode.</i>
dwobc-overflow	Parameter type: <Alarm::dwobc-overflow> (yes	check LT load to OBC in downstream.

name	Type	Description
	no) Possible values: - yes : down to obc overflow alarm - no : no down to obc overflow alarm	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::dwobc-overflow> (yes no) Possible values: - yes : down to obc overflow alarm - no : no down to obc overflow alarm	status of specifies down to obc overflow with its previous logged value <i>This element is only shown in detail mode.</i>
lwpriority-overflow	Parameter type: <Alarm::lwpriority-overflow> (yes no) Possible values: - yes : alarm - no : no dying gasp alarm	check Voice and Video load. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::lwpriority-overflow> (yes no) Possible values: - yes : alarm - no : no dying gasp alarm	status of specifies voice and video load with its previous logged value <i>This element is only shown in detail mode.</i>
fanout	Parameter type: <Alarm::fanout> (yes no) Possible values: - yes : fan out alarm - no : no fan out alarm	check LT Load. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::fanout> (yes no) Possible values: - yes : fan out alarm - no : no fan out alarm	status of fan out with its previous logged value <i>This element is only shown in detail mode.</i>

102.58 Ellid Alarm Status Command

Command Description

This command displays the ellid current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ellid [ (alarm-index) ]
```

Command Parameters

Table 102.58-1 "Ellid Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(alarm-index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.58-2 "Ellid Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ellid-index	Parameter type: <Itf::ComplexPortType> (xdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> voicefxs : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> xdsl-channel : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-if : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-pvc : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> bridge-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId>	this is the epon id for Snapshot alarms. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- voip : voip - voip:ng2 : voip - la-group : link aggregation group - dist-router-interface : dist router interface - voicefxs : voicefxs - mpm : multi-pon module Possible values: - vlan : vlan port Possible values: - slot-vlan : slot unstacked - slot-stacked : slot vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier Field type <Eqpt::ComboPonId> - the comboPON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::BundleId> - the BUNDLE identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

name	Type	Description
	Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id Field type <Eqpt::VlanId> - VLAN id Field type <Eqpt::LogicalId> - logical id Field type <Eqpt::VrflId> - VRF id	

Only Show Details: current and previous alarm log status		
name	Type	Description
key-fail-one-churn	Parameter type: <alarm::keyfailone> (yes no) Possible values: - yes : key exchange failure during one churning time - no : key exchange failure during one churning time is ok	key exchange failure during one churning time <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::keyfailone> (yes no) Possible values: - yes : key exchange failure during one churning time - no : key exchange failure during one churning time is ok	status of key fail one churn with its previous logged value <i>This element is only shown in detail mode.</i>
key-fail-three-churn	Parameter type: <alarm::keyfailthree> (yes no) Possible values: - yes : key exchange failure during three churning time - no : key exchange failure during three churning time is ok	key exchange failure during three churning time <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::keyfailthree> (yes no) Possible values: - yes : key exchange failure during three churning time - no : key exchange failure during three churning time is ok	status of key fail three churn with its previous logged value <i>This element is only shown in detail mode.</i>
oam-discov-fail	Parameter type: <alarm::oamext> (yes no) Possible values: - yes : extend oam discovery failure - no : extend oam discovery failure is ok	extend oam discovery failure <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::oamext> (yes no) Possible values: - yes : extend oam discovery failure - no : extend oam discovery failure is ok	status of extend oam fail with its previous logged value <i>This element is only shown in detail mode.</i>
report-timeout	Parameter type: <alarm::timeout> (yes no)	report timeout detecting <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - yes : report timeout detecting - no : report timeout detecting is ok	
prev-status	Parameter type: <alarm::timeout> (yes no) Possible values: - yes : report timeout detecting - no : report timeout detecting is ok	status of report timeout with its previous logged value <i>This element is only shown in detail mode.</i>
total-packets-exceed	Parameter type: <alarm::totalexceed> (yes no) Possible values: - yes : total amount of protocol packets exceed threshold - no : total amount of protocol packets is ok	total amount of protocol packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::totalexceed> (yes no) Possible values: - yes : total amount of protocol packets exceed threshold - no : total amount of protocol packets is ok	status of total packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
arp-packets-exceed	Parameter type: <alarm::arpexceed> (yes no) Possible values: - yes : protocol arp packets exceed threshold - no : protocol arp packets is ok	protocol arp packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::arpexceed> (yes no) Possible values: - yes : protocol arp packets exceed threshold - no : protocol arp packets is ok	status of arp packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
dhcp-packets-exceed	Parameter type: <alarm::dhcpxceed> (yes no) Possible values: - yes : protocol dhcp packets exceed threshold - no : protocol dhcp packets is ok	protocol dhcp packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::dhcpxceed> (yes no) Possible values: - yes : protocol dhcp packets exceed threshold - no : protocol dhcp packets is ok	status of dhcp packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
igmp-packets-exceed	Parameter type: <alarm::igmpexceed> (yes no) Possible values: - yes : protocol igmp packets exceed threshold - no : protocol igmp packets is ok	protocol igmp packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::igmpexceed> (yes no) Possible values: - yes : protocol igmp packets exceed threshold - no : protocol igmp packets is ok	status of igmp packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>

name	Type	Description
pppoe-packets-exceed	Parameter type: <alarm::pppoeexceed> (yes no) Possible values: - yes : protocol pppoe packets exceed threshold - no : protocol pppoe packets is ok	protocol pppoe packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::pppoeexceed> (yes no) Possible values: - yes : protocol pppoe packets exceed threshold - no : protocol pppoe packets is ok	status of pppoe packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
nd-packets-exceed	Parameter type: <alarm::ndexceed> (yes no) Possible values: - yes : protocol nd packets exceed threshold - no : protocol nd packets is ok	protocol nd packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::ndexceed> (yes no) Possible values: - yes : protocol nd packets exceed threshold - no : protocol nd packets is ok	status of nd packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
icmpv6-packets-exceed	Parameter type: <alarm::icmpexceed> (yes no) Possible values: - yes : protocol icmp packets exceed threshold - no : protocol icmp packets is ok	protocol icmpv6 packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::icmpexceed> (yes no) Possible values: - yes : protocol icmp packets exceed threshold - no : protocol icmp packets is ok	status of icmp packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
mld-packets-exceed	Parameter type: <alarm::mldexceed> (yes no) Possible values: - yes : protocol igmp packets exceed threshold - no : protocol igmp packets is ok	protocol mld packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::mldexceed> (yes no) Possible values: - yes : protocol igmp packets exceed threshold - no : protocol igmp packets is ok	status of mld packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>
dhcpv6-packets-exceed	Parameter type: <alarm::dhcpv6exceed> (yes no) Possible values: - yes : protocol dhcpv6 packets exceed threshold - no : protocol dhcpv6 packets is ok	protocol dhcpv6 packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::dhcpv6exceed> (yes no)	status of dhcpv6 packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - yes : protocol dhcpv6 packets exceed threshold - no : protocol dhcpv6 packets is ok	<i>detail mode.</i>
cfm-packets-exceed	Parameter type: <alarm::cfmexceed> (yes no) Possible values: - yes : protocol cfm packets exceed threshold - no : protocol cfm packets is ok	protocol cfm packets exceed threshold <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <alarm::cfmexceed> (yes no) Possible values: - yes : protocol cfm packets exceed threshold - no : protocol cfm packets is ok	status of cfm packets exceed with its previous logged value <i>This element is only shown in detail mode.</i>

102.59 Alarm Qos Queue Log Status Commands

Command Description

This command displays the Qos Queue alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log qos-queue [ (index) ]
```

Command Parameters

Table 102.59-1 "Alarm Qos Queue Log Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.59-2 "Alarm Qos Queue Log Status Commands" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
port	Parameter type: <Itf::PhyLine> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ont.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId>	identifies the physical position of the port <i>This element is always shown.</i>

102 Alarm Log Status Commands

name	Type	Description
	<code><Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId></code> <code> uni.ng2 : <Eqpt::ChannelGroupId> /</code> <code><Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni)</code> Possible values: - ont : ont - ont.ng2 : ngpon2 ONT style identification - uni.ng2 : ngpon2 UNI style identification Field type <code><Eqpt::RackId></code> - the rack number Field type <code><Eqpt::ShelfId></code> - the shelf number Field type <code><Eqpt::SlotId></code> - the LT slot number Field type <code><Eqpt::PortId></code> - the port number Field type <code><Eqpt::PonId></code> - the PON identifier Field type <code><Eqpt::OntId></code> - the ONT identifier Field type <code><Eqpt::ChannelGroupId></code> - the channel group identifier Field type <code><Eqpt::SubChannelGroupId></code> - the subchannel group identifier Field type <code><Eqpt::Ng2OntId></code> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <code><Eqpt::OntSlotId></code> - the ONT SLOT identifier Field type <code><Eqpt::OntPortId></code> - the ONT PORT identifier Field type <code><Eqpt::Ng2OntSlotId></code> - the NGPON2 ONT SLOT identifier Field type <code><Eqpt::Ng2OntPortId></code> - the NGPON2 ONT PORT identifier	
queue	Parameter type: <code><Qos::AlarmQueues></code> - identify where the alarm has occurred - range: [0...7]	identify where the alarm has occurred. <i>This element is always shown.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
queue-discard-overflow	Parameter type: <code><Alarm::queue-discard-overflow></code> (yes no) Possible values: - yes : queue discard alarm - no : no queue discard alarm	check the corresponding queue discard overflow. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <code><Alarm::queue-discard-overflow></code> (yes no) Possible values: - yes : queue discard alarm - no : no queue discard alarm	status of specifies queue discard overflow with its previous logged value <i>This element is only shown in detail mode.</i>
queue-load	Parameter type: <code><Alarm::queue-load></code>	check the corresponding queue

name	Type	Description
	(yes no) Possible values: - yes : queue load alarm - no : no queue load alarm	Load. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::queue-load> (yes no) Possible values: - yes : queue load alarm - no : no queue load alarm	status of queue load with its previous logged value <i>This element is only shown in detail mode.</i>
queue-peak-usage	Parameter type: <Alarm::queue-peak-usage> (yes no) Possible values: - yes : queue peak usage alarm - no : no queue peak usage alarm	check the corresponding queue peak usage. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::queue-peak-usage> (yes no) Possible values: - yes : queue peak usage alarm - no : no queue peak usage alarm	status of queue peak usage with its previous logged value <i>This element is only shown in detail mode.</i>

102.60 Log File Transfer Server Alarm Log Status Command

Command Description

This command displays the log status of the file transfer server alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log filetransfer [(index)]

Command Parameters

Table 102.60-1 "Log File Transfer Server Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.60-2 "Log File Transfer Server Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
server-id	Parameter type: <Alarm::FileTransfer> - next hop IP address	this is the server id for file server alarms <i>This element is only shown in detail mode.</i>
fileserv-unavail	Parameter type: <Alarm::FileTransferUnavail> (unavailable available) Possible values: - unavailable : file transfer Server unavailable or file transfer failed - available : file transfer server available	current status specifying that whether file transfer server available <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::relayNotSet>	status of relay with its previous

name	Type	Description
	(yes no) Possible values: - yes : wrong appliq - no : right appliq	logged value <i>This element is only shown in detail mode.</i>

102.61 Log Lsm Redundancy Alarm Log Status Command

Command Description

This command displays the log status of the Lsm Redundancy alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log lsmredundancy [(index)]

Command Parameters

Table 102.61-1 "Log Lsm Redundancy Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.61-2 "Log Lsm Redundancy Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
board-station	Parameter type: <Equipm::LtSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	this is the physical number of the slot for lsm redundancy alarms <i>This element is only shown in detail mode.</i>
loss-lsmswp-cap	Parameter type: <Alarm::SwoCap> (loss not-loss)	current status specifying the switchover capability in a redundant system

name	Type	Description
	Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	prev status specifying the swichover capability in a redundant system <i>This element is only shown in detail mode.</i>
data-xvps-diff	Parameter type: <Alarm::DataXvps> (invalid valid) Possible values: - invalid : data of xvps pair is not the same - valid : data of xvps pair is same	log status of the data of xvps pair <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::DataXvps> (invalid valid) Possible values: - invalid : data of xvps pair is not the same - valid : data of xvps pair is same	prev status of the data of xvps pair <i>This element is only shown in detail mode.</i>

102.62 Log L2 Forward Alarm Log Status Command

Command Description

This command displays the log status of the l2 forward alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log l2forward [ (index) ]
```

Command Parameters

Table 102.62-1 "Log L2 Forward Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.62-2 "Log L2 Forward Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
bridgeport	Parameter type: <Vlan::BridgePort> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni	identify the bridge port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni) Possible values: - ng2 : ngpon2 vlan bridge port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE	
vlan-id	Parameter type: <Vlan::StackedVlanSigned> (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndex> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndex> - service vlan identity	identify the vlan id where the alarm has occurred. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- range: [2...4093,4094] Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093,4094,4095,4096]	
mac-conflict	Parameter type: <Alarm::MACconflict> (yes no) Possible values: - yes : duplicate mac address from this bridge port - no : no duplicate mac address from this bridge port	specifies whether duplicate mac address from the Bridge port. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::MACconflict> (yes no) Possible values: - yes : duplicate mac address from this bridge port - no : no duplicate mac address from this bridge port	status of mac-conflict with its previous logged value. <i>This element is only shown in detail mode.</i>
vmac-full	Parameter type: <Alarm::VMACFull> (yes no) Possible values: - yes : virtual mac entry full on this bridge port - no : no virtual mac entry full on this bridge port	specifies whether virtual mac is full on the bridge port. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VMACFull> (yes no) Possible values: - yes : virtual mac entry full on this bridge port - no : no virtual mac entry full on this bridge port	status of vmac-full with its previous logged value. <i>This element is only shown in detail mode.</i>

102.63 External Device Alarm Log Status Command

Command Description

This command displays the external-device alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log external-device [(index)]

Command Parameters

Table 102.63-1 "External Device Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.63-2 "External Device Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
loss-env-mon	Parameter type: <Alarm::LossEnvMon> (lost not-lost) Possible values: - lost : env-mon box lost or not alive - not-lost : env-mon box exists	status of env-monitor box <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LossEnvMon> (lost not-lost) Possible values: - lost : env-mon box lost or not alive - not-lost : env-mon box exists	status of loss-env-mon with its previous logged value <i>This element is only shown in detail mode.</i>

102.64 Multicast Source Alarm Log Status Command

Command Description

This command displays the multicast source alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log msrc [ (index) ]
```

Command Parameters

Table 102.64-1 "Multicast Source Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.64-2 "Multicast Source Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
grp-ip-addr	Parameter type: <Alarm::IpAddress> - IPv4-address	identify the mcast address where the alarm has occurred. <i>This element is only shown in detail mode.</i>
slot-id	Parameter type: <Equipm::FullLtSlotIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> Possible values: - lt : lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number	

Only Show Details: current and previous alarm log status		
name	Type	Description
stream-lost	Parameter type: <Alarm::McastLoss> (yes no) Possible values: - yes : pon mcast video stream lost - no : pon mcast video stream not lost	current status of the alarm specifying if the pon mcast video stream is lost or not <i>This element is only shown in detail mode.</i>
prev-stream-lost	Parameter type: <Alarm::McastLoss> (yes no) Possible values: - yes : pon mcast video stream lost - no : pon mcast video stream not lost	status of stream-lost alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102.65 Vlanport Alarm Log Status Command

Command Description

This command displays the vlanport alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log vlanport [ (index) ]
```

Command Parameters

Table 102.65-1 "Vlanport Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.65-2 "Vlanport Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
vlanport	Parameter type: <Itf::VlanPortInterface> (vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked :	identify the provisioned vlanport where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<pre> <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni : <Eqpt::UnstackedVlan>) Possible values: - vlan-port : vlan port - vlan-port:ng2 : ngpon2 vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::Vpild> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> </pre>	

name	Type	Description
	- the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Ng2::OntId> - the ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier - Possible values: - vuni : virtual NGPON2 uni identifier - Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE - Possible values: - stacked : stacked vlan identity - Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	
svc-mismatch	Parameter type: <Alarm::SVCMismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned vlanport is accepted or not. <i>This element is only shown in detail mode.</i>
prev-svc-mismatch	Parameter type: <Alarm::SVCMismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	status of svc-mismatch alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102.66 BGP Alarm Log Status Command

Command Description

This command displays the bgp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log bgp [ (index) ]
```

Command Parameters

Table 102.66-1 "BGP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.66-2 "BGP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::AlarmIdentifIdxOrZero> - an unsigned integer	unique reference for the neighbor where the alarm occurred or zero when not applicable, neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>

name	Type	Description
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the neighbor where the alarm occurred or empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
peer-down	Parameter type: <Alarm::PeerDown> (yes no) Possible values: - yes : operational state down - no : operational state up	specifies whether the BGP peer operational state is up or down <i>This element is only shown in detail mode.</i>
prev-peer-down	Parameter type: <Alarm::PeerDown> (yes no) Possible values: - yes : operational state down - no : operational state up	status of peer-down with its previous logged value <i>This element is only shown in detail mode.</i>
routes-mid-limit	Parameter type: <Alarm::RoutesMidLimit> (reached not-reached) Possible values: - reached : reached: 90% of max allowed routes learned - not-reached : less than 90% of max allowed routes learned	specifies whether 90% of the max nbr of routes BGP can learn from a peer is reached or not <i>This element is only shown in detail mode.</i>
prev-routes-mid-limit	Parameter type: <Alarm::RoutesMidLimit> (reached not-reached) Possible values: - reached : reached: 90% of max allowed routes learned - not-reached : less than 90% of max allowed routes learned	status of routes-mid-limit with its previous logged value <i>This element is only shown in detail mode.</i>

102.67 RIP Alarm Log Status Command

Command Description

This command displays the rip alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log rip [ (index) ]
```

Command Parameters

Table 102.67-1 "RIP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.67-2 "RIP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
instance-down	Parameter type: <Alarm::InstanceDown> (yes no) Possible values: - yes : RIP instance down	specifies whether RIP instance is down or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : RIP instance up	
prev-instance-down	Parameter type: <Alarm::InstanceDown> (yes no) Possible values: - yes : RIP instance down - no : RIP instance up	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>

102.68 LAG Alarm Log Status Command

Command Description

This command displays the lag alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log lag [ (index) ]
```

Command Parameters

Table 102.68-1 "LAG Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.68-2 "LAG Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
lag-id	Parameter type: <Alarm::LagId> - link aggregation group id - range: [1...64]	Identifies the lag where the alarm has occurred <i>This element is only shown in detail mode.</i>
sub-group	Parameter type: <Alarm::AlarmIdentifIdxOrZero> - an unsigned integer	Identifies the subgroup for which the alarm has occurred or zero when not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
lag-down	Parameter type: <Alarm::EthLagDown> (yes no) Possible values:	specifies whether the link aggregation group is down or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : lag down - no : lag not down	
prev-lag-down	Parameter type: <Alarm::EthLagDown> (yes no) Possible values: - yes : lag down - no : lag not down	status of lag-down with its previous logged value <i>This element is only shown in detail mode.</i>
subgrp-thres-reach	Parameter type: <Alarm::LagSubgrpThresReach> (reached not-reached) Possible values: - reached : sub-group threshold reached - not-reached : sub-group threshold not reached	specifies whether the lag subgroup threshold is reached or not <i>This element is only shown in detail mode.</i>
prev-subgrp-thres-rch	Parameter type: <Alarm::LagSubgrpThresReach> (reached not-reached) Possible values: - reached : sub-group threshold reached - not-reached : sub-group threshold not reached	status of subgrp-thres-reach with its previous logged value <i>This element is only shown in detail mode.</i>
subgrp-switch-fail	Parameter type: <Alarm::LagSubgrpSwitchFail> (yes no) Possible values: - yes : lag subgroup switchover failed - no : lag subgroup switchover did not fail	specifies whether the lag subgroup switchover failed or not <i>This element is only shown in detail mode.</i>
prev-subgrp-swth-fail	Parameter type: <Alarm::LagSubgrpSwitchFail> (yes no) Possible values: - yes : lag subgroup switchover failed - no : lag subgroup switchover did not fail	status of subgrp-switch-fail with its previous logged value <i>This element is only shown in detail mode.</i>
nofree-port-inbase	Parameter type: <Alarm::LagNoUnpinFreePorts> (yes no) Possible values: - yes : No free ports available for un pinned traffic - no : free ports available for un pinned traffic	specifies whether the free ports available for unpinned traffic or not <i>This element is only shown in detail mode.</i>
prev-nofree-port-inbse	Parameter type: <Alarm::LagNoUnpinFreePorts> (yes no) Possible values: - yes : No free ports available for un pinned traffic - no : free ports available for un pinned traffic	status of LagNoUnpinFreePorts with its previous logged value <i>This element is only shown in detail mode.</i>

102.69 ihub-general Alarm Log Status Command

Command Description

This command displays the ihub-general alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ihub-general [(index)]

Command Parameters

Table 102.69-1 "ihub-general Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.69-2 "ihub-general Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
arp-limit	Parameter type: <Alarm::ArpLimit> (reached not-reached) Possible values: - reached : ARP tbl threshold reached or exceeded - not-reached : ARP tbl entries below threshold	specifies whether the nbr of ARP entries has reached the max threshold or not <i>This element is only shown in detail mode.</i>
prev-arp-limit	Parameter type: <Alarm::ArpLimit> (reached not-reached) Possible values: - reached : ARP tbl threshold reached or exceeded - not-reached : ARP tbl entries below threshold	status of arp-limit with its previous logged value <i>This element is only shown in detail mode.</i>
switch-out-of-res	Parameter type: <Alarm::IhubSwitchOutOfResource>	specifies whether e.g. storing a

name	Type	Description
	(yes no) Possible values: - yes : lack of resources in switch - no : no resource issues detected	configuration in the hardware has failed or not, due to a lack of resources in the switch. <i>This element is only shown in detail mode.</i>
prev-switch-out-of-res	Parameter type: <Alarm::IhubSwitchOutOfResource> (yes no) Possible values: - yes : lack of resources in switch - no : no resource issues detected	status of switch-out-of-res with its previous logged value <i>This element is only shown in detail mode.</i>
ipv6-nc-limit	Parameter type: <Alarm::IPv6NeighborCacheLimit> (reached not-reached) Possible values: - reached : neighbor cache up threshold reached - not-reached : neighbor cache entries within limit	specifies whether the number of ipv6 neighbor cache entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>
prev-ipv6-nc-limit	Parameter type: <Alarm::IPv6NeighborCacheLimit> (reached not-reached) Possible values: - reached : neighbor cache up threshold reached - not-reached : neighbor cache entries within limit	status of ipv6-nc-limit with its previous logged value <i>This element is only shown in detail mode.</i>
dhcp-session-oor	Parameter type: <Alarm::DhcpSessionOutOfResource> (yes no) Possible values: - yes : lack of resources for dhcp - no : no resource issues detected for dhcp	specifies whether dhcp session is out of resources or not. <i>This element is only shown in detail mode.</i>
prev-dhcp-session-oor	Parameter type: <Alarm::DhcpSessionOutOfResource> (yes no) Possible values: - yes : lack of resources for dhcp - no : no resource issues detected for dhcp	status of dhcp-session-oor with its previous logged value <i>This element is only shown in detail mode.</i>
fdb-limit	Parameter type: <Alarm::IhubL2FdbFull> (reached not-reached) Possible values: - reached : layer 2 fdb table entries reached upper threshold for the node - not-reached : layer 2 fdb table entries within limit for the node	specifies whether the number of layer 2 fdb table entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>
prev-fdb-limit	Parameter type: <Alarm::IhubL2FdbFull> (reached not-reached) Possible values: - reached : layer 2 fdb table entries reached upper threshold for the node - not-reached : layer 2 fdb table entries within limit for the node	status of fdb-limit with its previous logged value <i>This element is only shown in detail mode.</i>
mac-limit	Parameter type: <Alarm::IhubL2MacFull> (reached not-reached) Possible values: - reached : Internal Mac entries reached upper - not-reached : Internal Mac entries within limit	specifies whether the number of internal Mac entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
prev-mac-limit	Parameter type: <Alarm::IhubL2MacFull> (reached not-reached) Possible values: - reached : Internal Mac entries reached upper - not-reached : Internal Mac entries within limit	status of mac-limit with its previous logged value <i>This element is only shown in detail mode.</i>

102.70 VPRN Alarm Log Status Command

Command Description

This command displays the vprn alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log vprn [ (index) ]
```

Command Parameters

Table 102.70-1 "VPRN Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.70-2 "VPRN Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
if-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the interface for which the alarm occurred or zero when not applicable. <i>This element is only shown in detail mode.</i>
interface	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the interface for which the alarm occurred or empty

102 Alarm Log Status Commands

name	Type	Description
		string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
routes-limit	Parameter type: <Alarm::RoutesLimit> (reached not-reached) Possible values: - reached : ip routes limit reached or exceeded - not-reached : ip routes within limit	specifies whether the limit of dynamic routes is reached/exceeded or not <i>This element is only shown in detail mode.</i>
prev-routes-limit	Parameter type: <Alarm::RoutesLimit> (reached not-reached) Possible values: - reached : ip routes limit reached or exceeded - not-reached : ip routes within limit	status of routes-limit with its previous logged value <i>This element is only shown in detail mode.</i>
ipv6-routes-limit	Parameter type: <Alarm::IPv6RoutesLimit> (reached not-reached) Possible values: - reached : ipv6 routes limit reached or exceeded - not-reached : ipv6 routes within limit	specifies whether the number of dynamic ipv6 routes is approaching or has reached its limit <i>This element is only shown in detail mode.</i>
prev-ipv6-routes-limit	Parameter type: <Alarm::IPv6RoutesLimit> (reached not-reached) Possible values: - reached : ipv6 routes limit reached or exceeded - not-reached : ipv6 routes within limit	status of ipv6-routes-limit with its previous logged value <i>This element is only shown in detail mode.</i>
dhcpv6-lease-limit	Parameter type: <Alarm::DHCPV6LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv6 relay leases limit reached or exceeded - not-reached : dhcpv6 relay leases within limit	specifies whether the limit of dhcpv6 relay leases is reached or not <i>This element is only shown in detail mode.</i>
prev-dhcpv6-lease-limit	Parameter type: <Alarm::DHCPV6LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv6 relay leases limit reached or exceeded - not-reached : dhcpv6 relay leases within limit	status of dhcpv6-lease-limit with its previous logged value <i>This element is only shown in detail mode.</i>
dhcpv4-lease-limit	Parameter type: <Alarm::DHCPV4LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv4 relay leases limit reached or exceeded - not-reached : dhcpv4 relay leases within limit	specifies whether the limit of dhcpv4 relay leases is reached or not <i>This element is only shown in detail mode.</i>
prev-dhcpv4-lease-limit	Parameter type: <Alarm::DHCPV4LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv4 relay leases limit reached or exceeded - not-reached : dhcpv4 relay leases within limit	status of dhcpv4-lease-limit with its previous logged value <i>This element is only shown in detail mode.</i>

102.71 ISIS Alarm Log Status Command

Command Description

This command displays the isis alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log isis [ (index) ]
```

Command Parameters

Table 102.71-1 "ISIS Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.71-2 "ISIS Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
adjacency-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the adjacency where the alarm occurred or zero when not applicable, adjacency is further specified in additional-info <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the adjacency:instance/interface where the alarm occurred or empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
adjacency-down	Parameter type: <Alarm::AdjacencyDown> (yes no) Possible values: - yes : interface down - no : interface up	specifies whether isis adjacency is down or not <i>This element is only shown in detail mode.</i>
prev-adjacency-down	Parameter type: <Alarm::AdjacencyDown> (yes no) Possible values: - yes : interface down - no : interface up	status of adjacency-down with its previous logged value <i>This element is only shown in detail mode.</i>
adjacency-reject	Parameter type: <Alarm::AdjacencyReject> (yes no) Possible values: - yes : interface mismatch - no : no interface mismatch	specifies whether isis adjacency is rejected or not <i>This element is only shown in detail mode.</i>
prev-adjacency-reject	Parameter type: <Alarm::AdjacencyReject> (yes no) Possible values: - yes : interface mismatch - no : no interface mismatch	status of adjacency-reject with its previous logged value <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::IsisDown> (yes no) Possible values: - yes : ISIS instance down - no : ISIS instance up	specifies whether ISIS instance is down or not <i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::IsisDown> (yes no) Possible values: - yes : ISIS instance down - no : ISIS instance up	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>

102.72 Ospf Alarm Log Status Command

Command Description

This command displays the ospf alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ospf [ (index) ]
```

Command Parameters

Table 102.72-1 "Ospf Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.72-2 "Ospf Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the neighbor where the alarm occurred or zero when not applicable, neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the neighbor/instance where the alarm occurred or empty string if not applicable <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
lsa-limit	Parameter type: <Alarm::LsaLimit> (reached not-reached) Possible values: - reached : external LSA limit reached - not-reached : external LSAs within limitation	specifies whether the limit of received external LSAs is reached or not <i>This element is only shown in detail mode.</i>
prev-lsa-limit	Parameter type: <Alarm::LsaLimit> (reached not-reached) Possible values: - reached : external LSA limit reached - not-reached : external LSAs within limitation	status of lsa-limit with its previous logged value <i>This element is only shown in detail mode.</i>
lsa-mid-limit	Parameter type: <Alarm::LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of LSA limit reached - not-reached : less than 90% of LSA limit	specifies whether 90% of the limit of received external LSAs is reached or not <i>This element is only shown in detail mode.</i>
prev-lsa-mid-limit	Parameter type: <Alarm::LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of LSA limit reached - not-reached : less than 90% of LSA limit	status of lsa-mid-limit with its previous logged value <i>This element is only shown in detail mode.</i>
neighbor-down	Parameter type: <Alarm::NeighborDown> (yes no) Possible values: - yes : OSPF neighbor down - no : OSPF neighbor up	specifies whether ospf neighbour is down or not <i>This element is only shown in detail mode.</i>
prev-neighbor-down	Parameter type: <Alarm::NeighborDown> (yes no) Possible values: - yes : OSPF neighbor down - no : OSPF neighbor up	status of neighbor-down with its previous logged value <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::OspfDown> (yes no) Possible values: - yes : OSPF instance down - no : OSPF instance up	specifies whether OSPF instance is down or not <i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::OspfDown> (yes no) Possible values: - yes : OSPF instance down - no : OSPF instance up	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>
v3-lsa-limit	Parameter type: <Alarm::V3LsaLimit> (reached	specifies whether the limit of received external OSPFv3 LSAs

name	Type	Description
	not-reached) Possible values: - reached : external OSPFv3 LSA limit reached - not-reached : external OSPFv3 LSAs within limitation	is reached or not <i>This element is only shown in detail mode.</i>
prev-v3-lsa-limit	Parameter type: <Alarm::V3LsaLimit> (reached not-reached) Possible values: - reached : external OSPFv3 LSA limit reached - not-reached : external OSPFv3 LSAs within limitation	status of v3-lsa-limit with its previous logged value <i>This element is only shown in detail mode.</i>
v3-lsa-mid-limit	Parameter type: <Alarm::V3LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of OSPFv3 LSA limit reached - not-reached : less than 90% of OSPFv3 LSA limit	specifies whether 90% of the limit of received external OSPFv3 LSAs is reached or not <i>This element is only shown in detail mode.</i>
prev-v3-lsa-mid-limit	Parameter type: <Alarm::V3LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of OSPFv3 LSA limit reached - not-reached : less than 90% of OSPFv3 LSA limit	status of v3-lsa-mid-limit with its previous logged value <i>This element is only shown in detail mode.</i>
v3-neighbor-down	Parameter type: <Alarm::V3NeighborDown> (yes no) Possible values: - yes : OSPFv3 neighbor down - no : OSPFv3 neighbor up	specifies whether OSPFv3 neighbor is down or not <i>This element is only shown in detail mode.</i>
prev-v3-neighbor-down	Parameter type: <Alarm::V3NeighborDown> (yes no) Possible values: - yes : OSPFv3 neighbor down - no : OSPFv3 neighbor up	status of v3-neighbor-down with its previous logged value <i>This element is only shown in detail mode.</i>
v3-instance-down	Parameter type: <Alarm::V3OspfDown> (yes no) Possible values: - yes : OSPFv3 instance down - no : OSPFv3 instance up	specifies whether OSPFv3 instance is down or not <i>This element is only shown in detail mode.</i>
prev-v3-instance-down	Parameter type: <Alarm::V3OspfDown> (yes no) Possible values: - yes : OSPFv3 instance down - no : OSPFv3 instance up	status of v3-instance-down with its previous logged value <i>This element is only shown in detail mode.</i>

102.73 ihub-l2forward Alarm Log Status Command

Command Description

This command displays the ihub-l2forward alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ihub-l2forward [ (index) ]
```

Command Parameters

Table 102.73-1 "ihub-l2forward Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.73-2 "ihub-l2forward Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
port	Parameter type: <Ihub::EtherPortAndLag> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex>	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

name	Type	Description
	lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> lag : <Alarm::IhubLagId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - lag : key word to specify link aggregation group - nt-a : the nt-a slot - nt-b : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - eth : RJ45 or lemi port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::IhubLagId> - link aggregation group id Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the vpls service-id where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
stp-exception	Parameter type: <Alarm::StpException> (yes no) Possible values: - yes : stp exception condition detected on the port - no : no stp exception condition detected	specifies whether an STP exception condition is present on the port or not <i>This element is only shown in detail mode.</i>
prev-stp-exception	Parameter type: <Alarm::StpException> (yes no) Possible values: - yes : stp exception condition detected on the port - no : no stp exception condition detected	status of stp-exception with its previous logged value <i>This element is only shown in detail mode.</i>
stp-root-guard	Parameter type: <Alarm::StpRootGuard> (violation no violation) Possible values: - violation : stp root guard violation detected on the port	specifies whether an STP root-guard violation present or not <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no violation : no stp root guard violation detected	
prev-stp-root-guard	Parameter type: <Alarm::StpRootGuard> (violation no violation) Possible values: - violation : stp root guard violation detected on the port - no violation : no stp root guard violation detected	status of stp-root-guard with its previous logged value <i>This element is only shown in detail mode.</i>

102.74 Vpls Alarm Log Status Command

Command Description

This command displays the vpls alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log vpls [ (index) ]
```

Command Parameters

Table 102.74-1 "Vpls Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.74-2 "Vpls Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the vpls service-id where the alarm has occurred. <i>This element is only shown in detail mode.</i>
mac-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the duplicate mac alarm and zero for all other alarms; duplicate mac is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringVpls> - additional alarm information	Additional information regarding duplicate MAC alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

102 Alarm Log Status Commands

name	Type	Description
mfib-limit	Parameter type: <Alarm::MfibLimit> (reached not-reached) Possible values: - reached : mfib table size limit reached - not-reached : mfib table size below limit.	specifies whether the number of entries in the multicast FIB table reached its limit or not <i>This element is only shown in detail mode.</i>
prev-mfib-limit	Parameter type: <Alarm::MfibLimit> (reached not-reached) Possible values: - reached : mfib table size limit reached - not-reached : mfib table size below limit.	status of mfib-limit with its previous logged value <i>This element is only shown in detail mode.</i>
duplicate-mac	Parameter type: <Alarm::DuplicateMac> (yes no) Possible values: - yes : duplicate mac detected on vpls - no : no duplicate mac on the vpls	specifies whether a duplicate MAC address is detected or not <i>This element is only shown in detail mode.</i>
prev-duplicate-mac	Parameter type: <Alarm::DuplicateMac> (yes no) Possible values: - yes : duplicate mac detected on vpls - no : no duplicate mac on the vpls	status of duplicate-mac with its previous logged value <i>This element is only shown in detail mode.</i>
fdb-limit	Parameter type: <Alarm::FdbLimit> (reached not-reached) Possible values: - reached : fdb table size limit reached - not-reached : fdb table size below low limit	specifies whether the number of entries in the fdb table reached the upper limit or dropped below the lower limit. <i>This element is only shown in detail mode.</i>
prev-fdb-limit	Parameter type: <Alarm::FdbLimit> (reached not-reached) Possible values: - reached : fdb table size limit reached - not-reached : fdb table size below low limit	status of fdb-limit with its previous logged value <i>This element is only shown in detail mode.</i>
self-duplic-mac	Parameter type: <Alarm::Selfduplic> (yes no) Possible values: - yes : self duplicate mac detected on a sap of the vpls - no : no self duplicate mac on a sap of the vpls	specifies whether a duplicate of a system owned mac address is detected on a sap of the vpls service or not <i>This element is only shown in detail mode.</i>
prev-self-duplic-mac	Parameter type: <Alarm::Selfduplic> (yes no) Possible values: - yes : self duplicate mac detected on a sap of the vpls - no : no self duplicate mac on a sap of the vpls	status of self-duplic-mac with its previous logged value <i>This element is only shown in detail mode.</i>
sdp-self-dup-mac	Parameter type: <Alarm::SdpSelfdupMac> (yes no) Possible values: - yes : self duplicate mac detected on sdp binding of the vpls - no : no self duplicate mac on a sdp binding of the vpls	specifies whether a duplicate of a system owned mac address is detected on a sdp binding of the vpls service or not <i>This element is only shown in detail mode.</i>
prev-sdp-self-dup-mac	Parameter type: <Alarm::SdpSelfdupMac> (yes no)	status of sdp-self-dup-mac with its previous logged value <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - yes : self duplicate mac detected on sdp binding of the vpls - no : no self duplicate mac on a sdp binding of the vpls	<i>detail mode.</i>

102.75 IHUB-Eqip Alarm Log Status Command

Command Description

This command displays the ihub-equip alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ihub-equip [ (index) ]
```

Command Parameters

Table 102.75-1 "IHUB-Eqip Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.75-2 "IHUB-Eqip Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
slot	Parameter type: <Alarm::NtSlotId> (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	identifies the slot where the alarm has been detected. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	additional information regarding the out-of-mem alarm, containing the name of the Software Module triggering this alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
peer-comm	Parameter type: <Alarm::PeerComm>	specifies whether peer-to-peer

name	Type	Description
	(fail no fail) Possible values: - fail : peer-to-peer communication failure - no fail : no peer-to-peer communication failure	communication has failed or not <i>This element is only shown in detail mode.</i>
prev-peer-comm	Parameter type: <Alarm::PeerComm> (fail no fail) Possible values: - fail : peer-to-peer communication failure - no fail : no peer-to-peer communication failure	status of peer-comm with its previous logged value <i>This element is only shown in detail mode.</i>
sw-fail	Parameter type: <Alarm::SwFail> (yes no) Possible values: - yes : software failure detected - no : no software failure	specifies whether a software failure has occurred or not <i>This element is only shown in detail mode.</i>
prev-sw-fail	Parameter type: <Alarm::SwFail> (yes no) Possible values: - yes : software failure detected - no : no software failure	status of sw-fail with its previous logged value <i>This element is only shown in detail mode.</i>
hw-fail	Parameter type: <Alarm::HwFail> (yes no) Possible values: - yes : hardware failure detected - no : no hardware failure	specifies whether a hardware failure has occurred or not <i>This element is only shown in detail mode.</i>
prev-hw-fail	Parameter type: <Alarm::HwFail> (yes no) Possible values: - yes : hardware failure detected - no : no hardware failure	status of hw-fail with its previous logged value <i>This element is only shown in detail mode.</i>
link-fail	Parameter type: <Alarm::LinkFail> (yes no) Possible values: - yes : link failure detected - no : no link failiure	specifies whether a link failure has occurred or not <i>This element is only shown in detail mode.</i>
prev-link-fail	Parameter type: <Alarm::LinkFail> (yes no) Possible values: - yes : link failure detected - no : no link failiure	status of link-fail with its previous logged value <i>This element is only shown in detail mode.</i>
proc-overload	Parameter type: <Alarm::ProcOverload> (yes no) Possible values: - yes : processor overload detected - no : no processor overload	specifies whether an overload condition exists for the processor at ihub side <i>This element is only shown in detail mode.</i>
prev-proc-overload	Parameter type: <Alarm::ProcOverload> (yes no) Possible values:	status of proc-overload with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : processor overload detected - no : no processor overload	
out-of-mem	Parameter type: <Alarm::OutOfMem> (yes no) Possible values: - yes : memory allocation failure - no : memory allocation successful	specifies whether memory allocation in ihub failed or not <i>This element is only shown in detail mode.</i>
prev-out-of-mem	Parameter type: <Alarm::OutOfMem> (yes no) Possible values: - yes : memory allocation failure - no : memory allocation successful	status of out-of-mem with its previous logged value <i>This element is only shown in detail mode.</i>
ntp-comm	Parameter type: <Alarm::ntpCommLoss> (lost not-lost) Possible values: - lost : NTP communication lost - not-lost : NTP communication is not lost	specifies whether ntp communication is lost or not <i>This element is only shown in detail mode.</i>
prev-ntp-comm	Parameter type: <Alarm::ntpCommLoss> (lost not-lost) Possible values: - lost : NTP communication lost - not-lost : NTP communication is not lost	status of ntp communication with its previous logged value. <i>This element is only shown in detail mode.</i>

102.76 IHUB-Link Alarm Log Status Command

Command Description

This command displays the ihub-link alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ihub-link [ (index) ]
```

Command Parameters

Table 102.76-1 "IHUB-Link Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.76-2 "IHUB-Link Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
port	Parameter type: <Ihub::EtherPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : cfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-a : ieee1588 : <Alarm::FacePlatePortIndex> nt-a : ai : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : cfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> nt-b : ieee1588 : <Alarm::FacePlatePortIndex> nt-b : ai : <Alarm::FacePlatePortIndex>	identifies the ihub port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-1 : cfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : cfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> ntio-1 : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - cfp : CFP port - eth : RJ45 or lemi port - ieee1588 : IEEE1588 port - ai : AI port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	additional information regarding the lagport-add-fail alarm, containing the failure reason: Either of these will apply: - unknown - adminkey-mismatch - - sysid-mismatch - - lacp-passive-both-ends - - link-down <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
link-down	Parameter type: <Alarm::lhubLink>	specifies whether the link is

name	Type	Description
	(yes no) Possible values: - yes : link down - no : link up	down or not <i>This element is only shown in detail mode.</i>
prev-link-down	Parameter type: <Alarm::IhubLink> (yes no) Possible values: - yes : link down - no : link up	status of link-down with its previous logged value <i>This element is only shown in detail mode.</i>
lagport-add-fail	Parameter type: <Alarm::LagportAddFail> (yes no) Possible values: - yes : lag-port not added - no : lag-port successfully added	specifies whether a port was successfully added to a link aggregation group or not <i>This element is only shown in detail mode.</i>
prev-lagport-add-fail	Parameter type: <Alarm::LagportAddFail> (yes no) Possible values: - yes : lag-port not added - no : lag-port successfully added	status of lagport-add-fail with its previous logged value <i>This element is only shown in detail mode.</i>
conf-mismatch	Parameter type: <Alarm::SpeedMismatch> (yes no) Possible values: - yes : port configuration mismatch - no : no port configuration mismatch	specifies whether the inserted SFP or SFP+ type matches the planned speed and/or auto-negotiation for the port or not <i>This element is only shown in detail mode.</i>
prev-conf-mismatch	Parameter type: <Alarm::SpeedMismatch> (yes no) Possible values: - yes : port configuration mismatch - no : no port configuration mismatch	status of conf-mismatch with its previous logged value <i>This element is only shown in detail mode.</i>

102.77 IHUB-Tca Alarm Log Status Command

Command Description

This command displays the ihub-tca alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ihub-tca [ (index) ]
```

Command Parameters

Table 102.77-1 "IHUB-Tca Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.77-2 "IHUB-Tca Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
port	Parameter type: <Ihub::EtherPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : cfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-a : ieee1588 : <Alarm::FacePlatePortIndex> nt-a : ai : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : cfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> nt-b : ieee1588 : <Alarm::FacePlatePortIndex> nt-b : ai : <Alarm::FacePlatePortIndex>	identifies the ihub port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description

Only Show Details: current and previous alarm log status		
name	Type	Description
tca-outputbw	Parameter type: <Alarm::TcaOutputBw> (yes no) Possible values: - yes : tca output bandwidth crossed threshold - no : tca output bandwidth did not crossed threshold	specifies whether the output bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-outputbw	Parameter type: <Alarm::TcaOutputBw> (yes no) Possible values: - yes : tca output bandwidth crossed threshold	status of tca output bw with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : tca output bandwidth did not crossed threshold	
tca-inputbw	Parameter type: <Alarm::TcaInputBw> (yes no) Possible values: - yes : tca input bandwidth crossed threshold - no : tca input bandwidth did not crossed threshold	specifies whether the tca input bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-inputbw	Parameter type: <Alarm::TcaInputBw> (yes no) Possible values: - yes : tca input bandwidth crossed threshold - no : tca input bandwidth did not crossed threshold	status of tca input bw with its previous logged value <i>This element is only shown in detail mode.</i>
tca-rxcrcalign	Parameter type: <Alarm::TcaRxCrcAlign> (yes no) Possible values: - yes : tca rxrc align errors crossed threshold - no : tca rxrc align errors did not crossed threshold	specifies whether the tca rxrc align errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-rxcrcalign	Parameter type: <Alarm::TcaRxCrcAlign> (yes no) Possible values: - yes : tca rxrc align errors crossed threshold - no : tca rxrc align errors did not crossed threshold	status of tca rxrc align errors with its previous logged value <i>This element is only shown in detail mode.</i>
tca-txcrcalign	Parameter type: <Alarm::TcaTx_crcAlign> (yes no) Possible values: - yes : tca txrc align errors crossed threshold - no : tca txrc align errors did not crossed threshold	specifies whether the tca txrc align errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-txcrcalign	Parameter type: <Alarm::TcaTx_crcAlign> (yes no) Possible values: - yes : tca txrc align errors crossed threshold - no : tca txrc align errors did not crossed threshold	status of tca txrc align errors with its previous logged value <i>This element is only shown in detail mode.</i>
tca-txcollisions	Parameter type: <Alarm::TcaTxCollisions> (yes no) Possible values: - yes : tca txcollisions errors crossed threshold - no : tca txcollisions errors did not crossed threshold	specifies whether the tca tx collisions errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-txcollisions	Parameter type: <Alarm::TcaTxCollisions> (yes no) Possible values: - yes : tca txcollisions errors crossed threshold - no : tca txcollisions errors did not crossed threshold	status of tca tx collisions errors with its previous logged value <i>This element is only shown in detail mode.</i>
tca-outputhighbw	Parameter type: <Alarm::TcaOutputHighBw> (yes no) Possible values: - yes : tca output high bandwidth crossed threshold - no : tca output high bandwidth did not crossed threshold	specifies whether the continous output high bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-outputhighbw	Parameter type: <Alarm::TcaOutputHighBw> (yes	status of tca output high bw with its previous logged value

name	Type	Description
	no) Possible values: - yes : tca output high bandwidth crossed threshold - no : tca output high bandwidth did not crossed threshold	<i>This element is only shown in detail mode.</i>
tca-outputmedbw	Parameter type: <Alarm::TcaOutputMediumBw> (yes no) Possible values: - yes : tca output medium bandwidth crossed threshold - no : tca output medium bandwidth did not crossed threshold	specifies whether the continous output medium bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-outputmedbw	Parameter type: <Alarm::TcaOutputMediumBw> (yes no) Possible values: - yes : tca output medium bandwidth crossed threshold - no : tca output medium bandwidth did not crossed threshold	status of tca output medium bw with its previous logged value <i>This element is only shown in detail mode.</i>
tca-outputlowbw	Parameter type: <Alarm::TcaOutputLowBw> (yes no) Possible values: - yes : tca output low bandwidth crossed threshold - no : tca output low bandwidth did not crossed threshold	specifies whether the continous output low bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-outputlowbw	Parameter type: <Alarm::TcaOutputLowBw> (yes no) Possible values: - yes : tca output low bandwidth crossed threshold - no : tca output low bandwidth did not crossed threshold	status of tca output low bw with its previous logged value <i>This element is only shown in detail mode.</i>
tca-inputhighbw	Parameter type: <Alarm::TcaInputHighBw> (yes no) Possible values: - yes : tca input high bandwidth crossed threshold - no : tca input high bandwidth did not crossed threshold	specifies whether the continous input high bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-inputhighbw	Parameter type: <Alarm::TcaInputHighBw> (yes no) Possible values: - yes : tca input high bandwidth crossed threshold - no : tca input high bandwidth did not crossed threshold	status of tca input high bw with its previous logged value <i>This element is only shown in detail mode.</i>
tca-inputmediumbw	Parameter type: <Alarm::TcaInputMediumBw> (yes no) Possible values: - yes : tca input medium bandwidth crossed threshold - no : tca input medium bandwidth did not crossed threshold	specifies whether the continous input medium bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
prev-tca-inputmediumbw	Parameter type: <Alarm::TcaInputMediumBw> (yes no) Possible values: - yes : tca input medium bandwidth crossed threshold - no : tca input medium bandwidth did not crossed threshold	status of tca input medium bw with its previous logged value <i>This element is only shown in detail mode.</i>
tca-inputlowbw	Parameter type: <Alarm::TcaInputLowBw> (yes no)	specifies whether the continous input low bw has crossed threshold or not

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - yes : tca input low bandwidth crossed threshold - no : tca input low bandwidth did not crossed threshold	<i>This element is only shown in detail mode.</i>
prev-tca-inputlowbw	Parameter type: <Alarm::TcaInputLowBw> (yes no) Possible values: - yes : tca input low bandwidth crossed threshold - no : tca input low bandwidth did not crossed threshold	status of tca input low bw with its previous logged value <i>This element is only shown in detail mode.</i>

102.78 LDP Alarm Log Status Command

Command Description

This command displays the Label Distribution Protocol alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ldp [ (index) ]
```

Command Parameters

Table 102.78-1 "LDP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.78-2 "LDP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
ip-address	Parameter type: <Alarm::IPAddressOrZero> (not-applicable <IPv4::address>) Possible values: - not-applicable : not applicable Field type <IPv4::address> - IPv4-address	identifies the ip-address of the LDP targeted Peer <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
instance-down	Parameter type: <Alarm::LdpInstanceDown> (yes	specifies whether the LDP instance is down or not

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : ldp is down - no : ldp is up or not configured	<i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::LdpInstanceDown> (yes no) Possible values: - yes : ldp is down - no : ldp is up or not configured	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>
session-down	Parameter type: <Alarm::SessionDown> (yes no) Possible values: - yes : TCP session down - no : Connection re-established or ldp not configured or explicit configured peer is removed	specifies whether the LDP session is down or not <i>This element is only shown in detail mode.</i>
prev-session-down	Parameter type: <Alarm::SessionDown> (yes no) Possible values: - yes : TCP session down - no : Connection re-established or ldp not configured or explicit configured peer is removed	status of session-down with its previous logged value <i>This element is only shown in detail mode.</i>

102.79 MPLS Alarm Log Status Command

Command Description

This command displays the mpls alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log mpls [ (index) ]
```

Command Parameters

Table 102.79-1 "MPLS Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.79-2 "MPLS Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
lsp-id-or-lsp-path-idx	Parameter type: <Alarm::LspIdOrLspPathIndexOrZero> - a signed integer	Lsp id or Lsp path index (unique identifier) where the alarm occurred or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the alarm additional info specific to an mpls alarm. Empty string if not applicable. <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
		<i>detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
instance-down	Parameter type: <Alarm::MplsInstanceDown> (yes no) Possible values: - yes : mpls is down - no : mpls is up or not configured	specifies whether the MPLS instance is down or not <i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::MplsInstanceDown> (yes no) Possible values: - yes : mpls is down - no : mpls is up or not configured	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>
lsp-down	Parameter type: <Alarm::LspDown> (yes no) Possible values: - yes : lsp is down - no : lsp is up or shutdown, or mpls instance is stopped or not configured	specifies whether the LSP is down or not <i>This element is only shown in detail mode.</i>
prev-lsp-down	Parameter type: <Alarm::LspDown> (yes no) Possible values: - yes : lsp is down - no : lsp is up or shutdown, or mpls instance is stopped or not configured	status of session-down with its previous logged value <i>This element is only shown in detail mode.</i>
lsp-path-down	Parameter type: <Alarm::LspPathDown> (yes no) Possible values: - yes : lsp path is down - no : lsp path is up or shutdown, or lsp is shutdown, or mpls instance is stopped or not configured	specifies whether the LSP path is down or not <i>This element is only shown in detail mode.</i>
prev-lsp-path-down	Parameter type: <Alarm::LspPathDown> (yes no) Possible values: - yes : lsp path is down - no : lsp path is up or shutdown, or lsp is shutdown, or mpls instance is stopped or not configured	status of lsp path down with its previous logged value <i>This element is only shown in detail mode.</i>

102.80 SDP Alarm Log Status Command

Command Description

This command displays the Service Delivery Point alarm log status

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sdp [ (index) ]
```

Command Parameters

Table 102.80-1 "SDP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.80-2 "SDP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
sdp-id	Parameter type: <Alarm::SdpId> - sdp-id value - range: [1...17407]	identifies the sdp-id of the sdp binding where the alarm has occurred <i>This element is only shown in detail mode.</i>
vc-id	Parameter type: <Alarm::SvcIdOrZero> - vc-id value or zero - range: [0,1...4294967295]	identifies the vc-id of the sdp binding where the alarm occurred or zero when not applicable, the sdp binding is further specified in additional-info <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
instance-down	Parameter type: <Alarm::SdpInstanceDown>	specifies whether the SDP

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : sdp is operationl down - no : sdp is operational up or shutdown	instance is down or not <i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::SdpInstanceDown> (yes no) Possible values: - yes : sdp is operationl down - no : sdp is operational up or shutdown	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>
binding-down	Parameter type: <Alarm::BindlingDown> (yes no) Possible values: - yes : sdp binding is operational down - no : sdp binding is operational up or shutdown, or the sdp or service is shutdown	specifies whether the SDP binding is down or not <i>This element is only shown in detail mode.</i>
prev-binding-down	Parameter type: <Alarm::BindlingDown> (yes no) Possible values: - yes : sdp binding is operational down - no : sdp binding is operational up or shutdown, or the sdp or service is shutdown	status of binding down with its previous logged value <i>This element is only shown in detail mode.</i>

102.81 IHUB IPV6 Alarm Log Status Command

Command Description

This command displays the ihub-ipv6 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ihub-ipv6 [(index)]

Command Parameters

Table 102.81-1 "IHUB IPV6 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.81-2 "IHUB IPV6 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
duplicate-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the duplicate address for which the alarm occurred or zero when not applicable, duplicate address is further specified in additional-info. <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
		<i>detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringVprn> - additional alarm information	identifies the ipv6 alarm additional info or empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
duplicate-address-own	Parameter type: <Alarm::SelfDuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for own ipv6 address - no : no duplicate address detected for own ipv6 address	specifies whether a duplicate address is detected for own IPV6 address or not <i>This element is only shown in detail mode.</i>
prev-duplic-addr-own	Parameter type: <Alarm::SelfDuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for own ipv6 address - no : no duplicate address detected for own ipv6 address	status of duplicate-address-own with its previous logged value <i>This element is only shown in detail mode.</i>
duplicate-address	Parameter type: <Alarm::DuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 address - no : no duplicate address detected for user's ipv6 address	specifies whether a duplicate address is detected for a user's IPV6 address or not <i>This element is only shown in detail mode.</i>
prev-duplicate-address	Parameter type: <Alarm::DuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 address - no : no duplicate address detected for user's ipv6 address	status of duplicate-address with its previous logged value <i>This element is only shown in detail mode.</i>
ipv6-dup-pd-route	Parameter type: <Alarm::Ipv6DupPdRoute> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 PD route - no : no duplicate address detected for user's ipv6 PD route	status of ipv6-dup-pd-route <i>This element is only shown in detail mode.</i>
prev-ipv6-dup-pd-route	Parameter type: <Alarm::Ipv6DupPdRoute> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 PD route - no : no duplicate address detected for user's ipv6 PD route	status of ipv6-dup-pd-route with its previous logged value <i>This element is only shown in detail mode.</i>

102.82 EPIPE Alarm Log Status Command

Command Description

This command displays the Ethernet Pipe alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log epipe [(index)]

Command Parameters

Table 102.82-1 "EPIPE Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.82-2 "EPIPE Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the epipe service-id where the alarm has occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
instance-down	Parameter type: <Alarm::EpipeInstanceDown> (yes no) Possible values: - yes : epipe service is operational down - no : epipe service is operational up or shutdown	specifies whether the epipe instance is down or not <i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::EpipeInstanceDown> (yes no)	status of instance-down with its previous logged value <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - yes : epipe service is operationl down - no : epipe service is operational up or shutdown	<i>detail mode.</i>

102.83 PIM Alarm Log Status Command

Command Description

This command displays the PIM alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log pim [ (index) ]
```

Command Parameters

Table 102.83-1 "PIM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.83-2 "PIM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the base router id where the alarm has occurred. <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the neighbor where the alarm occurred <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringPim> - additional alarm information	identifies the neighbor/instance where the alarm occurred or empty string if not applicable

102 Alarm Log Status Commands

name	Type	Description
		<i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
pim-neighbor-down	Parameter type: <Alarm::IhubPimDown> (yes no) Possible values: - yes : pim neighbor down - no : pim neighbor up	specifies whether the neighbor instance is down or not <i>This element is only shown in detail mode.</i>
prev-pim-neighbor-down	Parameter type: <Alarm::IhubPimDown> (yes no) Possible values: - yes : pim neighbor down - no : pim neighbor up	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>
mc-maximum-routes	Parameter type: <Alarm::IhubMaxRoutes> (yes no) Possible values: - yes : maximum routes reached - no : maximum routes not reached	specifies whether the max mc routes is reached <i>This element is only shown in detail mode.</i>
prev-mc-maximum-routes	Parameter type: <Alarm::IhubMaxRoutes> (yes no) Possible values: - yes : maximum routes reached - no : maximum routes not reached	status of max mc route with its previous logged value <i>This element is only shown in detail mode.</i>

102.84 IHUB Lawful Intercept Alarm Log Status Command

Command Description

This command displays the lawful intercept alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log li [ (index) ]
```

Command Parameters

Table 102.84-1 "IHUB Lawful Intercept Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.84-2 "IHUB Lawful Intercept Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
li-traf-disabled	Parameter type: <Alarm::LiTrafficDisabled> (yes no) Possible values: - yes : lawful interception of traffic disabled - no : lawful interception of traffic enabled	specifies whether a lawful intercept traffic is disabled or not <i>This element is only shown in detail mode.</i>
prev-li-traf-disabled	Parameter type: <Alarm::LiTrafficDisabled> (yes no) Possible values:	status of li-traf-disabled with its previous logged value <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : lawful interception of traffic disabled - no : lawful interception of traffic enabled	
li-bandwidth	Parameter type: <Alarm::LiBandwidthLimit> (reached not-reached) Possible values: - reached : lawful intercept reached bandwidth limit - not-reached : lawful intercept within bandwidth limit	specifies whether lawful intercept reached bandwidth limit or not <i>This element is only shown in detail mode.</i>
prev-li-bandwidth	Parameter type: <Alarm::LiBandwidthLimit> (reached not-reached) Possible values: - reached : lawful intercept reached bandwidth limit - not-reached : lawful intercept within bandwidth limit	status of li-bandwidth with its previous logged value <i>This element is only shown in detail mode.</i>
li-out-of-res	Parameter type: <Alarm::LiOutOfRes> (yes no) Possible values: - yes : lack of resources for lawful intercept - no : no resource issues for lawful intercept	specifies whether lawful intercept is out of resources or not <i>This element is only shown in detail mode.</i>
prev-li-out-of-res	Parameter type: <Alarm::LiOutOfRes> (yes no) Possible values: - yes : lack of resources for lawful intercept - no : no resource issues for lawful intercept	status of li-out-of-res with its previous logged value <i>This element is only shown in detail mode.</i>

102.85 Sync Clock Alarm Log Status Command

Command Description

This command displays the synce and bits alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sync [ (index) ]
```

Command Parameters

Table 102.85-1 "Sync Clock Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.85-2 "Sync Clock Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>

Only Show Details: slot information		
name	Type	Description
slot	Parameter type: <Alarm::SynceSlot> (ntio-1 ntio-2 nt-a nt-b lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> not-used nt) Possible values: - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - nt-a : nt-a slot - nt-b : nt-b slot	identifies the synce port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- nt : active nt slot - lt : lt slot - not-used : no interface Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	
port	Parameter type: <Alarm::SyncePort> (sfp : <Alarm::SynceClk> xfp : <Alarm::SynceClk> bits-a bits-b ieee1588-a not-used ieee1588-b gnssrj45-a gnssrj45-b ieee1588-hybrid-a ieee1588-hybrid-b cfp : <Alarm::SynceClk> <Alarm::SynceClk> qsfp : <Alarm::SynceClk> ieee1588 internal-clk-a internal-clk-b) Possible values: - sfp : synce reference on sfp port - xfp : synce reference on xfp port - bits-a : bits clock source on nt-a - bits-b : bits clock source on nt-b - ieee1588-a : ieee1588 clock source on nt-a - ieee1588-b : ieee1588 clock source on nt-b - gnssrj45-a : gnss tod source on nt-a - gnssrj45-b : gnss tod source on nt-b - ieee1588-hybrid-a : 1588 hybrid tod source on nt-a - ieee1588-hybrid-b : 1588 hybrid tod source on nt-b - cfp : synce reference on cfp port - qsfp : synce reference on qsfp port - ieee1588 : ieee1588 clock source on nt - internal-clk-a : internal clock on nt-a - internal-clk-b : internal clock on nt-b - not-used : not-used Field type <Alarm::SynceClk> - value - range: [0...36]	identifies the synce port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
bits-fail	Parameter type: <Alarm::BitsFail> (yes no) Possible values: - yes : bits source failed - no : no bits source failed	specifies whether bits clock source has failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BitsFail> (yes	status of bits failure alarm with its previous logged value.

name	Type	Description
	no) Possible values: - yes : bits source failed - no : no bits source failed	<i>This element is only shown in detail mode.</i>
sync-fail	Parameter type: <Alarm::SyncFail> (yes no) Possible values: - yes : sync source failed - no : no sync source failed	specifies whether sync clock source has failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::SyncFail> (yes no) Possible values: - yes : sync source failed - no : no sync source failed	status of sync failure with its previous logged value. <i>This element is only shown in detail mode.</i>
bits-output-shutoff	Parameter type: <Alarm::BitsOutputShutoffFail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	specifies whether bits output failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BitsOutputShutoffFail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	status of bits output shutoff alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
ieee1588-fail	Parameter type: <Alarm::ieee1588Fail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	ieee1588 clock source failure <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ieee1588Fail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	status of 1588 fail alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
gnss-fail	Parameter type: <Alarm::gnssFail> (yes no) Possible values: - yes : gnss tod fail - no : no gnss tod fail	gnss time source failure <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::gnssFail> (yes no) Possible values: - yes : gnss tod fail - no : no gnss tod fail	status of gnss fail alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
ieee1588hybrid-fail	Parameter type: <Alarm::ieee1588hybridFail> (yes no) Possible values: - yes : 1588 hybrid tod fail	1588 ToD source failure <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : no 1588 hybrid tod fail	
prev-status	Parameter type: <Alarm::ieee1588hybridFail> (yes no) Possible values: - yes : 1588 hybrid tod fail - no : no 1588 hybrid tod fail	status of 1588 hybrid ToD fail alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
signal-loss	Parameter type: <Alarm::ClockLoss> (yes no) Possible values: - yes : synce or bits clock signal loss - no : no synce or bits clock signal loss	specifies whether synce or bits clock signal loss or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockLoss> (yes no) Possible values: - yes : synce or bits clock signal loss - no : no synce or bits clock signal loss	status of synce or bits clock signal loss alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
signal-efd	Parameter type: <Alarm::ClockEfd> (yes no) Possible values: - yes : synce or bits clock signal exceed frequency deviation - no : no synce or bits clock signal exceed frequency deviation	synce or bits clock signal exceed frequency deviation or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockEfd> (yes no) Possible values: - yes : synce or bits clock signal exceed frequency deviation - no : no synce or bits clock signal exceed frequency deviation	status of synce or bits clock signal exceed frequency deviation alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
esmc-loss	Parameter type: <Alarm::ClockEsmcLoss> (yes no) Possible values: - yes : clock source SSM infomation loss - no : no clock source SSM infomation loss	specifies whether clock source loss SSM infomation or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockEsmcLoss> (yes no) Possible values: - yes : clock source SSM infomation loss - no : no clock source SSM infomation loss	status of bclock source loss SSM information alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
bits-output-exceed	Parameter type: <Alarm::BitsOutputQlThreshExceed> (yes no) Possible values: - yes : bitout ql threshold exceed - no : no bitout ql threshold exceed	specifies whether bits output ql threshold exceeded or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::BitsOutputQlThreshExceed> (yes no) Possible values: - yes : bitout ql threshold exceed - no : no bitout ql threshold exceed	status of bits output ql threshold exceed alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
ql-input-exceed	Parameter type: <Alarm::ClockExceed> (yes no) Possible values: - yes : input clock source threshold exceed - no : no input clock source threshold exceed	specifies whether exceed input clock source threshold or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockExceed> (yes no) Possible values: - yes : input clock source threshold exceed - no : no input clock source threshold exceed	status of exceed input clock source threshold alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
holdover	Parameter type: <Alarm::ClockHoldover> (yes no) Possible values: - yes : Clock system is in the holdover - no : Clock system is not in the holdover	specifies whether clock system is in the holdover or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockHoldover> (yes no) Possible values: - yes : Clock system is in the holdover - no : Clock system is not in the holdover	status of clock system holdover alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
lti	Parameter type: <Alarm::ClockLTI> (yes no) Possible values: - yes : all clock source failed - no : no all clock source failed	specifies whether all clock source failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockLTI> (yes no) Possible values: - yes : all clock source failed - no : no all clock source failed	status of all clock source failed alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
tod-reference-fail	Parameter type: <Alarm::ToDHoldover> (yes no) Possible values: - yes : Clock system ToD reference is failed - no : Clock system ToD reference is OK	specifies whether clock system tod reference is failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ToDHoldover> (yes no) Possible values: - yes : Clock system ToD reference is failed - no : Clock system ToD reference is OK	status of clock system tod reference fail alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
internal-clk-fail	Parameter type: <Alarm::ClockOCXOFail> (yes no) Possible values: - yes : Internal CLK is failed - no : Internal CLK is OK	specifies whether internal clock is failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::ClockOCXOFail> (yes no)	status of internal clock fail alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Possible values: - yes : Internal CLK is failed - no : Internal CLK is OK	<i>detail mode.</i>

102.86 Equipment Supplemental Alarm Log Status Command

Command Description

This command displays the equipment supplemental alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log eqpt-supplemental [ (index) ]
```

Command Parameters

Table 102.86-1 "Equipment Supplemental Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.86-2 "Equipment Supplemental Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
syslog-upload	Parameter type: <Alarm::uploadFailed> (failed ok) Possible values:	current status of the alarm specifying whether a failure occurred during upload of the NE's system log file to the syslog

102 Alarm Log Status Commands

name	Type	Description
	- failed : upload of syslog file to remote server failed - ok : no syslog file upload failure detected	server or not <i>This element is only shown in detail mode.</i>
prev-syslog-upload	Parameter type: <Alarm::uploadFailed> (failed ok) Possible values: - failed : upload of syslog file to remote server failed - ok : no syslog file upload failure detected	status of syslog-upload alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
ont-sw-dnload	Parameter type: <Alarm::ontSoftwareDownload> (in-progress ok) Possible values: - in-progress : ont software download in progress - ok : no ont software download detected	current status of the alarm specifying whether downloading of ont sw from version control to ont is in progress or not <i>This element is only shown in detail mode.</i>
prev-ont-sw-dnload	Parameter type: <Alarm::ontSoftwareDownload> (in-progress ok) Possible values: - in-progress : ont software download in progress - ok : no ont software download detected	status of ont-sw-dnload alarm with its previous logged value . <i>This element is only shown in detail mode.</i>
cf-75%-used	Parameter type: <Alarm::cf75Percent> (above below) Possible values: - above : Compact flash exceeds 75% of life expectancy - below : Compact flash is below 75% of life expectancy	current status of CF utilization which could be more than 75% or less than that <i>This element is only shown in detail mode.</i>
prev-cf-75%-used	Parameter type: <Alarm::cf75Percent> (above below) Possible values: - above : Compact flash exceeds 75% of life expectancy - below : Compact flash is below 75% of life expectancy	status of CF utilization with its previous logged value. <i>This element is only shown in detail mode.</i>
cf-90%-used	Parameter type: <Alarm::cf90Percent> (above below) Possible values: - above : Compact flash exceeds 90% of life expectancy - below : Compact flash is below 90% of life expectancy	current status of CF utilization which could be more than 90% or less than that <i>This element is only shown in detail mode.</i>
prev-cf-90%-used	Parameter type: <Alarm::cf90Percent> (above below) Possible values: - above : Compact flash exceeds 90% of life expectancy - below : Compact flash is below 90% of life expectancy	status of CF utilization with its previous logged value. <i>This element is only shown in detail mode.</i>

102.87 Otdr Alarm Log Status Command

Command Description

This command displays the otdr alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log otdr [ (index) ]
```

Command Parameters

Table 102.87-1 "Otdr Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.87-2 "Otdr Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>

Only Show Details: sfp information		
name	Type	Description
ponindex	Parameter type: <Itf::ComplexPortType> (xdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> voicefxs : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> xdsl-channel : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-if : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-pvc : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> bridge-port : <Eqpt::RackId> / <Eqpt::ShelfId> /	identifies the sf where the alarm has occurred. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id Field type <Eqpt::VlanId> - VLAN id Field type <Eqpt::LogicalId> - logical id Field type <Eqpt::VrfId> - VRF id	

Only Show Details: current and previous alarm log status		
name	Type	Description
capability-mismatch	Parameter type: <Alarm::OTDRmismatch> (yes no) Possible values: - yes : otdr capability mismatch - no : no otdr capability mismatch	specifies whether otdr capability mismatch has occurred. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OTDRmismatch> (yes no) Possible values: - yes : otdr capability mismatch - no : no otdr capability mismatch	status of capability mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>

102.88 Management Security Access Alarm Log Status Command

Command Description

This command displays the management security access alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log mgmt-sec-access [ (index) ]
```

Command Parameters

Table 102.88-1 "Management Security Access Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.88-2 "Management Security Access Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ip-address	Parameter type: <Alarm::IpAddress> - IPv4-address	address of the operator <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
login-successful	Parameter type: <Alarm::MgmtAccess> (yes no) Possible values: - yes : successfully logged in via management access - no : successfully logged out via management access	current status specifying whether successfully logged in or logged out via Management access <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::MgmtAccess>	status of mgmt-access with its

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : successfully logged in via management access - no : successfully logged out via management access	previous logged value. <i>This element is only shown in detail mode.</i>
login-failure	Parameter type: <Alarm::InvalidAccess> (yes no) Possible values: - yes : invalid login via management access crossed the threshold - no : invalid login via management access within the threshold	current status specifying invalid attempts to login via management access crossed the threshold or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::InvalidAccess> (yes no) Possible values: - yes : invalid login via management access crossed the threshold - no : invalid login via management access within the threshold	status of invalid-access with its previous logged value. <i>This element is only shown in detail mode.</i>

102.89 IHUB BFD Alarm Log Status Command

Command Description

This command displays the bfd alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log bfd [ (index) ]
```

Command Parameters

Table 102.89-1 "IHUB BFD Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.89-2 "IHUB BFD Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
vpnrn-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
bfd-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringBfd>	Additional information regarding

102 Alarm Log Status Commands

name	Type	Description
	- additional alarm information	the bfd alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
bfd-session-down	Parameter type: <Alarm::BfdSessionDown> (yes no) Possible values: - yes : bfd session down - no : bfd session not down	specifies whether a bfd session went down or not <i>This element is only shown in detail mode.</i>
prev-bfd-session-down	Parameter type: <Alarm::BfdSessionDown> (yes no) Possible values: - yes : bfd session down - no : bfd session not down	status of bfd-session-down with its previous logged value <i>This element is only shown in detail mode.</i>
bfd-max-resource	Parameter type: <Alarm::BfdMaxResource> (yes no) Possible values: - yes : bfd maximum resources reached - no : no resource issues for bfd	specifies whether bfd has reached maximum resources or not <i>This element is only shown in detail mode.</i>
prev-bfd-max-resource	Parameter type: <Alarm::BfdMaxResource> (yes no) Possible values: - yes : bfd maximum resources reached - no : no resource issues for bfd	status of bfd-max-resource with its previous logged value <i>This element is only shown in detail mode.</i>
bfd-stale-entry	Parameter type: <Alarm::BfdStaleEntry> (yes no) Possible values: - yes : bfd stale entry present - no : bfd stale entry not present	specifies whether a bfd entry has become stale or not <i>This element is only shown in detail mode.</i>
prev-bfd-stale-entry	Parameter type: <Alarm::BfdStaleEntry> (yes no) Possible values: - yes : bfd stale entry present - no : bfd stale entry not present	status of bfd-stale-entry with its previous logged value <i>This element is only shown in detail mode.</i>

102.90 Application Intelligence Alarm Log Status Command

Command Description

This command displays the log for the Application Intelligence alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ai [ (index) ]
```

Command Parameters

Table 102.90-1 "Application Intelligence Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.90-2 "Application Intelligence Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
slot-id	Parameter type: <Equipm::NtSlotIndex> (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	identifies the board hosting the AI Platform for which the alarm has occurred. <i>This element is only shown in detail mode.</i>
application-virtplatf	Parameter type: <SignedInteger> - a signed integer	identifies the Application and/or the virtualplatform for which the alarm occurred <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringAI>	Additional information regarding

102 Alarm Log Status Commands

name	Type	Description
	- Additional info: Application Name - length: x<=32	the AI alarm (Application name or none) <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
ai-platform-down	Parameter type: <Alarm::AIPlatformDown> (yes no) Possible values: - yes : AI Platform down - no : AI Platform not down	specifies whether an AI Platform went down or not <i>This element is only shown in detail mode.</i>
prev-ai-platform-down	Parameter type: <Alarm::AIPlatformDown> (yes no) Possible values: - yes : AI Platform down - no : AI Platform not down	previously logged status of the ai-platform-down alarm <i>This element is only shown in detail mode.</i>
ai-appl-inst-fail	Parameter type: <Alarm::AIApplInstallFail> (yes no) Possible values: - yes : Application installation failed - no : Application installation successful	specifies whether an Application 'download and installation' failed or was successful <i>This element is only shown in detail mode.</i>
prev-ai-appl-inst-fail	Parameter type: <Alarm::AIApplInstallFail> (yes no) Possible values: - yes : Application installation failed - no : Application installation successful	previously logged status of the ai-appl-install-fail alarm <i>This element is only shown in detail mode.</i>
ip-assign-fail	Parameter type: <Alarm::IpAddrAssignFail> (yes no) Possible values: - yes : Dhcp assigned address failure - no : Dhcp assigned address successful	specifies whether dhcp client 'assigned ip address' failed or was successful <i>This element is only shown in detail mode.</i>
prev-ip-assign-fail	Parameter type: <Alarm::IpAddrAssignFail> (yes no) Possible values: - yes : Dhcp assigned address failure - no : Dhcp assigned address successful	previously logged status of the ip-addr-assign-fail alarm <i>This element is only shown in detail mode.</i>

102.91 ONT SNMP Alarm Log Status Command

Command Description

This command displays the ont snmp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ontsnmp [ (index) ]
```

Command Parameters

Table 102.91-1 "ONT SNMP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.91-2 "ONT SNMP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
uni-index	Parameter type: <Ces::InterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId>	identification of the uni interface index <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
snmp-mismatch	Parameter type: <Alarm::OntSnmpMismatch> (mismatch not-mismatch) Possible values: - mismatch : ont snmp agent configuration data is mismatch - not-mismatch : ont snmp agent configuration data is not mismatch	current status specifying ont snmp data is mismatch or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntSnmpMismatch> (mismatch not-mismatch) Possible values: - mismatch : ont snmp agent configuration data is mismatch - not-mismatch : ont snmp agent configuration data is not mismatch	status of snmp mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>

102.92 Tr069 Alarm Status Command

Command Description

This command displays the tr069 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log tr069serv [ (index) ]
```

Command Parameters

Table 102.92-1 "Tr069 Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.92-2 "Tr069 Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
tr069serv	Parameter type: <Ces::InterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId>	identifies the tr069 serv entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-tr069-serv-mis	Parameter type: <Alarm::Tr069ServMis> (yes no) Possible values: - yes : ont tr069 server mismatch occurred - no : no ont tr069 server mismatch	specifies ont tr069 server mismatch occurred or not. <i>This element is only shown in detail mode.</i>
prev-tr069-serv-mis	Parameter type: <Alarm::Tr069ServMis> (yes no) Possible values: - yes : ont tr069 server mismatch occurred - no : no ont tr069 server mismatch	status of ont-tr069-serv-mis with its previous logged value <i>This element is only shown in detail mode.</i>

102.93 Bulk Sync Alarm Log Status Command

Command Description

This command displays the bulk sync alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log bulk-sync [ (index) ]
```

Command Parameters

Table 102.93-1 "Bulk Sync Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.93-2 "Bulk Sync Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <RedPort::PortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	
Only Show Details: current and previous alarm log status		
name	Type	Description
bsf-dhcpv4-fail	Parameter type: <Alarm::BsfDHCPv4> ((failing fail) ok) Possible values: - failing : dhcpv4 bulk-sync is failing - fail : dhcpv4 bulk-sync is failing - ok : dhcpv4 bulk-sync is ok	current status of dhcpv4 bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-dhcpv6-fail	Parameter type: <Alarm::BsfDHCPv6> ((failing fail) ok) Possible values: - failing : dhcpv6 bulk-sync is failing - fail : dhcpv6 bulk-sync is failing - ok : dhcpv6 bulk-sync is ok	current status of dhcpv6 bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-pon-fail	Parameter type: <Alarm::BsfPON> ((failing fail) ok) Possible values: - failing : pon bulk-sync is failing - fail : pon bulk-sync is failing - ok : pon bulk-sync is ok	current status of pon bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-vlan-bridge-fail	Parameter type: <Alarm::BsfVBridge> ((failing fail) ok) Possible values: - failing : vlan-bridge bulk-sync is failing - fail : vlan-bridge bulk-sync is failing - ok : vlan-bridge bulk-sync is ok	current status of vlan-bridge bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-qos-fail	Parameter type: <Alarm::BsfQoS> ((failing fail) ok) Possible values: - failing : qos bulk-sync is failing - fail : qos bulk-sync is failing - ok : qos bulk-sync is ok	current status of qos bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-igmp-fail	Parameter type: <Alarm::BsfIGMP> ((failing fail) ok) Possible values: - failing : igmp bulk-sync is failing - fail : igmp bulk-sync is failing - ok : igmp bulk-sync is ok	current status of igmp bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-lxfwd-fail	Parameter type: <Alarm::BsfLxFwd> ((failing fail) ok) Possible values: - failing : LxFwd bulk-sync is failing - fail : LxFwd bulk-sync is failing - ok : LxFwd bulk-sync is ok	current status of lxfwd bulk-sync failure. <i>This element is only shown in detail mode.</i>

102.94 Protection Group Alarm Log Status Command

Command Description

This command displays the protection group alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log protection-group [(index)]

Command Parameters

Table 102.94-1 "Protection Group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.94-2 "Protection Group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <RedPort::PortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	
Only Show Details: current and previous alarm log status		
name	Type	Description
port-protection-fail	Parameter type: <Alarm::ProtNotAvail> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of port protection failure. <i>This element is only shown in detail mode.</i>
port-switchover-fail	Parameter type: <Alarm::ProtSwFail> ((failing fail) ok) Possible values: - failing : port protection switchover failing - fail : port protection switchover failing - ok : port protection switchover is ok	current status of port switchover failure. <i>This element is only shown in detail mode.</i>

102.95 Ont protection Alarm Log Status Command

Command Description

This command displays the ont protection alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ont-protection [(index)]

Command Parameters

Table 102.95-1 "Ont protection Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.95-2 "Ont protection Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-prot-fail	Parameter type: <Alarm::OntProtNotAvail> ((failing fail) ok) Possible values: - failing : ont protection is failing - fail : ont protection is failing - ok : ont protection is ok	current status of ont protection failure. <i>This element is only shown in detail mode.</i>

102.96 ONT General Supplemental Alarm Log Status Command

Command Description

This command displays the ONT general supplemental alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont [ (index) ]
```

Command Parameters

Table 102.96-1 "ONT General Supplemental Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.96-2 "ONT General Supplemental Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-gen-sw-dnload-file	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	ont sw download file missing <i>This element is only shown in detail mode.</i>
ont-gen-fan-fail	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	ont fan failure <i>This element is only shown in detail mode.</i>
ont-gen-high-temp	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	ont high temperature <i>This element is only shown in detail mode.</i>
ont-gen-high-temp-ex	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	ont excessive high temperature <i>This element is only shown in detail mode.</i>
ont-gen-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	ont emergency call <i>This element is only shown in detail mode.</i>
ont-gen-sw-version	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTLERP> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	ont sw version control error <i>This element is only shown in detail mode.</i>
ont-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes	ont poe exceed max <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	<i>detail mode.</i>
ont-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
ont-gen-cfgdld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	specifies download of voice xml file to ont failed or not. <i>This element is only shown in detail mode.</i>
ont-loopdetect-mis	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	ONT loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
rssi-mismatch	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	rssi mismatch status <i>This element is only shown in detail mode.</i>
tx-pwr-alm-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	tx pwr low alarm status <i>This element is only shown in detail mode.</i>
temp-alm-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	temp alarm high status <i>This element is only shown in detail mode.</i>
volt-alm-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	voltage alarm high status <i>This element is only shown in detail mode.</i>
bias-alm-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes	bias alarm high status <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
ont-olt-rx-pw-hig	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	olt side receive power from ont high <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-warnhig	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	olt side receive power from ont high warning <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-warnlo	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	olt side receive power from ont low warning <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-lo	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	olt side receive power from ont low <i>This element is only shown in detail mode.</i>
ont-gen-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	tod is out-sync with olt <i>This element is only shown in detail mode.</i>
ont-gen-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	ONU has failed to tune to Pref-ChnlPair <i>This element is only shown in detail mode.</i>
hgu-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
ont-gen-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	tod is mismatch <i>This element is only shown in detail mode.</i>

102.97 SFU ONT General Supplemental Alarm Log Status Command

Command Description

This command displays the SFU ONT general supplemental alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sfu-sup [ (index) ]
```

Command Parameters

Table 102.97-1 "SFU ONT General Supplemental Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.97-2 "SFU ONT General Supplemental Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
sfu-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	SFU ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
sfu-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	SFU ONT - Fan failure <i>This element is only shown in detail mode.</i>
sfu-sup-temp-high-warn	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	SFU ONT - High temperature warning <i>This element is only shown in detail mode.</i>
sfu-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	SFU ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
sfu-sup-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	SFU ONT - Emergency call active <i>This element is only shown in detail mode.</i>
sfu-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	SFU ONT - Software version control error <i>This element is only shown in detail mode.</i>

name	Type	Description
sfu-sup-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SFU ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>
sfu-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	SFU ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
sfu-ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
sfu-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SFU ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
sfu-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	SFU ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	SFU ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	SFU ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	SFU ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SFU ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
sfu-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	SFU ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	SFU ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-hi-warn	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	SFU ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-lo-warn	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	SFU ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	SFU ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
sfu-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	SFU ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
sfu-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	SFU ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
sfu-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	SFU ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	SFU ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

102.98 SOHO ONT General Supplemental Alarm Log Status Command

Command Description

This command displays the SOHO ONT general supplemental alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log soho-sup [(index)]

Command Parameters

Table 102.98-1 "SOHO ONT General Supplemental Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.98-2 "SOHO ONT General Supplemental Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
soho-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	SOHO ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
soho-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	SOHO ONT - Fan failure <i>This element is only shown in detail mode.</i>
soho-sup-temp-high-war	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	SOHO ONT - High temperature warning <i>This element is only shown in detail mode.</i>
soho-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	SOHO ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
soho-sup-emergency-cal	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	SOHO ONT - Emergency call active <i>This element is only shown in detail mode.</i>
soho-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	SOHO ONT - Software version control error <i>This element is only shown in detail mode.</i>

name	Type	Description
soho-sup-poe-exceed-ma	Parameter type: <Alarm::OntPoE> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SOHO ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>
soho-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	SOHO ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
soho-ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
soho-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SOHO ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
soho-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	SOHO ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
soho-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	SOHO ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
soho-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	SOHO ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	SOHO ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SOHO ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
soho-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	SOHO ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	SOHO ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-hi-war	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	SOHO ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-lo-war	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	SOHO ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	SOHO ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
soho-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	SOHO ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
soho-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	SOHO ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
soho-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	SOHO ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
soho-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	SOHO ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

102.99 MDU ONT General Supplemental Alarm Log Status Command

Command Description

This command displays the MDU ONT general supplemental alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log mdu-sup [ (index) ]
```

Command Parameters

Table 102.99-1 "MDU ONT General Supplemental Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.99-2 "MDU ONT General Supplemental Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
mdu-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	MDU ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
mdu-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	MDU ONT - Fan failure <i>This element is only shown in detail mode.</i>
mdu-sup-temp-high-warn	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	MDU ONT - High temperature warning <i>This element is only shown in detail mode.</i>
mdu-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	MDU ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
mdu-sup-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	MDU ONT - Emergency call active <i>This element is only shown in detail mode.</i>
mdu-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	MDU ONT - Software version control error <i>This element is only shown in detail mode.</i>

name	Type	Description
mdu-sup-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	MDU ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>
mdu-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	MDU ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
mdu-ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
mdu-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	MDU ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
mdu-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	MDU ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	MDU ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	MDU ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	MDU ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	MDU ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
mdu-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	MDU ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	MDU ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-hi-warn	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	MDU ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-lo-warn	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	MDU ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	MDU ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
mdu-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	MDU ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
mdu-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	MDU ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
mdu-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	MDU ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	MDU ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

102.100 ONT General Supplemental 2 Alarm Log Status Command

Command Description

This command displays the ONT general supplemental 2 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ont-ani [(index)]

Command Parameters

Table 102.100-1 "ONT General Supplemental 2 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.100-2 "ONT General Supplemental 2 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
temp-alm-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	temp alarm low status <i>This element is only shown in detail mode.</i>
volt-alm-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	voltage alarm low status <i>This element is only shown in detail mode.</i>
bias-alm-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	bias alarm low status <i>This element is only shown in detail mode.</i>
tx-pwr-alm-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	tx pwr high alarm status <i>This element is only shown in detail mode.</i>
rx-pwr-warn-high	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	rx pwr warning high status <i>This element is only shown in detail mode.</i>
rx-pwr-warn-low	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	rx pwr warning high status <i>This element is only shown in detail mode.</i>
tx-pwr-warn-high	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	tx pwr warning high status <i>This element is only shown in detail mode.</i>
tx-pwr-warn-low	Parameter type: <Alarm::OntTxPwrWarnLow>	tx pwr warning low status

name	Type	Description
	(yes no) Possible values: - yes : tx power at ont side is too low - no : tx power at ont side is normal	<i>This element is only shown in detail mode.</i>
temp-warn-high	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	temp warning high status <i>This element is only shown in detail mode.</i>
temp-warn-low	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	temp warning low status <i>This element is only shown in detail mode.</i>
volt-warn-high	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	voltage warning high status <i>This element is only shown in detail mode.</i>
volt-warn-low	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	voltage warning low status <i>This element is only shown in detail mode.</i>
bias-warn-high	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	bias warning high status <i>This element is only shown in detail mode.</i>
bias-warn-low	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	bias warning low status <i>This element is only shown in detail mode.</i>

102.101 SFU ONT General Supplemental 2 Alarm Log Status Command

Command Description

This command displays the SFU ONT general supplemental 2 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sfu-sup2 [ (index) ]
```

Command Parameters

Table 102.101-1 "SFU ONT General Supplemental 2 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.101-2 "SFU ONT General Supplemental 2 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
sfu-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SFU ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SFU ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SFU ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SFU ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	SFU ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	SFU ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-tx-hwarn	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SFU ONT - SFP Tx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
sfu-sup2-tx-lwarn	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values: - yes : tx power at ont side is too low - no : tx power at ont side is normal	SFU ONT - SFP Tx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-temp-hwarn	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	SFU ONT - SFP temperature is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-temp-lwarn	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SFU ONT - SFP temperature is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-hwarn	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SFU ONT - SFP voltage is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-lwarn	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SFU ONT - SFP voltage is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-hwarn	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	SFU ONT - SFP bias is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-lwarn	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SFU ONT - SFP bias is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

102.102 SOHO ONT General Supplemental 2 Alarm Log Status Command

Command Description

This command displays the SOHO ONT general supplemental 2 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log soho-sup2 [ (index) ]
```

Command Parameters

Table 102.102-1 "SOHO ONT General Supplemental 2 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.102-2 "SOHO ONT General Supplemental 2 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
soho-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SOHO ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
soho-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SOHO ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
soho-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SOHO ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
soho-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SOHO ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
soho-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	SOHO ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	SOHO ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-tx-hwarn	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SOHO ONT - SFP Tx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
soho-sup2-tx-lwarn	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values: - yes : tx power at ont side is too low - no : tx power at ont side is normal	SOHO ONT - SFP Tx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-temp-hwarn	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	SOHO ONT - SFP temperature is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-temp-lwarn	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SOHO ONT - SFP temperature is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-volt-hwarn	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SOHO ONT - SFP voltage is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-volt-lwarn	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SOHO ONT - SFP voltage is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-bias-hwarn	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	SOHO ONT - SFP bias is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-bias-lwarn	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SOHO ONT - SFP bias is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

102.103 MDU ONT General Supplemental 2 Alarm Log Status Command

Command Description

This command displays the MDU ONT general supplemental 2 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log mdu-sup2 [ (index) ]
```

Command Parameters

Table 102.103-1 "MDU ONT General Supplemental 2 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.103-2 "MDU ONT General Supplemental 2 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
mdu-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	MDU ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	MDU ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	MDU ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	MDU ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	MDU ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	MDU ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-tx-hwarn	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	MDU ONT - SFP Tx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
mdu-sup2-tx-lwarn	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values: - yes : tx power at ont side is too low - no : tx power at ont side is normal	MDU ONT - SFP Tx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-temp-hwarn	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	MDU ONT - SFP temperature is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-temp-lwarn	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	MDU ONT - SFP temperature is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-volt-hwarn	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	MDU ONT - SFP voltage is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-volt-lwarn	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	MDU ONT - SFP voltage is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-bias-hwarn	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	MDU ONT - SFP bias is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-bias-lwarn	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	MDU ONT - SFP bias is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

102.104 Ima-Group Alarm Log Status Command

Command Description

This command displays the Ima-Group alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log epon [(alarm-index)]

Command Parameters

Table 102.104-1 "Ima-Group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(alarm-index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.104-2 "Ima-Group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
pon-index	Parameter type: <Itf::ComplexPortType> (xdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> voicefxs : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> xdsl-channel : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-if : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-pvc : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> bridge-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId>	identifies the epon where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<pre> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan> l2-vlan : <Eqpt::VlanId> ip : <Eqpt::LogicalId> sw-loopback slip uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> atm-bonding : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> bonding : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> ip-gateway : <Eqpt::VrfId> ip-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> ip-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> shdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> e1-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-ima : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> ethernet-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> bridge-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> voip:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> ip-line : vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> ip-line : vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> ip-line : vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> ip-line : vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : </pre>

name	Type	Description
	- voip : voip - voip:ng2 : voip - la-group : link aggregation group - dist-router-interface : dist router interface - voicefxs : voicefxs - mpm : multi-pon module Possible values: - vlan : vlan port Possible values: - slot-vlan : slot unstacked - slot-stacked : slot vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier Field type <Eqpt::ComboPonId> - the comboPON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::BundleId> - the BUNDLE identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id Field type <Eqpt::VlanId> - VLAN id Field type <Eqpt::LogicalId> - logical id Field type <Eqpt::VrflId> - VRF id	
newonu-index	Parameter type: <SignedInteger> - a signed integer	the newonu index for the pon alarm <i>This element is only shown in detail mode.</i>
log-info	Parameter type: <Alarm::AdditionalInfo> - string to identify the owner (example: Tom) - length: x<=512	some additional information about the table entry. <i>This element is only shown in detail mode.</i>
newont-mac	Parameter type: <Alarm::MacAddr> - mac-address (example : 01:02:03:04:05:06) - length: 6	new ONT Mac address <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
onu-unprovisioned	Parameter type: <Alarm::checkNewOnu> (newonu not-newonu) Possible values: - newonu : new onu is exist - not-newonu : new onu is not exist	new onu is exist or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::checkNewOnu> (newonu not-newonu) Possible values: - newonu : new onu is exist - not-newonu : new onu is not exist	new onu is exist or not with its previous logged value <i>This element is only shown in detail mode.</i>
signal-loss	Parameter type: <Alarm::NearEndLOF> (yes no) Possible values: - yes : near end loss of frame occurred - no : no near end loss of frame	pon loss of signal.olt is not receiving any upstream transmissions. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::NearEndLOF> (yes no) Possible values: - yes : near end loss of frame occurred - no : no near end loss of frame	status of pon loss of signal with its previous logged value <i>This element is only shown in detail mode.</i>
bitrate-high	Parameter type: <Alarm::errorRateHigh> (yes no) Possible values:	the error bit rate high at pon interface is reached or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : the error bit rate is too high than configured alarm high threshold - no : the error bit rate is ok	
prev-status	Parameter type: <Alarm::errorRateHigh> (yes no) Possible values: - yes : the error bit rate is too high than configured alarm high threshold - no : the error bit rate is ok	status of the error bit rate high with its previous logged value <i>This element is only shown in detail mode.</i>
opmodule-mismatch	Parameter type: <Alarm::opmoduleTypeMismatch> (mismatch no-mismatch) Possible values: - mismatch : installed and planned shelf types are different - no-mismatch : installed and planned shelf types are the same	the optical module mismatched at pon interface failed or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::opmoduleTypeMismatch> (mismatch no-mismatch) Possible values: - mismatch : installed and planned shelf types are different - no-mismatch : installed and planned shelf types are the same	status of the optical module mismatched at pon interface with its previous logged value <i>This element is only shown in detail mode.</i>

102.105 LT CFM Alarm Log Status Command

Command Description

This command displays icam cfm alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log cfm [ (index) ]
```

Command Parameters

Table 102.105-1 "LT CFM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.105-2 "LT CFM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
cfm-mep-id	Parameter type: <UnsignedSignedInteger> - an unsigned integer	dot1agCfmMepIdentifier index where the alarm has occurred. <i>This element is only shown in detail mode.</i>
cfm-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringCcm> - additional alarm information	Additional information regarding the cfm alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
cfm-defrdiccm	Parameter type: <Alarm::IacmCfmRdiCcm> (yes no) Possible values: - yes : rdi bit in ccm received - no : no rdi bit in ccm received	specifies rdi bit in ccm received <i>This element is only shown in detail mode.</i>
cfm-defmacstatus	Parameter type: <Alarm::IacmCfmMacError> (yes no) Possible values: - yes : mac error status - no : no mac error status	ccm mac error status <i>This element is only shown in detail mode.</i>
cfm-defremoteccm	Parameter type: <Alarm::IacmCfmMepCcm> (yes no) Possible values: - yes : missing ccm from mep - no : no missing ccm from mep	specifies missing ccm from mep <i>This element is only shown in detail mode.</i>
cfm-deferrorccm	Parameter type: <Alarm::IacmCfmInvalidCcm> (yes no) Possible values: - yes : invalid ccm received - no : no invalid ccm received	specifies invalid ccm received <i>This element is only shown in detail mode.</i>
cfm-defxconccm	Parameter type: <Alarm::IacmCfmUnexpectedCcm> (yes no) Possible values: - yes : unexpected ccm received - no : no unexpected ccm received	specifies unexpected ccm received <i>This element is only shown in detail mode.</i>
cfm-defais	Parameter type: <Alarm::IacmCfmAis> (yes no) Possible values: - yes : ethernet ais received - no : no ethernet ais received	specifies ethernet ais received <i>This element is only shown in detail mode.</i>

102.106 IHUB CFM Alarm Log Status Command

Command Description

This command displays ihub cfm alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log eth-cfm [ (index) ]
```

Command Parameters

Table 102.106-1 "IHUB CFM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.106-2 "IHUB CFM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
cfm-mep-id	Parameter type: <UnsignedSignedInteger> - an unsigned integer	dot1agCfmMepIdentifier index where the alarm has occurred. <i>This element is only shown in detail mode.</i>
cfm-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringIhubCfm> - additional alarm information	Additional information regarding the eth cfm alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
defrdiccm	Parameter type: <Alarm::IhubCfmRdiCcm> (yes no) Possible values: - yes : rdi bit in ccm received - no : no rdi bit in ccm received	specifies rdi bit in ccm received <i>This element is only shown in detail mode.</i>
defmacstatus	Parameter type: <Alarm::IhubCfmMacError> (yes no) Possible values: - yes : mac error status - no : no mac error status	ccm mac error status <i>This element is only shown in detail mode.</i>
defremoteccm	Parameter type: <Alarm::IhubCfmMepCcm> (yes no) Possible values: - yes : missing ccm from mep - no : no missing ccm from mep	specifies missing ccm from mep <i>This element is only shown in detail mode.</i>
deferrorccm	Parameter type: <Alarm::IhubCfmInvalidCcm> (yes no) Possible values: - yes : invalid ccm received - no : no invalid ccm received	specifies invalid ccm received <i>This element is only shown in detail mode.</i>
defxconccm	Parameter type: <Alarm::IhubCfmUnexpectedCcm> (yes no) Possible values: - yes : unexpected ccm received - no : no unexpected ccm received	specifies unexpected ccm received <i>This element is only shown in detail mode.</i>

102.107 RSVP Alarm Log Status Command

Command Description

This command displays the rsvp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log rsvp [ (index) ]
```

Command Parameters

Table 102.107-1 "RSVP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.107-2 "RSVP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
neighbor-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	An unique number to identify the alarm or zero when not applicable, Neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the Neighbor using the Nbr address and ifIndex or empty string if not applicable <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
neighbor-down	Parameter type: <Alarm::RsvpNeighborDown> (yes no) Possible values: - yes : rsvp neighbor is down - no : rsvp neighbor is up or rsvp interface is shutdown or ip interface is shutdown or rsvp instance is shutdown	specifies whether the Rsvp neighbor is down or not <i>This element is only shown in detail mode.</i>
prev-neighbor-down	Parameter type: <Alarm::RsvpNeighborDown> (yes no) Possible values: - yes : rsvp neighbor is down - no : rsvp neighbor is up or rsvp interface is shutdown or ip interface is shutdown or rsvp instance is shutdown	status of neighbor-down with its previous logged value <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::RsvpInstanceDown> (yes no) Possible values: - yes : rsvp instance is down - no : rsvp instance is up or not configured	specifies whether the RSVP instance is down or not <i>This element is only shown in detail mode.</i>
prev-instance-down	Parameter type: <Alarm::RsvpInstanceDown> (yes no) Possible values: - yes : rsvp instance is down - no : rsvp instance is up or not configured	status of instance-down with its previous logged value <i>This element is only shown in detail mode.</i>

102.108 IPD eth-ring Alarm Log Status Command

Command Description

This command displays the ipd eth-ring alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log eth-ring [(index)]

Command Parameters

Table 102.108-1 "IPD eth-ring Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.108-2 "IPD eth-ring Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ring-id	Parameter type: <Alarm::genAlarmIndex> - index of a current alarm entry	identifies the eth-ring-instance <i>This element is only shown in detail mode.</i>
ring path-index	Parameter type: <Alarm::genAlarmIndex> - index of a current alarm entry	identifies the ring-path within a eth-ring <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
ering-path-blocked	Parameter type: <Alarm::EthRingPathBlocked> (yes no) Possible values: - yes : ethernet ring path is blocked - no : ethernet ring path is unblocked	specifies whether a eth-ring path is blocked or not <i>This element is only shown in detail mode.</i>

name	Type	Description
prev-ering-path-block	Parameter type: <Alarm::EthRingPathBlocked> (yes no) Possible values: - yes : ethernet ring path is blocked - no : ethernet ring path is unblocked	status of eth-ring path blocked state with its previous logged value <i>This element is only shown in detail mode.</i>

102.109 EFM-OAM Alarm Log Status Command

Command Description

This command displays the EFM-OAM alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log efm-oam [ (index) ]
```

Command Parameters

Table 102.109-1 "EFM-OAM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.109-2 "EFM-OAM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
line	Parameter type: <Itf::EfmEthernetIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical xdsl line <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
link-fault	Parameter type: <Alarm::linkFaultType> (yes	specifies whether link fault is present or not.

name	Type	Description
	no) Possible values: - yes : link fault at cpe/onu - no : link fault is not exist	<i>This element is only shown in detail mode.</i>
prev-link-fault	Parameter type: <Alarm::linkFaultType> (yes no) Possible values: - yes : link fault at cpe/onu - no : link fault is not exist	status of link-fault with its previous logged value. <i>This element is only shown in detail mode.</i>
dying-gasp	Parameter type: <Alarm::dyingGaspType> (yes no) Possible values: - yes : dying gasp is exist - no : dying gasp is not exist	specifies whether dying gasp indication is received from cpe or not. <i>This element is only shown in detail mode.</i>
prev-dying-gasp	Parameter type: <Alarm::dyingGaspType> (yes no) Possible values: - yes : dying gasp is exist - no : dying gasp is not exist	status of dying-gasp with its previous logged value. <i>This element is only shown in detail mode.</i>
critical-event	Parameter type: <Alarm::criticalEventType> (yes no) Possible values: - yes : critical event is exist - no : critical event is not exist	specifies whether critical event is received from cpe or not. <i>This element is only shown in detail mode.</i>
prev-critical-event	Parameter type: <Alarm::criticalEventType> (yes no) Possible values: - yes : critical event is exist - no : critical event is not exist	status of critical-event with its previous logged value. <i>This element is only shown in detail mode.</i>

102.110 ont loop detect Alarm Log Status Command

Command Description

This command displays the ont loop detect alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-loopdetect [ (index) ]
```

Command Parameters

Table 102.110-1 "ont loop detect Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.110-2 "ont loop detect Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the LT slot number - Field type <Eqpt::PonId> - the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier	
ont-loopdetect	Parameter type: <Alarm::OntLoopDetectPortNumber> (port 1 looped port 2 looped port 3 looped port 4 looped port 5 looped port 6 looped port 7 looped port 8 looped port 9 looped port 10 looped port 11 looped port 12 looped port 13 looped port 14 looped port 15 looped port 16 looped port 17 looped port 18 looped port 19 looped port 20 looped port 21 looped port 22 looped port 23 looped port 24 looped) Possible values: - port 1 looped : ont port loop occurred - port 2 looped : ont port loop occurred - port 3 looped : ont port loop occurred - port 4 looped : ont port loop occurred - port 5 looped : ont port loop occurred - port 6 looped : ont port loop occurred - port 7 looped : ont port loop occurred - port 8 looped : ont port loop occurred - port 9 looped : ont port loop occurred - port 10 looped : ont port loop occurred - port 11 looped : ont port loop occurred - port 12 looped : ont port loop occurred - port 13 looped : ont port loop occurred - port 14 looped : ont port loop occurred - port 15 looped : ont port loop occurred - port 16 looped : ont port loop occurred - port 17 looped : ont port loop occurred - port 18 looped : ont port loop occurred - port 19 looped : ont port loop occurred - port 20 looped : ont port loop occurred	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- port 21 looped : ont port loop occurred - port 22 looped : ont port loop occurred - port 23 looped : ont port loop occurred - port 24 looped : ont port loop occurred	

102.111 ONT PLOAM Alarm Log Status Command

Command Description

This command displays the ONT PLOAM alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ont-ploam [(index)]

Command Parameters

Table 102.111-1 "ONT PLOAM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.111-2 "ONT PLOAM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
ont-ploam-loss-sig	Parameter type: <Alarm::ONTPLOAMLOSO> (yes no) Possible values: - yes : loss of signal at ont - no : no loss of signal at ont	loss of signal at ont <i>This element is only shown in detail mode.</i>
ont-ploam-loss-ack	Parameter type: <Alarm::ONTPLOAMLOA> (yes no) Possible values: - yes : loss of acknowledge from ont - no : no loss of acknowledge from ont	loss of acknowledge from ont <i>This element is only shown in detail mode.</i>
ont-ploam-loss-cd	Parameter type: <Alarm::ONTPLOAMLCD> (yes no) Possible values: - yes : loss of gem/atm channel delineation of ont - no : gem/atm channel delineation of ont is normal	loss of gem/atm channel delineation of ont <i>This element is only shown in detail mode.</i>
ont-ploam-phy-eqpt-err	Parameter type: <Alarm::ONTPLOAMPEE> (yes no) Possible values: - yes : physical equipment error of ont - no : no physical equipment error of ont	physical equipment error of ont <i>This element is only shown in detail mode.</i>
ont-ploam-startup-fail	Parameter type: <Alarm::ONTPLOAMSUF> (yes no) Possible values: - yes : startup failure in ranging of ont - no : no startup failure in ranging of ont	startup failure in ranging of ont <i>This element is only shown in detail mode.</i>
ont-ploam-sig-degrade	Parameter type: <Alarm::ONTPLOAMSD> (yes no) Possible values: - yes : signal degrade ber threshold exceeded from ont - no : signal degrade ber threshold is normal	signal degrade ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
ont-ploam-disabled	Parameter type: <Alarm::ONTPLOAMONTDisabled> (yes no) Possible values: - yes : ont has been autonomously disabled - no : ont is enabled	ont has been autonomously disabled because of misbehaving transmissions <i>This element is only shown in detail mode.</i>
ont-ploam-err-msg	Parameter type: <Alarm::ONTPLOAMMEM> (yes no) Possible values: - yes : message error message from ont	message error message from ont <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no message error message from ont	
ont-ploam-inactive	Parameter type: <Alarm::ONTPLOAMInact> (yes no) Possible values: - yes : ont is inactive - no : ont is active	ont is inactive <i>This element is only shown in detail mode.</i>
ont-ploam-sig-fail	Parameter type: <Alarm::ONTPLOAMSF> (yes no) Possible values: - yes : signal fail ber threshold exceeded from ont - no : no signal fail ber threshold exceeded from ont	signal fail ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
ont-ploam-dying-gasp	Parameter type: <Alarm::ONTPLOAMDG> (yes no) Possible values: - yes : received dying gasp indication from ont - no : no received dying gasp indication from ont	received dying gasp indication from ont <i>This element is only shown in detail mode.</i>
ont-ploam-deact-fail	Parameter type: <Alarm::ONTPLOAMDF> (yes no) Possible values: - yes : deactivate failure of ont - no : no deactivate failure of ont	deactivate failure of ont <i>This element is only shown in detail mode.</i>
ont-ploam-oam	Parameter type: <Alarm::ONTPLOAMLOAM> (yes no) Possible values: - yes : loss of ploam for ont - no : no Loss of ploam for ont	loss of ploam for ont <i>This element is only shown in detail mode.</i>
ont-ploam-win-drift	Parameter type: <Alarm::ONTPLOAMDOW> (yes no) Possible values: - yes : drift of window - no : no drift of window	drift of window. <i>This element is only shown in detail mode.</i>
ont-ploam-rdi	Parameter type: <Alarm::ONTPLOAMRDI> (yes no) Possible values: - yes : remote defect indication from ont - no : no remote defect indication from ont	remote defect indication from ont. <i>This element is only shown in detail mode.</i>
ont-ploam-loss-ks	Parameter type: <Alarm::ONTPLOAMLOKS> (yes no) Possible values: - yes : loss of key synchronization between olt and ont - no : key synchronization between olt and ont is ok	loss of key synchronization between olt and ont <i>This element is only shown in detail mode.</i>
ont-ploam-pwr-burst	Parameter type: <Alarm::ONTPLOAMONTPWREERR> (yes no) Possible values: - yes : ont power up error - no : ont power up ok	ont power up error. <i>This element is only shown in detail mode.</i>
ont-ploam-rog-disa	Parameter type: <Alarm::ONTPLOAMROGUEONTDIS> (yes	ont has been autonomously disabled because of misbehaving

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : ont has been autonomously disabled to be a rogue ont - no : ont is normal	transmissions and is thought to be a rogue ont. <i>This element is only shown in detail mode.</i>
ont-ploam-diff-reach	Parameter type: <Alarm::ONTPLOAMDIFREACH> (yes no) Possible values: - yes : ont has been deactivated because its location on the pon has exceeded its differential reach capability - no : ont is normal	ont has been deactivated because its location on the pon has exceeded its differential reach capability. <i>This element is only shown in detail mode.</i>
ont-ploam-looc	Parameter type: <Alarm::ONTPLOAMLOOC> (yes no) Possible values: - yes : ont has been deactivated due to persistent OMCI MIC failure - no : ont is normal	ont has been deactivated due to persistent OMCI MIC failure. <i>This element is only shown in detail mode.</i>

102.112 SFU ONT PLOAM Alarm Log Status Command

Command Description

This command displays the SFU ONT PLOAM alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log sfu-ploam [ (index) ]
```

Command Parameters

Table 102.112-1 "SFU ONT PLOAM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	gpon ont equipment ifindex of ont <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
mdu-ploam-loss-sig	Parameter type: <Alarm::ONTPLOAMLOSO> (yes no) Possible values: - yes : loss of signal at ont - no : no loss of signal at ont	loss of signal at ont <i>This element is only shown in detail mode.</i>
mdu-ploam-loss-ack	Parameter type: <Alarm::ONTPLOAMLOA> (yes no) Possible values: - yes : loss of acknowledge from ont - no : no loss of acknowledge from ont	loss of acknowledge from ont <i>This element is only shown in detail mode.</i>
mdu-ploam-loss-cd	Parameter type: <Alarm::ONTPLOAMLCD> (yes no) Possible values: - yes : loss of gem/atm channel delineation of ont - no : gem/atm channel delineation of ont is normal	loss of gem/atm channel delineation of ont <i>This element is only shown in detail mode.</i>
mdu-ploam-phy-eqpt-err	Parameter type: <Alarm::ONTPLOAMPEE> (yes no) Possible values: - yes : physical equipment error of ont - no : no physical equipment error of ont	physical equipment error of ont <i>This element is only shown in detail mode.</i>
mdu-ploam-startup-fail	Parameter type: <Alarm::ONTPLOAMSUF> (yes no) Possible values: - yes : startup failure in ranging of ont - no : no startup failure in ranging of ont	startup failure in ranging of ont <i>This element is only shown in detail mode.</i>
mdu-ploam-sig-degrade	Parameter type: <Alarm::ONTPLOAMSD> (yes no) Possible values: - yes : signal degrade ber threshold exceeded from ont - no : signal degrade ber threshold is normal	signal degrade ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
mdu-ploam-disabled	Parameter type: <Alarm::ONTPLOAMONTDisabled> (yes no) Possible values: - yes : ont has been autonomously disabled - no : ont is enabled	ont has been autonomously disabled because of misbehaving transmissions <i>This element is only shown in detail mode.</i>
mdu-ploam-err-msg	Parameter type: <Alarm::ONTPLOAMMEM> (yes	message error message from ont <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : message error message from ont - no : no message error message from ont	detail mode.
mdu-ploam-inactive	Parameter type: <Alarm::ONTPLOAMInact> (yes no) Possible values: - yes : ont is inactive - no : ont is active	ont is inactive <i>This element is only shown in detail mode.</i>
mdu-ploam-sig-fail	Parameter type: <Alarm::ONTPLOAMSF> (yes no) Possible values: - yes : signal fail ber threshold exceeded from ont - no : no signal fail ber threshold exceeded from ont	signal fail ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
mdu-ploam-dying-gasp	Parameter type: <Alarm::ONTPLOAMDG> (yes no) Possible values: - yes : received dying gasp indication from ont - no : no received dying gasp indication from ont	received dying gasp indication from ont <i>This element is only shown in detail mode.</i>
mdu-ploam-deact-fail	Parameter type: <Alarm::ONTPLOAMDF> (yes no) Possible values: - yes : deactivate failure of ont - no : no deactivate failure of ont	deactivate failure of ont <i>This element is only shown in detail mode.</i>
mdu-ploam-oam	Parameter type: <Alarm::ONTPLOAMLOAM> (yes no) Possible values: - yes : loss of ploam for ont - no : no Loss of ploam for ont	loss of ploam for ont <i>This element is only shown in detail mode.</i>
mdu-ploam-win-drift	Parameter type: <Alarm::ONTPLOAMDOW> (yes no) Possible values: - yes : drift of window - no : no drift of window	drift of window. <i>This element is only shown in detail mode.</i>
mdu-ploam-rdi	Parameter type: <Alarm::ONTPLOAMRDI> (yes no) Possible values: - yes : remote defect indication from ont - no : no remote defect indication from ont	remote defect indication from ont. <i>This element is only shown in detail mode.</i>
mdu-ploam-loss-ks	Parameter type: <Alarm::ONTPLOAMLOKS> (yes no) Possible values: - yes : loss of key synchronization between olt and ont - no : key synchronization between olt and ont is ok	loss of key synchronization between olt and ont <i>This element is only shown in detail mode.</i>
mdu-ploam-pwr-burst	Parameter type: <Alarm::ONTPLOAMONTPWRERR> (yes no) Possible values: - yes : ont power up error	ont power up error. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : ont power up ok	
mdu-ploam-rog-disa	Parameter type: <Alarm::ONTPLOAMROGUEONTDIS> (yes no) Possible values: - yes : ont has been autonomously disabled to be a rogue ont - no : ont is normal	ont has been autonomously disabled because of misbehaving transmissions and is thought to be a rogue ont. <i>This element is only shown in detail mode.</i>
mdu-ploam-diff-reach	Parameter type: <Alarm::ONTPLOAMDIFREACH> (yes no) Possible values: - yes : ont has been deactivated because its location on the pon has exceeded its differential reach capability - no : ont is normal	ont has been deactivated because its location on the pon has exceeded its differential reach capability. <i>This element is only shown in detail mode.</i>
mdu-ploam-looc	Parameter type: <Alarm::ONTPLOAMLOOC> (yes no) Possible values: - yes : ont has been deactivated due to persistent OMCI MIC failure - no : ont is normal	ont has been deactivated due to persistent OMCI MIC failure. <i>This element is only shown in detail mode.</i>

102.115 ONT General Alarm Log Status Command

Command Description

This command displays the ONT general alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-gen [ (index) ]
```

Command Parameters

Table 102.115-1 "ONT General Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.115-2 "ONT General Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-gen-omci-fail	Parameter type: <Alarm::ONTGENERALOMCICOMM> (yes no) Possible values: - yes : ont fails to respond to omci message requests - no : ont responds to omci message requests works properly	ont fails to respond to omci message requests <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-selftest	Parameter type: <Alarm::ONTGENERALEQPT> (yes no) Possible values: - yes : ont has failed a self test - no : ont self test works properly	ont has failed a self-test <i>This element is only shown in detail mode.</i>
ont-gen-ac-pwr-fail	Parameter type: <Alarm::ONTGENERALACFAIL> (yes no) Possible values: - yes : loss of external ac power to the ont - no : external ac power to the ont is ok	loss of external ac power to the ont" <i>This element is only shown in detail mode.</i>
ont-gen-bat-missing	Parameter type: <Alarm::ONTGENERALBATTMIS> (yes no) Possible values: - yes : battery is provisioned for ont but is missing - no : battery is provisioned and present for ont	battery is provisioned for ont but is missing <i>This element is only shown in detail mode.</i>
ont-gen-bat-low	Parameter type: <Alarm::ONTGENERALBATTLLOW> (yes no) Possible values: - yes : battery charge is low - no : battery charge is ok	battery charge is low <i>This element is only shown in detail mode.</i>
ont-gen-bat-fail	Parameter type: <Alarm::ONTGENERALBATTFAIL> (yes no) Possible values: - yes : battery is provisioned and present but cannot recharge - no : battery is provisioned and present and can recharge	battery is provisioned and present but cannot recharge <i>This element is only shown in detail mode.</i>
ont-gen-phys-intrusion	Parameter type: <Alarm::ONTGENERALINTRUDER> (yes no) Possible values: - yes : unauthorized access to ont and door or box is open - no : authorized access to ont	unauthorized access to ont <i>This element is only shown in detail mode.</i>
ont-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes no) Possible values: - yes : download of software to ont has failed	download of software to ont has failed <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : download of software to ont works properly	
ont-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes no) Possible values: - yes : ont failed to activate the passive image designated by the olt - no : ont works properly to activate the passive image designated by the olt	ont failed to activate the passive image designated by the olt <i>This element is only shown in detail mode.</i>
ont-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
ont-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
ont-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
ont-gen-mdu-env1	Parameter type: <Alarm::ONTGENERALENV1> (yes no) Possible values: - yes : mdu environmental alarm1 - no : do not detect the mdu environmental alarm1	mdu environmental alarm1 <i>This element is only shown in detail mode.</i>
ont-gen-mdu-env2	Parameter type: <Alarm::ONTGENERALENV2>	mdu environmental alarm2

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : mdu environmental alarm2 - no : do not detect the mdu environmental alarm2	<i>This element is only shown in detail mode.</i>
ont-gen-mdv-env3	Parameter type: <Alarm::ONTGENERALENV3> (yes no) Possible values: - yes : mdu environmental alarm3 - no : do not detect the mdu environmental alarm3	mdv environmental alarm3 <i>This element is only shown in detail mode.</i>
ont-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
ont-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	optical signal level is too high <i>This element is only shown in detail mode.</i>
ont-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

102.116 SFU ONT General Alarm Log Status Command

Command Description

This command displays the SFU ONT general alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log sfu-gen [(index)]

Command Parameters

Table 102.116-1 "SFU ONT General Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.116-2 "SFU ONT General Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
sfu-gen-omci-fail	Parameter type: <Alarm::ONTGENERALOMCICOMM> (yes no) Possible values: - yes : ont fails to respond to omci message requests - no : ont responds to omci message requests works properly	ont fails to respond to omci message requests <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-selftest	Parameter type: <Alarm::ONTGENERALEQPT> (yes no) Possible values: - yes : ont has failed a self test - no : ont self test works properly	ont has failed a self-test <i>This element is only shown in detail mode.</i>
sfu-gen-ac-pwr-fail	Parameter type: <Alarm::ONTGENERALACFAIL> (yes no) Possible values: - yes : loss of external ac power to the ont - no : external ac power to the ont is ok	loss of external ac power to the ont" <i>This element is only shown in detail mode.</i>
sfu-gen-bat-missing	Parameter type: <Alarm::ONTGENERALBATTMIS> (yes no) Possible values: - yes : battery is provisioned for ont but is missing - no : battery is provisioned and present for ont	battery is provisioned for ont but is missing <i>This element is only shown in detail mode.</i>
sfu-gen-bat-low	Parameter type: <Alarm::ONTGENERALBATTLOW> (yes no) Possible values: - yes : battery charge is low - no : battery charge is ok	battery charge is low <i>This element is only shown in detail mode.</i>
sfu-gen-bat-fail	Parameter type: <Alarm::ONTGENERALBATTFAIL> (yes no) Possible values: - yes : battery is provisioned and present but cannot recharge - no : battery is provisioned and present and can recharge	battery is provisioned and present but cannot recharge <i>This element is only shown in detail mode.</i>
sfu-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes no) Possible values: - yes : download of software to ont has failed - no : download of software to ont works properly	download of software to ont has failed <i>This element is only shown in detail mode.</i>
sfu-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes	ont failed to activate the passive image designated by the olt

name	Type	Description
	no) Possible values: - yes : ont failed to activate the passive image designated by the olt - no : ont works properly to activate the passive image designated by the olt	<i>This element is only shown in detail mode.</i>
sfu-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
sfu-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
sfu-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
sfu-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
sfu-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes	optical signal level is too high <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	<i>detail mode.</i>
sfu-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

102.117 SOHO ONT General Alarm Log Status Command

Command Description

This command displays the SOHO ONT general alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log soho-gen [(index)]

Command Parameters

Table 102.117-1 "SOHO ONT General Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

soho-gen-ac-pwr-fail	Parameter type: <Alarm::ONTGENERALACFAIL> (yes no) Possible values: - yes : loss of external ac power to the ont - no : external ac power to the ont is ok	loss of external ac power to the ont" <i>This element is only shown in detail mode.</i>
soho-gen-bat-missing	Parameter type: <Alarm::ONTGENERALBATTMIS> (yes no) Possible values: - yes : battery is provisioned for ont but is missing - no : battery is provisioned and present for ont	battery is provisioned for ont but is missing <i>This element is only shown in detail mode.</i>
soho-gen-bat-low	Parameter type: <Alarm::ONTGENERALBATTLOW> (yes no) Possible values: - yes : battery charge is low - no : battery charge is ok	battery charge is low <i>This element is only shown in detail mode.</i>
soho-gen-bat-fail	Parameter type: <Alarm::ONTGENERALBATTFAIL> (yes no) Possible values: - yes : battery is provisioned and present but cannot recharge - no : battery is provisioned and present and can recharge	battery is provisioned and present but cannot recharge <i>This element is only shown in detail mode.</i>
soho-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes no) Possible values: - yes : download of software to ont has failed - no : download of software to ont works properly	download of software to ont has failed <i>This element is only shown in detail mode.</i>
soho-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes	ont failed to activate the passive image designated by the olt

name	Type	Description
	no) Possible values: - yes : ont failed to activate the passive image designated by the olt - no : ont works properly to activate the passive image designated by the olt	<i>This element is only shown in detail mode.</i>
soho-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
soho-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
soho-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
soho-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
soho-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
soho-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
soho-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes	optical signal level is too high <i>This element is only shown in</i>

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	<i>detail mode.</i>
soho-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
soho-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

102.118 MDU ONT General Alarm Log Status Command

Command Description

This command displays the MDU ONT general alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log mdu-gen [ (index) ]
```

Command Parameters

Table 102.118-1 "MDU ONT General Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.118-2 "MDU ONT General Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
mdu-gen-omci-fail	Parameter type: <Alarm::ONTGENERALOMCICOMM> (yes no) Possible values: - yes : ont fails to respond to omci message requests - no : ont responds to omci message requests works properly	ont fails to respond to omci message requests <i>This element is only shown in detail mode.</i>
mdu-gen-eqpt-selftest	Parameter type: <Alarm::ONTGENERALEQPT> (yes no) Possible values: - yes : ont has failed a self test - no : ont self test works properly	ont has failed a self-test <i>This element is only shown in detail mode.</i>
mdu-gen-ac-pwr-fail	Parameter type: <Alarm::ONTGENERALACFAIL> (yes no) Possible values: - yes : loss of external ac power to the ont - no : external ac power to the ont is ok	loss of external ac power to the ont" <i>This element is only shown in detail mode.</i>
mdu-gen-bat-missing	Parameter type: <Alarm::ONTGENERALBATMISSE> (yes no) Possible values: - yes : battery is provisioned for ont but is missing - no : battery is provisioned and present for ont	battery is provisioned for ont but is missing <i>This element is only shown in detail mode.</i>
mdu-gen-bat-low	Parameter type: <Alarm::ONTGENERALBATLOW> (yes no) Possible values: - yes : battery charge is low - no : battery charge is ok	battery charge is low <i>This element is only shown in detail mode.</i>
mdu-gen-bat-fail	Parameter type: <Alarm::ONTGENERALBATTFAIL> (yes no) Possible values: - yes : battery is provisioned and present but cannot recharge - no : battery is provisioned and present and can recharge	battery is provisioned and present but cannot recharge <i>This element is only shown in detail mode.</i>
mdu-gen-phys-intrusion	Parameter type: <Alarm::ONTGENERALINTRUDER> (yes no) Possible values: - yes : unauthorized access to ont and door or box is open - no : authorized access to ont	unauthorized access to ont <i>This element is only shown in detail mode.</i>
mdu-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes	download of software to ont has failed

name	Type	Description
	no) Possible values: - yes : download of software to ont has failed - no : download of software to ont works properly	<i>This element is only shown in detail mode.</i>
mdu-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes no) Possible values: - yes : ont failed to activate the passive image designated by the olt - no : ont works properly to activate the passive image designated by the olt	ont failed to activate the passive image designated by the olt <i>This element is only shown in detail mode.</i>
mdu-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
mdu-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
mdu-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
mdu-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
mdu-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
mdu-gen-mdu-env1	Parameter type: <Alarm::ONTGENERALENV1> (yes no) Possible values:	mdu environmental alarm1 <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : mdu environmental alarm1 - no : do not detect the mdu environmental alarm1	
mdu-gen-mdv-env2	Parameter type: <Alarm::ONTGENERALENV2> (yes no) Possible values: - yes : mdu environmental alarm2 - no : do not detect the mdu environmental alarm2	mdv environmental alarm2 <i>This element is only shown in detail mode.</i>
mdv-gen-mdv-env3	Parameter type: <Alarm::ONTGENERALENV3> (yes no) Possible values: - yes : mdu environmental alarm3 - no : do not detect the mdu environmental alarm3	mdv environmental alarm3 <i>This element is only shown in detail mode.</i>
mdv-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
mdv-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	optical signal level is too high <i>This element is only shown in detail mode.</i>
mdv-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
mdv-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

102.119 ONT SUBSCRIBER CARD Alarm Log

Status Command

Command Description

This command displays the ONT SUBSCRIBER CARD alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-card [ (index) ]
```

Command Parameters

Table 102.119-1 "ONT SUBSCRIBER CARD Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.119-2 "ONT SUBSCRIBER CARD Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont-card	Parameter type: <Gpon::OntSlotAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14]	
Only Show Details: current and previous alarm log status		
name	Type	Description
ont-sbscr-lim-missing	Parameter type: <Alarm::ONTCARDLIMMISSING> (yes no) Possible values: - yes : provisioned ont card missing - no : provisioned ont card works properly	provisioned ont card missing <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-type-mis	Parameter type: <Alarm::ONTCARDLIMMEA> (yes no) Possible values: - yes : plug-in ont card is wrong type - no : ont card works properly	plug-in ont card is wrong type <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-removal	Parameter type: <Alarm::ONTCARDLIMIMPROPRMVL> (yes no) Possible values: - yes : ont card removed without being deprovisioned - no : ont card removed correctly	ont card removed without being deprovisioned <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-fail	Parameter type: <Alarm::ONTCARDLIMFAIL> (yes no) Possible values: - yes : ont card failed detected or failed self test - no : ont card works properly	ont card failed detected or failed self test <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-svc-mis	Parameter type: <Alarm::ONTCARDLIMSVCMIS> (yes no) Possible values: - yes : ont did not accept the omci configuration requests for the provisioned onu card - no : ont card works properly	ont did not accept the omci configuration requests for the provisioned onu card <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-port-mis	Parameter type: <Alarm::ONTCARDLIMNUMPORTSMIS> (yes no) Possible values: - yes : the actual number of ports of a plug-in ont card is different from the planned number of ports - no : the actual number of ports of a plug-in ont card is the same to the planned number of ports	the actual number of ports of a plug-in ont card is different from the planned number of ports <i>This element is only shown in detail mode.</i>

102.120 ONT SERVICES POTS Alarm Log Status Command

Command Description

This command displays the ONT SERVICES POTS alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-pots [ (index) ]
```

Command Parameters

Table 102.120-1 "ONT SERVICES POTS Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.120-2 "ONT SERVICES POTS Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont-pots	Parameter type: <Gpon::OntPotsAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	gpon ont pots port index <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the shelf number - Field type <Eqpt::SlotId> - the LT slot number - Field type <Eqpt::PonId> - the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Only Show Details: current and previous alarm log status

name	Type	Description
ont-svc-pots-svc-mis	Parameter type: <Alarm::ONTPOTSSVCMIS> (yes no) Possible values: - yes : ont service mismatch for provisioned pots - no : ont service pots works properly	ont service mismatch for provisioned pots <i>This element is only shown in detail mode.</i>
ont-svc-pots-rtcp-lost	Parameter type: <Alarm::ONTPOTSRTCPSTREAMLOSS> (yes no) Possible values: - yes : pots realtime transport control protocol stream lost - no : ont service pots works properly	pots realtime transport control protocol stream lost <i>This element is only shown in detail mode.</i>
ont-svc-pots-icnf-sub	Parameter type: <Alarm::ONTPOTSICONFIGSUBFAIL> (yes no) Possible values: - yes : iconfig subscription of the pots line failed - no : ont service pots works properly	pots line iconfig subscription failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-icnf-ntfy	Parameter type: <Alarm::ONTPOTSICONFIGNOTIFYFAIL> (yes no) Possible values: - yes : iconfig notify failed for a pots line - no : ont service pots works properly	pots line iconfig notify failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-icnf-http	Parameter type: <Alarm::ONTPOTSICONFIGHTTPFAIL> (yes no) Possible values: - yes : iconfig http redirect failed for a pots line - no : ont service pots works properly	pots line iconfig http failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-sip-reg	Parameter type: <Alarm::ONTPOTSSIPREGFAIL> (yes no) Possible values: - yes : sip registration failed for the pots line	pots line sip registration failure <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : ont service pots works properly	
ont-svc-pots-sip-inv	Parameter type: <Alarm::ONTPOTSSIPINVITEFAIL> (yes no) Possible values: - yes : sip invite request for the pots line failed - no : ont service pots works properly	pots line sip invite request failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-sip-subsc	Parameter type: <Alarm::ONTPOTSSIPSUBFAIL> (yes no) Possible values: - yes : sip subscribe failed for the pots line - no : ont service pots works properly	pots line sip subscribe failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-sip-mt-tc	Parameter type: <Alarm::ONTPOTSSIPMSGTMOUTTCA> (yes no) Possible values: - yes : number of sip message timeouts threshold has crossed for the pots line - no : ont service pots works properly	pots line sip message timeout threshold crossed <i>This element is only shown in detail mode.</i>
ont-svc-pots-pk-los-tc	Parameter type: <Alarm::ONTPOTSRTPPKTLOSSTCA> (yes no) Possible values: - yes : number of rtp bearer packets loss on a pots line has been crossed - no : ont service pots works properly	pots line rtp bearer packets loss threshold crossed <i>This element is only shown in detail mode.</i>
ont-svc-pots-jitter-tc	Parameter type: <Alarm::ONTPOTSJITTERTCA> (yes no) Possible values: - yes : rtp jitter threshold has been crossed on a pots line - no : ont service pots works properly	pots line rtp jitter threshold crossed <i>This element is only shown in detail mode.</i>
ont-svc-pots-subs-dns	Parameter type: <Alarm::ONTPOTSICNFSUBSDNS> (yes no) Possible values: - yes : iconfig subscription failed because domain name could not be resolved - no : ont service pots works properly	iconfig subscription failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-subs-tcp	Parameter type: <Alarm::ONTPOTSICNFSUBSTCP> (yes no) Possible values: - yes : iconfig subscription failed because of TCP socket - no : ont service pots works properly	iconfig subscription failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-subs-tls	Parameter type: <Alarm::ONTPOTSICNFSUBSTLS> (yes no) Possible values: - yes : iconfig subscription failed because of TLS session - no : ont service pots works properly	iconfig subscription failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-subs-auth	Parameter type: <Alarm::ONTPOTSICNFSUBSAUTH> (yes no) Possible values:	iconfig subscription failed <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : iconfig subscription failed because authentication failed - no : ont service pots works properly	
ont-svc-pots-subs-to	Parameter type: <Alarm::ONTPOTSICNFSUBSTO> (yes no) Possible values: - yes : iconfig subscription failed because of retransmission timeout - no : ont service pots works properly	iconfig subscription failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-subs-err	Parameter type: <Alarm::ONTPOTSICNFSUBSERR> (yes no) Possible values: - yes : iconfig subscription failed because of response error - no : ont service pots works properly	iconfig subscription failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-not-to	Parameter type: <Alarm::ONTPOTSICNFNOTTO> (yes no) Possible values: - yes : iconfig notification failed because of retransmission timeout - no : ont service pots works properly	iconfig notification failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-notref-to	Parameter type: <Alarm::ONTPOTSICNFNOTREFTO> (yes no) Possible values: - yes : iconfig notification refresh failed because of timeout - no : ont service pots works properly	iconfig notification failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-not-mal	Parameter type: <Alarm::ONTPOTSICNFNOTMAL> (yes no) Possible values: - yes : iconfig notification refresh failed because of a malformed message - no : ont service pots works properly	iconfig notification failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-not-rej	Parameter type: <Alarm::ONTPOTSICNFNOTREJ> (yes no) Possible values: - yes : iconfig notification refresh failed because it was rejected by the server - no : ont service pots works properly	iconfig notification failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-dns	Parameter type: <Alarm::ONTPOTSICNFHTTPDNS> (yes no) Possible values: - yes : iconfig doc retrieval failed because domain name could not be resolved - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-tcp	Parameter type: <Alarm::ONTPOTSICNFHTTPTCP> (yes no) Possible values: - yes : iconfig doc retrieval failed because of TCP socket - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-tls	Parameter type: <Alarm::ONTPOTSICNFHTTPTLS>	iconfig doc retrieval failed

102 Alarm Log Status Commands

name	Type	Description
	(yes no) Possible values: - yes : iconfig doc retrieval failed because of TLS session - no : ont service pots works properly	<i>This element is only shown in detail mode.</i>
ont-svc-pots-http-auth	Parameter type: <Alarm::ONTPOTSICNFHTTPAUTH> (yes no) Possible values: - yes : iconfig doc retrieval failed because authentication failed - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-to	Parameter type: <Alarm::ONTPOTSICNFHTTPTO> (yes no) Possible values: - yes : iconfig doc retrieval failed because of retransmission timeout - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-err	Parameter type: <Alarm::ONTPOTSICNFHTTPERR> (yes no) Possible values: - yes : iconfig doc retrieval failed because of response error - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-mal	Parameter type: <Alarm::ONTPOTSICNFHTTPMAL> (yes no) Possible values: - yes : iconfig doc retrieval failed because of a malformed message - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-insuff	Parameter type: <Alarm::ONTPOTSINSUFF> (yes no) Possible values: - yes : iconfig service failed because of insufficient data - no : ont VOIP service pots works properly	iconfig VOIP service failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-poos	Parameter type: <Alarm::ONTPOTSPOOS> (yes no) Possible values: - yes : pots ports out of service - no : pots ports work properly	pots ports out of service <i>This element is only shown in detail mode.</i>

102.121 ONT SERVICES LAN Alarm Log Status Command

Command Description

This command displays the ONT SERVICES LAN alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-lan [ (index) ]
```

Command Parameters

Table 102.121-1 "ONT SERVICES LAN Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.121-2 "ONT SERVICES LAN Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	gpon ont port <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-lan-mismatch	Parameter type: <Alarm::ONTLANSVCMIS> (yes no) Possible values: - yes : the ont did not accept the omci configuration requests for the lan service - no : ont service lan works properly	ont service mismatch for lan <i>This element is only shown in detail mode.</i>
ont-svc-lan-loss-sig	Parameter type: <Alarm::ONTLANLOS> (yes no) Possible values: - yes : loss of signal on an ethernet port interface - no : ont service lan works properly	loss of signal on an ethernet port interface <i>This element is only shown in detail mode.</i>
ont-svc-enet-poos	Parameter type: <Alarm::ONTENETPOOS> (yes no) Possible values: - yes : ethernet ports out of service - no : ethernet ports work properly	ethernet ports out of service <i>This element is only shown in detail mode.</i>

102.122 ONT TC TCA Alarm Log Status Command

Command Description

This command displays the ONT TC TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ont-tc-tca [(index)]

Command Parameters

Table 102.122-1 "ONT TC TCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.122-2 "ONT TC TCA Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-tc-rx-los-frag-tc	Parameter type: <Alarm::ONTTCTCARLOSTFRAGS> (yes no) Possible values: - yes : rx loss of gem fragments threshold crossed - no : ont works properly	rx loss of gem fragments threshold crossed <i>This element is only shown in detail mode.</i>
ont-tc-tx-los-frag-tc	Parameter type: <Alarm::ONTTCTCATLOSTFRAGS> (yes no) Possible values: - yes : tx loss of gem fragments threshold crossed - no : ont works properly	tx loss of gem fragments threshold crossed <i>This element is only shown in detail mode.</i>
ont-tc-bad-gem-hd-tc	Parameter type: <Alarm::ONTTCTCABADGEMHDS> (yes no) Possible values: - yes : bad gem header threshold crossed - no : ont works properly	bad gem header threshold crossed <i>This element is only shown in detail mode.</i>

102.123 ONT TCA Alarm Log Status Command

Command Description

This command displays the ONT TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-tca [ (index) ]
```

Command Parameters

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-uni-ds-drpdp-fr-tc	Parameter type: <Alarm::ONTL2UNIETHTCADSDRPFDRMS> (yes no) Possible values: - yes : downstream l2 dropped frames threshold crossed - no : ont works properly	downstream l2 dropped frames threshold crossed <i>This element is only shown in detail mode.</i>
ont-uni-up-drpdp-fr-tc	Parameter type: <Alarm::ONTL2UNIETHTCAUSDRPFDRMS> (yes no) Possible values: - yes : upstream l2 dropped frames threshold crossed - no : ont works properly	upstream l2 dropped frames threshold crossed <i>This element is only shown in detail mode.</i>
ont-uni-ds-crc-fr-tc	Parameter type: <Alarm::ONTL2UNIDSCRCRPFDRMS> (yes no) Possible values: - yes : downstream l2 rx crc error frames threshold crossed - no : ont works properly	downstream l2 rx crc error frames threshold crossed <i>This element is only shown in detail mode.</i>
ont-uni-up-crc-fr-tc	Parameter type: <Alarm::ONTL2UNIUPCRCRPFDRMS> (yes no) Possible values: - yes : upstream l2 rx crc error frames threshold crossed - no : ont works properly	upstream l2 rx crc error frames threshold crossed <i>This element is only shown in detail mode.</i>

102.125 OLT PON TC TCA Alarm Log Status Command

Command Description

This command displays the OLT PON TC TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log olt-pon-tc-tca [ (index) ]
```

Command Parameters

Table 102.125-1 " OLT PON TC TCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

name	Type	Description
olt-pon-tc-err-frag-tc	Parameter type: <Alarm::OLTPONTCTCAERRFRAGSPON> (yes no) Possible values: - yes : pon errored fragments threshold crossed - no : olt works properly	pon errored fragments threshold crossed <i>This element is only shown in detail mode.</i>
olt-pon-up-bw-tca	Parameter type: <Alarm::OLTPONTCTCAUPBWTCa> (yes no) Possible values: - yes : olt pon upstream bandwidth tca - no : olt works properly	OLT PON upstream bandwidth TCA <i>This element is only shown in detail mode.</i>
olt-pon-down-bw-tca	Parameter type: <Alarm::OLTPONTCTCADWBWTCA> (yes no) Possible values: - yes : olt pon downstream bandwidth tca - no : olt works properly	OLT PON downstream bandwidth TCA <i>This element is only shown in detail mode.</i>

102.126 OLT PON Utilization TCA Alarm Log Status Command

Command Description

This command displays the OLT PON utilization TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log olt-pon-util-tca [ (index) ]
```

Command Parameters

102.127 OLT Channel Pair Utilization TCA Alarm Log Status Command

Command Description

This command displays the channel-pair utilization TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log olt-chpr-util-tca [(index)]

Command Parameters

Table 102.127-1 "OLT Channel Pair Utilization TCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.127-2 "OLT Channel Pair Utilization TCA Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
channel-pair	Parameter type: <Gpon::ChannelPairId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId>	channel-pair ifindex <i>This element is only shown in detail mode.</i>

ont-svc-pots-subs-refr	Parameter type: <Alarm::ONTSERVICESPOTSSUBSREFR> (yes no) Possible values: - yes : pots iconfig subscription could not be refreshed - no : pots iconfig subscription refreshed	ont services pots iconfig subscription could not be refreshed <i>This element is only shown in detail mode.</i>
ont-svc-pots-not-refr	Parameter type: <Alarm::ONTSERVICESPOTSNOTREFR> (yes no) Possible values: - yes : pots iconfig notify response for refresh subscribe failed - no : pots iconfig notify response for refresh subscribe succeeds	ont services pots iconfig notification could not be refreshed <i>This element is only shown in detail mode.</i>
ont-svc-pots-icfg-err	Parameter type: <Alarm::ONTSERVICESPOTSICFGERR> (yes no) Possible values: - yes : pots service failed due to an unmapped iconfig error - no : pots service works properly	ont services pots service failed due to an unmapped iconfig error <i>This element is only shown in detail mode.</i>

102.130 ONT VEIP Alarm Log Status Command

Command Description

This command displays the ONT VEIP alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-veip [ (index) ]
```

Command Parameters

Table 102.130-1 " ONT VEIP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.130-2 " ONT VEIP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	gpon ont port <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-veip-mismatch	Parameter type: <Alarm::ONTVEIPMISMATCH> (yes no) Possible values: - yes : ont veip mismatch - no : ont veip match	ont veip mismatch <i>This element is only shown in detail mode.</i>

102.131 ONT IP HOST Alarm Log Status Command

Command Description

This command displays the ONT IP HOST alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-iphost [ (index) ]
```

Command Parameters

Table 102.131-1 " ONT IP HOST Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.131-2 " ONT IP HOST Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
port	Parameter type: <Gpon::IpHostCommonIndex> (ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::IpHostId> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> ont:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Ng2::IpHostId> vlanport:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan>	gpon iphost port <i>This element is only shown in detail mode.</i>

name	Type	Description
	vlanport:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni : <Eqpt::UnstackedVlan>) Possible values: - ont:ng2 : ngpon2 ont - vlanport:ng2 : ngpon2 vlanport - ont : ont - vlanport : vlanport Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Gpon::IpHostID> - iphost id Field type <Ng2::IpHostID> - iphost id (ngpon2) Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-ip-host-mismatch	Parameter type: <Alarm::ONTIPHOS TMIS> (yes no) Possible values: - yes : ont ip host mismatch - no : ont ip host match	ont ip host mismatch <i>This element is only shown in detail mode.</i>
ont-ip-host-ip-alloc	Parameter type: <Alarm::ONTIPHOS TFAIL> (yes no) Possible values: - yes : ont ip host IP allocation failure - no : ont ip host IP allocation works properly	ont ip host IP allocation failure <i>This element is only shown in detail mode.</i>

102.132 Alarm Table Alarm Log Status Command

Command Description

This command displays the alarm-table alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log alarm-table [(index)]

Command Parameters

Table 102.132-1 "Alarm Table Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.132-2 "Alarm Table Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
alarm-tbl-overflow	Parameter type: <Alarm::AlrmTblOflow> (overflow no-overflow) Possible values: - overflow : alarm table overflow - no-overflow : no alarm table overflow	identify if the alarm table has overflowed <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::AlrmTblOflow> (overflow no-overflow) Possible values: - overflow : alarm table overflow - no-overflow : no alarm table overflow	previously logged value of the alarm table overflow alarm <i>This element is only shown in detail mode.</i>

102.133 ONT VIDEO Alarm Log Status Command

Command Description

This command displays the ONT VIDEO alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ont-video [(index)]

Command Parameters

Table 102.133-1 " ONT VIDEO Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.133-2 " ONT VIDEO Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
video-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	video port <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-video-conf-mis	Parameter type: <Alarm::ONTVIDEOUNISVCMIS> (yes no) Possible values: - yes : config request failure for video service - no : ont service is ok	config request failure for video service <i>This element is only shown in detail mode.</i>
ont-svc-video-pw-high	Parameter type: <Alarm::ONTRFOUTHIGH> (yes no) Possible values: - yes : high power level for rf video signal - no : ont service is ok	high power level for rf video signal <i>This element is only shown in detail mode.</i>
ont-svc-video-pw-low	Parameter type: <Alarm::ONTRFOUTLOW> (yes no) Possible values: - yes : low power level for rf video signal - no : ont service is ok	low power level for rf video signal <i>This element is only shown in detail mode.</i>

102.134 ONT CES Alarm Log Status Command

Command Description

This command displays the ONT CES alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-ces [ (index) ]
```

Command Parameters

Table 102.134-1 " ONT CES Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.134-2 " ONT CES Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
cesds1-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	ces port <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-ces-ds1-mis	Parameter type: <Alarm::ONTCESDS1SVCNIS> (yes no) Possible values: - yes : ont service mismatch for provisioned ces ds1 - no : ont service is ok	ont service mismatch for provisioned ces ds1 <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-los	Parameter type: <Alarm::ONTCESDS1LOS> (yes no) Possible values: - yes : loss of signal at ds1 interface - no : ont service is ok	loss of signal at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-lof	Parameter type: <Alarm::ONTCESDS1LOF> (yes no) Possible values: - yes : loss of frame at ds1 interface - no : ont service is ok	loss of frame at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-rair	Parameter type: <Alarm::ONTCESDS1RAIR> (yes no) Possible values: - yes : receiving rai at ds1 interface - no : ont service is ok	receiving rai at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-ais	Parameter type: <Alarm::ONTCESDS1AISR> (yes no) Possible values: - yes : receiving ais at ds1 interface - no : ont service is ok	receiving ais at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-lnlpbk	Parameter type: <Alarm::ONTCESDS1LNLBPBK> (yes no) Possible values: - yes : receiving line loopback at ds1 interface - no : ont service is ok	receiving line loopback at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-tmlpbk	Parameter type: <Alarm::ONTCESDS1TMLPBK> (yes no) Possible values:	receiving terminal loopback at ds1 interface <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : receiving terminal loopback at ds1 interface - no : ont service is ok	

102.135 ONT VOIP Alarm Log Status Command

Command Description

This command displays the ONT VOIP alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-voip [ (index) ]
```

Command Parameters

Table 102.135-1 " ONT VOIP Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.135-2 " ONT VOIP Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
voip-uni	Parameter type: <Gpon::VoipOntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / 1 ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / 1) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	voip uni ifindex <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Eqpt::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port	
client-number	Parameter type: <Gpon::AlarmIndex2Integer> - a signed integer	service client number <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-voip-cnf-file	Parameter type: <Alarm::ONTVOICONFIGFLERR> (yes no) Possible values: - yes : voice configuration file error - no : ont service is ok	voice configuration file error <i>This element is only shown in detail mode.</i>
ont-svc-voip-svc-mis	Parameter type: <Alarm::ONTVOICLISERMIS> (yes no) Possible values: - yes : service mismatch for provisioned client service - no : ont service is ok	service mismatch for provisioned client service <i>This element is only shown in detail mode.</i>
ont-svc-voip-gw-comm	Parameter type: <Alarm::ONTVOIGATWCOMFAIL> (yes no) Possible values: - yes : voice gateway communication failure - no : ont service is ok	voice gateway communication failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-fail	Parameter type: <Alarm::ONTVOIDHCPSEFAIL> (yes no) Possible values: - yes : voice gateway communication failure - no : ont service is ok	voice dhcp server failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-icnf-sub	Parameter type: <Alarm::ONTVOIICONSUBFAIL> (yes no) Possible values: - yes : voice iconfig subscription failure - no : ont service is ok	voice iconfig subscription failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-icnf-ntfy	Parameter type: <Alarm::ONTVOIICONNOTFAIL> (yes no) Possible values: - yes : voice iconfig notify failure - no : ont service is ok	voice iconfig notify failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-icnf-http	Parameter type: <Alarm::ONTVOIICONHTTPFAIL> (yes no) Possible values:	voice iconfig http failure <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : voice iconfig http failure - no : ont service is ok	
ont-svc-voip-dhcp-to	Parameter type: <Alarm::ONTVOIDHCPTO> (yes no) Possible values: - yes : DHCP server retransmissions timed out - no : ont service is ok	DHCP server retransmissions timed out <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-mal	Parameter type: <Alarm::ONTVOIDHCPMAL> (yes no) Possible values: - yes : DHCP response was malformed - no : ont service is ok	DHCP response was malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-noad	Parameter type: <Alarm::ONTVOIDHCPNOAD> (yes no) Possible values: - yes : DHCP server failed to issue the required parameters - no : ont service is ok	DHCP server failed to issue the required parameters <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-leas	Parameter type: <Alarm::ONTVOIDHCPLEAS> (yes no) Possible values: - yes : DHCP Server failure due to problem in lease renewal - no : ont service is ok	DHCP Server failure due to problem in lease renewal <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-dns	Parameter type: <Alarm::ONTVOIICONDNS> (yes no) Possible values: - yes : iConfig Subscription failure due to DNS problem - no : ont service is ok	iConfig Subscription failure due to DNS problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-tcp	Parameter type: <Alarm::ONTVOIICONTCP> (yes no) Possible values: - yes : iConfig Subscription failure due to TCP socket problem - no : ont service is ok	iConfig Subscription failure due to TCP socket problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-tls	Parameter type: <Alarm::ONTVOIICONTLS> (yes no) Possible values: - yes : iConfig Subscription failure due to TLS session problem - no : ont service is ok	iConfig Subscription failure due to TLS session problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-auth	Parameter type: <Alarm::ONTVOIICONAUTH> (yes no) Possible values: - yes : iConfig Subscription failure due to authentication error - no : ont service is ok	iConfig Subscription failure due to authentication error <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-timeout	Parameter type: <Alarm::ONTVOIICONSUBSTO> (yes no) Possible values:	iConfig Subscription failure due to retransmission timeout <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : iConfig Subscription failure due to retransmission timeout - no : ont service is ok	
ont-svc-voip-sub-err	Parameter type: <Alarm::ONTVOIICONSUBSERR> (yes no) Possible values: - yes : iConfig Subscription failure due to response error - no : ont service is ok	iConfig Subscription failure due to response error <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-to	Parameter type: <Alarm::ONTVOIICONNOTTO> (yes no) Possible values: - yes : iConfig Notify response timeout for new subscription - no : ont service is ok	iConfig Notify response is malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-notref-to	Parameter type: <Alarm::ONTVOIICONNOTREFTO> (yes no) Possible values: - yes : iConfig Notify response timeout for subscription refresh - no : ont service is ok	iConfig Notify response timeout for subscription refresh <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-mal	Parameter type: <Alarm::ONTVOIICONNOTMAL> (yes no) Possible values: - yes : iConfig Notify response is malformed - no : ont service is ok	iConfig Notify response is malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-rej	Parameter type: <Alarm::ONTVOIICONNOTREJ> (yes no) Possible values: - yes : iConfig subscription request rejected by configuration server - no : ont service is ok	iConfig subscription request rejected by configuration server <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-dns	Parameter type: <Alarm::ONTVOIHTTPDNS> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to DNS problem - no : ont service is ok	VOIP client can't retrieve config doc due to DNS problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-tcp	Parameter type: <Alarm::ONTVOIHTTPTCP> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to TCP socket problem - no : ont service is ok	VOIP client can't retrieve config doc due to TCP socket problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-tls	Parameter type: <Alarm::ONTVOIHTTPTLS> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to TLS session problem - no : ont service is ok	VOIP client can't retrieve config doc due to TLS session problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-auth	Parameter type: <Alarm::ONTVOIHTTPAUTH>	VOIP client can't retrieve config

name	Type	Description
	(yes no) Possible values: - yes : VOIP client can't retrieve config doc due to auth error - no : ont service is ok	doc due to auth error <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-to	Parameter type: <Alarm::ONTVOIHTTPTO> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to re-tx timeout - no : ont service is ok	VOIP client can't retrieve config doc due to re-tx timeout <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-err	Parameter type: <Alarm::ONTVOIHTTPErr> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to response error - no : ont service is ok	VOIP client can't retrieve config doc due to response error <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-mal	Parameter type: <Alarm::ONTVOIICONHTTPMAL> (yes no) Possible values: - yes : iConfig configuration document is malformed - no : ont service is ok	iConfig configuration document is malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscr-refr	Parameter type: <Alarm::ONTVOIICONSUBSREFR> (yes no) Possible values: - yes : iConfig Subscription refresh error - no : ont service is ok	iConfig Subscription refresh error <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-refr	Parameter type: <Alarm::ONTVOIICONNOTREFR> (yes no) Possible values: - yes : iConfig Notify response for refresh subscribe failed - no : ont service is ok	iConfig Notify response for refresh subscribe failed <i>This element is only shown in detail mode.</i>
ont-svc-voip-icfg-err	Parameter type: <Alarm::ONTVOIICONERR> (yes no) Possible values: - yes : iConfig Configuration Error - no : ont service is ok	iConfig Configuration Error <i>This element is only shown in detail mode.</i>

102.136 ONT VIDEO ANI Alarm Log Status Command

Command Description

This command displays the ONT VIDEO ANI alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-video-ani [ (index) ]
```

Command Parameters

Table 102.136-1 " ONT VIDEO ANI Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.136-2 " ONT VIDEO ANI Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
vedio-ani-index	Parameter type: <Gpon::AlarmIndex2Integer> - a signed integer	vedio ani index <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-v-ani-conf-mis	Parameter type: <Alarm::ONTVIDEOANISVCMIS> (yes no) Possible values: - yes : config request failure for video ani service - no : ont service is ok	config request failure for video ani service <i>This element is only shown in detail mode.</i>
ont-svc-v-ani-loss-sig	Parameter type: <Alarm::ONTVIDEOLOS> (yes no) Possible values: - yes : video loss of signal on ani - no : ont service is ok	video loss of signal on ani <i>This element is only shown in detail mode.</i>
ont-svc-v-ani-lv-high	Parameter <Alarm::ONTVIDEOOPTSIGLEVELHIGH> (yes no) Possible values: - yes : high video optical signal level - no : ont service is ok	type: high video optical signal level <i>This element is only shown in detail mode.</i>
ont-svc-v-ani-lv-low	Parameter <Alarm::ONTVIDEOOPTSIGLEVELLOW> (yes no) Possible values: - yes : low video optical signal level - no : ont service is ok	type: low video optical signal level <i>This element is only shown in detail mode.</i>

102.137 ONT PWE Alarm Log Status Command

Command Description

This command displays the ONT PWE alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-pwe [ (index) ]
```

Command Parameters

Table 102.137-1 " ONT PWE Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.137-2 " ONT PWE Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ont-ces-uni	Parameter type: <Ces::InterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId>	ont ces uni <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	
service-id	Parameter type: <Gpon::AlarmIndex2Integer> - a signed integer	service id <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-pwe-mismatch	Parameter type: <Alarm::ONTPWESVCMIS> (yes no) Possible values: - yes : service mismatch for provisioned pseudowire - no : ont service is ok	service mismatch for provisioned pseudowire <i>This element is only shown in detail mode.</i>
ont-svc-pwe-reordr-lof	Parameter type: <Alarm::ONTPWELOSSREORDER> (yes no) Possible values: - yes : pseudowire reordering and loss of frame - no : ont service is ok	pseudowire reordering and loss of frame <i>This element is only shown in detail mode.</i>
ont-svc-pwe-jitt-buf-o	Parameter type: <Alarm::ONTPWEJBOVRRUN> (yes no) Possible values: - yes : pseudowire jitter buffer overrun - no : ont service is ok	pseudowire jitter buffer overrun <i>This element is only shown in detail mode.</i>
ont-svc-pwe-jitt-buf-u	Parameter type: <Alarm::ONTPWEJBUNDRUN> (yes no) Possible values: - yes : pseudowire jitter buffer underrun - no : ont service is ok	pseudowire jitter buffer underrun <i>This element is only shown in detail mode.</i>
ont-svc-pwe-malf-frms	Parameter type: <Alarm::ONTPWEMALFORM> (yes no) Possible values: - yes : pseudowire malformed frames - no : ont service is ok	pseudowire malformed frames <i>This element is only shown in detail mode.</i>
ont-svc-pwe-late-frms	Parameter type: <Alarm::ONTPWELATEFRMS> (yes no) Possible values: - yes : pseudowire late frames - no : ont service is ok	pseudowire late frames <i>This element is only shown in detail mode.</i>
ont-svc-pwe-link-loss	Parameter type: <Alarm::ONTPWELINKLOSS> (yes no) Possible values: - yes : pseudowire link loss - no : ont service is ok	pseudowire link loss <i>This element is only shown in detail mode.</i>
ont-svc-pwe-arp-fail	Parameter type: <Alarm::ONTPWEARPFAIL> (yes no) Possible values: - yes : pseudowire arp failure - no : ont service is ok	pseudowire arp failure <i>This element is only shown in detail mode.</i>

102.138 ONT CESE1 Alarm Log Status Command

Command Description

This command displays the ONT CESE1 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-cese1 [ (index) ]
```

Command Parameters

Table 102.138-1 " ONT CESE1 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.138-2 " ONT CESE1 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
ces-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	ces port <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-svc-ces-e1-mis	Parameter type: <Alarm::ONTCESE1SVCNIS> (yes no) Possible values: - yes : ont service mismatch for provisioned ces e1 - no : ont service is ok	ont service mismatch for provisioned ces e1 <i>This element is only shown in detail mode.</i>
ont-svc-ces-e1-los	Parameter type: <Alarm::ONTCESE1LOS> (yes no) Possible values: - yes : loss of signal at e1 interface - no : ont service is ok	loss of signal at e1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-e1-lof	Parameter type: <Alarm::ONTCESE1LOF> (yes no) Possible values: - yes : loss of frame at e1 interface - no : ont service is ok	loss of frame at e1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-e1-rair	Parameter type: <Alarm::ONTCESE1RAIR> (yes no) Possible values: - yes : receiving rai at e1 interface - no : ont service is ok	receiving rai at e1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-e1-ais	Parameter type: <Alarm::ONTCESE1AISR> (yes no) Possible values: - yes : receiving ais at e1 interface - no : ont service is ok	receiving ais at e1 interface <i>This element is only shown in detail mode.</i>

102.139 ONT XDSL Alarm Log Status Command

Command Description

This command displays the ONT XDSL alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-xdsl [ (index) ]
```

Command Parameters

Table 102.139-1 " ONT XDSL Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

102.145 ONT MoCA Alarm Log Status Command

Command Description

This command displays the ONT MoCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ont-moca [(index)]

Command Parameters

Table 102.145-1 " ONT MoCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.145-2 " ONT MoCA Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
uni-index	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	ont port <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-moca-svc-mis	Parameter type: <Alarm::ONTMOCASVCMIS> (yes no) Possible values: - yes : moca ont service mismatch - no : moca ont service is ok	ont moca service mismatch <i>This element is only shown in detail mode.</i>
ont-moca-link-los	Parameter type: <Alarm::ONTMOCALOL> (yes no) Possible values: - yes : moca loss of link - no : moca ont service is ok	ont moca loss of link <i>This element is only shown in detail mode.</i>
ont-moca-min-bw	Parameter type: <Alarm::ONTMOCALIMLINK> (yes no) Possible values: - yes : moca limited link - no : moca ont service is ok	ont moca bw between nodes less than minimum bw <i>This element is only shown in detail mode.</i>

102.146 ONT MoCA Threshold Crossing Alert (TCA) Alarm Log Command

Command Description

This command displays the ONT MoCA Threshold Crossing Alert (TCA) alarm log.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-moca-tca [ (index) ]
```

Command Parameters

Table 102.146-1 " ONT MoCA Threshold Crossing Alert (TCA) Alarm Log Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.146-2 " ONT MoCA Threshold Crossing Alert (TCA) Alarm Log Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
uni-index	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number	ont port <i>This element is only shown in detail mode.</i>

name	Type	Description
	Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: current and previous alarm log status		
name	Type	Description
ont-moca-rx-err-fr	Parameter type: <Alarm::ONTMOCATCARXERRFRMS> (yes no) Possible values: - yes : ont moca rx errored frames threshold alert - no : no ont moca threshold alerts	ont moca rx errored frames threshold alert <i>This element is only shown in detail mode.</i>

102.147 Auto-Switch Alarm Log Status command

Command Description

This command displays log table of autoswitch alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log auto-switch [(index)]

Command Parameters

Table 102.147-1 "Auto-Switch Alarm Log Status command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.147-2 "Auto-Switch Alarm Log Status command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
auto-switch-status	Parameter type: <Alarm::autoSwitchStatus> (yes	show auto-switch alarm status. <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : auto-switch alarm status - no : auto-switch alarm status clear	<i>detail mode.</i>
prev-status	Parameter type: <Alarm::autoSwitchStatus> (yes no) Possible values: - yes : auto-switch alarm status - no : auto-switch alarm status clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
queue-full-atm	Parameter type: <Alarm::auswqueuefullatm> (yes no) Possible values: - yes : auto-switch queue full for ATM - no : auto-switch queue full for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswqueuefullatm> (yes no) Possible values: - yes : auto-switch queue full for ATM - no : auto-switch queue full for ATM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-data-bkup-fail-atm	Parameter type: <Alarm::auswbkpfailatm> (yes no) Possible values: - yes : auto-switch data backup failed for ATM - no : auto-switch data backup failed for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswbkpfailatm> (yes no) Possible values: - yes : auto-switch data backup failed for ATM - no : auto-switch data backup failed for ATM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
recfg-fail-atm	Parameter type: <Alarm::auswrecfgfailatm> (yes no) Possible values: - yes : auto-switch reconfig failed for ATM - no : auto-switch reconfig failed for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswrecfgfailatm> (yes no) Possible values: - yes : auto-switch reconfig failed for ATM - no : auto-switch reconfig failed for ATM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
data-unavail-atm	Parameter type: <Alarm::auswdataunatm> (yes no) Possible values: - yes : auto-switch data unavailable for ATM - no : auto-switch data unavailable for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswdataunatm> (yes no) Possible values: - yes : auto-switch data unavailable for ATM	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- no : auto-switch data unavailable for ATM clear	
queue-full-ptm	Parameter type: <Alarm::auswqueuefulptm> (yes no) Possible values: - yes : auto-switch queue full for PTM - no : auto-switch queue full for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswqueuefulptm> (yes no) Possible values: - yes : auto-switch queue full for PTM - no : auto-switch queue full for PTM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
backup-fail-ptm	Parameter type: <Alarm::auswbkpfailptm> (yes no) Possible values: - yes : auto-switch data backup failed for PTM - no : auto-switch data backup failed for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswbkpfailptm> (yes no) Possible values: - yes : auto-switch data backup failed for PTM - no : auto-switch data backup failed for PTM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
recfg-fail-ptm	Parameter type: <Alarm::auswrecfgfailptm> (yes no) Possible values: - yes : auto-switch reconfig failed for PTM - no : auto-switch reconfig failed for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswrecfgfailptm> (yes no) Possible values: - yes : auto-switch reconfig failed for PTM - no : auto-switch reconfig failed for PTM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
data-unavail-ptm	Parameter type: <Alarm::auswdataunptm> (yes no) Possible values: - yes : auto-switch data unavailable for PTM - no : auto-switch data unavailable for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswdataunptm> (yes no) Possible values: - yes : auto-switch data unavailable for PTM - no : auto-switch data unavailable for PTM clear	status of auto-switch with its previous logged value. <i>This element is only shown in detail mode.</i>
bakp-fail-atm	Parameter type: <Alarm::auswbakpfailatm> (yes no) Possible values: - yes : auto-switch backup fail for ATM - no : auto-switch backup fail for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::auswbakpfailatm> (yes	status of auto-switch with its previous logged value.

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : auto-switch backup fail for ATM - no : auto-switch bakcup fail for ATM clear	<i>This element is only shown in detail mode.</i>

102.148 Channel Pair Alarm Log Status Command

Command Description

This command displays the Channel Pair alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log channel-pair [(index)]

Command Parameters

Table 102.148-1 " Channel Pair Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.148-2 " Channel Pair Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
channel-pair	Parameter type: <Gpon::ChannelPairId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	specify which channel pair the alarm occurred on. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm log status		
name	Type	Description
comm-fail	Parameter type: <Alarm::ChnPairComm> ((failing fail))	current status of Channel pair Communication failure on OLT

name	Type	Description
	ok) Possible values: - failing : Channel pair Communication is failing - fail : Channel pair Communication is failing - ok : Channel pair Communication is ok	Port <i>This element is only shown in detail mode.</i>
tx-fail	Parameter type: <Alarm::ChnPairTf> ((failing fail) ok) Possible values: - failing : Transmitt is failing - fail : Transmitt is failing - ok : Transmitt is ok	current status of transmit failure on OLT port <i>This element is only shown in detail mode.</i>
new-ont	Parameter type: <Alarm::ChnPairNewOnt> ((failing fail) ok) Possible values: - failing : NEW ONT is failing - fail : NEW ONT is failing - ok : NEW ONT is ok	current status of unprovisioned ont appearance <i>This element is only shown in detail mode.</i>
prov-mismatch	Parameter type: <Alarm::ChnPairMea> ((failing fail) ok) Possible values: - failing : Channel Pair Mismatch Provisioning is failing - fail : Channel Pair Mismatch Provisioning is failing - ok : Channel Pair Mismatch Provisioning is ok	current status of pon provision failure. <i>This element is only shown in detail mode.</i>
loss-sig	Parameter type: <Alarm::ChnPairLoss> ((failing fail) ok) Possible values: - failing : Channel Pair Loss of Signal is failing - fail : Channel Pair Loss of Signal is failing - ok : Channel Pair Loss of Signal is ok	current status of channel pair loss. <i>This element is only shown in detail mode.</i>
diagnostic	Parameter type: <Alarm::ChnPairRogueTest> ((failing fail) ok) Possible values: - failing : Rogue ONT detection mechanism effective is failing - fail : Rogue ONT detection mechanism effective is failing - ok : Rogue ONT detection mechanism effective is ok	current status of diagnostic tests <i>This element is only shown in detail mode.</i>
loid-conflict	Parameter type: <Alarm::ChnPairLoidConflict> ((failing fail) ok) Possible values: - failing : ONT LOID Conflict is failing - fail : ONT LOID Conflict is failing - ok : LOID Conflict is ok	current status of loid conflict ont. <i>This element is only shown in detail mode.</i>
loid-pwd-err	Parameter type: <Alarm::ChnPairLoidPwdErr> ((failing fail) ok) Possible values: - failing : ONT LOID PWD ERR is failing - fail : ONT LOID PWD ERR is failing - ok : ONT LOID PWD ERR is ok	current status of loid password error. <i>This element is only shown in detail mode.</i>
stk-laser-dis	Parameter type: <Alarm::ChnPairStkLaserDis> ((failing fail)	current status of stuck laser disabled.

102 Alarm Log Status Commands

name	Type	Description
	ok) Possible values: - failing : Unranged ONT with stuck laser disabled is failing - fail : Unranged ONT with stuck laser disabled is failing - ok : Unranged ONT with stuck laser disabled is ok	<i>This element is only shown in detail mode.</i>
sfp-mismatch	Parameter type: <Alarm::ChnPairSfpMismatch> ((failing fail) ok) Possible values: - failing : sfp mismatch is failing - fail : sfp mismatch is failing - ok : sfp mismatch is ok	current status of sfp mismatch. <i>This element is only shown in detail mode.</i>
rng-mismatch	Parameter type: <Alarm::ChnPairRngMismatch> ((failing fail) ok) Possible values: - failing : ranging mismatch is failing - fail : ranging mismatch is failing - ok : ranging mismatch is ok	current status of ranging mismatch. <i>This element is only shown in detail mode.</i>
alien-test	Parameter type: <Alarm::ChnPairAlienTest> ((failing fail) ok) Possible values: - failing : Alien ONT detection mechanism is active - fail : Alien ONT detection mechanism is active - ok : Alien ONT detection mechanism is not active	current status of alien diagnostic tests <i>This element is only shown in detail mode.</i>
alien-detect	Parameter type: <Alarm::ChnPairAlienDetected> ((failing fail) ok) Possible values: - failing : Alien ONT detected - fail : Alien ONT detected - ok : No alien ONT detected	current status of alien detect <i>This element is only shown in detail mode.</i>
deactont-high-tca	Parameter type: <Alarm::ChnPairDeactOntHighTca> (failing ok) Possible values: - failing : deactivated ont amount exceed high threshold occurred - ok : deactivated ont amount is less than high threshold occurred	current status of deactont high tca <i>This element is only shown in detail mode.</i>
deactont-low-tca	Parameter type: <Alarm::ChnPairDeactOntLowTca> (failing ok) Possible values: - failing : deactivated ont amount exceed low threshold occurred - ok : deactivated ont amount is less than low threshold occurred	current status of deactont low tca <i>This element is only shown in detail mode.</i>
datapath-integ	Parameter type: <Alarm::ChnPairDataPathInteg> (failing ok) Possible values: - failing : number of ONTs with SIPREGTO alarm exceeds threshold - ok : number of ONTs with SIPREGTO alarm does not exceed the threshold	current status of Channel-Pair Data Path Integrity <i>This element is only shown in detail mode.</i>

102.149 Channel Pair OLT TC TCA Alarm Log Status Command

Command Description

This command displays the Channel Pair OLT TC TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log olt-chpair-tc-tca [ (index) ]
```

Command Parameters

Table 102.149-1 " Channel Pair OLT TC TCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 102.149-2 " Channel Pair OLT TC TCA Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
channel-pair	Parameter type: <Gpon::ChannelPairId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channelpair ifindex <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
olt-chpr-tc-err-frag	Parameter type: <Alarm::OLTCHPRTCTCAERRFRAGSPON> (yes no) Possible values: - yes : channelpair errored fragments threshold crossed - no : olt works properly	channelpair errored fragments threshold crossed <i>This element is only shown in detail mode.</i>
olt-chpr-up-bw-tca	Parameter type: <Alarm::OLTCHPRTCTCAUPBWTCa> (yes no) Possible values: - yes : olt channelpair upstream bandwidth tca - no : olt works properly	OLT CHANNELPAIR upstream bandwidth TCA <i>This element is only shown in detail mode.</i>
olt-chpr-down-bw-tca	Parameter type: <Alarm::OLTCHPRTCTCADWBWTCA> (yes no) Possible values: - yes : olt channelpair downstream bandwidth tca - no : olt works properly	OLT PON downstream bandwidth TCA <i>This element is only shown in detail mode.</i>

102.150 Ont Configuration Download Alarm Log Status Command

Command Description

This command displays the ont configuration download alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log ont-cfg-dld [ (index) ]
```

Command Parameters

Table 102.150-1 "Ont Configuration Download Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.150-2 "Ont Configuration Download Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
cfgfile-idx	Parameter type: <Alarm::OntCfgFileIndex> (configure file 1 configure file 2) Possible values: - configure file 1 : configure file 1 generate the alarm - configure file 2 : configure file 2 generate the alarm	identifies the configure file which generate the alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
cfg-dld-fail	Parameter type: <Alarm::OntCfgDldFail> (yes no) Possible values: - yes : download of configure file to ont is failed - no : download of configure file to ont is ok	current status of the alarm specifying download of configure file to ont is failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgDldFail> (yes no) Possible values: - yes : download of configure file to ont is failed - no : download of configure file to ont is ok	status of cfg-dld-fail with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-act-fail	Parameter type: <Alarm::OntCfgActFail> (yes no) Possible values: - yes : activate the passive config file failed - no : activate the passive config file ok	current status of the alarm specifying activate of configure file to ont is failed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgActFail> (yes no) Possible values: - yes : activate the passive config file failed - no : activate the passive config file ok	status of cfg-act-fail with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-dld-ip	Parameter type: <Alarm::OntCfgDldIp> (yes no) Possible values: - yes : ont configure file download in progress - no : no ont configure file download detected	current status of the alarm specifying whether downloading <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgDldIp> (yes no) Possible values: - yes : ont configure file download in progress - no : no ont configure file download detected	status of cfg-dld-ip with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-ver-mismatch	Parameter type: <Alarm::OntCfgVerMismatch> (yes	current status of the alarm specifying whether planned

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : the planned configure file does not match the active configure file - no : the planned configure file match the active configure file	configure file match the active configure file or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgVerMismatch> (yes no) Possible values: - yes : the planned configure file does not match the active configure file - no : the planned configure file match the active configure file	status of cfg-ver-mismatch with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-file-missing	Parameter type: <Alarm::OntCfgFileMissing> (yes no) Possible values: - yes : ont configure file missing or has an error - no : ont configure file ok	ont configure file missing <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgFileMissing> (yes no) Possible values: - yes : ont configure file missing or has an error - no : ont configure file ok	status of cfg-file-missing with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-verctrl-err	Parameter type: <Alarm::OntCfgVerCtrlErr> (yes no) Possible values: - yes : ont configure file version control error - no : ont configure file version control ok	ont configure file version control error <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgVerCtrlErr> (yes no) Possible values: - yes : ont configure file version control error - no : ont configure file version control ok	status of cfg-verctrl-err with its previous logged value. <i>This element is only shown in detail mode.</i>
cfg-not-supported	Parameter type: <Alarm::OntCfgNotSupported> (yes no) Possible values: - yes : ont not support the configure file download function - no : ont support the configure file download function	ont not support configure file download function <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::OntCfgNotSupported> (yes no) Possible values: - yes : ont not support the configure file download function - no : ont support the configure file download function	status of cfg-not-supported with its previous logged value. <i>This element is only shown in detail mode.</i>

102.151 HGU TR069 Alarm Log Status Command

Command Description

This command displays the hgu tr069 alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log hgu-tr069 [ (index) ]
```

Command Parameters

Table 102.151-1 "HGU TR069 Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.151-2 "HGU TR069 Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	identifies the ont entry <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
cust-alm1	Parameter type: <Alarm::HguCustAlm1> (yes no) Possible values: - yes : customized alarm 1 exist - no : customized alarm 1 not exist	current status of customized alarm 1 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm1> (yes no) Possible values: - yes : customized alarm 1 exist - no : customized alarm 1 not exist	status of cust-alm1 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm2	Parameter type: <Alarm::HguCustAlm2> (yes no) Possible values: - yes : customized alarm 2 exist - no : customized alarm 2 not exist	current status of customized alarm 2 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm2> (yes no) Possible values: - yes : customized alarm 2 exist - no : customized alarm 2 not exist	status of cust-alm2 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm3	Parameter type: <Alarm::HguCustAlm3> (yes no) Possible values: - yes : customized alarm 3 exist - no : customized alarm 3 not exist	current status of customized alarm 3 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm3> (yes no) Possible values: - yes : customized alarm 3 exist - no : customized alarm 3 not exist	status of cust-alm3 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm4	Parameter type: <Alarm::HguCustAlm4> (yes no) Possible values: - yes : customized alarm 4 exist - no : customized alarm 4 not exist	current status of customized alarm 4 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm4> (yes no) Possible values: - yes : customized alarm 4 exist	status of cust-alm4 with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : customized alarm 4 not exist	
cust-alm5	Parameter type: <Alarm::HguCustAlm5> (yes no) Possible values: - yes : customized alarm 5 exist - no : customized alarm 5 not exist	current status of customized alarm 5 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm5> (yes no) Possible values: - yes : customized alarm 5 exist - no : customized alarm 5 not exist	status of cust-alm5 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm6	Parameter type: <Alarm::HguCustAlm6> (yes no) Possible values: - yes : customized alarm 6 exist - no : customized alarm 6 not exist	current status of customized alarm 6 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm6> (yes no) Possible values: - yes : customized alarm 6 exist - no : customized alarm 6 not exist	status of cust-alm6 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm7	Parameter type: <Alarm::HguCustAlm7> (yes no) Possible values: - yes : customized alarm 7 exist - no : customized alarm 7 not exist	current status of customized alarm 7 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm7> (yes no) Possible values: - yes : customized alarm 7 exist - no : customized alarm 7 not exist	status of cust-alm7 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm8	Parameter type: <Alarm::HguCustAlm8> (yes no) Possible values: - yes : customized alarm 8 exist - no : customized alarm 8 not exist	current status of customized alarm 8 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm8> (yes no) Possible values: - yes : customized alarm 8 exist - no : customized alarm 8 not exist	status of cust-alm8 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm9	Parameter type: <Alarm::HguCustAlm9> (yes no) Possible values: - yes : customized alarm 9 exist - no : customized alarm 9 not exist	current status of customized alarm 9 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm9> (yes	status of cust-alm9 with its previous logged value.

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : customized alarm 9 exist - no : customized alarm 9 not exist	<i>This element is only shown in detail mode.</i>
cust-alm10	Parameter type: <Alarm::HguCustAlm10> (yes no) Possible values: - yes : customized alarm 10 exist - no : customized alarm 10 not exist	current status of customized alarm 10 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm10> (yes no) Possible values: - yes : customized alarm 10 exist - no : customized alarm 10 not exist	status of cust-alm10 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm11	Parameter type: <Alarm::HguCustAlm11> (yes no) Possible values: - yes : customized alarm 11 exist - no : customized alarm 11 not exist	current status of customized alarm 11 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm11> (yes no) Possible values: - yes : customized alarm 11 exist - no : customized alarm 11 not exist	status of cust-alm11 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm12	Parameter type: <Alarm::HguCustAlm12> (yes no) Possible values: - yes : customized alarm 12 exist - no : customized alarm 12 not exist	current status of customized alarm 12 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm12> (yes no) Possible values: - yes : customized alarm 12 exist - no : customized alarm 12 not exist	status of cust-alm12 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm13	Parameter type: <Alarm::HguCustAlm13> (yes no) Possible values: - yes : customized alarm 13 exist - no : customized alarm 13 not exist	current status of customized alarm 13 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm13> (yes no) Possible values: - yes : customized alarm 13 exist - no : customized alarm 13 not exist	status of cust-alm13 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm14	Parameter type: <Alarm::HguCustAlm14> (yes no) Possible values: - yes : customized alarm 14 exist	current status of customized alarm 14 <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : customized alarm 14 not exist	
prev-status	Parameter type: <Alarm::HguCustAlm14> (yes no) Possible values: - yes : customized alarm 14 exist - no : customized alarm 14 not exist	status of cust-alm14 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm15	Parameter type: <Alarm::HguCustAlm15> (yes no) Possible values: - yes : customized alarm 15 exist - no : customized alarm 15 not exist	current status of customized alarm 15 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm15> (yes no) Possible values: - yes : customized alarm 15 exist - no : customized alarm 15 not exist	status of cust-alm15 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm16	Parameter type: <Alarm::HguCustAlm16> (yes no) Possible values: - yes : customized alarm 16 exist - no : customized alarm 16 not exist	current status of customized alarm 16 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm16> (yes no) Possible values: - yes : customized alarm 16 exist - no : customized alarm 16 not exist	status of cust-alm16 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm17	Parameter type: <Alarm::HguCustAlm17> (yes no) Possible values: - yes : customized alarm 17 exist - no : customized alarm 17 not exist	current status of customized alarm 17 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm17> (yes no) Possible values: - yes : customized alarm 17 exist - no : customized alarm 17 not exist	status of cust-alm17 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm18	Parameter type: <Alarm::HguCustAlm18> (yes no) Possible values: - yes : customized alarm 18 exist - no : customized alarm 18 not exist	current status of customized alarm 18 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm18> (yes no) Possible values: - yes : customized alarm 18 exist - no : customized alarm 18 not exist	status of cust-alm18 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm19	Parameter type: <Alarm::HguCustAlm19> (yes	current status of customized alarm 19

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : customized alarm 19 exist - no : customized alarm 19 not exist	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm19> (yes no) Possible values: - yes : customized alarm 19 exist - no : customized alarm 19 not exist	status of cust-alm19 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm20	Parameter type: <Alarm::HguCustAlm20> (yes no) Possible values: - yes : customized alarm 20 exist - no : customized alarm 20 not exist	current status of customized alarm 20 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm20> (yes no) Possible values: - yes : customized alarm 20 exist - no : customized alarm 20 not exist	status of cust-alm20 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm21	Parameter type: <Alarm::HguCustAlm21> (yes no) Possible values: - yes : customized alarm 21 exist - no : customized alarm 21 not exist	current status of customized alarm 21 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm21> (yes no) Possible values: - yes : customized alarm 21 exist - no : customized alarm 21 not exist	status of cust-alm21 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm22	Parameter type: <Alarm::HguCustAlm22> (yes no) Possible values: - yes : customized alarm 22 exist - no : customized alarm 22 not exist	current status of customized alarm 22 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm22> (yes no) Possible values: - yes : customized alarm 22 exist - no : customized alarm 22 not exist	status of cust-alm22 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm23	Parameter type: <Alarm::HguCustAlm23> (yes no) Possible values: - yes : customized alarm 23 exist - no : customized alarm 23 not exist	current status of customized alarm 23 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm23> (yes no) Possible values: - yes : customized alarm 23 exist	status of cust-alm23 with its previous logged value. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : customized alarm 23 not exist	
cust-alm24	Parameter type: <Alarm::HguCustAlm24> (yes no) Possible values: - yes : customized alarm 24 exist - no : customized alarm 24 not exist	current status of customized alarm 24 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm24> (yes no) Possible values: - yes : customized alarm 24 exist - no : customized alarm 24 not exist	status of cust-alm24 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm25	Parameter type: <Alarm::HguCustAlm25> (yes no) Possible values: - yes : customized alarm 25 exist - no : customized alarm 25 not exist	current status of customized alarm 25 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm25> (yes no) Possible values: - yes : customized alarm 25 exist - no : customized alarm 25 not exist	status of cust-alm25 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm26	Parameter type: <Alarm::HguCustAlm26> (yes no) Possible values: - yes : customized alarm 26 exist - no : customized alarm 26 not exist	current status of customized alarm 26 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm26> (yes no) Possible values: - yes : customized alarm 26 exist - no : customized alarm 26 not exist	status of cust-alm26 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm27	Parameter type: <Alarm::HguCustAlm27> (yes no) Possible values: - yes : customized alarm 27 exist - no : customized alarm 27 not exist	current status of customized alarm 27 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm27> (yes no) Possible values: - yes : customized alarm 27 exist - no : customized alarm 27 not exist	status of cust-alm27 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm28	Parameter type: <Alarm::HguCustAlm28> (yes no) Possible values: - yes : customized alarm 28 exist - no : customized alarm 28 not exist	current status of customized alarm 28 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm28> (yes	status of cust-alm28 with its previous logged value.

102 Alarm Log Status Commands

name	Type	Description
	no) Possible values: - yes : customized alarm 28 exist - no : customized alarm 28 not exist	<i>This element is only shown in detail mode.</i>
cust-alm29	Parameter type: <Alarm::HguCustAlm29> (yes no) Possible values: - yes : customized alarm 29 exist - no : customized alarm 29 not exist	current status of customized alarm 29 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm29> (yes no) Possible values: - yes : customized alarm 29 exist - no : customized alarm 29 not exist	status of cust-alm29 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm30	Parameter type: <Alarm::HguCustAlm30> (yes no) Possible values: - yes : customized alarm 30 exist - no : customized alarm 30 not exist	current status of customized alarm 30 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm30> (yes no) Possible values: - yes : customized alarm 30 exist - no : customized alarm 30 not exist	status of cust-alm30 with its previous logged value. <i>This element is only shown in detail mode.</i>
cust-alm31	Parameter type: <Alarm::HguCustAlm31> (yes no) Possible values: - yes : customized alarm 31 exist - no : customized alarm 31 not exist	current status of customized alarm 31 <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::HguCustAlm31> (yes no) Possible values: - yes : customized alarm 31 exist - no : customized alarm 31 not exist	status of cust-alm31 with its previous logged value. <i>This element is only shown in detail mode.</i>

102.152 Equipment Holder Extended Alarm Log Status Command

Command Description

This command displays the equipment holder extended alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log eqpt-psu [ (index) ]
```

Command Parameters

Table 102.152-1 "Equipment Holder Extended Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.152-2 "Equipment Holder Extended Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
Only Show Details: current and previous alarm log status		
name	Type	Description
psu-a-fail-presence	Parameter type: <Alarm::psuAPresence> (yes no) Possible values:	current status of PSU A presence <i>This element is only shown in detail mode.</i>

102 Alarm Log Status Commands

name	Type	Description
	- yes : PSU A presence failure - no : PSU A presence state OK	
prev-status	Parameter type: <Alarm::psuAPresence> (yes no) Possible values: - yes : PSU A presence failure - no : PSU A presence state OK	status of PSU A presence alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-overtemp	Parameter type: <Alarm::psuAFailOverTemp> (yes no) Possible values: - yes : PSU A failure over temperature - no : PSU A temperature OK	current status of PSU A temperature alarm <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::psuAFailOverTemp> (yes no) Possible values: - yes : PSU A failure over temperature - no : PSU A temperature OK	status of PSU A output over temperature alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-vin-ac-nok	Parameter type: <Alarm::psuAFailVinACNOK> (yes no) Possible values: - yes : PSU A failure input AC voltage - no : PSU A input AC voltage OK	current status of PSU A input AC voltage alarm <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::psuAFailVinACNOK> (yes no) Possible values: - yes : PSU A failure input AC voltage - no : PSU A input AC voltage OK	status of PSU A input AC voltage alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-presence	Parameter type: <Alarm::psuBPresence> (yes no) Possible values: - yes : PSU B presence failure - no : PSU B presence state OK	current status of PSU B presence <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::psuBPresence> (yes no) Possible values: - yes : PSU B presence failure - no : PSU B presence state OK	status of PSU B presence alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-overtemp	Parameter type: <Alarm::psuBFailOverTemp> (yes no) Possible values: - yes : PSU B failure over temperature - no : PSU B temperature OK	current status of PSU B temperature alarm <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::psuBFailOverTemp> (yes no) Possible values: - yes : PSU B failure over temperature - no : PSU B temperature OK	status of PSU B output over temperature alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-vin-ac-nok	Parameter type: <Alarm::psuBFailVinACNOK>	current status of PSU B input AC

name	Type	Description
	(yes no) Possible values: - yes : PSU B failure input AC voltage - no : PSU B input AC voltage OK	voltage alarm <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::psuBFailVinACNOK> (yes no) Possible values: - yes : PSU B failure input AC voltage - no : PSU B input AC voltage OK	status of PSU B input AC voltage alarm <i>This element is only shown in detail mode.</i>

102.153 Ethernet Ring Alarm Log Status Command

Command Description

This command displays ethernet ring alarm Log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log ethernet-ring [(index)]

Command Parameters

Table 102.153-1 "Ethernet Ring Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.153-2 "Ethernet Ring Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged <i>This element is only shown in detail mode.</i>
eth-ring-instance-id	Parameter type: <UnsignedSignedInteger> - an unsigned integer	ethernet ring instance id where the alarm has occurred <i>This element is only shown in detail mode.</i>
eth-ring-path	Parameter type: <Alarm::EthernetRingPath> (path-a path-b n/a) Possible values: - path-a : path-a of the ethernet ring instance - path-b : path-b of the ethernet ring instance - n/a : not applicable for the alarm, fop-pm	unique identification for the alarm, which identifies the path of the ethernet ring instance <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
eth-ring-fwd-st	Parameter type: <Alarm::EthernetRingPathFwdState>	current status of the forward state

name	Type	Description
	(blocked unblocked) Possible values: - blocked : ethernet ring path fwd state blocked - unblocked : ethernet ring path fwd state unblocked	of the ethernet ring path <i>This element is only shown in detail mode.</i>
prev-eth-ring-fwd-st	Parameter type: <Alarm::EthernetRingPathFwdState> (blocked unblocked) Possible values: - blocked : ethernet ring path fwd state blocked - unblocked : ethernet ring path fwd state unblocked	previous status of the forward state of the ethernet ring path <i>This element is only shown in detail mode.</i>
eth-ring-fop-to	Parameter type: <Alarm::EthernetRingFOPTIMEOUT> (yes no) Possible values: - yes : fop-to occurred - no : fop-to not occurred	current status of ethernet ring fop-to failure of protocol timeout <i>This element is only shown in detail mode.</i>
prev-eth-ring-fop-to	Parameter type: <Alarm::EthernetRingFOPTIMEOUT> (yes no) Possible values: - yes : fop-to occurred - no : fop-to not occurred	previous status of the ethernet ring fop-to failure of protocol timeout <i>This element is only shown in detail mode.</i>
eth-ring-fop-pm	Parameter type: <Alarm::EthernetRingFOPPM> (yes no) Possible values: - yes : fop-pm occurred - no : fop-pm not occurred	current status of ethernet ring failure of protocol provision mismatch alarm (fop-pm) <i>This element is only shown in detail mode.</i>
prev-eth-ring-fop-pm	Parameter type: <Alarm::EthernetRingFOPPM> (yes no) Possible values: - yes : fop-pm occurred - no : fop-pm not occurred	previous status of the ethernet ring failure of protocol provision mismatch alarm (fop-pm) <i>This element is only shown in detail mode.</i>

102.154 Lldpmed Alarm Log Status Command

Command Description

This command displays the LLDP-MED alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log lldpmed [ (index) ]
```

Command Parameters

Table 102.154-1 "Lldpmed Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.154-2 "Lldpmed Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
port	Parameter type: <LLDPMed::LLDPMedPort> (uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - uni : uni - uni:ng2 : ngpon2 UNI style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	identify the provisioned lldpmed port where the alarm has occurred. <i>This element is always shown.</i>

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Only Show Details: current and previous alarm log status		
name	Type	Description
lldpmed-portcfg-mis	Parameter type: <Alarm::LLDPMED-portcfg-mismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned lldpmed port is accepted or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LLDPMED-portcfg-mismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	status of lldpmed portconfig mismatch alarm with its previous logged value. <i>This element is only shown in detail mode.</i>
lldpmed-mediapl-mis	Parameter type: <Alarm::LLDPMED-mediapl-mismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned lldpmed mediapolicy is accepted or not. <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LLDPMED-mediapl-mismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	status of lldpmed mediapolicy mismatch alarm with its previous logged value. <i>This element is only shown in detail mode.</i>

102.155 Lag group Alarm Log Status Command

Command Description

This command displays lag group alarm Log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm log link-aggr [ (index) ]
```

Command Parameters

Table 102.155-1 "Lag group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.155-2 "Lag group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
group	Parameter type: <Itf::LaGroupIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies lag group index <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
la-oper-down	Parameter type: <Alarm::LaGroupDown> (yes	specifies whether an lag is down or not

name	Type	Description
	no) Possible values: - yes : link group operation down - no : link group operation up	<i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LaGroupDown> (yes no) Possible values: - yes : link group operation down - no : link group operation up	previously oper-status of the lag alarm. <i>This element is only shown in detail mode.</i>
standby-not-available	Parameter type: <Alarm::StandbyUnavailable> (yes no) Possible values: - yes : lack of link-up ports on standby slot - no : link-up ports enough on standby slot	specifies whether standby slot is available <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::StandbyUnavailable> (yes no) Possible values: - yes : lack of link-up ports on standby slot - no : link-up ports enough on standby slot	status of available of standby slot. <i>This element is only shown in detail mode.</i>
switch-fail	Parameter type: <Alarm::LaSwitchFail> (yes no) Possible values: - yes : switchover failed for cross-lt la group - no : switchover is successful for cross-lt la group	specifies whether switchover is failed <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LaSwitchFail> (yes no) Possible values: - yes : switchover failed for cross-lt la group - no : switchover is successful for cross-lt la group	status of switchover of cross-lag. <i>This element is only shown in detail mode.</i>
la-degrade	Parameter type: <Alarm::LaDegrade> (yes no) Possible values: - yes : lack of link-up ports on active slot - no : link-up ports enough on active slot	specifies whether lag degrades <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::LaDegrade> (yes no) Possible values: - yes : lack of link-up ports on active slot - no : link-up ports enough on active slot	status of degradation of lag. <i>This element is only shown in detail mode.</i>

102.156 40GBase-KR4 fcs exceed Alarm Log Status Command

Command Description

This command displays 40GBase-KR4 fcs exceed alarm Log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm log fcs-exceed [(index)]

Command Parameters

Table 102.156-1 "40GBase-KR4 fcs exceed Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 102.156-2 "40GBase-KR4 fcs exceed Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
slot	Parameter type: <Equipm::EqptSlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>)	identifies index <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
nta/b	Parameter type: <UnsignedSignedInteger> - an unsigned integer	identifies index2 <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
fcs-is-exceed	Parameter type: <Alarm::almltypeFCSthreshexceed> (yes no) Possible values: - yes : FCS auto-recovery counter exceeded threshold - no : FCS auto-recovery counter not exceeded threshold	specifies whether fcs auto-recovery counter is exceed or not <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::almltypeFCSthreshexceed> (yes no) Possible values: - yes : FCS auto-recovery counter exceeded threshold - no : FCS auto-recovery counter not exceeded threshold	previously oper-status of the 40GBase-KR4 fcs exceed alarm. <i>This element is only shown in detail mode.</i>

103- Alarm Snap-shot Status Commands

103.1 Alarm Snap-shot Status Command Tree	103-4390
103.2 Alarm Snapshot Status Command	103-4396
103.3 Alarm Snapshot Equipment Status Command	103-4404
103.4 Equipment Holder Alarm Log Status Command	103-4407
103.5 Equipment Holder Alarm Extended Log Status Command	103-4409
103.6 Plug-in Unit Alarm Log Status Command	103-4411
103.7 ATM Alarm Log Status Command	103-4414
103.8 Alarm Snapshot Ethernet Interface Status Command	103-4416
103.9 Alarm Snapshot Software Management Status Command	103-4417
103.10 Alarm Snapshot Temporal Filter Status Command	103-4419
103.11 Alarm Snapshot Spatial Filter Status Command	103-4423
103.12 Alarm xDSL Snapshot Status Command	103-4427
103.13 TCA xDSL Alarm Log Status Command	103-4431
103.14 OLT General Alarm Snapshot Status Command	103-4435
103.15 Alarm Vectoring Line Snapshot Status Command	103-4439
103.16 Alarm Vectoring Board Snapshot Status Command	103-4441
103.17 Alarm Electrical-to-Optical Conversion for Snapshot Status Command	103-4443
103.18 Authentication Alarms for Snapshot Status Command	103-4444
103.19 Alarm xDSL Bonding Snap Shot Status Command	103-4447

103.2 Alarm Snapshot Status Command

Command Description

This command displays the snapshot alarm entries.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot table [(index)]

Command Parameters

Table 103.2-1 "Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.2-2 "Alarm Snapshot Status Command" Display parameters

Common Information:general information		
name	Type	Description
timeout-period	Parameter type: <IgnoredTimeTicks> - a timeout value - unit: msec	specifies the time out of the snapshot table <i>This element is always shown.</i>
entries	Parameter type: <IgnoredGauge> - gauge	specifies nbr of entries in the snapshot table. <i>This element is always shown.</i>
indeterminate	Parameter type: <Alarm::IndetSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	active indeterminate severity levels of the alarms in the snapshot table. <i>This element is always shown.</i>
warning	Parameter type: <Alarm::WarnSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	active warning severity levels of the alarms in the snapshot table. <i>This element is always shown.</i>
minor	Parameter type: <Alarm::MinorSevState>	active minor severity levels of the

name	Type	Description
	(active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	alarms in the snapshot table. <i>This element is always shown.</i>
major	Parameter type: <Alarm::MajorSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	active major severity levels of the alarms in the snapshot table. <i>This element is always shown.</i>
critical	Parameter type: <Alarm::CriticalSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	active critical severity levels of the alarms in the snapshot table. <i>This element is always shown.</i>
owner-id	Parameter type: <Alarm::alarmSnapShotOwner> - string to identify the owner (example: Tom),the string should has less than or equal to 128 characters - length: 1<=x<=128	the actual owner of the snap-shot <i>This element is always shown.</i>

Specific Information

last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>

103.3 Alarm Snapshot Equipment Status Command

Command Description

This command displays the equipment snapshot.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot equipment [(index)]

Command Parameters

Table 103.3-1 "Alarm Snapshot Equipment Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.3-2 "Alarm Snapshot Equipment Status Command" Display parameters

Specific Information		
name	Type	Description
persist-data	Parameter type: <Alarm::persistDataLoss> (lost not-lost) Possible values: - lost : persistant data is lost - not-lost : persistant data is not lost	current status specifying persistant data is lost or not <i>This element is only shown in detail mode.</i>
sntp-comm	Parameter type: <Alarm::sntpCommLoss> (lost not-lost) Possible values: - lost : SNTP communication lost - not-lost : SNTP communication is not lost	current status of sntp communication is lost or not <i>This element is only shown in detail mode.</i>
cf-error	Parameter type: <Alarm::cfError> ((error cfError) (no-error cfNoError)) Possible values: - error : CF access error - cfError : CF access error - no-error : CF no access error	Compact flash read or write error occurred <i>This element is only shown in detail mode.</i>

name	Type	Description
	- cfNoError : CF no access error	
board-with-cf-error	Parameter type: <Eqptm::EqptNtSlotIndexOrNone> (nt-a nt-b nt <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> none none) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - none : board not specified - none : board not specified Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::EqSlotId> - the equipment slot number	Board identification with cf-error <i>This element is only shown in detail mode.</i>
nt-disk	Parameter type: <Alarm::ntDiskSpace> ((nintyfive-perc 95%-full) (less-nintyfive-perc less-than-95%)) Possible values: - nintyfive-perc : NT disk space is 95% full - 95%-full : NT disk space is 95% full - less-nintyfive-perc : NT disk space usage less that 95% - less-than-95% : NT disk space usage less that 95%	current status of nt disk space is 95% full or less than that <i>This element is only shown in detail mode.</i>
preferred-mode	Parameter type: <Alarm::clkPrefMode> (not-available available) Possible values: - not-available : Preferred timing mode is not available - available : Preferred Timing mode available	current status of preferred timing mode <i>This element is only shown in detail mode.</i>
timing-reference	Parameter type: <Alarm::clkFreeMode> (failed available) Possible values: - failed : System is in holdover or free-run mode - available : System is not in holdover or free-run mode	shows the availability or failure of timing reference <i>This element is only shown in detail mode.</i>
connection-lost	Parameter type: <Alarm::ShubLoc> (lost not-lost) Possible values: - lost : NT shub communication lost - not-lost : NT shub communication intact	current status of nt shub communication is lost or intact <i>This element is only shown in detail mode.</i>
back-pnl-inv short name: bpnl-inv	Parameter type: <Alarm::BackPnlInv> (invalid valid) Possible values: - invalid : BackPanel-type Invalid - valid : BackPanel-type Valid	current status of BackPanel-type Invalid alarm. <i>This element is only shown in detail mode.</i>
shub-conf-lost	Parameter type: <Alarm::SHubCfgLost> (lost not-lost) Possible values: - lost : SHub configuration loss - recent changes lost	actual shub configuration may differ from lanx database on nt <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- not-lost : SHub configuration up to date	

103.4 Equipment Holder Alarm Log Status Command

Command Description

This command displays the snapshot equipment holder alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot eqpt-holder [ (index) ]
```

Command Parameters

Table 103.4-1 "Equipment Holder Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.4-2 "Equipment Holder Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
rack-power	Parameter type: <Alarm::rackPower> (failing ok) Possible values: - failing : the fuse is broken - ok : the fuse is intact	current status of rack power alarm, indicating fuse is broken or intact <i>This element is only shown in detail mode.</i>
fan-unit1	Parameter type: <Alarm::fanUnit1> ((failing fail) ok) Possible values:	current status of fan-unit1 <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- failing : fan unit 1 is failing - fail : fan unit 1 is failing - ok : fan unit 1 is ok	
fan-unit2	Parameter type: <Alarm::fanUnit2> ((failing fail) ok) Possible values: - failing : fan unit 2 is failing - fail : fan unit 2 is failing - ok : fan unit 2 is ok	current status of fan-unit2 <i>This element is only shown in detail mode.</i>
shelf-type-mismatch	Parameter type: <Alarm::shelfTypeMismatch> (mismatch no-mismatch) Possible values: - mismatch : installed and planned shelf types are different - no-mismatch : installed and planned shelf types are the same	current status specifies installed and planned shelf types are different <i>This element is only shown in detail mode.</i>
ext-chain-instl	Parameter type: <Alarm::extChainInstl> ((consistency-problem inconsistent) (no-consistency-problem ok)) Possible values: - consistency-problem : consistency problem detected for installation of extension chain - inconsistent : consistency problem detected for installation of extension chain - no-consistency-problem: no consistency problem - ok : no consistency problem	current alarm status of consistency problem detected for installation of extension chain <i>This element is only shown in detail mode.</i>
shelf-missing	Parameter type: <Alarm::shelfMissing> (missing not-missing) Possible values: - missing : detected shelf now missing - not-missing : detected shelf was missing, now reinserted	current status specifies once inserted shelf has gone missing <i>This element is only shown in detail mode.</i>
shelf-install-missing	Parameter type: <Alarm::shelfInstall> (yes no) Possible values: - yes : shelf now installed - no : shelf now not installed	current status specifies shelf is planned but not installed <i>This element is only shown in detail mode.</i>
door	Parameter type: <Alarm::door> ((failing fail) ok) Possible values: - failing : the cabinet door is opened - fail : the cabinet door is opened - ok : the cabinet door is closed	current status of door alarm, indicating the cabinet door is opened <i>This element is only shown in detail mode.</i>
ac-power-fail	Parameter type: <Alarm::acPowerFail> ((failing fail) ok) Possible values: - failing : system AC power fails - fail : system AC power fails - ok : the system AC power works properly	current status of AC power failure alarm, indicating the AC Power is broken <i>This element is only shown in detail mode.</i>

103.5 Equipment Holder Alarm Extended Log Status Command

Command Description

This command displays the snapshot equipment holder extended alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot eqpt-holder-ext [(index)]

Command Parameters

Table 103.5-1 "Equipment Holder Alarm Extended Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.5-2 "Equipment Holder Alarm Extended Log Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
ctl-com-fail	Parameter type: <Alarm::ctlComFail> ((failing fail) ok) Possible values: - failing : shelf controller communication is failing - fail : shelf controller communication is failing - ok : shelf controller communication is ok	status of shelf controller communication failure. <i>This element is only shown in detail mode.</i>
bat-a-fail	Parameter type: <Alarm::batAFail> (yes no)	status of shelf power source A failure. <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : Power Source Battery A Failure - no : Power Source Battery A is OK	<i>detail mode.</i>
bat-b-fail	Parameter type: <Alarm::batBFail> (yes no) Possible values: - yes : Power Source Battery B Failure - no : bfd stale entry not present	status of shelf power source B failure. <i>This element is only shown in detail mode.</i>
water-seepage-in-box	Parameter type: <Alarm::waterSeepageInBox> (detected not-detected) Possible values: - detected : detected water seepage in the enclosure - not-detected : no water seepage detected in the enclosure	status of detected water seepage in the enclosure <i>This element is only shown in detail mode.</i>
sealed-box-open	Parameter type: <Alarm::sealedBoxOpen> (detected not-detected) Possible values: - detected : detected open sealed box - not-detected : closed sealed box	status of detected open sealed box <i>This element is only shown in detail mode.</i>

103.6 Plug-in Unit Alarm Log Status Command

Command Description

This command displays the snapshot plug-in unit alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot plug-in-unit [(index)]

Command Parameters

Table 103.6-1 "Plug-in Unit Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.6-2 "Plug-in Unit Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
board-mismatch	Parameter type: <Alarm::boardMismatch> (yes no) Possible values: - yes : planned and plugged-in types are different - no : planned and plugged-in types are same	alarm specifying the planned and plugged-in types are different <i>This element is only shown in detail mode.</i>
sw-download	Parameter type: <Alarm::swStatus> (waiting completed) Possible values: - waiting : not able to download all the applicable SW files - completed : download completed	alarm specifying download of the software is completed or not. <i>This element is only shown in detail mode.</i>
temperature	Parameter type: <Alarm::tempStatus> (above-thres below-thres) Possible values: - above-thres : temperature threshold on board exceeded - below-thres : board temperature within threshold	alarm specifying board temperature is crossed the threshold or not. <i>This element is only shown in detail mode.</i>
temp-shutoff	Parameter type: <Alarm::tempShutoffStatus> (board-switched-off board-switched-on) Possible values: - board-switched-off : board switched off - excess temperature - board-switched-on : board switched on	alarm specifying board is switched off because of excess temperature. <i>This element is only shown in detail mode.</i>
sem-power-fail	Parameter type: <Alarm::extPowerStatus> (sem-power-fail sem-power-ok) Possible values: - sem-power-fail : SEM external power failure - sem-power-ok : SEM external power ok	alarm specifying SEM external power failure. <i>This element is only shown in detail mode.</i>
sem-ups-fail	Parameter type: <Alarm::powerSupplyStatus> (sem-ups-fail sem-ups-ok) Possible values: - sem-ups-fail : SEM external power supply failure - sem-ups-ok : SEM external power supply ok	alarm specifying SEM external power supply failure. <i>This element is only shown in detail mode.</i>
board-present	Parameter type: <Alarm::boardPresence> (missing yes) Possible values: - missing : board was present, but now missing - yes : board present	indicates the presence of the board. <i>This element is only shown in detail mode.</i>
board-inserted	Parameter type: <Alarm::boardInsertion>	indicates the status of board was

name	Type	Description
	(never-inserted inserted) Possible values: - never-inserted : board was never inserted - inserted : board was inserted	inserted or not. <i>This element is only shown in detail mode.</i>
board-init	Parameter type: <Alarm::boardInit> (failed completed) Possible values: - failed : board initialization failed - completed : board initialization completed	specifies board initializaion is sucessful or failed. <i>This element is only shown in detail mode.</i>
board-reset-cf	Parameter type: <Alarm::boardResetCommFail> (yes ok) Possible values: - yes : board reset/communication failure occurred - ok : no board reset/communication failure	indicates there has been a reset and/or communication failure of the board. <i>This element is only shown in detail mode.</i>
shub-uplink	Parameter type: <Alarm::lanxuplinkbrkdwn> (failure ok) Possible values: - failure : lanx uplink breakdown or removal - ok : no breakdown or removal of lanx uplink	indicates that lanx uplink breakdown or removal. <i>This element is only shown in detail mode.</i>
backplane-data-failure	Parameter type: <Alarm::BackplaneMismatch> (yes no) Possible values: - yes : LT backplane ports data failure - no : LT backplane ports data normal	indicates the lt backplane data status <i>This element is only shown in detail mode.</i>

103.7 ATM Alarm Log Status Command

Command Description

This command displays the ATM alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot atm [ (index) ]
```

Command Parameters

Table 103.7-1 "ATM Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.7-2 "ATM Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Equipm::AtmIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
vpi-vci	Parameter type: <Alarm::VpiVciValues> - the vpi and vci value (vpi/vci)	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
cell-discard-up	Parameter type: <Alarm::CellDiscardUpstream> (discarded no-discard) Possible values:	specifies ATM cell is discarded or not in upstream direction. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- discarded : ATM cell discarded in upstream direction - no-discard : no ATM cell discarded in upstream direction	
cell-discard-down	Parameter type: <Alarm::CellDiscardDownstream> (discarded no-discard) Possible values: - discarded : ATM cell discarded in downstream direction - no-discard : no ATM cell discarded in downstream direction	specifies ATM cell is discarded or not in downstream direction. <i>This element is only shown in detail mode.</i>

103.8 Alarm Snapshot Ethernet Interface Status Command

Command Description

This command displays the current Ethernet interface alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ether-itf [(index)]

Command Parameters

Table 103.8-1 "Alarm Snapshot Ethernet Interface Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.8-2 "Alarm Snapshot Ethernet Interface Status Command" Display parameters

Specific Information		
name	Type	Description
ether-ifindex	Parameter type: <Ether::InterfaceIndex> - index of the collision interface - range: [0...2147483647]	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

103.9 Alarm Snapshot Software Management Status Command

Command Description

This command displays the snapshot software management status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sw-mgmt [ (index) ]
```

Command Parameters

Table 103.9-1 "Alarm Snapshot Software Management Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.9-2 "Alarm Snapshot Software Management Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identifies the physical position of the slot <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
sw-rollback	Parameter type: <Alarm::SwRollback> (yes no) Possible values: - yes : implicit software rollback performed - no : no implicit software rollback	specifies implicit software rollback is performed or not. <i>This element is only shown in detail mode.</i>
db-rollback	Parameter type: <Alarm::DbRollback> (yes no) Possible values: - yes : implicit database rollback performed - no : no implicit database rollback	specifies implicit database rollback is performed or not. <i>This element is only shown in detail mode.</i>
xvps-inv-dbase	Parameter type: <Alarm::XvpsInvalidDataBase> (invalid valid) Possible values: - invalid : invalid xvps dbbase is detected - valid : xvps dbase is valid	specifies implicit xvps dbase is valid or not. <i>This element is only shown in detail mode.</i>
inv-cde-file	Parameter type: <Alarm::XvpsInvalidCDEFile> (invalid valid) Possible values: - invalid : invalid xvps cde file is detected - valid : xvps cde file is valid	specifies implicit xvps dbase is valid or not. <i>This element is only shown in detail mode.</i>
miss-cde-file	Parameter type: <Alarm::MissingCDEProfile> (yes no) Possible values: - yes : cde profile is missed - no : cde profile is exist	specifies cde profile is missed or not. <i>This element is only shown in detail mode.</i>

103.10 Alarm Snapshot Temporal Filter Status Command

Command Description

This command displays the temporal filter snapshot.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot temporal [(index)]

Command Parameters

Table 103.10-1 "Alarm Snapshot Temporal Filter Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.10-2 "Alarm Snapshot Temporal Filter Status Command" Display parameters

Specific Information		
name	Type	Description
tmp-filter1	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	current status of temporal filter1 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter2	Parameter type: <Alarm::almFilter2> (yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	current status of temporal filter2 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter3	Parameter type: <Alarm::almFilter3> (yes no) Possible values:	current status of temporal filter3 is derived or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : derived filter3 alarm - no : not derived filter3 alarm	
tmp-filter4	Parameter type: <Alarm::alrmFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	current status of temporal filter4 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter5	Parameter type: <Alarm::alrmFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	current status of temporal filter5 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter6	Parameter type: <Alarm::alrmFilter6> (yes no) Possible values: - yes : derived filter6 alarm - no : not derived filter6 alarm	current status of temporal filter6 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter7	Parameter type: <Alarm::alrmFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	current status of temporal filter7 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter8	Parameter type: <Alarm::alrmFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	current status of temporal filter8 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter9	Parameter type: <Alarm::alrmFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	current status of temporal filter9 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter10	Parameter type: <Alarm::alrmFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	current status of temporal filter10 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter11	Parameter type: <Alarm::alrmFilter11> (yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	current status of temporal filter11 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter12	Parameter type: <Alarm::alrmFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	current status of temporal filter12 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter13	Parameter type: <Alarm::alrmFilter13>	current status of temporal filter13

name	Type	Description
	(yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter14	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	current status of temporal filter14 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter15	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	current status of temporal filter15 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter16	Parameter type: <Alarm::almFilter16> (yes no) Possible values: - yes : derived filter16 alarm - no : not derived filter16 alarm	current status of temporal filter16 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter17	Parameter type: <Alarm::almFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	current status of temporal filter17 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter18	Parameter type: <Alarm::almFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	current status of temporal filter18 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter19	Parameter type: <Alarm::almFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	current status of temporal filter19 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter20	Parameter type: <Alarm::almFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	current status of temporal filter20 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter21	Parameter type: <Alarm::almFilter21> (yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	current status of temporal filter21 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter22	Parameter type: <Alarm::almFilter22> (yes no) Possible values:	current status of temporal filter22 is derived or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : derived filter22 alarm - no : not derived filter22 alarm	
tmp-filter23	Parameter type: <Alarm::alrmFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	current status of temporal filter23 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter24	Parameter type: <Alarm::alrmFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	current status of temporal filter24 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter25	Parameter type: <Alarm::alrmFilter25> (yes no) Possible values: - yes : derived filter25 alarm - no : not derived filter25 alarm	current status of temporal filter25 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter26	Parameter type: <Alarm::alrmFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	current status of temporal filter26 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter27	Parameter type: <Alarm::alrmFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	current status of temporal filter27 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter28	Parameter type: <Alarm::alrmFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	current status of temporal filter28 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter29	Parameter type: <Alarm::alrmFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	current status of temporal filter29 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter30	Parameter type: <Alarm::alrmFilter30> (yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	current status of temporal filter30 is derived or not <i>This element is only shown in detail mode.</i>
tmp-filter31	Parameter type: <Alarm::alrmFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	current status of temporal filter31 is derived or not <i>This element is only shown in detail mode.</i>

103.11 Alarm Snapshot Spatial Filter Status Command

Command Description

This command displays the spatial filter snapshot.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot spatial [(index)]

Command Parameters

Table 103.11-1 "Alarm Snapshot Spatial Filter Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.11-2 "Alarm Snapshot Spatial Filter Status Command" Display parameters

Specific Information		
name	Type	Description
spa-filter1	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	current status of spatial filter1 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter2	Parameter type: <Alarm::almFilter2> (yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	current status of spatial filter2 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter3	Parameter type: <Alarm::almFilter3> (yes no) Possible values:	current status of spatial filter3 is derived or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : derived filter3 alarm - no : not derived filter3 alarm	
spa-filter4	Parameter type: <Alarm::alrmFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	current status of spatial filter4 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter5	Parameter type: <Alarm::alrmFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	current status of spatial filter5 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter6	Parameter type: <Alarm::alrmFilter6> (yes no) Possible values: - yes : derived filter6 alarm - no : not derived filter6 alarm	current status of spatial filter6 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter7	Parameter type: <Alarm::alrmFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	current status of spatial filter7 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter8	Parameter type: <Alarm::alrmFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	current status of spatial filter8 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter9	Parameter type: <Alarm::alrmFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	current status of spatial filter9 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter10	Parameter type: <Alarm::alrmFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	current status of spatial filter10 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter11	Parameter type: <Alarm::alrmFilter11> (yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	current status of spatial filter11 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter12	Parameter type: <Alarm::alrmFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	current status of spatial filter12 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter13	Parameter type: <Alarm::alrmFilter13>	current status of spatial filter13 is

name	Type	Description
	(yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	derived or not <i>This element is only shown in detail mode.</i>
spa-filter14	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	current status of spatial filter14 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter15	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	current status of spatial filter15 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter16	Parameter type: <Alarm::almFilter16> (yes no) Possible values: - yes : derived filter16 alarm - no : not derived filter16 alarm	current status of spatial filter16 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter17	Parameter type: <Alarm::almFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	current status of spatial filter17 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter18	Parameter type: <Alarm::almFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	current status of spatial filter18 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter19	Parameter type: <Alarm::almFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	current status of spatial filter19 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter20	Parameter type: <Alarm::almFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	current status of spatial filter20 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter21	Parameter type: <Alarm::almFilter21> (yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	current status of spatial filter21 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter22	Parameter type: <Alarm::almFilter22> (yes no) Possible values:	current status of spatial filter22 is derived or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : derived filter22 alarm - no : not derived filter22 alarm	
spa-filter23	Parameter type: <Alarm::alrmFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	current status of spatial filter23 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter24	Parameter type: <Alarm::alrmFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	current status of spatial filter24 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter25	Parameter type: <Alarm::alrmFilter25> (yes no) Possible values: - yes : derived filter25 alarm - no : not derived filter25 alarm	current status of spatial filter25 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter26	Parameter type: <Alarm::alrmFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	current status of spatial filter26 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter27	Parameter type: <Alarm::alrmFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	current status of spatial filter27 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter28	Parameter type: <Alarm::alrmFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	current status of spatial filter28 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter29	Parameter type: <Alarm::alrmFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	current status of spatial filter29 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter30	Parameter type: <Alarm::alrmFilter30> (yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	current status of spatial filter30 is derived or not <i>This element is only shown in detail mode.</i>
spa-filter31	Parameter type: <Alarm::alrmFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	current status of spatial filter31 is derived or not <i>This element is only shown in detail mode.</i>

103.12 Alarm xDSL Snapshot Status Command

Command Description

This command displays the status of the snapshot xDSL alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot xdsl [(index)]

Command Parameters

Table 103.12-1 "Alarm xDSL Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.12-2 "Alarm xDSL Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
near-end-los	Parameter type: <Alarm::NearEndLOS> (yes no) Possible values: - yes : near end loss of signal occurred - no : no near end loss of signal	specifies near end loss of signal occurred or not. <i>This element is only shown in detail mode.</i>
near-end-lof	Parameter type: <Alarm::NearEndLOF> (yes	specifies near end loss of frame occurred or not.

103 Alarm Snap-shot Status Commands

name	Type	Description
	no) Possible values: - yes : near end loss of frame occurred - no : no near end loss of frame	<i>This element is only shown in detail mode.</i>
near-end-lom	Parameter type: <Alarm::NearEndLOM> (yes no) Possible values: - yes : near end loss of margin occurred - no : no near end loss of margin	specifies near end loss of margin occurred or not. <i>This element is only shown in detail mode.</i>
near-end-ese	Parameter type: <Alarm::NearEndESE> (yes no) Possible values: - yes : near end excessive severe errors occurred - no : no near end excessive severe errors occurred	specifies near end excessive severe errors occurred or not. <i>This element is only shown in detail mode.</i>
line-config	Parameter type: <Alarm::LineConfig> (config-error config-ok) Possible values: - config-error : line configuration data cannot be used - config-ok : Line configuration data OK	specifies whether line configuration data is used or not. <i>This element is only shown in detail mode.</i>
line-capacity	Parameter type: <Alarm::LineCapacity> (below-requirement meets-requirement) Possible values: - below-requirement : line capacity not enough to set up requested profile - meets-requirement : line capacity enough to set up requested profile	specifies whether line capacity is set up or not. <i>This element is only shown in detail mode.</i>
near-end-bitrate	Parameter type: <Alarm::NearEndBRthres> (below-plan meets-plan) Possible values: - below-plan : upstream planned bitrate not reached after initialization - meets-plan : upstream planned bitrate reached	specifies whether upstream planned bitrate reached or not after initialization. <i>This element is only shown in detail mode.</i>
near-end-ncd	Parameter type: <Alarm::NearEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no near end cell delineation - cell-deline-occurred : near end cell delineation occurred	specifies whether near end cell delineation is occurred or not. <i>This element is only shown in detail mode.</i>
near-end-lcd	Parameter type: <Alarm::NearEndLCD> (yes no) Possible values: - yes : loss of near end cell deliniation - no : no loss of near end cell deliniation	specifies whether loss of near end cell deliniation is occurred or not. <i>This element is only shown in detail mode.</i>
far-end-los	Parameter type: <Alarm::FarEndLOS> (yes no) Possible values: - yes : far end loss of signal occurred - no : no far end loss of signal	specifies whether far end loss of signal occurred or not. <i>This element is only shown in detail mode.</i>
far-end-lof	Parameter type: <Alarm::FarEndLOF> (yes	specifies whether far end loss of frame occurred or not.

name	Type	Description
	no) Possible values: - yes : far end loss of frame occurred - no : no far end loss of frame	<i>This element is only shown in detail mode.</i>
far-end-lpr	Parameter type: <Alarm::FarEndLPR> (yes no) Possible values: - yes : far end loss of power detected - no : no far end loss of power	specifies whether far end loss of power detected or not. <i>This element is only shown in detail mode.</i>
far-end-lol	Parameter type: <Alarm::FarEndLOL> (yes no) Possible values: - yes : far end loss of link detected - no : no far end loss of link	specifies whether far end loss of link detected or not. <i>This element is only shown in detail mode.</i>
far-end-lom	Parameter type: <Alarm::FarEndLOM> (yes no) Possible values: - yes : far end loss of margin occurred - no : no far end loss of margin	specifies whether far end loss of margin occurred or not. <i>This element is only shown in detail mode.</i>
far-end-ese	Parameter type: <Alarm::FarEndESE> (yes no) Possible values: - yes : far end excessive severe errors occurred - no : no far end excessive severe errors occurred	specifies whether far end excessive severe errors occurred or not. <i>This element is only shown in detail mode.</i>
xdsl-init	Parameter type: <Alarm::Initialization> (failed successful) Possible values: - failed : initialization unsuccessful due to communication problem - successful : initialization successful	specifies xdsl line initialization is successful or not. <i>This element is only shown in detail mode.</i>
peer-modem	Parameter type: <Alarm::PeerModem> (no yes) Possible values: - no : no peer modem detected - yes : peer modem detected	specifies whether peer modem detected or not. <i>This element is only shown in detail mode.</i>
far-end-bitrate	Parameter type: <Alarm::FarEndBRthres> (below-plan meets-plan) Possible values: - below-plan : downstream planned bitrate not reached after initialization - meets-plan : downstream planned bitrate reached	specifies whether downstream planned bitrate reached or not. <i>This element is only shown in detail mode.</i>
far-end-ncd	Parameter type: <Alarm::FarEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no far end cell delineation - cell-deline-occurred : far end cell delineation occurred	specifies whether far end cell delineation occurred or not. <i>This element is only shown in detail mode.</i>
far-end-lcd	Parameter type: <Alarm::FarEndLCD> (yes no)	specifies there is loss of far end cell deliniation or not. <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : loss of far end cell deliniation - no : no loss of far end cell deliniation	<i>detail mode.</i>
far-end-upbo-vio	Parameter type: <Alarm::FarEndUPBO> (yes no) Possible values: - yes : UPBO violation - no : no UPBO violation	UPBO violation <i>This element is only shown in detail mode.</i>
far-end-cpe-pol	Parameter type: <Alarm::FarEndActFail> (yes no) Possible values: - yes : activation failure due to CPE policing - no : no activation failure due to CPE policing	activation failure due to CPE policing <i>This element is only shown in detail mode.</i>
far-end-mis-peer-35b	Parameter type: <Alarm::FarEndMismatchPeer35B> (yes no) Possible values: - yes : VDSL2 35b opmode mismatch between XTU-C and XTU-R - no : No VDSL2 35b opmode mismatch between XTU-C and XTU-R	VDSL2 35b opmode mismatch between XTU-C and XTU-R. <i>This element is only shown in detail mode.</i>
forced-rtx-init	Parameter type: <Alarm::ForcedRtxInit> (failed successful) Possible values: - failed : initialization unsuccessful due to forced retransmission - successful : initialization successful	specifies forced rtx initialization is successful or not <i>This element is only shown in detail mode.</i>
tpstc-mis	Parameter type: <Alarm::TpstcMis> (yes no) Possible values: - yes : mismatch between the configured tps-tc mode and the mode supported by the connected cpe - no : no mismatch between the configured and the tpstc mode supported by connected cpe	mismatch between the configured tps-tc mode and the mode supported by the connected cpe <i>This element is only shown in detail mode.</i>
vect-dle	Parameter type: <Alarm::NearEndVectDle> (yes no) Possible values: - yes : loss of us signal due to disorderly leaving event - no : no disorderly leaving detected	specifies whether a disorderly leaving event occurred or not. <i>This element is only shown in detail mode.</i>

103.13 TCA xDSL Alarm Log Status Command

Command Description

This command displays the xDSL threshold cross alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot xdsl-tca [ (index) ]
```

Command Parameters

Table 103.13-1 "TCA xDSL Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.13-2 "TCA xDSL Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies where the alarm occurred <i>This element is only shown in detail mode.</i>
errored-secs	Parameter type: <Alarm::ErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of errored seconds exceeded threshold - below-thres : number of errored seconds below threshold	number of errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
es-in-a-day	Parameter type: <Alarm::ErroredSecondsInAday>	errored seconds in a day

103 Alarm Snap-shot Status Commands

name	Type	Description
	(above-thres below-thres) Possible values: - above-thres : number of errored seconds in a day, exceeded threshold - below-thres : number of errored seconds in a day, below threshold	exceeded or below threshold <i>This element is only shown in detail mode.</i>
severely-es	Parameter type: <Alarm::SeverelyErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds exceeded threshold - below-thres : number of severely errored seconds below threshold	number of severely errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
severely-es-in-a-day	Parameter type: <Alarm::SevErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds in a day, exceeded threshold - below-thres : number of severely errored seconds in a day, below threshold	number of severely errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
unavailable-secs	Parameter type: <Alarm::UnavailableSeconds> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds exceeded threshold - below-thres : number of unavailable seconds below threshold	number of unavailable seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
unavail-secs-in-a-day	Parameter type: <Alarm::UnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds in a day, exceeded threshold - below-thres : number of unavailable seconds in a day, below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
far-end-es	Parameter type: <Alarm::FarEndErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds exceeded threshold - below-thres : number of far end errored seconds below threshold	number of far end errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-severely-es	Parameter type: <Alarm::FarEndSevErroredSecs> (above-thres below-thres) Possible values: - above-thres : number of far end severely errored seconds exceeded threshold - below-thres : number of far end severely errored seconds below threshold	number of far end severely errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-severely-es/day	Parameter type: <Alarm::FarEndSevErroredSecsInAday> (above-thres	number of severely errored seconds in a day, exceeded or

name	Type	Description
	below-thres) Possible values: - above-thres : number of far end severely errored seconds in a day, exceeded threshold - below-thres : number of far end severely errored seconds in a day, below threshold	below threshold <i>This element is only shown in detail mode.</i>
fe-unavail-secs	Parameter type: <Alarm::FarEndUnavailSecs> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds exceeded threshold - below-thres : number of far end unavailable seconds below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-unavail-sec/day	Parameter type: <Alarm::FarEndUnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds in a day, exceeded threshold - below-thres : number of far end unavailable seconds in a day, below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-es-in-a-day	Parameter type: <Alarm::FarEndErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds in a day, exceeded threshold - below-thres : number of far end errored seconds in a day, below threshold	number of far end errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
leftrs	Parameter type: <Alarm::LeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds exceeded threshold - below-thres : number of low error free throughput seconds below threshold	number of low error free throughput seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
leftrs-in-a-day	Parameter type: <Alarm::LeftrSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds in a day, exceeded threshold - below-thres : number of low error free throughput seconds in a day, below threshold	number of low error free throughput seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-leftrs	Parameter type: <Alarm::FarEndLeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end low error free throughput seconds exceeded threshold - below-thres : number of far end low error free throughput seconds below threshold	number of far end low error free throughput seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-leftrs-in-a-day	Parameter type: <Alarm::FarEndLeftrSecondsInAday> (above-thres below-thres)	number of far end low error free throughput seconds in a day, exceeded or below threshold

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - above-thres : number of far end low error free throughput seconds in a day, exceeded threshold - below-thres : number of far end low error free throughput seconds in a day, below threshold	<i>This element is only shown in detail mode.</i>
xtca-auto-port-reset	Parameter type: <Alarm::AutoPortResetInAweek> (above-thres below-thres) Possible values: - above-thres : number of auto-port-resets reached threshold with in a week - below-thres : number of auto-port-resets below threshold	number of auto-port-resets in a week reached threshold <i>This element is only shown in detail mode.</i>
reinit	Parameter type: <Alarm::Reinit> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	number of Reinitialization count in 15min, exceeded or below threshold <i>This element is only shown in detail mode.</i>
reinit-in-a-day	Parameter type: <Alarm::ReinitInAday> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	number of Reinitialization count in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>

103.14 OLT General Alarm Snapshot Status Command

Command Description

This command displays the OLT general alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot olt-gen [ (index) ]
```

Command Parameters

Table 103.14-1 "OLT General Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.14-2 "OLT General Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Gpon::PonId> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	
Only Show Details: alarm snap-shot log status		
name	Type	Description
olt-pon-comm	Parameter type: <Alarm::OltPonComm> ((failing fail) ok) Possible values: - failing : OLT port communication is failing - fail : OLT port communication is failing - ok : port protection is ok	snap-shot status of PON Communication failure on OLT Port <i>This element is only shown in detail mode.</i>
olt-gen-tf	Parameter type: <Alarm::OltGenTf> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	snap-shot status of transmit failure on OLT port <i>This element is only shown in detail mode.</i>
olt-new-ont	Parameter type: <Alarm::OltNewOnt> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	snap-shot status of unprovisioned ont appearance <i>This element is only shown in detail mode.</i>
olt-pon-mea	Parameter type: <Alarm::OltPonMea> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	snap-shot status of pon provision failure. <i>This element is only shown in detail mode.</i>
olt-pon-loss	Parameter type: <Alarm::OltPonLoss> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	snap-shot status of pon loss. <i>This element is only shown in detail mode.</i>
pon-rogue-test	Parameter type: <Alarm::PonRogueTest> ((failing fail) ok) Possible values: - failing : Rogue ONT detection mechanism effective is failing - fail : Rogue ONT detection mechanism effective is failing - ok : Rogue ONT detection mechanism effective is ok	snap-shot status of diagnostic tests <i>This element is only shown in detail mode.</i>
onu-loid-conflict	Parameter type: <Alarm::OnuLoidConflict> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing	snap-shot status of loid conflict ont. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- ok : port protection is ok	
onu-loid-pwd-err	Parameter type: <Alarm::OnuLoidPwdErr> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	snap-shot status of loid password error. <i>This element is only shown in detail mode.</i>
stk-laser-dis	Parameter type: <Alarm::StkLaserDis> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	snap-shot status of stuck laser disabled. <i>This element is only shown in detail mode.</i>
pon-alien-test	Parameter type: <Alarm::PonAlienTest> ((failing fail) ok) Possible values: - failing : Alien ONT detection mechanism is active - fail : Alien ONT detection mechanism is active - ok : Alien ONT detection mechanism is not active	snap-shot status of alien diagnostic tests <i>This element is only shown in detail mode.</i>
pon-alien-detect	Parameter type: <Alarm::AlienDetected> ((failing fail) ok) Possible values: - failing : Alien ONT detected - fail : Alien ONT detected - ok : No alien ONT detected	snap-shot status of alien detect <i>This element is only shown in detail mode.</i>
pon-rng-mismatch	Parameter type: <Alarm::PonRngMismatch> ((failing fail) ok) Possible values: - failing : ranging mismatch detection mechanism effective is failing - fail : ranging mismatch detection mechanism effective is failing - ok : ranging mismatch detection mechanism effective is ok	snap-shot status of ranging mismatch <i>This element is only shown in detail mode.</i>
pon-sfp-mismatch	Parameter type: <Alarm::PonSfpMismatch> ((failing fail) ok) Possible values: - failing : pon sfp mismatch is failing - fail : pon sfp mismatch is failing - ok : pon sfp mismatch is ok	snap-shot status of sfp mismatch <i>This element is only shown in detail mode.</i>
deactont-high-tca	Parameter type: <Alarm::DeactOntHighTca> (failing ok) Possible values: - failing : pon deactivated ont amount exceed high threshold occurred - ok : pon deactivated ont amount is less than high threshold occurred	snap-shot status of deactont high tca <i>This element is only shown in detail mode.</i>
deactont-low-tca	Parameter type: <Alarm::DeactOntLowTca> (failing ok) Possible values:	snap-shot status of deactont low tca <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- failing : pon deactivated ont amount exceed low threshhold occurred - ok : pon deactivated ont amount is less than low threshhold occurred	
datapath-integ	Parameter type: <Alarm::DataPathInteg> (failing ok) Possible values: - failing : number of ONTs with SIPREGTO alarm exceeds threshold - ok : number of ONTs with SIPREGTO alarm does not exceed the threshold	snap-shot status of PON Data Path Integrity <i>This element is only shown in detail mode.</i>

103.15 Alarm Vectoring Line Snapshot Status Command

Command Description

This command displays the status of the snapshot vectoring line alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot vect-line [(index)]

Command Parameters

Table 103.15-1 "Alarm Vectoring Line Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	index of the alarm snap shot table

Command Output

Table 103.15-2 "Alarm Vectoring Line Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port where the alarm has occurred. <i>This element is only shown in detail mode.</i>
xtc-variation-vict	Parameter type: <Alarm::VectXtcVariation> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc	excessive : abnormal amplitude variation in xtc coefficients <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	coefficients - normal : no excessive xtc coefficients variation	
xtc-variation-dist	Parameter type: <Alarm::VectXtcVariationDist> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc coefficients - normal : no excessive xtc coefficients variation	specifies if excessive outgoing crosstalk coefficient variation occurred or not <i>This element is only shown in detail mode.</i>
corrupted-errf	Parameter type: <Alarm::VectCorptErrf> (yes no) Possible values: - yes : at least 10% corrupted or missing errorf samples received - no : received errorf samples ok	specifies if corrupted or at least 10% missing errorf samples received occurred or not <i>This element is only shown in detail mode.</i>
vect-cpe-cap-mismatch	Parameter type: <Alarm::VectCpeCapMism> (yes no) Possible values: - yes : not allowed Vectoring CPE connected - no : allowed Vectoring CPE connected	specifies if an allowed Vectoring CPE is connected or not <i>This element is only shown in detail mode.</i>
vect-conf-not-feas	Parameter type: <Alarm::VectConfNotFeas> (yes no) Possible values: - yes : vectoring configuration not feasible - no : vectoring configuration feasible	specifies if the vectoring configuration is feasible <i>This element is only shown in detail mode.</i>
prev-status	Parameter type: <Alarm::VectConfNotFeas> (yes no) Possible values: - yes : vectoring configuration not feasible - no : vectoring configuration feasible	status of vect-conf-not-feas with its previous logged value <i>This element is only shown in detail mode.</i>

103.16 Alarm Vectoring Board Snapshot Status Command

Command Description

This command displays the status of the snapshot vectoring board alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot vect-board [(index)]

Command Parameters

Table 103.16-1 "Alarm Vectoring Board Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	index of the alarm snap shot table

Command Output

Table 103.16-2 "Alarm Vectoring Board Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
board-index	Parameter type: <Equipm::EqptVpSlotIndex> (ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	specifies where the alarm has occurred. <i>This element is only shown in detail mode.</i>
vp-link-index	Parameter type: <Alarm::VectVpLinkId2> - specifies the soft-link or the vp-link on the vp-board, or zero - range: [0,1...16]	this is the vplink id. This index has value zero when it is not used <i>This element is only shown in detail mode.</i>
vp-lt-mismatch	Parameter type: <Alarm::VectVpLtMism>	specifies if a mismatch between

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : mismatch between expected and actual vp-lt mapping or incompatible sw version on vp and lt - no : expected and actual vp-lt in line or vp and lt have compatible sw versions, OR autodiscovery enabled on vp, autodiscovery disabled on lt	expected and actual vp-lt mapping OR incompatible sw version on vp and lt is detected or not. In case vplt-autodiscovery disabled on vp, failure reported on vp-board. In case vplt-autodiscovery enabled on lt, failure reported on lt-board. <i>This element is only shown in detail mode.</i>
qsfp-id	Parameter type: <Alarm::VectQsfpInvalidNokiaID> (invalid valid) Possible values: - invalid : QSFP does not have valid Nokia ID - valid : QSFP has valid Nokia ID OR no QSFP detected.	specifies if detected QSFP of the frontcable has a valid Nokia ID or not <i>This element is only shown in detail mode.</i>
vp-lt-link	Parameter type: <Alarm::VPLTLINKFAIL> (linkdown linkup) Possible values: - linkdown : vp-lt link problem - linkup : vp-lt link ok or no lt-expected OR autodiscovery enabled on vp, autodiscovery disabled on lt	specifies if a VP-LT link failure is detected or not. In case vplt-autodiscovery disabled on vp, failure reported on vp-board when an lt was expected but no valid connection between vp-lt. In case vplt-autodiscovery enabled on lt, failure reported on lt-board when no valid connection between vp-lt. <i>This element is only shown in detail mode.</i>
vect-no-gain-at-init	Parameter type: <Alarm::VECTNOGAINATINIT> (yes no) Possible values: - yes : Lines cannot train in gain-at-init mode - no : Lines can train in gain-at-init mode	vectoring gain-at-init mode is not feasible due to excessive number of non-FDPS capable CPEs <i>This element is only shown in detail mode.</i>

103.17 Alarm Electrical-to-Optical Conversion for Snapshot Status Command

Command Description

This command displays the electrical-to-optical conversion alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot eo-conversion [ (index) ]
```

Command Parameters

Table 103.17-1 "Alarm Electrical-to-Optical Conversion for Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.17-2 "Alarm Electrical-to-Optical Conversion for Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
loss-of-signal	Parameter type: <Alarm::EoConvLOS> (yes no) Possible values: - yes : loss of signal detected in the EO conversion module - no : no loss of signal detected in the EO conversion module	specifies whether loss of signal detected or not in the EO conversion module <i>This element is only shown in detail mode.</i>
transmission	Parameter type: <Alarm::EoConvTx> (faulty ok) Possible values: - faulty : transmission fault in the EO module - ok : transmission OK	specifies whether transmission fault is occurred or not in the EO module <i>This element is only shown in detail mode.</i>

103.18 Authentication Alarms for Snapshot Status Command

Command Description

This command displays the status of authentication-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot authentication [(index)]

Command Parameters

Table 103.18-1 " Authentication Alarms for Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.18-2 " Authentication Alarms for Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
uni	Parameter type: <Itf::BridgePortItf> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> /	specify which uni the alarm occurred on. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE	
vlan-assignment	Parameter type: <Alarm::VLANAssignment> (failed successful) Possible values: - failed : failure to assign a VLAN for a user session - successful : assigned a VLAN for a user session	specifies whether a VLAN for a user session is assigned or failed <i>This element is only shown in detail mode.</i>
vsa-info-invalid	Parameter type: <Alarm::VSAValid> (yes no) Possible values: - yes : invalid VSA info alarm from RADIUS - no : valid VSA info from RADIUS and no alarm	specifies whether vsa information valid or not from RADIUS server. <i>This element is only shown in detail mode.</i>
mac-conflict	Parameter type: <Alarm::MACConflict> (yes	specifies whether mac conflict occurred or not in mac based

103 Alarm Snap-shot Status Commands

name	Type	Description
	no) Possible values: - yes : status of auth-mac-conflict alarm occurred - no : no status of auth-mac-conflict alarm occurred	authentication. <i>This element is only shown in detail mode.</i>
user-pwd-fault	Parameter type: <Alarm::USRPWDFault> (yes no) Possible values: - yes : invalid user or password alarm occurred - no : valid user and password and no alarm	specifies whether user or password valid or not in mac based authenticaiton. <i>This element is only shown in detail mode.</i>

103.19 Alarm xDSL Bonding Snap Shot Status Command

Command Description

This command displays the alarms of the xDSL bonding snap shot.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot bonding-group [(index)]

Command Parameters

Table 103.19-1 "Alarm xDSL Bonding Snap Shot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.19-2 "Alarm xDSL Bonding Snap Shot Status Command" Display parameters

Specific Information		
name	Type	Description
group	Parameter type: <Xdsl::BondingInterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the bonding group interface index <i>This element is only shown in detail mode.</i>
up-plan-bitrate	Parameter type: <Alarm::UpPlannedBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum	specifies whether the actual group upstream bit rate is above the group upstream planned bit rate or not <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	upstream bitrate but below the group upstream planned bitrate - ok : actual group bitrate is above the group upstream planned bitrate	<i>detail mode.</i>
down-plan-bitrate	Parameter type: <Alarm::DownPlanBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum downstream bitrate but below the group downstream planned bitrate - ok : actual group bitrate is above the group downstream planned bitrate	specifies whether the actual group downstream bit rate is above the group downstream planned bit rate or not <i>This element is only shown in detail mode.</i>
up-min-bitrate	Parameter type: <Alarm::UpMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group upstream minimum bitrate - ok : actual group bitrate is above the group upstream minimum bitrate	specifies whether the actual group upstream bit rate is above the group upstream minimum bit rate or not <i>This element is only shown in detail mode.</i>
down-min-bitrate	Parameter type: <Alarm::DownMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group downstream minimum bitrate - ok : actual group bitrate is above the group downstream minimum bitrate	specifies whether the actual group downstream bit rate is above the group downstream minimum bit rate or not <i>This element is only shown in detail mode.</i>
up-config	Parameter type: <Alarm::UpConfig> (not-feasible feasible) Possible values: - not-feasible : upstream configuration not feasible - feasible : upstream configuration feasible	specifies whether the upstream configuration is feasible or not <i>This element is only shown in detail mode.</i>
down-config	Parameter type: <Alarm::DownConfig> (not-feasible feasible) Possible values: - not-feasible : downstream configuration not feasible - feasible : downstream configuration feasible	specifies whether the downstream configuration is feasible or not <i>This element is only shown in detail mode.</i>
bond-cpe-conn	Parameter type: <Alarm::BondCPE> (not-connected connected) Possible values: - not-connected : bonding cpe modem not connected - connected : bonding cpe modem connected	specifies whether a bonding CPE modem is connected or not <i>This element is only shown in detail mode.</i>
multiple-cpes	Parameter type: <Alarm::BgConnCPE> (true false) Possible values: - true : bonding group has multiple cpe modems connected - false : bonding group has one cpe modem connected	specifies whether the lines of a bonding group are connected to multiple CPEs or only one <i>This element is only shown in detail mode.</i>
register	Parameter type: <Alarm::BgRegFail> (failure ok) Possible values:	specifies whether a discovery or aggregation failure is encountered or not <i>This element is only shown in</i>

name	Type	Description
	- failure : bonding group discovery or aggregation register failure detected - ok : bonding group discovery or aggregation register failure not detected	<i>detail mode.</i>
group-incomplete	Parameter type: <Alarm::BgNotCompl> (true false) Possible values: - true : bonding group is incomplete - false : bonding group is complete	specifies whether all configured lines of the bonding group are part of the bonding group <i>This element is only shown in detail mode.</i>

103.20 Alarm Redundancy Snapshot Status Command

Command Description

This command displays the redundancy snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot redundancy [(index)]

Command Parameters

Table 103.20-1 "Alarm Redundancy Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.20-2 "Alarm Redundancy Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
loss-swo-cap	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	identify the swichover capability in a redundant system. <i>This element is only shown in detail mode.</i>
ping-check	Parameter type: <Alarm::PingCheck> (failure successful) Possible values: - failure : system failure of ping check - successful : system successful of ping check	identify the ping check in a redundant system. <i>This element is only shown in detail mode.</i>

103.21 Alarm Custom Snapshot Status Command

Command Description

This command displays custom snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot custom [(index)]

Command Parameters

Table 103.21-1 "Alarm Custom Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.21-2 "Alarm Custom Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
custom-alarm1	Parameter type: <Alarm::custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm1 . <i>This element is only shown in detail mode.</i>
custom-alarm2	Parameter type: <Alarm::custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm2 . <i>This element is only shown in detail mode.</i>
custom-alarm3	Parameter type: <Alarm::custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm3 . <i>This element is only shown in detail mode.</i>
custom-alarm4	Parameter type: <Alarm::custom4>	identify the customizableAlarm4

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	. <i>This element is only shown in detail mode.</i>
custom-alarm5	Parameter type: <Alarm::custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm5 . <i>This element is only shown in detail mode.</i>
custom-alarm6	Parameter type: <Alarm::custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm6 . <i>This element is only shown in detail mode.</i>
custom-alarm7	Parameter type: <Alarm::custom7> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm7 . <i>This element is only shown in detail mode.</i>
custom-alarm8	Parameter type: <Alarm::custom8> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm8 . <i>This element is only shown in detail mode.</i>
custom-alarm9	Parameter type: <Alarm::custom9> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm9 . <i>This element is only shown in detail mode.</i>
custom-alarm10	Parameter type: <Alarm::custom10> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm10 . <i>This element is only shown in detail mode.</i>
custom-alarm11	Parameter type: <Alarm::custom11> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm11 . <i>This element is only shown in detail mode.</i>
custom-alarm12	Parameter type: <Alarm::custom12> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm12 . <i>This element is only shown in detail mode.</i>
custom-alarm13	Parameter type: <Alarm::custom13> (yes no) Possible values:	identify the customizableAlarm13 . <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	
custom-alarm14	Parameter type: <Alarm::custom14> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm14 . <i>This element is only shown in detail mode.</i>
custom-alarm15	Parameter type: <Alarm::custom15> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm15 . <i>This element is only shown in detail mode.</i>
custom-alarm16	Parameter type: <Alarm::custom16> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm16 . <i>This element is only shown in detail mode.</i>
custom-alarm17	Parameter type: <Alarm::custom17> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm17 . <i>This element is only shown in detail mode.</i>

Only Show Details: host expansion shelves customizable alarms

name	Type	Description
shelf	Parameter type: <Equipm::HolderId> (<Eqpt::RackId> / <Eqpt::ShelfId> not-applicable) Possible values: - not-applicable : not applicable Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	this is the shelf id (equipment hoder id) for host expansion alarms, otherwise it is the rack ID <i>This element is only shown in detail mode.</i>
he-custom-alarm1	Parameter type: <Alarm::he-custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion's customizableAlarm1 . <i>This element is only shown in detail mode.</i>
he-custom-alarm2	Parameter type: <Alarm::he-custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion's customizableAlarm2 . <i>This element is only shown in detail mode.</i>
he-custom-alarm3	Parameter type: <Alarm::he-custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion's customizableAlarm3 . <i>This element is only shown in detail mode.</i>
he-custom-alarm4	Parameter type: <Alarm::he-custom4> (yes	identify the host expansion's customizableAlarm4 .

103 Alarm Snap-shot Status Commands

name	Type	Description
	no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	<i>This element is only shown in detail mode.</i>
he-custom-alarm5	Parameter type: <Alarm::he-custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion's customizableAlarm5 . <i>This element is only shown in detail mode.</i>
he-custom-alarm6	Parameter type: <Alarm::he-custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion's customizableAlarm6 . <i>This element is only shown in detail mode.</i>

103.22 Alarm SFP Snapshot Status Command

This command displays the SFP snapshot-related alarms.

Command Description

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfp [ (index) ]
```

Command Parameters

Table 103.22-1 "Alarm SFP Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.22-2 "Alarm SFP Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
alarm index 1	Parameter type: <Alarm::SfpAlarmIdx1Type> (<Alarm::SfpAlarmIdx1> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - lt : the lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::SfpAlarmIdx1> - the host port faceplate number or the equipment slot-id for expansion shelf alarm	this is the host sfp faceplate number for host alarms or it is the equipment slot id for expansion shelf alarms <i>This element is only shown in detail mode.</i>
alarm index 2	Parameter type: <Ihub::EthernetPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex>	this is the ethernet port id or LT slot for host alarms. this index is not used for expansion shelf alarms <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> not-applicable lt-slot : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - lt-slot : the port in lt slot - not-applicable : no port Possible values: - sfp : SFP port - xfp : XFP port - eth : RJ45 or lemi port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number	detail mode.

Only Show Details: host shelf alarms		
name	Type	Description
host-sfp-los	Parameter type: <Alarm::hostSFPLOS> (failing ok) Possible values: - failing : host downlink SFP loss of signal - ok : host downlink SFP signal ok	current status host downlink SFP loss of signal <i>This element is only shown in detail mode.</i>
host-sfp-tx	Parameter type: <Alarm::hostSFPTxFail> (failing ok) Possible values: - failing : host downlink SFP tx failure - ok : host downlink SFP tx ok	current status host downlink SFP tx failure <i>This element is only shown in detail mode.</i>
host-sfp-pres	Parameter type: <Alarm::hostSFPMissing> (not-present present) Possible values: - not-present : host downlink SFP not present - present : host downlink SFP present	current status host downlink SFP not present <i>This element is only shown in detail mode.</i>
host-sfp-id	Parameter type: <Alarm::hostSFPInvalidNokiaID> (invalid valid) Possible values: - invalid : host downlink SFP does not have valid Nokia ID - valid : host downlink SFP has valid Nokia ID	current status host downlink SFP does not have valid Nokia ID <i>This element is only shown in detail mode.</i>
host-sfp-ctrl	Parameter type: <Alarm::hostSFPControlFail>	current status host downlink SFP

name	Type	Description
	(failing ok) Possible values: - failing : host downlink SFP control failure - ok : host downlink SFP control ok	control failure <i>This element is only shown in detail mode.</i>
host-sfp-rmtlt	Parameter type: <Alarm::hostSFPUnexpectedRemoteLT> (yes no) Possible values: - yes : host shelf SFP unexpected remote LT plug-in - no : host shelf SFP expected remote LT plug-in	current status of SFP alarm, host downlink SFP detected unexpected remote plug-in <i>This element is only shown in detail mode.</i>
host-sfp-mismatch	Parameter type: <Alarm::hostSFPAssignmentMismatch> (yes no) Possible values: - yes : host shelf SFP assignment does not match reported rack/shelf/slot - no : host shelf SFP assignment matches reported rack/shelf/slot	current status of SFP alarm, host downlink SFP assignment does not match reported rack/shelf/slot <i>This element is only shown in detail mode.</i>
host-sfp-incompt	Parameter type: <Alarm::hostSFPIncompatibleShelf> (yes no) Possible values: - yes : host shelf SFP incompatible shelf type detected - no : host shelf SFP compatible shelf type detected	current status of SFP alarm, host downlink SFP detected incompatible shelf type <i>This element is only shown in detail mode.</i>

Only Show Details: expansion shelf alarms

name	Type	Description
exp-sfp-los	Parameter type: <Alarm::expansionShelfSFPLos> (failing ok) Possible values: - failing : expansion shelf downlink SFP loss of signal - ok : expansion shelf downlink SFP signal ok	current status expansion side SFP loss of signal <i>This element is only shown in detail mode.</i>
exp-sfp-tx	Parameter type: <Alarm::expansionShelfSFPTxFail> (failing ok) Possible values: - failing : expansion shelf host downlink SFP tx failure - ok : expansion shelf downlink SFP tx ok	current status expansion shelf downlink SFP tx failure <i>This element is only shown in detail mode.</i>
exp-sfp-pres	Parameter type: <Alarm::expansionShelfSFPMissing> (not-present present) Possible values: - not-present : expansion shelf downlink SFP not present - present : expansion shelf downlink SFP present	current status expansion shelf downlink SFP not detected <i>This element is only shown in detail mode.</i>
exp-sfp-id	Parameter type: <Alarm::expShelfSFPInvalidNokiaID> (invalid valid) Possible values: - invalid : expansion shelf downlink SFP does not have valid Nokia ID - valid : expansion shelf downlink SFP has valid Nokia ID	current status expansion shelf downlink SFP does not have valid Nokia ID <i>This element is only shown in detail mode.</i>
exp-sfp-ctrl	Parameter type: <Alarm::expansionShelfSFPCtrlFail> (failing ok) Possible values: - failing : expansion shelf downlink SFP control failure	current status expansion shelf downlink SFP control failure <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- ok : expansion shelf downlink SFP control ok	
exp-sfp-1-los	Parameter type: <Alarm::expansionShelfSFP1Los> (failing ok) Possible values: - failing : expansion shelf downlink SFP1 loss of signal - ok : expansion shelf downlink SFP1 signal ok	current status expansion side SFP1 loss of signal <i>This element is only shown in detail mode.</i>
exp-sfp-2-los	Parameter type: <Alarm::expansionShelfSFP2Los> (failing ok) Possible values: - failing : expansion shelf downlink SFP2 loss of signal - ok : expansion shelf downlink SFP2 signal ok	current status expansion side SFP2 loss of signal <i>This element is only shown in detail mode.</i>

103.23 Alarm Custom External Snap Shot Status Command

Command Description

This command shows the customizable external alarm snap shot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot custom-ext-alarm [(index)]

Command Parameters

Table 103.23-1 "Alarm Custom External Snap Shot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.23-2 "Alarm Custom External Snap Shot Status Command" Display parameters

Specific Information		
name	Type	Description
ext-alarm1	Parameter type: <Alarm::custExtAlarm1> (yes no) Possible values: - yes : customizable external alarm 1 - no : no customizable external alarm 1	current status specifying external alarm 1 is present or not <i>This element is always shown.</i>
ext-alarm2	Parameter type: <Alarm::custExtAlarm2> (yes no) Possible values: - yes : customizable external alarm 2 - no : no customizable external alarm 2	current status specifying external alarm 2 is present or not <i>This element is always shown.</i>
ext-alarm3	Parameter type: <Alarm::custExtAlarm3> (yes no) Possible values:	current status specifying external alarm 3 is present or not <i>This element is always shown.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : customizable external alarm 3 - no : no customizable external alarm 3	
ext-alarm4	Parameter type: <Alarm::custExtAlarm4> (yes no) Possible values: - yes : customizable external alarm 4 - no : no customizable external alarm 4	current status specifying external alarm 4 is present or not <i>This element is always shown.</i>
ext-alarm5	Parameter type: <Alarm::custExtAlarm5> (yes no) Possible values: - yes : customizable external alarm 5 - no : no customizable external alarm 5	current status specifying external alarm 5 is present or not <i>This element is always shown.</i>

103.24 Alarm RSSI SFP Snapshot Status Command

Command Description

This command displays the SFP RSSI snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfrssi [ (index) ]
```

Command Parameters

Table 103.24-1 "Alarm RSSI SFP Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.24-2 "Alarm RSSI SFP Snapshot Status Command" Display parameters

name	Type	Description
tx-power-high-alarm	Parameter type: <Alarm::NTNTIOTXPWHI> (yes no) Possible values: - yes : TX optical power is too high than configured alarm high threshold - no : The TX optical power is ok	current status optical power is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
tx-power-low-alarm	Parameter type: <Alarm::NTNTIOTXPWLO> (yes no)	current status Tx optical power is too low than the configured alarm low threshold

name	Type	Description
	Possible values: - yes : TX optical power is too low than the configured alarm low threshold - no : TX optical power is ok	<i>This element is only shown in detail mode.</i>
rx-power-high-alarm	Parameter type: <Alarm::NTNTIORXPWHI> (yes no) Possible values: - yes : RX optical power is too high than the configured alarm high threshold - no : RX optical power is ok	current status Rx optical power is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
rx-power-low-alarm	Parameter type: <Alarm::NTNTIORXPWLO> (yes no) Possible values: - yes : RX optical power is too low than the configured alarm low threshold - no : RX optical power is ok	current status Rx optical power is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
tx-biascur-high-alarm	Parameter type: <Alarm::NTNTIOTXBIASHI> (yes no) Possible values: - yes : TX bias is too high than the configured alarm low threshold - no : TX bias current is ok	current status Tx bias is too high than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
tx-biascur-low-alarm	Parameter type: <Alarm::NTNTIOTXBIASLO> (yes no) Possible values: - yes : TX bias is too low than the configured alarm low threshold - no : TX bias current is ok	current status Tx bias is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
volt-high-alarm	Parameter type: <Alarm::NTNTIOVOLHI> (yes no) Possible values: - yes : voltage is too high than the configured alarm high threshold - no : voltage is ok	current status voltage is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
volt-low-alarm	Parameter type: <Alarm::NTNTIOVOLLO> (yes no) Possible values: - yes : voltage is too low than the configured alarm low threshold - no : voltage is ok	current status voltage is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
temp-high-alarm	Parameter type: <Alarm::NTNTIOTEMPHI> (yes no) Possible values: - yes : temperature is too high than the configured alarm high threshold - no : temperature is ok	current status temperature is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
temp-low-alarm	Parameter type: <Alarm::NTNTIOTEMPLO> (yes no) Possible values:	current status temperature is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : temperature is too low than the configured alarm low threshold - no : temperature is ok	<i>detail mode.</i>
tx-power-high-warn	Parameter type: <Alarm::NTNTIOTXPWHIWARN> (yes no) Possible values: - yes : TX optical power is too high than the configured warning high threshold - no : TX optical power is ok	current status Tx optical power is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
tx-power-low-warn	Parameter type: <Alarm::NTNTIOTXPWLOWARN> (yes no) Possible values: - yes : TX optical power is too low than the configured warning low threshold - no : TX optical power is ok	current status Tx optical power is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
rx-power-high-warn	Parameter type: <Alarm::NTNTIORXPWHIWARN> (yes no) Possible values: - yes : RX optical power is too low than the configured warning high threshold - no : RX optical power is ok	current status Rx optical power is too low than the configured warning high threshold <i>This element is only shown in detail mode.</i>
rx-power-low-warn	Parameter type: <Alarm::NTNTIORXPWLOWARN> (yes no) Possible values: - yes : RX optical power is too low than the configured warning low threshold - no : RX optical power is ok	current status Rx optical power is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
tx-biascur-high-warn	Parameter type: <Alarm::NTNTIOTXBIASHIWARN> (yes no) Possible values: - yes : TX bias is too high than the configured warning high threshold - no : TX bias current is ok	current status Tx bias is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
tx-biascur-low-warn	Parameter type: <Alarm::NTNTIOTXBIASLOWARN> (yes no) Possible values: - yes : TX bias is too low than the configured warning low threshold - no : TX bias current is ok	current status Tx bias is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
volt-high-warn	Parameter type: <Alarm::NTNTIOVOLHIWARN> (yes no) Possible values: - yes : voltage is too high than the configured warning high threshold - no : no Miscellaneous environment alarm	current status voltage is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
volt-low-warn	Parameter type: <Alarm::NTNTIOVOLLOWARN> (yes no) Possible values: - yes : voltage is too low than the configured warning low threshold	current status voltage is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
	threshold - no : voltage is ok	
temp-high-warn	Parameter type: <Alarm::NTNTIOTEMPEHIWARN> (yes no) Possible values: - yes : temperature is too high than the configured warning high threshold - no : temperature is ok	current status temperature is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
temp-low-warn	Parameter type: <Alarm::NTNTIOTEMPELOWARN> (yes no) Possible values: - yes : temperature is too high than the configured warning low threshold - no : temperature is ok	current status temperature is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>

103.25 Alarm PPP Cross-Connect Engine TCA Snapshot Status Command

Command Description

This command displays the ppp cross-connect engine TCA snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot pppcc-engine-tca [ (index) ]
```

Command Parameters

Table 103.25-1 "Alarm PPP Cross-Connect Engine TCA Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.25-2 "Alarm PPP Cross-Connect Engine TCA Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
engine	Parameter type: <Vlan::StackedVlanSigned> (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndex> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndex> - service vlan identity - range: [2...4093,4094] Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093,4094,4095,4096]	this is the ppp-cc engine number <i>This element is only shown in detail mode.</i>

Only Show Details: pppoe cross-connect engine tca alarms		
name	Type	Description
pppcce-trans-15min-tca	Parameter type: <Alarm::PPPCCETRANS15MIN> (yes no) Possible values: - yes : 15 minutes transaction timeout count exceeds configured TCA - no : 15 minutes transaction timeout count is OK	current 15 minutes transaction timeout count exceeds configured tca <i>This element is only shown in detail mode.</i>
pppcce-sess-15min-tca	Parameter type: <Alarm::PPPCCESESS15MIN> (yes no) Possible values: - yes : 15 minutes session timeout count exceeds configured TCA - no : 15 minutes session timeout count is OK	15 minutes session timeout count exceeds configured TCA <i>This element is only shown in detail mode.</i>
pppcce-trans-1day-tca	Parameter type: <Alarm::PPPCCETRANS1DAY> (yes no) Possible values: - yes : 1day transaction timeout count exceeds configured TCA - no : 1day transaction timeout count is OK	1day transaction timeout count exceeds configured TCA <i>This element is only shown in detail mode.</i>
pppcce-sess-1day-tca	Parameter type: <Alarm::PPPCCESESS1DAY> (yes no) Possible values: - yes : 1day session timeout count exceeds configured TCA - no : 1day session timeout count is OK	1day session timeout count exceeds configured TCA <i>This element is only shown in detail mode.</i>

103.26 Ellid Alarm Status Command

Command Description

This command displays the ellid current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ellid [(alarm-index)]

Command Parameters

Table 103.26-1 "Ellid Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(alarm-index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.26-2 "Ellid Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ellid-index	Parameter type: <Itf::ComplexPortType> (xdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> voicefxs : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> xdsl-channel : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-if : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-pvc : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> bridge-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId>	this is the epon id for Snapshot alarms. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- voip : voip - voip:ng2 : voip - la-group : link aggregation group - dist-router-interface : dist router interface - voicefxs : voicefxs - mpm : multi-pon module Possible values: - vlan : vlan port Possible values: - slot-vlan : slot unstacked - slot-stacked : slot vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier Field type <Eqpt::ComboPonId> - the comboPON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::BundleId> - the BUNDLE identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

name	Type	Description
	Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id Field type <Eqpt::VlanId> - VLAN id Field type <Eqpt::LogicalId> - logical id Field type <Eqpt::VrflId> - VRF id	

Only Show Details: ellid alarms		
name	Type	Description
key-fail-one-churn	Parameter type: <alarm::keyfailone> (yes no) Possible values: - yes : key exchange failure during one churning time - no : key exchange failure during one churning time is ok	key exchange failure during one churning time <i>This element is only shown in detail mode.</i>
key-fail-three-churn	Parameter type: <alarm::keyfailthree> (yes no) Possible values: - yes : key exchange failure during three churning time - no : key exchange failure during three churning time is ok	key exchange failure during three churning time <i>This element is only shown in detail mode.</i>
oam-discov-fail	Parameter type: <alarm::oamext> (yes no) Possible values: - yes : extend oam discovery failure - no : extend oam discovery failure is ok	extend oam discovery failure <i>This element is only shown in detail mode.</i>
report-timeout	Parameter type: <alarm::timeout> (yes no) Possible values: - yes : report timeout detecting - no : report timeout detecting is ok	report timeout detecting <i>This element is only shown in detail mode.</i>
total-packets-exceed	Parameter type: <alarm::totalexceed> (yes no) Possible values: - yes : total amount of protocol packets exceed threshold - no : total amount of protocol packets is ok	total amount of protocol packets exceed threshold <i>This element is only shown in detail mode.</i>
arp-packets-exceed	Parameter type: <alarm::arpexceed> (yes no) Possible values: - yes : protocol arp packets exceed threshold - no : protocol arp packets is ok	protocol arp packets exceed threshold <i>This element is only shown in detail mode.</i>
dhcp-packets-exceed	Parameter type: <alarm::dhcpxceed> (yes no)	protocol dhcp packets exceed threshold <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : protocol dhcp packets exceed threshold - no : protocol dhcp packets is ok	<i>detail mode.</i>
igmp-packets-exceed	Parameter type: <alarm::igmpexceed> (yes no) Possible values: - yes : protocol igmp packets exceed threshold - no : protocol igmp packets is ok	protocol igmp packets exceed threshold <i>This element is only shown in detail mode.</i>
pppoe-packets-exceed	Parameter type: <alarm::pppoeexceed> (yes no) Possible values: - yes : protocol pppoe packets exceed threshold - no : protocol pppoe packets is ok	protocol pppoe packets exceed threshold <i>This element is only shown in detail mode.</i>
nd-packets-exceed	Parameter type: <alarm::ndexceed> (yes no) Possible values: - yes : protocol nd packets exceed threshold - no : protocol nd packets is ok	protocol nd packets exceed threshold <i>This element is only shown in detail mode.</i>
icmpv6-packets-exceed	Parameter type: <alarm::icmpexceed> (yes no) Possible values: - yes : protocol icmp packets exceed threshold - no : protocol icmp packets is ok	protocol icmpv6 packets exceed threshold <i>This element is only shown in detail mode.</i>
mld-packets-exceed	Parameter type: <alarm::mldexceed> (yes no) Possible values: - yes : protocol igmp packets exceed threshold - no : protocol igmp packets is ok	protocol mld packets exceed threshold <i>This element is only shown in detail mode.</i>
dhcpv6-packets-exceed	Parameter type: <alarm::dhcpv6exceed> (yes no) Possible values: - yes : protocol dhcpv6 packets exceed threshold - no : protocol dhcpv6 packets is ok	protocol dhcpv6 packets exceed threshold <i>This element is only shown in detail mode.</i>
cfm-packets-exceed	Parameter type: <alarm::cfmexceed> (yes no) Possible values: - yes : protocol cfm packets exceed threshold - no : protocol cfm packets is ok	protocol cfm packets exceed threshold <i>This element is only shown in detail mode.</i>

103.27 2xE1/DS1 SFP Clock Snapshot Status Command

Command Description

This command displays the 2xE1/DS1 SFP Clock Snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfpe1t1-clock [ (index) ]
```

Command Parameters

Table 103.27-1 "2xE1/DS1 SFP Clock Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.27-2 "2xE1/DS1 SFP Clock Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
alarm index 1	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2 vlt : <Eqpt::RackId> / <Eqpt::ShelfId> /	this is the nt/ntio slot id for host alarms. <i>This element is only shown in detail mode.</i>

name	Type	Description
dsx1-serdes-fail	Parameter type: <Alarm::DSX1SERDESFAIL> (yes no) Possible values: - yes : SERDES clock failure alarm - no : SERDES Clock no failure	SERDES clock alarm failure <i>This element is only shown in detail mode.</i>
dsx1-tributary1-fail	Parameter type: <Alarm::DSX1TRIB1FAIL> (yes no) Possible values: - yes : Tributary 1 clock failure alarm - no : Tributary 1 clock no failure	tributary 1 clock failure alarm <i>This element is only shown in detail mode.</i>
dsx1-tributary2-fail	Parameter type: <Alarm::DSX1TRIB2FAIL> (yes no) Possible values: - yes : Tributary 2 clock failure alarm - no : Tributary 2 clock no failure	tributary 2 clock failure alarm <i>This element is only shown in detail mode.</i>

name	Type	Description
dsx1-los-fail	Parameter type: <Alarm::DSX1LOSFAIL> (yes no) Possible values: - yes : All selected tributaries in Loss Of Signal - no : No All selected tributaries in Loss Of Signal	all selected tributaries in loss of signal <i>This element is only shown in detail mode.</i>
dsx1-ais-sync	Parameter type: <Alarm::DSX1AISFAIL> (yes no) Possible values: - yes : Alarm Indication Signal on the tributary selected sync source - no : No Alarm Indication Signal on the tributary selected sync source	alarm indication signal on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-lof-sync	Parameter type: <Alarm::DSX1LOFSYNCFAIL> (yes no) Possible values: - yes : Loss of Frame on the tributary selected sync source - no : No Loss of Frame on the tributary selected sync source	loss of frame on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-los-sync	Parameter type: <Alarm::DSX1LOSSYNCFAIL> (yes no) Possible values: - yes : Loss of Signal on the tributary selected sync source - no : No Loss of Signal on the tributary selected sync source	loss of signal on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-deg-fail	Parameter type: <Alarm::DSX1DEGFAIL> (yes no) Possible values: - yes : Signal degrade alarm - no : Signal degrade alarm	signal degrade alarm <i>This element is only shown in detail mode.</i>

103.28 2xE1/DS1 SFP Framer Snapshot Status Command

Command Description

This command displays the 2xE1/DS1 SFP Framer snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfpe1t1-framer [ (index) ]
```

Command Parameters

Table 103.28-1 "2xE1/DS1 SFP Framer Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

	- yes : e1t1 sfp Cyclic Redundancy Check 6 from IWF - no : No e1t1 sfp Cyclic Redundancy Check 6 from IWF	
crc4-from-iwf	Parameter type: <Alarm::DSX1CRC4IWF> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 from IWF - no : No e1t1 sfp Cyclic Redundancy Check 4 from IWF	cyclic redundancy check 4 from IWF <i>This element is only shown in detail mode.</i>
crc4-threshold-from-iwf	Parameter type: <Alarm::DSX1CRC4THIWF> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from IWF - no : No e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from IWF	cyclic redundancy check 4 threshold alarm from IWF <i>This element is only shown in detail mode.</i>
ais-from-iwf	Parameter type: <Alarm::DSX1AISIWF> (yes no) Possible values: - yes : e1t1 sfp Alarm Indication Signal alarm from IWF - no : No e1t1 sfp Alarm Indication Signal alarm from IWF	alarm indication signal alarm from IWF <i>This element is only shown in detail mode.</i>
los-from-iwf	Parameter type: <Alarm::DSX1LOSIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of signal alarm from IWF - no : No e1t1 sfp Loss of signal alarm from IWF	loss of signal alarm from IWF <i>This element is only shown in detail mode.</i>
lof-from-iwf	Parameter type: <Alarm::DSX1LOFIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of frame alarm from IWF - no : No e1t1 sfp Loss of frame alarm from IWF	loss of frame alarm from IWF <i>This element is only shown in detail mode.</i>
lomf-from-iwf	Parameter type: <Alarm::DSX1LOMFIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of multi frame alarm from IWF - no : No e1t1 sfp Loss of multi frame alarm from IWF	loss of multi frame alarm from LIU <i>This element is only shown in detail mode.</i>

103.29 Epon Olt Sfp RSSI Snapshot Alarm Status Command

Command Description

This command displays the Epon Olt Sfp RSSI Snapshot alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot eoltrssi [ (index) ]
```

Command Parameters

Table 103.29-1 "Epon Olt Sfp RSSI Snapshot Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.29-2 "Epon Olt Sfp RSSI Snapshot Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
epon id	Parameter type: <Epon::PonId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	this is the epon id for Snapshot alarms. <i>This element is only shown in detail mode.</i>
Only Show Details: epon olt sfp rssi diagnostic threshold control alarms		
name	Type	Description
eolt-tpwr-hi-alm	Parameter type: <Alarm::OLTTXPWHI> (yes no)	Snapshot status Tx optical power is too high than the configured alarm high threshold

name	Type	Description
	Possible values: - yes : Olt sfp Tx power is higher than the configured alarm high threshold - no : Olt sfp Tx power current is ok	<i>This element is only shown in detail mode.</i>
eolt-txpwr-lw-alm	Parameter type: <Alarm::OLTTPWLO> (yes no) Possible values: - yes : Olt sfp Tx power is lower than the configured alarm low threshold - no : Olt sfp Tx power current is ok	Snapshot status Tx optical power is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-txbias-hi-alm	Parameter type: <Alarm::OLTTXBIASHI> (yes no) Possible values: - yes : Olt sfp Bias is higher than the configured alarm high threshold - no : Olt sfp Bias current is ok	Snapshot status Bias is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
eolt-txbias-lw-alm	Parameter type: <Alarm::OLTTXBIASLO> (yes no) Possible values: - yes : Olt sfp Bias is lower than the configured alarm low threshold - no : Olt sfp Bias current is ok	Snapshot status Bias is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-volt-hi-alm	Parameter type: <Alarm::OLTVOLHI> (yes no) Possible values: - yes : Olt sfp voltage is higher than the configured alarm high threshold - no : Olt sfp voltage current is ok	Snapshot status voltage is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
eolt-volt-lw-alm	Parameter type: <Alarm::OLTVOLLO> (yes no) Possible values: - yes : Olt sfp voltage is lower than the configured alarm low threshold - no : Olt sfp voltage current is ok	Snapshot status voltage is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-temp-hi-alm	Parameter type: <Alarm::OLTTEMPEHI> (yes no) Possible values: - yes : Olt sfp temperature is higher than the configured alarm high threshold - no : Olt sfp temperature current is ok	Snapshot status temperature is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
eolt-temp-lw-alm	Parameter type: <Alarm::OLTTEMPELO> (yes no) Possible values: - yes : Olt sfp temperature is lower than the configured alarm low threshold - no : Olt sfp temperature current is ok	Snapshot status temperature is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-txpwr-hi-warn	Parameter type: <Alarm::OLTTPWHIWARN> (yes no) Possible values:	Snapshot status Tx optical power is too high than the configured warning high threshold <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : Olt sfp Tx power is higher than the configured warning high threshold - no : Olt sfp Tx power current is ok	<i>detail mode.</i>
eolt-txpwr-lw-warn	Parameter type: <Alarm::OLTTPWLOWARN> (yes no) Possible values: - yes : Olt sfp Tx power is lower than the configured warning low threshold - no : Olt sfp Tx power current is ok	Snapshot status Tx optical power is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-txbias-hi-warn	Parameter type: <Alarm::OLTTXBIASHIWARN> (yes no) Possible values: - yes : Olt sfp Bias is higher than the configured warning high threshold - no : Olt sfp Bias current is ok	Snapshot status bias is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-txbias-lw-warn	Parameter type: <Alarm::OLTTXBIASLOWARN> (yes no) Possible values: - yes : Olt sfp Bias is lower than the configured warning low threshold - no : Olt sfp Bias current is ok	Snapshot status bias is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-volt-hi-warn	Parameter type: <Alarm::OLTVOLHIWARN> (yes no) Possible values: - yes : Olt sfp voltage is higher than the configured warning high threshold - no : Olt sfp voltage current is ok	Snapshot status voltage is too low than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-volt-lw-warn	Parameter type: <Alarm::OLTVOLLOWARN> (yes no) Possible values: - yes : Olt sfp voltage is lower than the configured warning low threshold - no : Olt sfp voltage current is ok	Snapshot status voltage is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-temp-hi-warn	Parameter type: <Alarm::OLTTEMPEHIWARN> (yes no) Possible values: - yes : Olt sfp temperature is higher than the configured warning high threshold - no : Olt sfp temperature current is ok	Snapshot status temperature is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-temp-lw-warn	Parameter type: <Alarm::OLTTEMPELOWARN> (yes no) Possible values: - yes : Olt sfp temperature is lower than the configured warning low threshold - no : Olt sfp temperature current is ok	Snapshot status temperature is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-txpwr-hi-alm	Parameter type: <Alarm::OLTEXTTPWHI> (yes no) Possible values: - yes : Olt xfp Tx power is higher than the configured alarm	Snapshot status Xfp Tx optical power is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
	high threshold - no : Olt xfp Tx power current is ok	
eolt-xfp-txpwr-lw-alm	Parameter type: <Alarm::OLTEXTTXPWLO> (yes no) Possible values: - yes : Olt xfp Tx power is lower than the configured alarm low threshold - no : Olt xfp Tx power current is ok	Snapshot status Xfp Tx optical power is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-hi-alm	Parameter type: <Alarm::OLTEXTTXBIASHI> (yes no) Possible values: - yes : Olt xfp Bias is higher than the configured alarm high threshold - no : Olt xfp Bias current is ok	Snapshot status Xfp bias is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-lw-alm	Parameter type: <Alarm::OLTEXTTXBIASLO> (yes no) Possible values: - yes : Olt xfp Bias is lower than the configured alarm low threshold - no : Olt xfp Bias current is ok	Snapshot status Xfp bias is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-txpwr-hi-warn	Parameter type: <Alarm::OLTEXTTXPWHIWARN> (yes no) Possible values: - yes : Olt xfp Tx power is higher than the configured warning high threshold - no : Olt xfp Tx power current is ok	Snapshot status Xfp Tx optical power is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-txpwr-lw-warn	Parameter type: <Alarm::OLTEXTTXPWLOWARN> (yes no) Possible values: - yes : Olt xfp Tx power is lower than the configured warning low threshold - no : Olt xfp Tx power current is ok	Snapshot status Xfp Tx optical power is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-hi-warn	Parameter type: <Alarm::OLTEXTTXBIASHIWARN> (yes no) Possible values: - yes : Olt xfp Bias is higher than the configured warning high threshold - no : Olt xfp Bias current is ok	Snapshot status Xfp bias is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-lw-warn	Parameter type: <Alarm::OLTEXTTXBIASLOWARN> (yes no) Possible values: - yes : Olt xfp Bias is lower than the configured warning low threshold - no : Olt xfp Bias current is ok	Snapshot status Xfp bias is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>

103.30 Alarm Plug In Unit Extended Snap Shot Status Command

Command Description

This command shows the alarm snap shot status for the extended plug in unit.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot plug-in-unit-ext [ (index) ]
```

Command Parameters

Table 103.30-1 "Alarm Plug In Unit Extended Snap Shot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.30-2 "Alarm Plug In Unit Extended Snap Shot Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
fan-alarm	Parameter type: <Alarm::pluginFan> (yes no) Possible values: - yes : fan alarm - no : no fan alarm	current status specifying fan alarm is present or not <i>This element is only shown in detail mode.</i>
dc-a-alarm	Parameter type: <Alarm::plugin-dc-a> (yes no) Possible values: - yes : dc a failure alarm - no : no dc a failure alarm	current status specifying dc-a failure alarm is present or not <i>This element is only shown in detail mode.</i>
dc-b-alarm	Parameter type: <Alarm::plugin-dc-b> (yes no) Possible values: - yes : dc b failure alarm - no : no dc b failure alarm	current status specifying dc-b failure alarm is present or not <i>This element is only shown in detail mode.</i>
dg-alarm	Parameter type: <Alarm::plugin-dg> (yes no) Possible values: - yes : dying gasp alarm - no : no dying gasp alarm	current status specifying dying gasp alarm is present or not <i>This element is only shown in detail mode.</i>
apsf-alarm	Parameter type: <Alarm::pluginApsf> (yes no) Possible values: - yes : apsf failure alarm - no : no apsf failure alarm	power for the applique is available or not <i>This element is only shown in detail mode.</i>
ntr-a-loss	Parameter type: <Alarm::NTRALoss> (yes no) Possible values: - yes : ntr-a signal unavailable - no : ntr-a signal available	current status specifying NTR-A loss alarm is present or not <i>This element is only shown in detail mode.</i>
ntr-b-loss	Parameter type: <Alarm::NTRBLoss> (yes no) Possible values:	current status specifying NTR-B loss alarm is present or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : ntr-b signal unavailable - no : ntr-b signal available	
xvps-conf-loss	Parameter type: <Alarm::XvpsConfLoss> (yes no) Possible values: - yes : implicit xvps configuration loss. - no : no implicit xvps configuration loss.	implicit xvps configuration loss or not. <i>This element is only shown in detail mode.</i>
mac-entry-nofree	Parameter type: <Alarm::MacNofree> (nofree free) Possible values: - nofree : no free mac entry in the mac table on the lt board. - free : file transfer server available.	current status specifying no free mac entry in the mac table on the lt board. <i>This element is only shown in detail mode.</i>
fibre-conn-mismatch	Parameter type: <Alarm::FibreConnMismatch> (yes no) Possible values: - yes : REM fibre connection mismatch alarm - no : no REM fibre connection mismatch alarm	current status specifying fibre connection mismatch on detected control card. <i>This element is only shown in detail mode.</i>
link-cap-mismatch	Parameter type: <Alarm::LinkCapMismatch> (yes no) Possible values: - yes : actual link speed is not inline with the end-to-end link capability between NT and LT - no : actual link speed is inline with the end-to-end link capability between NT and LT	log-status specifies that the actual link speed is not in line with the end-to-end link capability between NT and LT. <i>This element is only shown in detail mode.</i>
eqpt-cap-mismatch	Parameter type: <Alarm::EqptCapMismatch> (yes no) Possible values: - yes : not all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed. - no : all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed.	log-status specifies that not all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed. <i>This element is only shown in detail mode.</i>
ctrl-dnld-failure	Parameter type: <Alarm::CtrlDownloadFailure> (yes no) Possible values: - yes : The downloading of the Software image to the controller card failed.. - no : The downloading of the Software image to the controller card passed.	log-status specifies that the downloading of the Software image to the controller card failed. <i>This element is only shown in detail mode.</i>
melt-hw-issue	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue - no : No Board hardware issue.	log-status specifies that MELT hardware issue. <i>This element is only shown in detail mode.</i>
melt-board-reset	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue	log-status specifies that MELT board got reset. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : No Board hardware issue.	
board-shelf-mismatch	Parameter type: <Alarm::boardShelfMismatch> (yes no) Possible values: - yes : plugged-in board and shelf type are mismatch - no : plugged-in board and shelf type are match	alarm specifying the shelf type and plugged-in board types are mismatch. <i>This element is only shown in detail mode.</i>
single-fan-fail	Parameter type: <Alarm::SINGLEFANFAILURE> (yes no) Possible values: - yes : single fan failure` - no : no single fan failure	log-status specifies that SINGLE FAN IS FAIL. <i>This element is only shown in detail mode.</i>
multi-fan-fail	Parameter type: <Alarm::MULTIFANFAILURE> (yes no) Possible values: - yes : more than one fan failed - no : NO MULTIPLE fans are failed	log-status specifies that MULTIPLE FAN IS FAIL. <i>This element is only shown in detail mode.</i>
fan-tray-missing	Parameter type: <Alarm::FANTRAYMISSING> (yes no) Possible values: - yes : fan tray missing - no : fans tray is present	log-status specifies that FAN TRAY IS MISSING. <i>This element is only shown in detail mode.</i>

103.31 Alarm Snap-shot SIP Server Status Command

Command Description

This command show the alarm snap-shot of SIP Server

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sip-server [(index)]

Command Parameters

Table 103.31-1 "Alarm Snap-shot SIP Server Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.31-2 "Alarm Snap-shot SIP Server Status Command" Display parameters

Specific Information		
name	Type	Description
transport-mismatch	Parameter type: <Alarm::transportMismatch> (yes no) Possible values: - yes : mismatch - no : not mismatch	specifies isamv and server transport mismatch or not. <i>This element is only shown in detail mode.</i>
dns-lookup-failure	Parameter type: <Alarm::dnsLookUpFailure> (yes no) Possible values: - yes : fail - no : not fail	specifies dns look up fail or not. <i>This element is only shown in detail mode.</i>

103.32 Alarm Snap-shot SIP VSP Status Command

Command Description

This command show the alarm snap-shot of SIP VSP

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sip-vsp [(index)]

Command Parameters

Table 103.32-1 "Alarm Snap-shot SIP VSP Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.32-2 "Alarm Snap-shot SIP VSP Status Command" Display parameters

Specific Information		
name	Type	Description
none-dns-srv	Parameter type: <Alarm::noneDNSSRV> (yes no) Possible values: - yes : none of dns server give reply to to DNS look up - no : dns server give reply to to DNS look up	specifies none of dns server give reply to to DNS look up or not. <i>This element is only shown in detail mode.</i>
no-dns-srv	Parameter type: <Alarm::noDNSSRV> (yes no) Possible values: - yes : no dns server configured when sip request - no : dns server configured when sip request	specifies no dns server configured when sip request or not. <i>This element is only shown in detail mode.</i>
none-srv	Parameter type: <Alarm::noneSRV> (yes no) Possible values: - yes : none sip server give reply when send sip request - no : sip server give reply when send sip request	specifies none sip server give reply when send sip request or not. <i>This element is only shown in detail mode.</i>
no-srv	Parameter type: <Alarm::noSRV>	specifies no sip proxy server

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : no sip proxy server configured when send sip request - no : sip proxy server configured when send sip request	configured when send sip request or not. <i>This element is only shown in detail mode.</i>
reg-srv-unreach	Parameter type: <Alarm::noRegSRV> (yes no) Possible values: - yes : no sip register server give reply when send sip register - no : sip register server give reply when send sip register	specifies no sip register servers give reply when send sip register or not. <i>This element is only shown in detail mode.</i>
prxy-srv-unreach	Parameter type: <Alarm::noPrxySRV> (yes no) Possible values: - yes : no sip proxy server give reply when send sip request - no : sip proxy server give reply when send sip request	specifies no sip proxy servers give reply when send sip request or not. <i>This element is only shown in detail mode.</i>
fo-trigger	Parameter type: <Alarm::foTrigger> (yes no) Possible values: - yes : fail over triggered - no : fail over is not triggered	specifies fail-over is triggered or not. <i>This element is only shown in detail mode.</i>
fb-trigger	Parameter type: <Alarm::fbTrigger> (yes no) Possible values: - yes : fail back triggered - no : fail back is not triggered	specifies fail-back is triggered or not. <i>This element is only shown in detail mode.</i>
du-trigger	Parameter type: <Alarm::duTrigger> (yes no) Possible values: - yes : deliberate update triggered - no : deliberate update is not triggered	specifies deliberate-update is triggered or not. <i>This element is only shown in detail mode.</i>
ssp-missing	Parameter type: <Alarm::sspMissing> (yes no) Possible values: - yes : SSP missing in CDE - no : SSP exist in CDE	specifies ssp missing in cde or not. <i>This element is only shown in detail mode.</i>
dns-pool-exceed	Parameter type: <Alarm::dnsPoolExceed> (yes no) Possible values: - yes : Number of different SG associated DNS pools exceed - no : Number of different SG associated DNS pools exceed	specifies Number of different SG associated DNS pools exceed or not. <i>This element is only shown in detail mode.</i>
lsa-fo-trigger	Parameter type: <Alarm::lsaFoTrigger> (yes no) Possible values: - yes : SIP voice service degraded - fail-over to LSA server - no : fail-over to LSA server is not triggered	specifies lsa-fail-over is triggered or not. <i>This element is only shown in detail mode.</i>

103.33 Alarm Snap-shot SIP Dial Plan Status Command

Command Description

This command show the alarm snap-shot of SIP Dial Plan

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sip-dial-plan [(index)]

Command Parameters

Table 103.33-1 "Alarm Snap-shot SIP Dial Plan Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.33-2 "Alarm Snap-shot SIP Dial Plan Status Command" Display parameters

Specific Information		
name	Type	Description
bad-digitmap	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	sepcifies the sip digitmap usable or not. <i>This element is only shown in detail mode.</i>

103.34 Alarm Snap-shot SIP User Agent Status Command

Command Description

This command show the alarm snap-shot of SIP User Agent

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sip-user-agent [(index)]

Command Parameters

Table 103.34-1 "Alarm Snap-shot SIP User Agent Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.34-2 "Alarm Snap-shot SIP User Agent Status Command" Display parameters

Specific Information		
name	Type	Description
bad-digitmap	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	sepcifies the sip digitmap usable or not. <i>This element is only shown in detail mode.</i>
dhcp-unreach	Parameter type: <Alarm::dhcpUnreach> (yes no) Possible values: - yes : The DHCP server is unreachable - no : The DHCP server is reachable	specifies the DHCP server is unreachable or not <i>This element is only shown in detail mode.</i>
dhcp-no-srv	Parameter type: <Alarm::dhcpNoSrv> (yes no) Possible values:	specifies the address in DHCP reply is NULL or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : The address in DHCP reply is NULL - no : The address in DHCP reply is not NULL	
dhcp-inv-srv	Parameter type: <Alarm::dhcpInvSrv> (yes no) Possible values: - yes : The address in DHCP reply is invalid - no : The address in DHCP reply is OK	specifies the address in DHCP reply is invalid or not <i>This element is only shown in detail mode.</i>

103.35 Alarm Snap-shot SIP Slot Status Command

Command Description

This command show the alarm snap-shot of SIP Slot

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sip-plugin-unit [(index)]

Command Parameters

Table 103.35-1 "Alarm Snap-shot SIP Slot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.35-2 "Alarm Snap-shot SIP Slot Status Command" Display parameters

Specific Information		
name	Type	Description
short-res	Parameter type: <Alarm::shortResource> (yes no) Possible values: - yes : short call resource - no : have call resource	sepcifies the call resource short or not. <i>This element is only shown in detail mode.</i>
norpniewithsoftdsp	Parameter type: <Alarm::noRpniEWithSoftDsp> (yes no) Possible values: - yes : plan / plug-in RPNI-E board with SoftDsp SW image - no : no plan / plug-in RPNI-E board with SoftDsp SW image	sepcifies if plan / plug-in RPNI-E board with SoftDsp SW image or not. <i>This element is only shown in detail mode.</i>

103.36 Alarm Snap-shot SIP Termination Status Command

Command Description

This command show the alarm snap-shot of SIP termination

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sip-termination [(index)]

Command Parameters

Table 103.36-1 "Alarm Snap-shot SIP Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.36-2 "Alarm Snap-shot SIP Termination Status Command" Display parameters

Specific Information		
name	Type	Description
unknown-sub	Parameter type: <Alarm::unknownSubscriber> (yes no) Possible values: - yes : wrong subscriber - no : right subscriber	specifies the sip subscriber unknown or not. <i>This element is only shown in detail mode.</i>
ground-key	Parameter type: <Alarm::groundKey> (yes no) Possible values: - yes : current to ground - no : current not to ground	status of the ground key. <i>This element is only shown in detail mode.</i>
port-hightemp	Parameter type: <Alarm::highTemperature> (yes no) Possible values:	status of the port temperature. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : high temperature - no : not high temperature	
l1-act-failure	Parameter type: <Alarm::l1ActFailure> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of the layer 1 activation. <i>This element is only shown in detail mode.</i>
port-overcurrent	Parameter type: <Alarm::overCurrent> (yes no) Possible values: - yes : over current - no : not over current	status of the port current. <i>This element is only shown in detail mode.</i>
port-jbfltca	Parameter type: <Alarm::jbflTca> (yes no) Possible values: - yes : high jb fill level - no : not high jb fill level	status of the port jitter buffer fill level tca. <i>This element is only shown in detail mode.</i>
reg-domainname	Parameter type: <Alarm::regdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>
reg-auth	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
reg-timeout	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
reg-srvfailresp	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
inv-domainname	Parameter type: <Alarm::invdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
inv-auth	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
inv-timeout	Parameter type: <Alarm::invtimeout>	status of message timeout

name	Type	Description
	(yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	(invite). <i>This element is only shown in detail mode.</i>
inv-srvfailresp	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
subs-srvfailresp	Parameter type: <Alarm::subsrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe). <i>This element is only shown in detail mode.</i>
subs-domainname	Parameter type: <Alarm::subsdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe). <i>This element is only shown in detail mode.</i>
subs-auth	Parameter type: <Alarm::subsauth> (yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	status of authentication(subscribe). <i>This element is only shown in detail mode.</i>
subs-refreshfail	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received(refresher subscribe). <i>This element is only shown in detail mode.</i>
subs-inittimeout	Parameter type: <Alarm::subsintimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout(initial subscribe). <i>This element is only shown in detail mode.</i>
emergency-call	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>

103.37 Alarm Snap-shot Secondary SIP Termination Status Command

Command Description

This command show the alarm snap-shot of secondary SIP termination.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot secondary-sip-term [(index)]

Command Parameters

Table 103.37-1 "Alarm Snap-shot Secondary SIP Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.37-2 "Alarm Snap-shot Secondary SIP Termination Status Command" Display parameters

Specific Information		
name	Type	Description
reg-domainname-sec	Parameter type: <Alarm::regdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>
reg-auth-sec	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
reg-timeout-sec	Parameter type: <Alarm::regtimeout> (yes	status of message timeout (register).

name	Type	Description
	no) Possible values: - yes : register - message timeout - no : register - message not timeout	<i>This element is only shown in detail mode.</i>
reg-srvfailresp-sec	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
inv-domainname-sec	Parameter type: <Alarm::invdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
inv-auth-sec	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
inv-timeout-sec	Parameter type: <Alarm::invtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite). <i>This element is only shown in detail mode.</i>
inv-srvfailresp-sec	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
subs-srvfailresp-sec	Parameter type: <Alarm::subsrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe). <i>This element is only shown in detail mode.</i>
subs-domainname-sec	Parameter type: <Alarm::subsdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe). <i>This element is only shown in detail mode.</i>
subs-auth-sec	Parameter type: <Alarm::subsauth> (yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	status of authentication(subscribe). <i>This element is only shown in detail mode.</i>
subs-refreshfail-sec	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure	status of message timeout or 481 received(refresher subscribe). <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- no : Subscribe - refresh failure	
subs-inittimeout-sec	Parameter type: <Alarm::subsinittimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout(initial subscribe). <i>This element is only shown in detail mode.</i>
emergency-call-sec	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>

103.38 Alarm Snap-shot SIP Termination Status Command

Command Description

This command show the alarm snap-shot of SIP termination

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot e1-sip-termination [(index)]

Command Parameters

Table 103.38-1 "Alarm Snap-shot SIP Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.38-2 "Alarm Snap-shot SIP Termination Status Command" Display parameters

Specific Information		
name	Type	Description
reg-domainname	Parameter type: <Alarm::isdnregdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>
reg-auth	Parameter type: <Alarm::isdnregauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
reg-timeout	Parameter type: <Alarm::isdnregtimeout> (yes no) Possible values:	status of message timeout (register). <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : register - message timeout - no : register - message not timeout	
reg-srvfailresp	Parameter type: <Alarm::isdnregsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
inv-domainname	Parameter type: <Alarm::isdninvdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
inv-auth	Parameter type: <Alarm::isdninvauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
inv-timeout	Parameter type: <Alarm::isdninvtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite). <i>This element is only shown in detail mode.</i>
inv-srvfailresp	Parameter type: <Alarm::isdninvsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
emergency-call	Parameter type: <Alarm::isdnemergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>
ais-signal	Parameter type: <Alarm::isdnaissignal> (yes no) Possible values: - yes : Alarm Indication Signal detected at E1 interface - no : no Alarm Indication Signal detected at E1 interface	status of Alarm Indication Signal. <i>This element is only shown in detail mode.</i>
los-signal	Parameter type: <Alarm::isdnlossignal> (yes no) Possible values: - yes : Loss Of Signal detected at E1 interface - no : no Loss Of Signal detected at E1 interface	status of Loss Of Signal Alarm. <i>This element is only shown in detail mode.</i>
rai-signal	Parameter type: <Alarm::isdnraisignal> (yes no) Possible values: - yes : Remote Alarm Indication detected at E1 interface - no : no Remote Alarm Indication detected at E1 interface	status of Remote Alarm Indication. <i>This element is only shown in detail mode.</i>
e1sip-misconfig-mgc10	Parameter type: <Alarm::sipmiscfgmgc10>	status of config error when

name	Type	Description
	(yes no) Possible values: - yes : Configuration not conform with the core network entity - no : no Configuration not conform with the core network entity	connect to mgc10. <i>This element is only shown in detail mode.</i>
e1sip-nsmprf-missed	Parameter type: <Alarm::sipnsmprofmis> (yes no) Possible values: - yes : The SIP termination requires a NSM profile - no : no The SIP termination requires a NSM profile	status of config error when connect to mgc10. <i>This element is only shown in detail mode.</i>

103.39 Alarm Snap-shot E1/T1 interface Status Command

Command Description

This command shows the snap shot status of E1T1 interface alarm

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot e1t1-interface [ (index) ]
```

Command Parameters

Table 103.39-1 "Alarm Snap-shot E1/T1 interface Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.39-2 "Alarm Snap-shot E1/T1 interface Status Command" Display parameters

Specific Information		
name	Type	Description
e1t1itf-recv-ais	Parameter type: <Alarm::itfaissignal> (yes no) Possible values: - yes : Alarm Indication Signal received at interface - no : no Alarm Indication Signal received at interface	status of Alarm Indication Signal received at interface <i>This element is only shown in detail mode.</i>
e1t1itf-recv-los	Parameter type: <Alarm::itflossignal> (yes no) Possible values: - yes : Loss Of Signal received at interface - no : no Loss Of Signal received at interface	status of Loss Of Signal Alarm received at interface <i>This element is only shown in detail mode.</i>
e1t1itf-recv-rai	Parameter type: <Alarm::itfraissignal> (yes no) Possible values:	status of Remote Alarm Indication received at interface <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : Remote Alarm Indication received at interface - no : no Remote Alarm Indication received at interface	

103.40 Alarm Snap-shot SIP Termination Status Command

Command Description

This command show the alarm snap-shot of SIP termination

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot cas-r2-channel [ (index) ]
```

Command Parameters

Table 103.40-1 "Alarm Snap-shot SIP Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.40-2 "Alarm Snap-shot SIP Termination Status Command" Display parameters

Specific Information		
name	Type	Description
exp-seizureack	Parameter type: <Alarm::ExpSeizureAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the SEIZURE ACK signal - no : Channel was not blocked due to failure in the reception of the SEIZURE ACK signal	status of seizure ack signal <i>This element is only shown in detail mode.</i>
exp-disconack	Parameter type: <Alarm::ExpDisconnectAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the DISCONNECTION ACK signal - no : Channel was not blocked due to failure in the reception of the DISCONNECTION ACK signal	status of disconnect ack signal <i>This element is only shown in detail mode.</i>

name	Type	Description
exp-forcerelack	Parameter type: <Alarm::ExpForceRelAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal - no : No Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal	status of foreced release ack signal <i>This element is only shown in detail mode.</i>

103.41 Alarm Snap-shot Pseudo Wire Status Command

Command Description

This command show the alarm snap-shot of the Pseudo Wire.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot pseudo-wire [(index)]

Command Parameters

Table 103.41-1 "Alarm Snap-shot Pseudo Wire Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.41-2 "Alarm Snap-shot Pseudo Wire Status Command" Display parameters

Specific Information		
name	Type	Description
packet-loss	Parameter type: <Alarm::PacketLoss> (yes no) Possible values: - yes : Pseudo Wire entered the Packet loss state - no : Pseudo Wire not entered the Packet loss state	specifies the packet loss is unknown or not. <i>This element is only shown in detail mode.</i>
remote-packet-loss	Parameter type: <Alarm::RemotePacketLoss> (yes no) Possible values: - yes : Remote Packet loss detected - no : Remote Packet loss not detected	specifies the remote packet loss or not. <i>This element is only shown in detail mode.</i>
no-dsp-resource	Parameter type: <Alarm::NoDspResource> (yes no) Possible values:	specifies no DSP resource or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : DSP resource allocation failed - no : DSP resource allocation failed	

103.42 Alarm Snap-shot Megaco Media Gateway Status Command

Command Description

This command show the alarm snap-shot of Megaco media gateway.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot megaco-media-gw [(index)]

Command Parameters

Table 103.42-1 "Alarm Snap-shot Megaco Media Gateway Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.42-2 "Alarm Snap-shot Megaco Media Gateway Status Command" Display parameters

Specific Information		
name	Type	Description
mgc-unreachable	Parameter type: <Alarm::mgcUnreachable> (yes no) Possible values: - yes : media gateway controller is unreachable - no : media gateway controller is reachable	specifies the media gateway controller is unreachable or not. <i>This element is only shown in detail mode.</i>
failover-to-esamgc	Parameter type: <Alarm::failovertoESAMGC> (yes no) Possible values: - yes : failover to esa mgc - no : normal mgc is in service	specifies the media gateway failover to esa mgc or not. <i>This element is only shown in detail mode.</i>

103.43 Alarm Snap-shot Megaco Signaling Gateway Status Command

Command Description

This command show the alarm snap-shot of Megaco signaling gateway.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot megaco-sig-gw [(index)]

Command Parameters

Table 103.43-1 "Alarm Snap-shot Megaco Signaling Gateway Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.43-2 "Alarm Snap-shot Megaco Signaling Gateway Status Command" Display parameters

Specific Information		
name	Type	Description
sig-unreachable	Parameter type: <Alarm::sgcUnreachable> (yes no) Possible values: - yes : signalling gateway controller is unreachable - no : signalling gateway controller is reachable	specifies the signaling gateway controller is unreachable or not. <i>This element is only shown in detail mode.</i>

103.44 Alarm Snap-shot Megaco Plug Unit Status Command

Command Description

This command show the alarm snap-shot of Megaco plug unit.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot megaco-plug-unit [(index)]

Command Parameters

Table 103.44-1 "Alarm Snap-shot Megaco Plug Unit Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.44-2 "Alarm Snap-shot Megaco Plug Unit Status Command" Display parameters

Specific Information		
name	Type	Description
lcard-unreach-srvcard	Parameter type: <Alarm::lineCardUnreachSrvCard> (yes no) Possible values: - yes : line card is unreachable with server card - no : line card is reachable with server card	specifies the line card is unreachable with server card or not. <i>This element is only shown in detail mode.</i>
lcard-type-mismatch	Parameter type: <Alarm::lineCardTypeMismatchch> (yes no) Possible values: - yes : line card type is mismatch - no : line card type is match	specifies the line card type is mismatch or not. <i>This element is only shown in detail mode.</i>

103.45 Alarm Snap-shot Megaco Termination Status Command

Command Description

This command show the alarm snap-shot of Megaco termination.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot megaco-term [(index)]

Command Parameters

Table 103.45-1 "Alarm Snap-shot Megaco Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.45-2 "Alarm Snap-shot Megaco Termination Status Command" Display parameters

Specific Information		
name	Type	Description
meg-unknown-sub	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	specifies the megaco subscriber is unknown or not. <i>This element is only shown in detail mode.</i>
meg-ground-key	Parameter type: <Alarm::voicePortGroundKey> (yes no) Possible values: - yes : voice port ground key - no : voice port not ground key	specifies the voice port ground key or not. <i>This element is only shown in detail mode.</i>
meg-high-temp	Parameter type: <Alarm::voicePortHighTemp> (yes no) Possible values:	specifies the voice port high temperature or not. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : voice port high temperature - no : voice port not high temperature	
l1-act-fail	Parameter type: <Alarm::voicePortL1ActFail> (yes no) Possible values: - yes : voice port l1 act failure - no : voice port l1 act not failure	specifies the voice port l1 act failure or not. <i>This element is only shown in detail mode.</i>
over-current	Parameter type: <Alarm::voicePortOverCurrent> (yes no) Possible values: - yes : voice port over current - no : voice port not over current	specifies the voice port over current or not. <i>This element is only shown in detail mode.</i>
line-showering	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	specifies the line showering or not. <i>This element is only shown in detail mode.</i>
low-qos-packetloss	Parameter type: <Alarm::lowQosPacketLoss> (yes no) Possible values: - yes : the total packet loss has exceeded the configured threshold - no : the total packet loss has not exceeded the configured threshold	specifies the megaco total packet loss has exceeded the configured threshold or not. <i>This element is only shown in detail mode.</i>
low-qos-jitter	Parameter type: <Alarm::lowQosJitter> (yes no) Possible values: - yes : the rtp jitter has exceeded the configured threshold - no : the rtp jitter has not exceeded the configured threshold	specifies the megaco rtp jitter has exceeded the configured threshold or not. <i>This element is only shown in detail mode.</i>
low-qos-delay	Parameter type: <Alarm::lowQosDelay> (yes no) Possible values: - yes : the rtp delay has exceeded the configured threshold - no : the rtp delay has not exceeded the configured threshold	specifies the megaco rtp delay has exceeded the configured threshold or not. <i>This element is only shown in detail mode.</i>

103.46 Alarm Snap-shot Secondary Megaco Termination Status Command

Command Description

This command show the alarm snap-shot of the secondary Megaco termination.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot secondary-megaco-term [(index)]

Command Parameters

Table 103.46-1 "Alarm Snap-shot Secondary Megaco Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.46-2 "Alarm Snap-shot Secondary Megaco Termination Status Command" Display parameters

Specific Information		
name	Type	Description
meg-unknown-sub-sec	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	specifies the megaco subscriber is unknown or not. <i>This element is only shown in detail mode.</i>
line-showering-sec	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	specifies the line showering or not. <i>This element is only shown in detail mode.</i>

103.47 Alarm Snap-shot Megaco Signaling Lt Status Command

Command Description

This command show the alarm snap-shot of Megaco signaling Lt.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot megaco-sig-lt [(index)]

Command Parameters

Table 103.47-1 "Alarm Snap-shot Megaco Signaling Lt Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.47-2 "Alarm Snap-shot Megaco Signaling Lt Status Command" Display parameters

Specific Information		
name	Type	Description
sig-brd-persist-loss	Parameter type: <Alarm::megacoSigBoardPersDataLoss> (yes no) Possible values: - yes : the voice signaling board persistenet data loss - no : the voice signaling board persistenet data not loss	specifies the voice signaling board persistenet data loss or not. <i>This element is only shown in detail mode.</i>
sig-brd-disk-full	Parameter type: <Alarm::voiceSigBoard90PercentFull> (yes no) Possible values: - yes : specifies the voice signaling board disk 90% full - no : specifies the voice signaling board disk no 90% full	specifies the voice signaling board disk 90% full or not. <i>This element is only shown in detail mode.</i>
sig-brd-db-rollback	Parameter type: <Alarm::sigBoardDBRollback> (yes no) Possible values:	specifies he voice signaling board implicit db rollback or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : specifies the voice signaling board implicit db rollback - no : specifies the voice signaling board implicit db no rollback	
mg-overload	Parameter type: <Alarm::megMGOverLoad> (yes no) Possible values: - yes : specifies the mg overload - no : specifies the mg no overload	specifies the mg overload or not. <i>This element is only shown in detail mode.</i>

103.48 Alarm Snap-shot E1 Status Command

Command Description

This command show the alarm snap-shot of E1

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot e1 [ (index) ]
```

Command Parameters

Table 103.48-1 "Alarm Snap-shot E1 Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.48-2 "Alarm Snap-shot E1 Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::E1Line> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
rx-rai	Parameter type: <Alarm::E1RxRai> (yes no) Possible values: - yes : recieving RAI - no : no recieving RAI	snap shot of E1 receiving RAI <i>This element is only shown in detail mode.</i>
tx-rai	Parameter type: <Alarm::E1TxRai> (yes	snap shot of E1 transmitting RAI <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : transmitting RAI - no : no transmitting RAI	<i>detail mode.</i>
rx-ais	Parameter type: <Alarm::E1RxAis> (yes no) Possible values: - yes : recieving AIS - no : no recieving AIS	snap shot of E1 receiving AIS <i>This element is only shown in detail mode.</i>
tx-ais	Parameter type: <Alarm::E1TxAis> (yes no) Possible values: - yes : transmitting AIS - no : no transmitting AIS	snap shot of E1 transmitting AIS <i>This element is only shown in detail mode.</i>
lof	Parameter type: <Alarm::E1LOF> (yes no) Possible values: - yes : loss of frame - no : no loss of frame	snap shot of E1 loss of frame <i>This element is only shown in detail mode.</i>
los	Parameter type: <Alarm::E1LOS> (yes no) Possible values: - yes : loss of signal - no : no loss of signal	snap shot of E1 loss of signal <i>This element is only shown in detail mode.</i>
loopback	Parameter type: <Alarm::E1Loopback> (yes no) Possible values: - yes : facility in loopback - no : facility not in loopback	snap shot of E1 loopback <i>This element is only shown in detail mode.</i>

103.49 Alarm Snap-shot Shdsl Status Command

Command Description

This command show the alarm snap-shot of Shdsl

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot shdsl [(index)]

Command Parameters

Table 103.49-1 "Alarm Snap-shot Shdsl Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.49-2 "Alarm Snap-shot Shdsl Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
unit	Parameter type: <Alarm::LinkDeviceValues> - a signed integer	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
loop-act-net	Parameter type: <Alarm::LoopbackActiveNetwork> (yes no) Possible values:	snap shot of loopback active at the network side <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : loopback active - no : no loopback active	
loop-act-cus	Parameter type: <Alarm::LoopbackActiveCustom> (yes no) Possible values: - yes : loopback active - no : no loopback active	snap shot of loopback active at the custom side <i>This element is only shown in detail mode.</i>
config-error	Parameter type: <Alarm::ConfigError> (yes no) Possible values: - yes : config error - no : no config error	snap shot of configuration error <i>This element is only shown in detail mode.</i>
loss-atm	Parameter type: <Alarm::LossATMCellDel> (yes no) Possible values: - yes : loss atm cell delineation - no : no loss atm cell delineation	snap shot of loss of atm cell delineation <i>This element is only shown in detail mode.</i>
loss-pr	Parameter type: <Alarm::LossPowerSTUR> (yes no) Possible values: - yes : loss power at stu-r - no : no loss power at stu-r	snap shot of loss of power at stu-r <i>This element is only shown in detail mode.</i>
secu-error	Parameter type: <Alarm::UnableDisableSTUR> (yes no) Possible values: - yes : loss ability at stu-r - no : no loss ability at stu-r	snap shot of loss of ability to disable stu-r access <i>This element is only shown in detail mode.</i>
dev-fault	Parameter type: <Alarm::DeviceFault> (yes no) Possible values: - yes : device fault - no : no device fault	snap shot of fault of device <i>This element is only shown in detail mode.</i>
atm-ncd	Parameter type: <Alarm::ATMCellDel> (yes no) Possible values: - yes : no atm cell delineation - no : atm cell delineation	snap shot of none of atm cell delineation <i>This element is only shown in detail mode.</i>

103.50 Alarm Snap-shot Shdsl Status Command

Command Description

This command show the alarm snap-shot of Shdsl

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot shdsl-isam [(index)]

Command Parameters

Table 103.50-1 "Alarm Snap-shot Shdsl Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.50-2 "Alarm Snap-shot Shdsl Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
wire-pair	Parameter type: <Alarm::LinkDeviceValuesHigh> - identify where the alarm occurred	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
unit	Parameter type: <Alarm::LinkDeviceValuesLow> - identify where the alarm occurred	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>

name	Type	Description
loss-syn-net	Parameter type: <Alarm::LossSyncWordNetwork> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	snap shot of loss of sync word at the network side on each pair <i>This element is only shown in detail mode.</i>
loss-syn-cus	Parameter type: <Alarm::LossSyncWordCustom> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	snap shot of loss of sync word at the custom side on each pair <i>This element is only shown in detail mode.</i>
loop-att-net	Parameter type: <Alarm::LoopAttenuationNetwork> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	snap shot of loop attenuation alarm at the network side on each pair <i>This element is only shown in detail mode.</i>
loop-att-cus	Parameter type: <Alarm::LoopAttenuationCustom> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	snap shot of loop attenuation alarm at the custom side on each pair <i>This element is only shown in detail mode.</i>
snr-net	Parameter type: <Alarm::SNRNetwork> (yes no) Possible values: - yes : snr margin - no : no snr margin	snap shot of snr margin alarm at the network side each pair <i>This element is only shown in detail mode.</i>
snr-cus	Parameter type: <Alarm::SNRCustom> (yes no) Possible values: - yes : snr margin - no : no snr margin	snap shot of snr margin alarm at the custom side each pair <i>This element is only shown in detail mode.</i>
dc-net	Parameter type: <Alarm::DCContinuityFaultNetwork> (yes no) Possible values: - yes : dc fault - no : no dc fault	snap shot of dc continuity fault at the network side on each pair <i>This element is only shown in detail mode.</i>
dc-cus	Parameter type: <Alarm::DCContinuityFaultCustom> (yes no) Possible values: - yes : dc fault - no : no dc fault	snap shot of dc continuity fault at the custom side on each pair <i>This element is only shown in detail mode.</i>

103.51 Alarm Snap-shot Ima-Group Status Command

Command Description

This command show the alarm snap-shot of Ima-Group

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ima-group [(index)]

Command Parameters

Table 103.51-1 "Alarm Snap-shot Ima-Group Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.51-2 "Alarm Snap-shot Ima-Group Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Equipm::AtmImaIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
far-end-start	Parameter type: <Alarm::FarEndStartup> (yes no) Possible values: - yes : far-end startup	snap shot of far-end starting up <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no far-end startup	
far-end-fconf	Parameter type: <Alarm::FarEndFailedConfig> (yes no) Possible values: - yes : far-end failed config - no : no far-end failed config	snap shot of failed configuration of far-end <i>This element is only shown in detail mode.</i>
near-end-fconf	Parameter type: <Alarm::NearEndFailedConfig> (yes no) Possible values: - yes : near-end failed config - no : no near-end failed config	snap shot of failed configuration of near-end <i>This element is only shown in detail mode.</i>
far-end-ins-lnk	Parameter type: <Alarm::FarEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at far-end - no : no insufficient number of links at far-end	snap shot of insufficient number of links at far-end <i>This element is only shown in detail mode.</i>
near-end-ins-lnk	Parameter type: <Alarm::NearEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at near-end - no : no insufficient number of links at near-end	snap shot of insufficient number of links at near-end <i>This element is only shown in detail mode.</i>
far-end-blk	Parameter type: <Alarm::FarEndBlocked> (yes no) Possible values: - yes : far-end blocked - no : no far-end blocked	snap shot of status that far-end is blocked <i>This element is only shown in detail mode.</i>

103.52 Alarm Snap-shot Ima-Link Status Command

Command Description

This command show the alarm snap-shot of Ima-Link

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ima-link [(index)]

Command Parameters

Table 103.52-1 "Alarm Snap-shot Ima-Link Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.52-2 "Alarm Snap-shot Ima-Link Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
loss-ima-frm	Parameter type: <Alarm::LossImaFrame> (yes no) Possible values: - yes : loss ima frame - no : no loss ima frame	snap shot of loss of ima frame <i>This element is only shown in detail mode.</i>
lods	Parameter type: <Alarm::LinkOutofDelaySynch> (yes	snap shot of link out of delay synchronization

name	Type	Description
	no) Possible values: - yes : link out of delay - no : no link out of delay	<i>This element is only shown in detail mode.</i>
link-misc	Parameter type: <Alarm::LinkMisconnect> (yes no) Possible values: - yes : link misconnect - no : no link misconnect	snap shot of link of misconnecting <i>This element is only shown in detail mode.</i>
link-rfi	Parameter type: <Alarm::LinkRemoteFailureIndication> (yes no) Possible values: - yes : link remote failure indication - no : no link remote failure indication	snap shot of link of remote failure indication <i>This element is only shown in detail mode.</i>
link-fault	Parameter type: <Alarm::LinkFault> (yes no) Possible values: - yes : fault in link facility - no : no fault in link facility	snap shot of fault of link <i>This element is only shown in detail mode.</i>
fe-tx-blk	Parameter type: <Alarm::FarEndTXBlocked> (yes no) Possible values: - yes : transmit blocked due to far-end - no : no transmit blocked due to far-end	snap shot of transmit blocked due to far-end <i>This element is only shown in detail mode.</i>
fe-rec-blk	Parameter type: <Alarm::FarEndRXBlocked> (yes no) Possible values: - yes : receive blocked due to far-end - no : no receive blocked due to far-end	snap shot of receive blocked due to far-end <i>This element is only shown in detail mode.</i>

103.53 Alarm Snap-shot Ether-Tca Status Command

Command Description

This command show the alarm snap-shot of Ether-Tca

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ether-tca [(index)]

Command Parameters

Table 103.53-1 "Alarm Snap-shot Ether-Tca Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.53-2 "Alarm Snap-shot Ether-Tca Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
etca-los	Parameter type: <Alarm::EthTcaLos> (yes no) Possible values: - yes : ethernet loss of signal errors exceeds	snap shot of ethernet los in 15 min <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : ethernet loss of signal errors normal	
etca-fcs	Parameter type: <Alarm::EthTcaFcs> (yes no) Possible values: - yes : ethernet frame check sequence errors exceeds - no : ethernet frame check sequence errors normal	snap shot of ethernet fcs in 15 min <i>This element is only shown in detail mode.</i>
etca-rx-octets	Parameter type: <Alarm::EthTcaRxb> (yes no) Possible values: - yes : received octets exceeds - no : received octets normal	snap shot of received octets in 15 min <i>This element is only shown in detail mode.</i>
etca-tx-octets	Parameter type: <Alarm::EthTcaTxb> (yes no) Possible values: - yes : transmitted octets exceeds - no : transmitted octets normal	snap shot of transmitted octets in 15 min <i>This element is only shown in detail mode.</i>
etca-day-los	Parameter type: <Alarm::EthDayLos> (yes no) Possible values: - yes : ethernet day los errors exceeds - no : ethernet day los errors normal	snap shot of ethernet day los <i>This element is only shown in detail mode.</i>
etca-day-fcs	Parameter type: <Alarm::EthDayFcs> (yes no) Possible values: - yes : ethernet day fcs errors exceeds - no : ethernet day fcs errors normal	snap shot of ethernet day fcs <i>This element is only shown in detail mode.</i>
etca-day-rx-octets	Parameter type: <Alarm::EthDayRxb> (yes no) Possible values: - yes : received octets day exceeds - no : received octets day normal	snap shot of received octets in 1 day <i>This element is only shown in detail mode.</i>
etca-day-tx-octets	Parameter type: <Alarm::EthDayTxb> (yes no) Possible values: - yes : transmitted octets day exceeds - no : transmitted octets day normal	snap shot of transmitted octets in 1 day <i>This element is only shown in detail mode.</i>

103.54 Alarm Snap-shot Ether-Sfp Status Command

Command Description

This command show the alarm snap-shot of Ether-Sfp

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ether-sfp [(index)]

Command Parameters

Table 103.54-1 "Alarm Snap-shot Ether-Sfp Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.54-2 "Alarm Snap-shot Ether-Sfp Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
user-sfp-los	Parameter type: <Alarm::EthSfpLos> (yes no) Possible values: - yes : ethernet sfp los error	snap shot of ethernet sfp los <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : ethernet sfp los normal	
user-sfp-tx-fail	Parameter type: <Alarm::EthSfpTxFail> (yes no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	snap shot of ethernet sfp tx <i>This element is only shown in detail mode.</i>
user-sfp-not-prst	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	snap shot of ethernet sfp presence <i>This element is only shown in detail mode.</i>
user-sfp-inv-id	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	snap shot of ethernet sfp id <i>This element is only shown in detail mode.</i>
user-sfp-t-exceed	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed - no : ethernet sfp temperature normal	snap shot of ethernet sfp temperature <i>This element is only shown in detail mode.</i>
user-sfp-mismatch	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	snap shot of ethernet sfp type <i>This element is only shown in detail mode.</i>

103.55 Alarm Snap-shot Ether-Sfp Status Command

Command Description

This command show the alarm snap-shot of Ether-Sfp

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot uplink-ether-sfp [(index)]

Command Parameters

Table 103.55-1 "Alarm Snap-shot Ether-Sfp Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.55-2 "Alarm Snap-shot Ether-Sfp Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
uplink-sfp-los	Parameter type: <Alarm::EthSfpLos> (yes no) Possible values: - yes : ethernet sfp los error	snap shot of uplink ethernet sfp los <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : ethernet sfp los normal	
uplink-sfp-tx-fail	Parameter type: <Alarm::EthSfpTxFail> (yes no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	snap shot of uplink ethernet sfp tx <i>This element is only shown in detail mode.</i>
uplink-sfp-not-prst	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	snap shot of uplink ethernet sfp presence <i>This element is only shown in detail mode.</i>
uplink-sfp-inv-id	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	snap shot of uplink ethernet sfp invalid id <i>This element is only shown in detail mode.</i>
uplink-sfp-t-exceed	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed - no : ethernet sfp temperature normal	snap shot of uplink ethernet sfp temperature <i>This element is only shown in detail mode.</i>
uplink-sfp-mismatch	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	snap shot of uplink ethernet sfp type mismatch <i>This element is only shown in detail mode.</i>

103.56 Alarm Snap-shot SIP Termination Status Command

Command Description

This command show the alarm snap-shot of Qos Slot

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot qos-slot [(index)]

Command Parameters

Table 103.56-1 "Alarm Snap-shot SIP Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.56-2 "Alarm Snap-shot SIP Termination Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equiptm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify where the alarm has occurred. <i>This element is always shown.</i>

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
up-overflow	Parameter type: <Alarm::up-overflow> (yes no) Possible values: - yes : up overflow alarm - no : no up overflow alarm	Check LT load in upstream. <i>This element is always shown.</i>
dw-overflow	Parameter type: <Alarm::dw-overflow> (yes no) Possible values: - yes : down overflow alarm - no : no down overflow alarm	Check LT load in downstream. <i>This element is always shown.</i>
upobc-overflow	Parameter type: <Alarm::upobc-overflow> (yes no) Possible values: - yes : up to obc overflow alarm - no : no up to obc overflow alarm	Check LT load to OBC in upstream. <i>This element is always shown.</i>
dwobc-overflow	Parameter type: <Alarm::dwobc-overflow> (yes no) Possible values: - yes : down to obc overflow alarm - no : no down to obc overflow alarm	Check LT load to OBC in downstream. <i>This element is always shown.</i>
lwpriority-overflow	Parameter type: <Alarm::lwpriority-overflow> (yes no) Possible values: - yes : alarm - no : no dying gasp alarm	Check Voice and Video load. <i>This element is always shown.</i>
fanout	Parameter type: <Alarm::fanout> (yes no) Possible values: - yes : fan out alarm - no : no fan out alarm	Check LT Load. <i>This element is always shown.</i>

103.57 Alarm Snap-shot SIP Termination Status Command

Command Description

This command show the alarm snap-shot of Qos Queue

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot qos-queue [ (index) ]
```

Command Parameters

Table 103.57-1 "Alarm Snap-shot SIP Termination Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.57-2 "Alarm Snap-shot SIP Termination Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::PhyLine> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ont.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> /	identifies the physical position of the port <i>This element is always shown.</i>

name	Type	Description
	<Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ont : ont - ont.ng2 : ngpon2 ONT style identification - uni.ng2 : ngpon2 UNI style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	
queue	Parameter type: <Qos::AlarmQueues> - identify where the alarm has occurred - range: [0...7]	identify where the alarm has occurred. <i>This element is always shown.</i>
queue-discard-overflow	Parameter type: <Alarm::queue-discard-overflow> (yes no) Possible values: - yes : queue discard alarm - no : no queue discard alarm	Check the corresponding queue Load. <i>This element is always shown.</i>
queue-load	Parameter type: <Alarm::queue-load> (yes no) Possible values: - yes : queue load alarm - no : no queue load alarm	Check the corresponding queue Load. <i>This element is always shown.</i>
queue-peak-usage	Parameter type: <Alarm::queue-peak-usage> (yes no)	Check the corresponding queue peak usage. <i>This element is always shown.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : queue peak usage alarm - no : no queue peak usage alarm	

103.58 Alarm File Transfer Server Status Command

Command Description

This command displays the snap-shot of file transfer server alarm

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot filetransfer [(index)]

Command Parameters

Table 103.58-1 "Alarm File Transfer Server Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.58-2 "Alarm File Transfer Server Status Command" Display parameters

Specific Information		
name	Type	Description
server-id	Parameter type: <Alarm::FileTransfer> - next hop IP address	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
fileserv-unavail	Parameter type: <Alarm::FileTransferUnavail> (unavailable available) Possible values: - unavailable : file transfer Server unavailable or file transfer failed - available : file transfer server available	current status specifying that whether file transfer server available <i>This element is only shown in detail mode.</i>

103.59 Alarm Lsm Redundancy Status Command

Command Description

This command displays the snap-shot of Lsm Redundancy alarm

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot lsmredundancy [(index)]

Command Parameters

Table 103.59-1 "Alarm Lsm Redundancy Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.59-2 "Alarm Lsm Redundancy Status Command" Display parameters

Specific Information		
name	Type	Description
board-station	Parameter type: <Equipm::LtSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	physical number of the slot for lsm redundancy alarms <i>This element is only shown in detail mode.</i>
loss-lsmswp-cap	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	snapshot of the swichover capability in a redundant system <i>This element is only shown in detail mode.</i>
data-xvps-diff	Parameter type: <Alarm::DataXvps> (invalid valid) Possible values:	log status of the data of xvps pair <i>This element is only shown in detail mode.</i>

name	Type	Description
	- invalid : data of xvps pair is not the same - valid : data of xvps pair is same	

103.60 Alarm L2 Forward Status Command

Command Description

This command displays the snap-shot of l2 forward alarm

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot l2forward [ (index) ]
```

Command Parameters

Table 103.60-1 "Alarm L2 Forward Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.60-2 "Alarm L2 Forward Status Command" Display parameters

Specific Information		
name	Type	Description
bridgeport	Parameter type: <Vlan::BridgePort> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VcId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni) Possible values:	identify the bridge port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- ng2 : ngpon2 vlan bridge port - Field type <Eqpt::RackId> - the rack number - Field type <Eqpt::ShelfId> - the shelf number - Field type <Eqpt::SlotId> - the LT slot number - Field type <Eqpt::PortId> - the port number - Field type <Eqpt::VpiId> - atm VPI - Field type <Eqpt::VciId> - atm VCI - Field type <Eqpt::PonId> - the PON identifier - Field type <Eqpt::ChannelGroupId> - the channel group identifier - Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Possible values: - voip : virtual uni identifier - obsolete alternative replaced by vuni - vuni : virtual uni identifier - Possible values: - vuni : virtual NGPON2 uni identifier - Field type <Eqpt::OntSlotId> - the ONT SLOT identifier - Field type <Eqpt::OntPortId> - the ONT PORT identifier - Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier - Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier - Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE	
vlan-id	Parameter type: <Vlan::StackedVlanSigned> (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndex> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity - Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] - Field type <Vlan::SVlanIndex> - service vlan identity - range: [2...4093,4094] - Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093,4094,4095,4096]	identify the vlan id where the alarm has occurred. <i>This element is only shown in detail mode.</i>
mac-conflict	Parameter type: <Alarm::MACconflict> (yes no) Possible values:	specifies whether duplicate mac address from the bridge port. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : duplicate mac address from this bridge port - no : no duplicate mac address from this bridge port	
vmac-full	Parameter type: <Alarm::VMACFull> (yes no) Possible values: - yes : virtual mac entry full on this bridge port - no : no virtual mac entry full on this bridge port	specifies whether virtual mac is full on the bridge port. <i>This element is only shown in detail mode.</i>

103.61 Alarm Snap-shot External Device Status Command

Command Description

This command show the alarm snap-shot of external-device

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot external-device [(index)]

Command Parameters

Table 103.61-1 "Alarm Snap-shot External Device Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.61-2 "Alarm Snap-shot External Device Status Command" Display parameters

Specific Information		
name	Type	Description
loss-env-mon	Parameter type: <Alarm::LossEnvMon> (lost not-lost) Possible values: - lost : env-mon box lost or not alive - not-lost : env-mon box exists	snap shot status of env-monitor box <i>This element is only shown in detail mode.</i>

103.62 Alarm Snap-shot Multicast Source Status Command

Command Description

This command displays the multicast source alarm snap-shot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot mcsrc [ (index) ]
```

Command Parameters

Table 103.62-1 "Alarm Snap-shot Multicast Source Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.62-2 "Alarm Snap-shot Multicast Source Status Command" Display parameters

Specific Information		
name	Type	Description
grp-ip-addr	Parameter type: <Alarm::IpAddress> - IPv4-address	identify the mcast addr where the alarm has occurred. <i>This element is only shown in detail mode.</i>
slot-id	Parameter type: <Equipm::FullLtSlotIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> Possible values: - lt : lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
stream-lost	Parameter type: <Alarm::McastLoss> (yes	current status of the alarm specifying if the pon mcast video

name	Type	Description
	no) Possible values: - yes : pon mcast video stream lost - no : pon mcast video stream not lost	stream is lost or not <i>This element is only shown in detail mode.</i>

103.63 Vlanport Alarm Snapshot Status Command

Command Description

This command displays the vlanport alarm snap-shot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot vlanport [ (index) ]
```

Command Parameters

Table 103.63-1 "Vlanport Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.63-2 "Vlanport Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
vlanport	Parameter type: <Itf::VlanPortInterface> (vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan>	identify the provisioned vlanport where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<pre> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni : <Eqpt::UnstackedVlan>) Possible values: - vlan-port : vlan port - vlan-port:ng2 : ngpon2 vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Ng2::OntId> - the ONT identifier </pre>	

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	
svc-mismatch	Parameter type: <Alarm::SVCMismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned vlanport is accepted or not. <i>This element is only shown in detail mode.</i>

103.64 BGP Alarm SnapShot Status Command

Command Description

This command displays the SnapShot bgp alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot bgp [ (index) ]
```

Command Parameters

Table 103.64-1 "BGP Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.64-2 "BGP Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::AlarmIdentifIdxOrZero> - an unsigned integer	unique reference for the neighbor where the alarm occurred or zero when not applicable, neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the neighbor where the alarm occurred or empty string if not applicable. <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
		<i>detail mode.</i>
Only Show Details: current alarm status		
name	Type	Description
peer-down	Parameter type: <Alarm::PeerDown> (yes no) Possible values: - yes : operational state down - no : operational state up	specifies whether the BGP peer operational state is up or down <i>This element is only shown in detail mode.</i>
routes-mid-limit	Parameter type: <Alarm::RoutesMidLimit> (reached not-reached) Possible values: - reached : reached: 90% of max allowed routes learned - not-reached : less than 90% of max allowed routes learned	specifies whether 90% of the max nbr of routes BGP can learn from a peer is reached or not <i>This element is only shown in detail mode.</i>

103.65 RIP Alarm SnapShot Status Command

Command Description

This command displays the SnapShot rip alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot rip [(index)]

Command Parameters

Table 103.65-1 "RIP Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.65-2 "RIP Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
instance-down	Parameter type: <Alarm::InstanceDown> (yes no) Possible values: - yes : RIP instance down - no : RIP instance up	specifies whether RIP instance is down or not <i>This element is only shown in detail mode.</i>

103.66 LAG Alarm SnapShot Status Command

Command Description

This command displays the SnapShot lag alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot lag [(index)]

Command Parameters

Table 103.66-1 "LAG Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.66-2 "LAG Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
lag-id	Parameter type: <Alarm::LagId> - link aggregation group id - range: [1...64]	Identifies the lag where the alarm has occurred <i>This element is only shown in detail mode.</i>
sub-group	Parameter type: <Alarm::AlarmIdentifIdxOrZero> - an unsigned integer	Identifies the lag subgroup for which the alarm has occurred or zero when not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm snap-shot status		
name	Type	Description
lag-down	Parameter type: <Alarm::EthLagDown> (yes no) Possible values: - yes : lag down - no : lag not down	specifies whether the link aggregation group is down or not <i>This element is only shown in detail mode.</i>
subgrp-thres-reach	Parameter type: <Alarm::LagSubgrpThresReach> (reached	specifies whether the lag subgroup threshold is reached or

name	Type	Description
	not-reached) Possible values: - reached : sub-group threshold reached - not-reached : sub-group threshold not reached	not <i>This element is only shown in detail mode.</i>
subgrp-switch-fail	Parameter type: <Alarm::LagSubgrpSwitchFail> (yes no) Possible values: - yes : lag subgroup switchover failed - no : lag subgroup switchover did not fail	specifies whether the lag subgroup switchover failed or not <i>This element is only shown in detail mode.</i>
no-free-port-inbase	Parameter type: <Alarm::LagNoUnpinFreePorts> (yes no) Possible values: - yes : No free ports available for un pinned traffic - no : free ports available for un pinned traffic	specifies whether the free ports available for unpinned traffic or not <i>This element is only shown in detail mode.</i>

103.67 ihub-general Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ihub-general alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ihub-general [ (index) ]
```

Command Parameters

Table 103.67-1 "ihub-general Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.67-2 "ihub-general Alarm SnapShot Status Command" Display parameters

Only Show Details: current alarm snap-shot status		
name	Type	Description
arp-limit	Parameter type: <Alarm::ArpLimit> (reached not-reached) Possible values: - reached : ARP tbl threshold reached or exceeded - not-reached : ARP tbl entries below threshold	specifies whether the nbr of ARP entries has reached the max threshold or not <i>This element is only shown in detail mode.</i>
switch-out-of-res	Parameter type: <Alarm::IhubSwitchOutOfResource> (yes no) Possible values: - yes : lack of resources in switch - no : no resource issues detected	specifies whether e.g. storing a configuration in the hardware has failed or not, due to a lack of resources in the switch. <i>This element is only shown in detail mode.</i>
ipv6-nc-limit	Parameter type: <Alarm::IPv6NeighborCacheLimit> (reached not-reached) Possible values:	specifies whether the number of ipv6 neighbor cache entries reached maximum threshold or not.

name	Type	Description
	- reached : neighbor cache up threshold reached - not-reached : neighbor cache entries within limit	<i>This element is only shown in detail mode.</i>
dhcp-session-oor	Parameter type: <Alarm::DhcpSessionOutOfResource> (yes no) Possible values: - yes : lack of resources for dhcp - no : no resource issues detected for dhcp	specifies whether dhcp session is out of resources or not. <i>This element is only shown in detail mode.</i>
fdb-limit	Parameter type: <Alarm::IhubL2FdbFull> (reached not-reached) Possible values: - reached : layer 2 fdb table entries reached upper threshold for the node - not-reached : layer 2 fdb table entries within limit for the node	specifies whether the number of layer 2 fdb table entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>
mac-limit	Parameter type: <Alarm::IhubL2MacFull> (reached not-reached) Possible values: - reached : Internal Mac entries reached upper - not-reached : Internal Mac entries within limit	specifies whether the number of internal Mac entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>

103.68 VPRN Alarm SnapShot Status Command

Command Description

This command displays the SnapShot vprn alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot vprn [ (index) ]
```

Command Parameters

Table 103.68-1 "VPRN Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.68-2 "VPRN Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
if-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the interface for which the alarm occurred or zero when not applicable. <i>This element is only shown in detail mode.</i>
interface	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the interface for which the alarm occurred or empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm snap-shot status

name	Type	Description
routes-limit	Parameter type: <Alarm::RoutesLimit> (reached not-reached) Possible values: - reached : ip routes limit reached or exceeded - not-reached : ip routes within limit	specifies whether the limit of dynamic routes is reached/exceeded or not <i>This element is only shown in detail mode.</i>
ipv6-routes-limit	Parameter type: <Alarm::IPv6RoutesLimit> (reached not-reached) Possible values: - reached : ipv6 routes limit reached or exceeded - not-reached : ipv6 routes within limit	specifies whether the number of dynamic ipv6 routes is approaching or has reached its limit <i>This element is only shown in detail mode.</i>
dhcpv6-lease-limit	Parameter type: <Alarm::DHCPV6LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv6 relay leases limit reached or exceeded - not-reached : dhcpv6 relay leases within limit	specifies whether the limit of dhcpv6 relay leases is reached or not <i>This element is only shown in detail mode.</i>
dhcpv4-lease-limit	Parameter type: <Alarm::DHCPV4LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv4 relay leases limit reached or exceeded - not-reached : dhcpv4 relay leases within limit	specifies whether the limit of dhcpv4 relay leases is reached or not <i>This element is only shown in detail mode.</i>

103.69 ISIS Alarm SnapShot Status Command

Command Description

This command displays the SnapShot isis alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot isis [(index)]

Command Parameters

Table 103.69-1 "ISIS Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.69-2 "ISIS Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
adjacency-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the adjacency where the alarm occurred or zero when not applicable, adjacency is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the adjacency:instance/interface where the alarm occurred or empty string if not applicable.

name	Type	Description
		<i>This element is only shown in detail mode.</i>

Only Show Details: current alarm snap-shot status		
name	Type	Description
adjacency-down	Parameter type: <Alarm::AdjacencyDown> (yes no) Possible values: - yes : interface down - no : interface up	specifies whether isis adjacency is down or not <i>This element is only shown in detail mode.</i>
adjacency-reject	Parameter type: <Alarm::AdjacencyReject> (yes no) Possible values: - yes : interface mismatch - no : no interface mismatch	specifies whether isis adjacency is rejected or not <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::IsisDown> (yes no) Possible values: - yes : ISIS instance down - no : ISIS instance up	specifies whether ISIS instance is down or not <i>This element is only shown in detail mode.</i>

103.70 OSPF Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ospf alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ospf [(index)]

Command Parameters

Table 103.70-1 "OSPF Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.70-2 "OSPF Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the neighbor where the alarm occurred or zero when not applicable, neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the neighbor/instance where the alarm occurred or empty string if not applicable <i>This element is only shown in</i>

name	Type	Description
		<i>detail mode.</i>

Only Show Details: snap-shot alarm status		
name	Type	Description
lsa-limit	Parameter type: <Alarm::LsaLimit> (reached not-reached) Possible values: - reached : external LSA limit reached - not-reached : external LSAs within limitation	specifies whether the limit of received external LSAs is reached or not <i>This element is only shown in detail mode.</i>
lsa-mid-limit	Parameter type: <Alarm::LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of LSA limit reached - not-reached : less than 90% of LSA limit	specifies whether 90% of the limit of received external LSAs is reached or not <i>This element is only shown in detail mode.</i>
neighbor-down	Parameter type: <Alarm::NeighborDown> (yes no) Possible values: - yes : OSPF neighbor down - no : OSPF neighbor up	specifies whether ospf neighbour is down or not <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::OspfDown> (yes no) Possible values: - yes : OSPF instance down - no : OSPF instance up	specifies whether OSPF instance is down or not <i>This element is only shown in detail mode.</i>
v3-lsa-limit	Parameter type: <Alarm::V3LsaLimit> (reached not-reached) Possible values: - reached : external OSPFv3 LSA limit reached - not-reached : external OSPFv3 LSAs within limitation	specifies whether the limit of received external OSPFv3 LSAs is reached or not <i>This element is only shown in detail mode.</i>
v3-lsa-mid-limit	Parameter type: <Alarm::V3LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of OSPFv3 LSA limit reached - not-reached : less than 90% of OSPFv3 LSA limit	specifies whether 90% of the limit of received external OSPFv3 LSAs is reached or not <i>This element is only shown in detail mode.</i>
v3-neighbor-down	Parameter type: <Alarm::V3NeighborDown> (yes no) Possible values: - yes : OSPFv3 neighbor down - no : OSPFv3 neighbor up	specifies whether OSPFv3 neighbor is down or not <i>This element is only shown in detail mode.</i>
v3-instance-down	Parameter type: <Alarm::V3OspfDown> (yes no) Possible values: - yes : OSPFv3 instance down - no : OSPFv3 instance up	specifies whether OSPFv3 instance is down or not <i>This element is only shown in detail mode.</i>

103.71 ihub-l2forward Alarm SnapShot Status Command

Command Description

This command displays the ihub-l2forward SnapShot alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ihub-l2forward [ (index) ]
```

Command Parameters

Table 103.71-1 "ihub-l2forward Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.71-2 "ihub-l2forward Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Ihub::EtherPortAndLag> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

name	Type	Description
	lag : <Alarm::IhubLagId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - lag : key word to specify link aggregation group - nt-a : the nt-a slot - nt-b : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - eth : RJ45 or lemi port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::IhubLagId> - link aggregation group id Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the vpls service-id where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: snap-shot alarm status		
name	Type	Description
stp-exception	Parameter type: <Alarm::StpException> (yes no) Possible values: - yes : stp exception condition detected on the port - no : no stp exception condition detected	specifies whether an STP exception condition is present on the port or not <i>This element is only shown in detail mode.</i>
stp-root-guard	Parameter type: <Alarm::StpRootGuard> (violation no violation) Possible values: - violation : stp root guard violation detected on the port - no violation : no stp root guard violation detected	specifies whether an STP root-guard violation present or not <i>This element is only shown in detail mode.</i>

103.72 VPLS Alarm SnapShot Status Command

Command Description

This command displays the SnapShot VPLS alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot vpls [ (index) ]
```

Command Parameters

Table 103.72-1 "VPLS Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.72-2 "VPLS Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the vpls service-id where the alarm has occurred. <i>This element is only shown in detail mode.</i>
mac-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the duplicate mac alarm and zero for all other alarms; duplicate mac is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringVpls> - additional alarm information	Additional information regarding duplicate MAC alarm <i>This element is only shown in detail mode.</i>

Only Show Details: snap-shot alarm status		
name	Type	Description
mfib-limit	Parameter type: <Alarm::MfibLimit> (reached not-reached)	specifies whether the number of entries in the multicast FIB table reached its limit or not

name	Type	Description
	Possible values: - reached : mfib table size limit reached - not-reached : mfib table size below limit.	<i>This element is only shown in detail mode.</i>
duplicate-mac	Parameter type: <Alarm::DuplicateMac> (yes no) Possible values: - yes : duplicate mac detected on vpls - no : no duplicate mac on the vpls	specifies whether a duplicate MAC address is detected or not <i>This element is only shown in detail mode.</i>
fdb-limit	Parameter type: <Alarm::FdbLimit> (reached not-reached) Possible values: - reached : fdb table size limit reached - not-reached : fdb table size below low limit	specifies whether the number of entries in the fdb table reached the upper limit or dropped below the lower limit. <i>This element is only shown in detail mode.</i>
self-duplic-mac	Parameter type: <Alarm::Selfduplic> (yes no) Possible values: - yes : self duplicate mac detected on a sap of the vpls - no : no self duplicate mac on a sap of the vpls	specifies whether a duplicate of a system owned mac address is detected on a sap of the vpls service or not <i>This element is only shown in detail mode.</i>
sdp-self-dup-mac	Parameter type: <Alarm::SdpSelfdupMac> (yes no) Possible values: - yes : self duplicate mac detected on sdp binding of the vpls - no : no self duplicate mac on a sdp binding of the vpls	specifies whether a duplicate of a system owned mac address is detected on a sdp binding of the vpls service or not <i>This element is only shown in detail mode.</i>

103.73 IHUB-Equip Alarm SnapShot Status Command

Command Description

This command displays the SnapShot Ihub-equip alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ihub-equip [(index)]

Command Parameters

Table 103.73-1 "IHUB-Equip Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.73-2 "IHUB-Equip Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
slot	Parameter type: <Alarm::NtSlotId> (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	identifies the slot where the alarm has been detected. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	additional information regarding the out-of-mem alarm, containing the name of the Software Module triggering this alarm <i>This element is only shown in detail mode.</i>

Only Show Details: snap-shot alarm status		
name	Type	Description
peer-comm	Parameter type: <Alarm::PeerComm> (fail	specifies whether peer-to-peer communication has failed or not

name	Type	Description
	no fail) Possible values: - fail : peer-to-peer communication failure - no fail : no peer-to-peer communication failure	<i>This element is only shown in detail mode.</i>
sw-fail	Parameter type: <Alarm::SwFail> (yes no) Possible values: - yes : software failure detected - no : no software failure	specifies whether a software failure has occurred or not <i>This element is only shown in detail mode.</i>
hw-fail	Parameter type: <Alarm::HwFail> (yes no) Possible values: - yes : hardware failure detected - no : no hardware failure	specifies whether a hardware failure has occurred or not <i>This element is only shown in detail mode.</i>
link-fail	Parameter type: <Alarm::LinkFail> (yes no) Possible values: - yes : link failure detected - no : no link failiure	specifies whether a link failure has occurred or not <i>This element is only shown in detail mode.</i>
proc-overload	Parameter type: <Alarm::ProcOverload> (yes no) Possible values: - yes : processor overload detected - no : no processor overload	specifies whether an overload condition exists for the processor at ihub side <i>This element is only shown in detail mode.</i>
out-of-mem	Parameter type: <Alarm::OutOfMem> (yes no) Possible values: - yes : memory allocation failure - no : memory allocation successful	specifies whether memory allocation in ihub failed or not <i>This element is only shown in detail mode.</i>
ntp-comm	Parameter type: <Alarm::ntpCommLoss> (lost not-lost) Possible values: - lost : NTP communication lost - not-lost : NTP communication is not lost	specifies whether ntp communication is lost or not <i>This element is only shown in detail mode.</i>

103.74 IHUB-link Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ihub-link alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ihub-link [ (index) ]
```

Command Parameters

Table 103.74-1 "IHUB-link Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.74-2 "IHUB-link Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Ihub::EtherPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : cfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-a : ieee1588 : <Alarm::FacePlatePortIndex> nt-a : ai : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : cfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> nt-b : ieee1588 : <Alarm::FacePlatePortIndex> nt-b : ai : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-1 : cfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex>	identifies the ihub port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : cfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> ntio-1 : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - cfp : CFP port - eth : RJ45 or lemi port - ieee1588 : IEEE1588 port - ai : AI port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	additional information regarding the lagport-add-fail alarm, containing the failure reason: Either of these will apply: - unknown - adminkey-mismatch - sysid-mismatch - lacp-passive-both-ends - link-down <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status

name	Type	Description
link-down	Parameter type: <Alarm::IhubLink> (yes no) Possible values: - yes : link down - no : link up	specifies whether the link is down or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
lagport-add-fail	Parameter type: <Alarm::LagportAddFail> (yes no) Possible values: - yes : lag-port not added - no : lag-port successfully added	specifies whether a port was successfully added to a link aggregation group or not <i>This element is only shown in detail mode.</i>
conf-mismatch	Parameter type: <Alarm::SpeedMismatch> (yes no) Possible values: - yes : port configuration mismatch - no : no port configuration mismatch	specifies whether the inserted SFP or SFP+ type matches the planned speed and/or auto-negotiation for the port or not <i>This element is only shown in detail mode.</i>

103.75 IHUB-tca Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ihub-tca alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ihub-tca [ (index) ]
```

Command Parameters

Table 103.75-1 "IHUB-tca Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.75-2 "IHUB-tca Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Ihub::EtherPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : cfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-a : ieee1588 : <Alarm::FacePlatePortIndex> nt-a : ai : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : cfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> nt-b : ieee1588 : <Alarm::FacePlatePortIndex> nt-b : ai : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-1 : cfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex>	identifies the ihub port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : cfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> ntio-1 : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - cfp : CFP port - eth : RJ45 or lemi port - ieee1588 : IEEE1588 port - ai : AI port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	

Only Show Details: alarm snap-shot status		
name	Type	Description
tca-outputbw	Parameter type: <Alarm::TcaOutputBw> (yes no) Possible values: - yes : tca output bandwidth crossed threshold - no : tca output bandwidth did not crossed threshold	specifies whether the output bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputbw	Parameter type: <Alarm::TcaInputBw> (yes no) Possible values: - yes : tca input bandwidth crossed threshold - no : tca input bandwidth did not crossed threshold	specifies whether the tca input bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-rxcrcalign	Parameter type: <Alarm::TcaRxCrcAlign> (yes no) Possible values:	specifies whether the tca rxrcrc align errors has crossed threshold or not <i>This element is only shown in</i>

name	Type	Description
	- yes : tca rxcrc align errors crossed threshold - no : tca rxcrc align errors did not crossed threshold	<i>detail mode.</i>
tca-txcrcalign	Parameter type: <Alarm::TcaTxCrcAlign> (yes no) Possible values: - yes : tca txcrc align errors crossed threshold - no : tca txcrc align errors did not crossed threshold	specifies whether the tca txcrc align errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-txcollisions	Parameter type: <Alarm::TcaTxCollisions> (yes no) Possible values: - yes : tca txcollisions errors crossed threshold - no : tca txcollisions errors did not crossed threshold	specifies whether the tca tx collisions errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-outputhighbw	Parameter type: <Alarm::TcaOutputHighBw> (yes no) Possible values: - yes : tca output high bandwidth crossed threshold - no : tca output high bandwidth did not crossed threshold	specifies whether the continous output high bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-outputmedbw	Parameter type: <Alarm::TcaOutputMediumBw> (yes no) Possible values: - yes : tca output medium bandwidth crossed threshold - no : tca output medium bandwidth did not crossed threshold	specifies whether the continous output medium bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-outputlowbw	Parameter type: <Alarm::TcaOutputLowBw> (yes no) Possible values: - yes : tca output low bandwidth crossed threshold - no : tca output low bandwidth did not crossed threshold	specifies whether the continous output low bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputhighbw	Parameter type: <Alarm::TcaInputHighBw> (yes no) Possible values: - yes : tca input high bandwidth crossed threshold - no : tca input high bandwidth did not crossed threshold	specifies whether the continous input high bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputmediumbw	Parameter type: <Alarm::TcaInputMediumBw> (yes no) Possible values: - yes : tca input medium bandwidth crossed threshold - no : tca input medium bandwidth did not crossed threshold	specifies whether the continous input medium bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputlowbw	Parameter type: <Alarm::TcaInputLowBw> (yes no) Possible values: - yes : tca input low bandwidth crossed threshold - no : tca input low bandwidth did not crossed threshold	specifies whether the continous input low bw has crossed threshold or not <i>This element is only shown in detail mode.</i>

103.76 LDP Alarm SnapShot Status Command

Command Description

This command displays the snapshot Label Distribution Protocol alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ldp [ (index) ]
```

Command Parameters

Table 103.76-1 "LDP Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.76-2 "LDP Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
ip-address	Parameter type: <Alarm::IPAddressOrZero> (not-applicable <IPv4::address>) Possible values: - not-applicable : not applicable Field type <IPv4::address> - IPv4-address	identifies the ip-address of the LDP targeted Peer <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
instance-down	Parameter type: <Alarm::LdpInstanceDown> (yes no) Possible values: - yes : ldp is down - no : ldp is up or not configured	specifies whether the LDP instance is down or not <i>This element is only shown in detail mode.</i>

name	Type	Description
session-down	Parameter type: <Alarm::SessionDown> (yes no) Possible values: - yes : TCP session down - no : Connection re-established or ldp not configured or explicit configured peer is removed	specifies whether the LDP session is down or not <i>This element is only shown in detail mode.</i>

103.77 Alarm SnapShot MPLS Status Command

Command Description

This command displays the snap-shot MPLS alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot mpls [ (index) ]
```

Command Parameters

Table 103.77-1 "Alarm SnapShot MPLS Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.77-2 "Alarm SnapShot MPLS Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
lsp-id-or-lsp-path-idx	Parameter type: <Alarm::LspIdOrLspPathIndexOrZero> - a signed integer	Lsp id or Lsp path index (unique identifier) where the alarm occurred or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the alarm additional info specific to an mpls alarm. Empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
instance-down	Parameter type: <Alarm::MplsInstanceDown>	specifies whether the MPLS

name	Type	Description
	(yes no) Possible values: - yes : mpls is down - no : mpls is up or not configured	instance is down or not <i>This element is only shown in detail mode.</i>
lsp-down	Parameter type: <Alarm::LspDown> (yes no) Possible values: - yes : lsp is down - no : lsp is up or shutdown, or mpls instance is stopped or not configured	specifies whether the LSP is down or not <i>This element is only shown in detail mode.</i>
lsp-path-down	Parameter type: <Alarm::LspPathDown> (yes no) Possible values: - yes : lsp path is down - no : lsp path is up or shutdown, or lsp is shutdown, or mpls instance is stopped or not configured	specifies whether the LSP Path is down or not <i>This element is only shown in detail mode.</i>

103.78 Alarm SnapShot SDP Status Command

Command Description

This command displays the snapshot Service Delivery Point alarm status

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot sdp [(index)]

Command Parameters

Table 103.78-1 "Alarm SnapShot SDP Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.78-2 "Alarm SnapShot SDP Status Command" Display parameters

Specific Information		
name	Type	Description
sdp-id	Parameter type: <Alarm::SdpId> - sdp-id value - range: [1...17407]	identifies the sdp-id of the sdp binding where the alarm has occurred <i>This element is only shown in detail mode.</i>
vc-id	Parameter type: <Alarm::SvcIdOrZero> - vc-id value or zero - range: [0,1...4294967295]	identifies the vc-id of the sdp binding where the alarm occurred or zero when not applicable, the sdp binding is further specified in additional-info <i>This element is only shown in detail mode.</i>
Only Show Details: alarm snap-shot status		
name	Type	Description
instance-down	Parameter type: <Alarm::SdpInstanceDown> (yes no) Possible values: - yes : sdp is operationl down	specifies whether the SDP instance is down or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : sdp is operational up or shutdown	
binding-down	Parameter type: <Alarm::BindlingDown> (yes no) Possible values: - yes : sdp binding is operational down - no : sdp binding is operational up or shutdown, or the sdp or service is shutdown	specifies whether the SDP binding is down or not <i>This element is only shown in detail mode.</i>

103.79 IHUB IPV6 Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ihub-ipv6 alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ihub-ipv6 [ (index) ]
```

Command Parameters

Table 103.79-1 "IHUB IPV6 Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.79-2 "IHUB IPV6 Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
duplicate-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the duplicate address for which alarm has occurred or zero when not applicable, duplicate address is further specified in additional-info. <i>This element is only shown in detail mode.</i>

name	Type	Description
additional-info	Parameter type: <Alarm::AddInfoStringVprn> - additional alarm information	identifies the ipv6 alarm additional info. empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm snap-shot status		
name	Type	Description
duplicate-address-own	Parameter type: <Alarm::SelfDuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for own ipv6 address - no : no duplicate address detected for own ipv6 address	specifies whether a duplicate address is detected for own IPV6 address or not <i>This element is only shown in detail mode.</i>
duplicate-address	Parameter type: <Alarm::DuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 address - no : no duplicate address detected for user's ipv6 address	specifies whether a duplicate address is detected for a user's IPV6 address or not <i>This element is only shown in detail mode.</i>
ipv6-dup-pd-route	Parameter type: <Alarm::Ipv6DupPdRoute> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 PD route - no : no duplicate address detected for user's ipv6 PD route	status of ipv6-dup-pd-route <i>This element is only shown in detail mode.</i>

103.80 Alarm SnapShot EPIPE Status Command

Command Description

This command displays the snapshot Ethernet Pipe alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot epipe [(index)]

Command Parameters

Table 103.80-1 "Alarm SnapShot EPIPE Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.80-2 "Alarm SnapShot EPIPE Status Command" Display parameters

Specific Information		
name	Type	Description
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the base router <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
instance-down	Parameter type: <Alarm::EpipeInstanceDown> (yes no) Possible values: - yes : epipe service is operational down - no : epipe service is operational up or shutdown	specifies whether the epipe instance is down or not <i>This element is only shown in detail mode.</i>

103.81 Alarm SnapShot PIM Status Command

Command Description

This command displays the snapshot PIM alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot pim [(index)]

Command Parameters

Table 103.81-1 "Alarm SnapShot PIM Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.81-2 "Alarm SnapShot PIM Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the base router id where the alarm has occurred <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the neighbor where the alarm occurred <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringPim> - additional alarm information	identifies the neighbor/instance where the alarm occurred or empty string if not applicable <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status

103 Alarm Snap-shot Status Commands

name	Type	Description
pim-neighbor-down	Parameter type: <Alarm::IhubPimDown> (yes no) Possible values: - yes : pim neighbor down - no : pim neighbor up	specifies whether the neighbor instance is down or not <i>This element is only shown in detail mode.</i>
mc-maximum-routes	Parameter type: <Alarm::IhubMaxRoutes> (yes no) Possible values: - yes : maximum routes reached - no : maximum routes not reached	specifies whether the max mc routes is reached <i>This element is only shown in detail mode.</i>

103.82 IHUB Lawful Intercept Alarm SnapShot Status Command

Command Description

This command displays the SnapShot lawful intercept alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot li [ (index) ]
```

Command Parameters

Table 103.82-1 "IHUB Lawful Intercept Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.82-2 "IHUB Lawful Intercept Alarm SnapShot Status Command" Display parameters

Only Show Details: current alarm snap-shot status		
name	Type	Description
li-traf-disabled	Parameter type: <Alarm::LiTrafficDisabled> (yes no) Possible values: - yes : lawful interception of traffic disabled - no : lawful interception of traffic enabled	specifies whether a lawful intercept traffic is disabled or not <i>This element is only shown in detail mode.</i>
li-bandwidth	Parameter type: <Alarm::LiBandwidthLimit> (reached not-reached) Possible values: - reached : lawful intercept reached bandwidth limit - not-reached : lawful intercept within bandwidth limit	specifies whether lawful intercept reached bandwidth limit or not <i>This element is only shown in detail mode.</i>
li-out-of-res	Parameter type: <Alarm::LiOutOfRes> (yes no) Possible values:	specifies whether lawful intercept is out of resources or not <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : lack of resources for lawful intercept - no : no resource issues for lawful intercept	

103.83 Sync Clock Alarm SnapShot Status Command

Command Description

This command displays the synce and bits snapShot alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sync [ (index) ]
```

Command Parameters

Table 103.83-1 "Sync Clock Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.83-2 "Sync Clock Alarm SnapShot Status Command" Display parameters

Only Show Details: slot information		
name	Type	Description
slot	Parameter type: <Alarm::SynceSlot> (ntio-1 ntio-2 nt-a nt-b lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> not-used nt) Possible values: - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - nt-a : nt-a slot - nt-b : nt-b slot - nt : active nt slot - lt : lt slot - not-used : no interface	identifies the synce port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	
port	Parameter type: <Alarm::SyncePort> (sfp : <Alarm::SynceClk> xfp : <Alarm::SynceClk> bits-a bits-b ieee1588-a not-used ieee1588-b gnssrj45-a gnssrj45-b ieee1588-hybrid-a ieee1588-hybrid-b cfp : <Alarm::SynceClk> <Alarm::SynceClk> qsfp : <Alarm::SynceClk> ieee1588 internal-clk-a internal-clk-b) Possible values: - sfp : synce reference on sfp port - xfp : synce reference on xfp port - bits-a : bits clock source on nt-a - bits-b : bits clock source on nt-b - ieee1588-a : ieee1588 clock source on nt-a - ieee1588-b : ieee1588 clock source on nt-b - gnssrj45-a : gnss tod source on nt-a - gnssrj45-b : gnss tod source on nt-b - ieee1588-hybrid-a : 1588 hybrid tod source on nt-a - ieee1588-hybrid-b : 1588 hybrid tod source on nt-b - cfp : synce reference on cfp port - qsfp : synce reference on qsfp port - ieee1588 : ieee1588 clock source on nt - internal-clk-a : internal clock on nt-a - internal-clk-b : internal clock on nt-b - not-used : not-used Field type <Alarm::SynceClk> - value - range: [0...36]	identifies the synce port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: snap-shot alarm status		
name	Type	Description
bits-fail	Parameter type: <Alarm::BitsFail> (yes no) Possible values: - yes : bits source failed - no : no bits source failed	specifies whether bits clock source has failed or not <i>This element is only shown in detail mode.</i>
synce-fail	Parameter type: <Alarm::SynceFail> (yes no) Possible values: - yes : synce source failed	specifies whether synce clock source has failed or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no synce source failed	
bits-output-shutoff	Parameter type: <Alarm::BitsOutputShutoffFail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	specifies whether bits output failed or not <i>This element is only shown in detail mode.</i>
ieee1588-fail	Parameter type: <Alarm::ieee1588Fail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	ieee1588 clock source failure <i>This element is only shown in detail mode.</i>
gnss-fail	Parameter type: <Alarm::gnssFail> (yes no) Possible values: - yes : gnss tod fail - no : no gnss tod fail	gnss time source failure <i>This element is only shown in detail mode.</i>
signal-loss	Parameter type: <Alarm::ClockLoss> (yes no) Possible values: - yes : synce or bits clock signal loss - no : no synce or bits clock signal loss	specifies whether synce or bits clock signal loss or not <i>This element is only shown in detail mode.</i>
signal-efd	Parameter type: <Alarm::ClockEfd> (yes no) Possible values: - yes : synce or bits clock signal exceed frequency deviation - no : no synce or bits clock signal exceed frequency deviation	specifies whether bsynce or bits clock signal exceed frequency deviation or not <i>This element is only shown in detail mode.</i>
esmc-loss	Parameter type: <Alarm::ClockEsmcLoss> (yes no) Possible values: - yes : clock source SSM infomation loss - no : no clock source SSM infomation loss	specifies whether clock source loss SSM infomation or not <i>This element is only shown in detail mode.</i>
bits-output-exceed	Parameter type: <Alarm::BitsOutputQlThreshExceed> (yes no) Possible values: - yes : bitout ql threshold exceed - no : no bitout ql threshold exceed	specifies whether bits output ql threshold exceeded or not <i>This element is only shown in detail mode.</i>
ql-input-exceed	Parameter type: <Alarm::ClockExceed> (yes no) Possible values: - yes : input clock source threshold exceed - no : no input clock source threshold exceed	specifies whether exceed input clock source threshold or not <i>This element is only shown in detail mode.</i>
holdover	Parameter type: <Alarm::ClockHoldover> (yes no) Possible values: - yes : Clock system is in the holdover - no : Clock system is not in the holdover	specifies whether clock system is in the holdover or not <i>This element is only shown in detail mode.</i>
lti	Parameter type: <Alarm::ClockLTI>	specifies whether all clock source

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : all clock source failed - no : no all clock source failed	failed or not <i>This element is only shown in detail mode.</i>
tod-reference-fail	Parameter type: <Alarm::ToDHoldover> (yes no) Possible values: - yes : Clock system ToD reference is failed - no : Clock system ToD reference is OK	specifies whether clock system tod reference is failed or not <i>This element is only shown in detail mode.</i>
internal-clk-fail	Parameter type: <Alarm::ClockOCXOFail> (yes no) Possible values: - yes : Internal CLK is failed - no : Internal CLK is OK	specifies whether internal clock is failed or not <i>This element is only shown in detail mode.</i>

103.84 Alarm Snapshot Equipment Supplemental Status Command

Command Description

This command displays the equipment supplemental snapshot.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot eqpt-supplemental [(index)]

Command Parameters

Table 103.84-1 "Alarm Snapshot Equipment Supplemental Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.84-2 "Alarm Snapshot Equipment Supplemental Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
syslog-upload	Parameter type: <Alarm::uploadFailed> (failed ok) Possible values: - failed : upload of syslog file to remote server failed - ok : no syslog file upload failure detected	current status of the alarm specifying whether a failure occurred during upload of the NE's system log file to the syslog server or not <i>This element is only shown in detail mode.</i>
ont-sw-dnload	Parameter type: <Alarm::ontSoftwareDownload> (in-progress ok)	current status of the alarm specifying whether downloading of ont sw from version control to

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - in-progress : ont software download in progress - ok : no ont software download detected	ont is in progress or not <i>This element is only shown in detail mode.</i>
cf-75%-used	Parameter type: <Alarm::cf75Percent> (above below) Possible values: - above : Compact flash exceeds 75% of life expectancy - below : Compact flash is below 75% of life expectancy	current status of CF utilization which could be more than 75% or less than that <i>This element is only shown in detail mode.</i>
cf-90%-used	Parameter type: <Alarm::cf90Percent> (above below) Possible values: - above : Compact flash exceeds 90% of life expectancy - below : Compact flash is below 90% of life expectancy	current status of CF utilization which could be more than 90% or less than that <i>This element is only shown in detail mode.</i>

103.85 Otdr Alarm SnapShot Status Command

Command Description

This command displays the otdr snapShot alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot otdr [(index)]

Command Parameters

Table 103.85-1 "Otdr Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Only Show Details: snap-shot alarm status		
name	Type	Description
capability-mismatch	Parameter type: <Alarm::OTDRmismatch> (yes no) Possible values: - yes : otdr capability mismatch - no : no otdr capability mismatch	specifies whether otdr capability mismatch has occurred. <i>This element is only shown in detail mode.</i>

103.86 Management Security Access Alarm SnapShot Status Command

Command Description

This command displays the management security access alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot mgmt-sec-access [(index)]

Command Parameters

Table 103.86-1 "Management Security Access Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.86-2 "Management Security Access Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ip-address	Parameter type: <Alarm::IpAddress> - IPv4-address	address of the operator <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <PrintableString> - printable string	displays the timestamp and operator name separated by semicolon. <i>This element is only shown in detail mode.</i>

Only Show Details: snap-shot alarm status

103 Alarm Snap-shot Status Commands

name	Type	Description
login-successful	Parameter type: <Alarm::MgmtAccess> (yes no) Possible values: - yes : successfully logged in via management access - no : successfully logged out via management access	current status specifying whether successfully logged in or logged out via Management access <i>This element is only shown in detail mode.</i>
login-failure	Parameter type: <Alarm::InvalidAccess> (yes no) Possible values: - yes : invalid login via management access crossed the threshold - no : invalid login via management access within the threshold	current status specifying invalid attempts to login via management access crossed the threshold or not <i>This element is only shown in detail mode.</i>

103.87 IHUB BFD Alarm SnapShot Status Command

Command Description

This command displays the SnapShot bfd alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot bfd [(index)]

Command Parameters

Table 103.87-1 "IHUB BFD Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.87-2 "IHUB BFD Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
vprn-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
bfd-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringBfd> - additional alarm information	Additional information regarding the bfd alarm

103 Alarm Snap-shot Status Commands

name	Type	Description
		<i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
bfd-session-down	Parameter type: <Alarm::BfdSessionDown> (yes no) Possible values: - yes : bfd session down - no : bfd session not down	specifies whether a bfd session went down or not <i>This element is only shown in detail mode.</i>
bfd-max-resource	Parameter type: <Alarm::BfdMaxResource> (yes no) Possible values: - yes : bfd maximum resources reached - no : no resource issues for bfd	specifies whether bfd has reached maximum resources or not <i>This element is only shown in detail mode.</i>
bfd-stale-entry	Parameter type: <Alarm::BfdStaleEntry> (yes no) Possible values: - yes : bfd stale entry present - no : bfd stale entry not present	specifies whether a bfd entry has become stale or not <i>This element is only shown in detail mode.</i>

103.88 Application Intelligence Alarm Snap-shot Status Command

Command Description

This command displays the snap-shot for the Application Intelligence alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ai [ (index) ]
```

Command Parameters

Table 103.88-1 "Application Intelligence Alarm Snap-shot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap-shot table index

Command Output

Table 103.88-2 "Application Intelligence Alarm Snap-shot Status Command" Display parameters

Specific Information		
name	Type	Description
slot-id	Parameter type: <Equipm::NtSlotIndex> (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	identifies the board hosting the AI Platform for which the alarm has occurred. <i>This element is only shown in detail mode.</i>
application-virtplatf	Parameter type: <SignedInteger> - a signed integer	identifies the Application and/or the virtualplatform for which the alarm occurred <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringAI> - Additional info: Application Name - length: x<=32	identifies the Application and/or the virtualplatform for which the alarm occurred <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

Only Show Details: alarm snap-shot status		
name	Type	Description
ai-platform-down	Parameter type: <Alarm::AIPlatformDown> (yes no) Possible values: - yes : AI Platform down - no : AI Platform not down	specifies whether an AI Platform went down or not <i>This element is only shown in detail mode.</i>
ai-appl-install-fail	Parameter type: <Alarm::AIApplInstallFail> (yes no) Possible values: - yes : Application installation failed - no : Application installation successful	specifies whether an Application 'download and installation' failed or was successful <i>This element is only shown in detail mode.</i>
ip-assign-fail	Parameter type: <Alarm::IpAddrAssignFail> (yes no) Possible values: - yes : Dhcp assigned address failure - no : Dhcp assigned address successful	specifies whether dhcp client 'assigned ip address' failed or was successful <i>This element is only shown in detail mode.</i>

103.89 Alarm ONT SNMP Snapshot Status Command

This command displays the ont snmp snapshot-related alarms.

Command Description

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ontsnmp [ (index) ]
```

Command Parameters

Table 103.89-1 "Alarm ONT SNMP Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.89-2 "Alarm ONT SNMP Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
uni-index	Parameter type: <Ces::InterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier	identification of the uni interface index <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::OntPortId> - the ONT PORT identifier	
snmp-mismatch	Parameter type: <Alarm::OntSnmpMismatch> (mismatch not-mismatch) Possible values: - mismatch : ont snmp agent configuration data is mismatch - not-mismatch : ont snmp agent configuration data is not mismatch	current status specifying ont snmp is mismatch or not <i>This element is only shown in detail mode.</i>

103.90 Tr069 Alarm Status Command

Command Description

This command displays the tr069 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot tr069serv [ (index) ]
```

Command Parameters

Table 103.90-1 "Tr069 Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.90-2 "Tr069 Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
tr069serv	Parameter type: <Gpon::UniInterfaceIndexSnmpAgent> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId>	identifies the tr069 serv entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-tr069-serv-mis	Parameter type: <Alarm::Tr069ServMis> (yes no) Possible values: - yes : ont tr069 server mismatch occurred - no : no ont tr069 server mismatch	specifies ont tr069 server mismatch occurred or not. <i>This element is only shown in detail mode.</i>

103.91 Bulk Sync Alarm Log Status Command

Command Description

This command displays the bulk sync alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot bulk-sync [(index)]

Command Parameters

Table 103.91-1 "Bulk Sync Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.91-2 "Bulk Sync Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <RedPort::PortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
bsf-dhcpv4-fail	Parameter type: <Alarm::BsfDHCPv4> ((failing fail) ok) Possible values: - failing : dhcpv4 bulk-sync is failing - fail : dhcpv4 bulk-sync is failing - ok : dhcpv4 bulk-sync is ok	current status of dhcpv4 bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-dhcpv6-fail	Parameter type: <Alarm::BsfDHCPv6> ((failing fail) ok) Possible values: - failing : dhcpv6 bulk-sync is failing - fail : dhcpv6 bulk-sync is failing - ok : dhcpv6 bulk-sync is ok	current status of dhcpv6 bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-pon-fail	Parameter type: <Alarm::BsfPON> ((failing fail) ok) Possible values: - failing : pon bulk-sync is failing - fail : pon bulk-sync is failing - ok : pon bulk-sync is ok	current status of pon bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-vbridge-fail	Parameter type: <Alarm::BsfVBridge> ((failing fail) ok) Possible values: - failing : vlan-bridge bulk-sync is failing - fail : vlan-bridge bulk-sync is failing - ok : vlan-bridge bulk-sync is ok	current status of vlan-bridge bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-qos-fail	Parameter type: <Alarm::BsfQoS> ((failing fail) ok) Possible values: - failing : qos bulk-sync is failing - fail : qos bulk-sync is failing - ok : qos bulk-sync is ok	current status of qos bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-igmp-fail	Parameter type: <Alarm::BsfIGMP> ((failing fail) ok) Possible values: - failing : igmp bulk-sync is failing - fail : igmp bulk-sync is failing - ok : igmp bulk-sync is ok	current status of igmp bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-lxfwd-fail	Parameter type: <Alarm::BsfLxFwd> ((failing fail) ok) Possible values: - failing : LxFwd bulk-sync is failing - fail : LxFwd bulk-sync is failing - ok : LxFwd bulk-sync is ok	current status of lxfwd bulk-sync failure. <i>This element is only shown in detail mode.</i>

103.92 Protection Group Alarm Log Status Command

Command Description

This command displays the protection group alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot protection-group [(index)]

Command Parameters

Table 103.92-1 "Protection Group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.92-2 "Protection Group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
port	Parameter type: <RedPort::PortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
port-protection-fail	Parameter type: <Alarm::ProtNotAvail> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	status of port protection failure. <i>This element is only shown in detail mode.</i>
port-switchover-fail	Parameter type: <Alarm::ProtSwFail> ((failing fail) ok) Possible values: - failing : port protection switchover failing - fail : port protection switchover failing - ok : port protection switchover is ok	status of port switchover failure. <i>This element is only shown in detail mode.</i>

103.93 Ont protection Alarm Snapshot Status Command

Command Description

This command displays the ont protection alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-protection [(index)]

Command Parameters

Table 103.93-1 "Ont protection Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.93-2 "Ont protection Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-prot-fail	Parameter type: <Alarm::OntProtNotAvail> ((failing fail) ok) Possible values: - failing : ont protection is failing - fail : ont protection is failing - ok : ont protection is ok	status of ont protection failure. <i>This element is only shown in detail mode.</i>

103.94 ONT General Supplemental Alarm Snapshot Status Command

Command Description

This command displays the ONT general supplemental alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont [(index)]

Command Parameters

Table 103.94-1 "ONT General Supplemental Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.94-2 "ONT General Supplemental Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-gen-sw-dnload-file	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	ont sw download file missing <i>This element is only shown in detail mode.</i>
ont-gen-fan-fail	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	ont fan failure <i>This element is only shown in detail mode.</i>
ont-gen-high-temp	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	ont high temperature <i>This element is only shown in detail mode.</i>
ont-gen-high-temp-ex	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	ont excessive high temperature <i>This element is only shown in detail mode.</i>
ont-gen-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	ont emergency call <i>This element is only shown in detail mode.</i>
ont-gen-sw-version	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	ont sw version control error <i>This element is only shown in detail mode.</i>
ont-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	ont poe exceed max <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
ont-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	Specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
ont-gen-cfgdld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	specifies download of voice xml file to ont failed or not. <i>This element is only shown in detail mode.</i>
ont-loopdetect-mis	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	ONT loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
rsi-mismatch	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	rsi mismatch status <i>This element is only shown in detail mode.</i>
tx-pwr-alm-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	tx pwr low alarm status <i>This element is only shown in detail mode.</i>
temp-alm-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	temp alarm high status <i>This element is only shown in detail mode.</i>
volt-alm-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	voltage alarm high status <i>This element is only shown in detail mode.</i>
bias-alm-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	bias alarm high status <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	
ont-olt-rx-pw-hig	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	olt side receive power from ont high <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-warnhig	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	olt side receive power from ont high warning <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-warnlo	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	olt side receive power from ont low warning <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-lo	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	olt side receive power from ont low <i>This element is only shown in detail mode.</i>
ont-gen-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	tod is out-sync with olt <i>This element is only shown in detail mode.</i>
ont-gen-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	ONU has failed to tune to Pref-ChnlPair <i>This element is only shown in detail mode.</i>
hgu-tr069-param-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
ont-gen-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	tod is mismatch <i>This element is only shown in detail mode.</i>

103.95 SFU ONT General Supplemental Alarm Snapshot Status Command

Command Description

This command displays the SFU ONT general supplemental alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfu-sup [ (index) ]
```

Command Parameters

Table 103.95-1 "SFU ONT General Supplemental Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.95-2 "SFU ONT General Supplemental Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
sfu-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	SFU ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
sfu-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	SFU ONT - Fan failure <i>This element is only shown in detail mode.</i>
sfu-sup-temp-high-warn	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	SFU ONT - High temperature warning <i>This element is only shown in detail mode.</i>
sfu-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	SFU ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
sfu-sup-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	SFU ONT - Emergency call active <i>This element is only shown in detail mode.</i>
sfu-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTRLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	SFU ONT - Software version control error <i>This element is only shown in detail mode.</i>
sfu-sup-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	SFU ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
sfu-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	SFU ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
sfu-ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
sfu-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SFU ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
sfu-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	SFU ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	SFU ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	SFU ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	SFU ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SFU ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	SFU ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
sfu-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	SFU ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-hi-warn	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	SFU ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-lo-warn	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	SFU ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	SFU ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
sfu-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	SFU ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
sfu-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	SFU ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
sfu-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	SFU ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	SFU ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

103.96 SOHO ONT General Supplemental Alarm Snapshot Status Command

Command Description

This command displays the SOHO ONT general supplemental alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot soho-sup [(index)]

Command Parameters

Table 103.96-1 "SOHO ONT General Supplemental Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.96-2 "SOHO ONT General Supplemental Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
soho-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	SOHO ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
soho-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	SOHO ONT - Fan failure <i>This element is only shown in detail mode.</i>
soho-sup-temp-high-war	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	SOHO ONT - High temperature warning <i>This element is only shown in detail mode.</i>
soho-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	SOHO ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
soho-sup-emergency-cal	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	SOHO ONT - Emergency call active <i>This element is only shown in detail mode.</i>
soho-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTRLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	SOHO ONT - Software version control error <i>This element is only shown in detail mode.</i>
soho-sup-poe-exceed-ma	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	SOHO ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
soho-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	SOHO ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
soho-ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
soho-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SOHO ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
soho-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	SOHO ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
soho-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	SOHO ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
soho-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	SOHO ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	SOHO ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SOHO ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	SOHO ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
soho-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	SOHO ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-hi-war	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	SOHO ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-lo-war	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	SOHO ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	SOHO ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
soho-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	SOHO ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
soho-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	SOHO ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
soho-tr069-param-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	SOHO ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
soho-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	SOHO ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

103.97 MDU ONT General Supplemental Alarm Snapshot Status Command

Command Description

This command displays the MDU ONT general supplemental alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot mdu-sup [(index)]

Command Parameters

Table 103.97-1 "MDU ONT General Supplemental Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.97-2 "MDU ONT General Supplemental Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
mdu-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	MDU ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
mdu-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	MDU ONT - Fan failure <i>This element is only shown in detail mode.</i>
mdu-sup-temp-high-warn	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	MDU ONT - High temperature warning <i>This element is only shown in detail mode.</i>
mdu-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	MDU ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
mdu-sup-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	MDU ONT - Emergency call active <i>This element is only shown in detail mode.</i>
mdu-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTRLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	MDU ONT - Software version control error <i>This element is only shown in detail mode.</i>
mdu-sup-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	MDU ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
mdu-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	MDU ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
mdu-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
mdu-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	MDU ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
mdu-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	MDU ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	MDU ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	MDU ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	MDU ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	MDU ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	MDU ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
mdu-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	MDU ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-hi-warn	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	MDU ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-lo-warn	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	MDU ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	MDU ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
mdu-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	MDU ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
mdu-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	MDU ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
mdu-tr069-param-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	MDU ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	MDU ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

103.98 ONT General Supplemental 2 Alarm Snapshot Status Command

Command Description

This command displays the ONT general supplemental2 alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-ani [(index)]

Command Parameters

Table 103.98-1 "ONT General Supplemental 2 Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.98-2 "ONT General Supplemental 2 Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
temp-alm-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	temp alarm low status <i>This element is only shown in detail mode.</i>
volt-alm-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	voltage alarm low status <i>This element is only shown in detail mode.</i>
bias-alm-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	bias alarm low status <i>This element is only shown in detail mode.</i>
tx-pwr-alm-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	tx pwr high alarm status <i>This element is only shown in detail mode.</i>
rx-pwr-warn-high	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	rx pwr warning high status <i>This element is only shown in detail mode.</i>
rx-pwr-warn-low	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	rx pwr warning high status <i>This element is only shown in detail mode.</i>
tx-pwr-warn-high	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	tx pwr warning high status <i>This element is only shown in detail mode.</i>
tx-pwr-warn-low	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values:	tx pwr warning low status <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : tx power at ont side is too low - no : tx power at ont side is normal	
temp-warn-high	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	temp warning high status <i>This element is only shown in detail mode.</i>
temp-warn-low	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	temp warning low status <i>This element is only shown in detail mode.</i>
volt-warn-high	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	voltage warning high status <i>This element is only shown in detail mode.</i>
volt-warn-low	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	voltage warning low status <i>This element is only shown in detail mode.</i>
bias-warn-high	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	bias warning high status <i>This element is only shown in detail mode.</i>
bias-warn-low	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	bias warning low status <i>This element is only shown in detail mode.</i>

103.99 SFU ONT General Supplemental 2 Alarm Snapshot Status Command

Command Description

This command displays the SFU ONT general supplemental 2 alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfu-sup2 [ (index) ]
```

Command Parameters

Table 103.99-1 "SFU ONT General Supplemental 2 Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.99-2 "SFU ONT General Supplemental 2 Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
sfu-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SFU ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SFU ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SFU ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SFU ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	SFU ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	SFU ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-tx-hwarn	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SFU ONT - SFP Tx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-tx-lwarn	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values:	SFU ONT - SFP Tx power is lower than configured warn threshold <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : tx power at ont side is too low - no : tx power at ont side is normal	<i>detail mode.</i>
sfu-sup2-temp-hwarn	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	SFU ONT - SFP temperature is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-temp-lwarn	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SFU ONT - SFP temperature is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-hwarn	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SFU ONT - SFP voltage is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-lwarn	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SFU ONT - SFP voltage is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-hwarn	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	SFU ONT - SFP bias is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-lwarn	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SFU ONT - SFP bias is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

103.100 SOHO ONT General Supplemental 2 Alarm Snapshot Status Command

Command Description

This command displays the SOHO ONT general supplemental 2 alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot soho-sup2 [ (index) ]
```

Command Parameters

Table 103.100-1 "SOHO ONT General Supplemental 2 Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.100-2 "SOHO ONT General Supplemental 2 Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
soho-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SOHO ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
soho-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SOHO ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
soho-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SOHO ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
soho-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SOHO ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
soho-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	SOHO ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	SOHO ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-tx-hwarn	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SOHO ONT - SFP Tx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-tx-lwarn	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values:	SOHO ONT - SFP Tx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : tx power at ont side is too low - no : tx power at ont side is normal	<i>detail mode.</i>
soho-sup2-temp-hwarn	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	SOHO ONT - SFP temperature is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-temp-lwarn	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SOHO ONT - SFP temperature is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-volt-hwarn	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SOHO ONT - SFP voltage is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-volt-lwarn	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SOHO ONT - SFP voltage is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-bias-hwarn	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	SOHO ONT - SFP bias is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
soho-sup2-bias-lwarn	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SOHO ONT - SFP bias is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

103.101 MDU ONT General Supplemental 2 Alarm Snapshot Status Command

Command Description

This command displays the MDU ONT general supplemental 2 alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot mdu-sup2 [ (index) ]
```

Command Parameters

Table 103.101-1 "MDU ONT General Supplemental 2 Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.101-2 "MDU ONT General Supplemental 2 Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
mdu-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	MDU ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	MDU ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	MDU ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	MDU ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	MDU ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	MDU ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-tx-hwarn	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	MDU ONT - SFP Tx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-tx-lwarn	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values:	MDU ONT - SFP Tx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- yes : tx power at ont side is too low - no : tx power at ont side is normal	<i>detail mode.</i>
mdu-sup2-temp-hwarn	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	MDU ONT - SFP temperature is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-temp-lwarn	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	MDU ONT - SFP temperature is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-volt-hwarn	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	MDU ONT - SFP voltage is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-volt-lwarn	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	MDU ONT - SFP voltage is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-bias-hwarn	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	MDU ONT - SFP bias is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
mdu-sup2-bias-lwarn	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	MDU ONT - SFP bias is lower than configured warn threshold <i>This element is only shown in detail mode.</i>

103.102 LT CFM Alarm SnapShot Status Command

Command Description

This command displays the SnapShot iacm cfm alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot cfm [(index)]

Command Parameters

Table 103.102-1 "LT CFM Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	cfm log table index

Command Output

Table 103.102-2 "LT CFM Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
cfm-mep-id	Parameter type: <UnsignedSignedInteger> - an unsigned integer	dot1agCfmMepIdentifier index where the alarm has occurred. <i>This element is only shown in detail mode.</i>
cfm-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringCcm> - additional alarm information	Additional information regarding the cfm alarm <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
cfm-defrdiccm	Parameter type: <Alarm::IacmCfmRdiCcm> (yes no)	specifies rdi bit in ccm received <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : rdi bit in ccm received - no : no rdi bit in ccm received	
cfm-defmacstatus	Parameter type: <Alarm::IacmCfmMacError> (yes no) Possible values: - yes : mac error status - no : no mac error status	ccm mac error status <i>This element is only shown in detail mode.</i>
cfm-defremoteccm	Parameter type: <Alarm::IacmCfmMepCcm> (yes no) Possible values: - yes : missing ccm from mep - no : no missing ccm from mep	specifies missing ccm from mep <i>This element is only shown in detail mode.</i>
cfm-deferrorccm	Parameter type: <Alarm::IacmCfmInvalidCcm> (yes no) Possible values: - yes : invalid ccm received - no : no invalid ccm received	specifies invalid ccm received <i>This element is only shown in detail mode.</i>
cfm-defxconccm	Parameter type: <Alarm::IacmCfmUnexpectedCcm> (yes no) Possible values: - yes : unexpected ccm received - no : no unexpected ccm received	specifies unexpected ccm received <i>This element is only shown in detail mode.</i>
cfm-defais	Parameter type: <Alarm::IacmCfmAis> (yes no) Possible values: - yes : ethernet ais received - no : no ethernet ais received	specifies ethernet ais received <i>This element is only shown in detail mode.</i>

103.103 IHUB CFM Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ihub cfm alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot eth-cfm [ (index) ]
```

Command Parameters

Table 103.103-1 "IHUB CFM Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	eth cfm log table index

Command Output

Table 103.103-2 "IHUB CFM Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
cfm-mep-id	Parameter type: <UnsignedSignedInteger> - an unsigned integer	dot1agCfmMepIdentifier index where the alarm has occurred. <i>This element is only shown in detail mode.</i>
cfm-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringIhubCfm> - additional alarm information	Additional information regarding the eth cfm alarm <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status

103 Alarm Snap-shot Status Commands

name	Type	Description
defrdiccm	Parameter type: <Alarm::IhubCfmRdiCcm> (yes no) Possible values: - yes : rdi bit in ccm received - no : no rdi bit in ccm received	specifies rdi bit in ccm received <i>This element is only shown in detail mode.</i>
defmacstatus	Parameter type: <Alarm::IhubCfmMacError> (yes no) Possible values: - yes : mac error status - no : no mac error status	ccm mac error status <i>This element is only shown in detail mode.</i>
defremoteccm	Parameter type: <Alarm::IhubCfmMepCcm> (yes no) Possible values: - yes : missing ccm from mep - no : no missing ccm from mep	specifies missing ccm from mep <i>This element is only shown in detail mode.</i>
deferrorccm	Parameter type: <Alarm::IhubCfmInvalidCcm> (yes no) Possible values: - yes : invalid ccm received - no : no invalid ccm received	specifies invalid ccm received <i>This element is only shown in detail mode.</i>
defxconccm	Parameter type: <Alarm::IhubCfmUnexpectedCcm> (yes no) Possible values: - yes : unexpected ccm received - no : no unexpected ccm received	specifies unexpected ccm received <i>This element is only shown in detail mode.</i>

103.104 Alarm SnapShot RSVP Status Command

Command Description

This command displays the snap-shot RSVP alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot rsvp [ (index) ]
```

Command Parameters

Table 103.104-1 "Alarm SnapShot RSVP Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.104-2 "Alarm SnapShot RSVP Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
neighbor-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	An unique number to identify the alarm or zero when not applicable, Neighbor is further specified in additional <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the Neighbor using the Nbr address and ifIndex or empty string if not applicable <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
neighbor-down	Parameter type: <Alarm::RsvpNeighborDown> (yes	specifies whether the RSVP neighbor is down or not

103 Alarm Snap-shot Status Commands

name	Type	Description
	no) Possible values: - yes : rsvp neighbor is down - no : rsvp neighbor is up or rsvp interface is shutdown or ip interface is shutdown or rsvp instance is shutdown	<i>This element is only shown in detail mode.</i>
rsvp-instance-down	Parameter type: <Alarm::RsvpInstanceDown> (yes no) Possible values: - yes : rsvp instance is down - no : rsvp instance is up or not configured	specifies whether the RSVP instance is down or not <i>This element is only shown in detail mode.</i>

103.105 IPD eth-ring Alarm SnapShot Status Command

Command Description

This command displays the SnapShot ipd eth-ring alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot eth-ring [(index)]

Command Parameters

Table 103.105-1 "IPD eth-ring Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.105-2 "IPD eth-ring Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
ring-id	Parameter type: <Alarm::genAlarmIndex> - index of a current alarm entry	identifies the eth-ring-instance <i>This element is only shown in detail mode.</i>
ring path-index	Parameter type: <Alarm::genAlarmIndex> - index of a current alarm entry	identifies the ring-path within a eth-ring <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
ering-path-blocked	Parameter type: <Alarm::EthRingPathBlocked> (yes no) Possible values: - yes : ethernet ring path is blocked - no : ethernet ring path is unblocked	specifies whether a eth-ring path is blocked or not <i>This element is only shown in detail mode.</i>

103.106 EFM-OAM alarm Snap-shot Status Command

Command Description

This command shows the snap-shot of EFM-OAM alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot efm-oam [(index)]

Command Parameters

Table 103.106-1 "EFM-OAM alarm Snap-shot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	current alarm index

Command Output

Table 103.106-2 "EFM-OAM alarm Snap-shot Status Command" Display parameters

Specific Information		
name	Type	Description
line	Parameter type: <Itf::EfmEthernetIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the line where the alarm has occurred. <i>This element is only shown in detail mode.</i>
Only Show Details: snap-shot alarm status		
name	Type	Description
link-fault	Parameter type: <Alarm::linkFaultType> (yes no)	Link fault at cpe <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : link fault at cpe/onu - no : link fault is not exist	
dying-gasp	Parameter type: <Alarm::dyingGaspType> (yes no) Possible values: - yes : dying gasp is exist - no : dying gasp is not exist	received dying gasp indication from cpe <i>This element is only shown in detail mode.</i>
critical-event	Parameter type: <Alarm::criticalEventType> (yes no) Possible values: - yes : critical event is exist - no : critical event is not exist	receive critical event indication from cpe <i>This element is only shown in detail mode.</i>

103.107 ONT loop detect alarm Snap-shot Status Command

Command Description

This command shows the snap-shot of ont loop detect alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-loopdetect [ (index) ]
```

Command Parameters

Table 103.107-1 "ONT loop detect alarm Snap-shot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.107-2 "ONT loop detect alarm Snap-shot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
ont-loopdetect	Parameter type: <Alarm::OntLoopDetectPortNumber> (port 1 looped port 2 looped port 3 looped port 4 looped port 5 looped port 6 looped port 7 looped port 8 looped port 9 looped port 10 looped port 11 looped port 12 looped port 13 looped port 14 looped port 15 looped port 16 looped port 17 looped port 18 looped port 19 looped port 20 looped port 21 looped port 22 looped port 23 looped port 24 looped) Possible values: - port 1 looped : ont port loop occurred - port 2 looped : ont port loop occurred - port 3 looped : ont port loop occurred - port 4 looped : ont port loop occurred - port 5 looped : ont port loop occurred - port 6 looped : ont port loop occurred - port 7 looped : ont port loop occurred - port 8 looped : ont port loop occurred - port 9 looped : ont port loop occurred - port 10 looped : ont port loop occurred - port 11 looped : ont port loop occurred - port 12 looped : ont port loop occurred - port 13 looped : ont port loop occurred - port 14 looped : ont port loop occurred - port 15 looped : ont port loop occurred - port 16 looped : ont port loop occurred - port 17 looped : ont port loop occurred - port 18 looped : ont port loop occurred - port 19 looped : ont port loop occurred - port 20 looped : ont port loop occurred - port 21 looped : ont port loop occurred - port 22 looped : ont port loop occurred - port 23 looped : ont port loop occurred - port 24 looped : ont port loop occurred	identifies the ont entry <i>This element is only shown in detail mode.</i>

103.108 ONT PLOAM Alarm Snapshot Status Command

Command Description

This command displays the ONT PLOAM alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-ploam [ (index) ]
```

Command Parameters

Table 103.108-1 "ONT PLOAM Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.108-2 "ONT PLOAM Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	gpon ont equipment ifindex of ont <i>This element is only shown in detail mode.</i>

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status

name	Type	Description
ont-ploam-loss-sig	Parameter type: <Alarm::ONTPLOAMLOSO> (yes no) Possible values: - yes : loss of signal at ont - no : no loss of signal at ont	loss of signal at ont <i>This element is only shown in detail mode.</i>
ont-ploam-loss-ack	Parameter type: <Alarm::ONTPLOAMLOA> (yes no) Possible values: - yes : loss of acknowledge from ont - no : no loss of acknowledge from ont	loss of acknowledge from ont <i>This element is only shown in detail mode.</i>
ont-ploam-loss-cd	Parameter type: <Alarm::ONTPLOAMLCD> (yes no) Possible values: - yes : loss of gem/atm channel delineation of ont - no : gem/atm channel delineation of ont is normal	loss of gem/atm channel delineation of ont <i>This element is only shown in detail mode.</i>
ont-ploam-phy-eqpt-err	Parameter type: <Alarm::ONTPLOAMPEE> (yes no) Possible values: - yes : physical equipment error of ont - no : no physical equipment error of ont	physical equipment error of ont <i>This element is only shown in detail mode.</i>
ont-ploam-startup-fail	Parameter type: <Alarm::ONTPLOAMSUF> (yes no) Possible values: - yes : startup failure in ranging of ont - no : no startup failure in ranging of ont	startup failure in ranging of ont <i>This element is only shown in detail mode.</i>
ont-ploam-sig-degrade	Parameter type: <Alarm::ONTPLOAMSD> (yes no) Possible values: - yes : signal degrade ber threshold exceeded from ont - no : signal degrade ber threshold is normal	signal degrade ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
ont-ploam-disabled	Parameter type: <Alarm::ONTPLOAMONTDisabled> (yes no) Possible values: - yes : ont has been autonomously disabled - no : ont is enabled	ont has been autonomously disabled because of misbehaving transmissions <i>This element is only shown in detail mode.</i>
ont-ploam-err-msg	Parameter type: <Alarm::ONTPLOAMMEM> (yes no) Possible values: - yes : message error message from ont - no : no message error message from ont	message error message from ont <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
ont-ploam-inactive	Parameter type: <Alarm::ONTPLOAMInact> (yes no) Possible values: - yes : ont is inactive - no : ont is active	ont is inactive <i>This element is only shown in detail mode.</i>
ont-ploam-sig-fail	Parameter type: <Alarm::ONTPLOAMSF> (yes no) Possible values: - yes : signal fail ber threshold exceeded from ont - no : no signal fail ber threshold exceeded from ont	signal fail ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
ont-ploam-dying-gasp	Parameter type: <Alarm::ONTPLOAMDG> (yes no) Possible values: - yes : received dying gasp indication from ont - no : no received dying gasp indication from ont	received dying gasp indication from ont <i>This element is only shown in detail mode.</i>
ont-ploam-deact-fail	Parameter type: <Alarm::ONTPLOAMDF> (yes no) Possible values: - yes : deactivate failure of ont - no : no deactivate failure of ont	deactivate failure of ont <i>This element is only shown in detail mode.</i>
ont-ploam-oam	Parameter type: <Alarm::ONTPLOAMLOAM> (yes no) Possible values: - yes : loss of ploam for ont - no : no Loss of ploam for ont	loss of ploam for ont <i>This element is only shown in detail mode.</i>
ont-ploam-win-drift	Parameter type: <Alarm::ONTPLOAMDOW> (yes no) Possible values: - yes : drift of window - no : no drift of window	drift of window. <i>This element is only shown in detail mode.</i>
ont-ploam-rdi	Parameter type: <Alarm::ONTPLOAMRDI> (yes no) Possible values: - yes : remote defect indication from ont - no : no remote defect indication from ont	remote defect indication from ont. <i>This element is only shown in detail mode.</i>
ont-ploam-loss-ks	Parameter type: <Alarm::ONTPLOAMLOKS> (yes no) Possible values: - yes : loss of key synchronization between olt and ont - no : key synchronization between olt and ont is ok	loss of key synchronization between olt and ont <i>This element is only shown in detail mode.</i>
ont-ploam-pwr-burst	Parameter type: <Alarm::ONTPLOAMONTPWRERR> (yes no) Possible values: - yes : ont power up error - no : ont power up ok	ont power up error. <i>This element is only shown in detail mode.</i>
ont-ploam-rog-disa	Parameter type: <Alarm::ONTPLOAMROGUEONTDIS> (yes no)	ont has been autonomously disabled because of misbehaving transmissions and is thought to be

name	Type	Description
	Possible values: - yes : ont has been autonomously disabled to be a rogue ont - no : ont is normal	a rogue ont. <i>This element is only shown in detail mode.</i>
ont-ploam-diff-reach	Parameter type: <Alarm::ONTPLOAMDIFREACH> (yes no) Possible values: - yes : ont has been deactivated because its location on the pon has exceeded its differential reach capability - no : ont is normal	ont has been deactivated because its location on the pon has exceeded its differential reach capability. <i>This element is only shown in detail mode.</i>
ont-ploam-looc	Parameter type: <Alarm::ONTPLOAMLOOC> (yes no) Possible values: - yes : ont has been deactivated due to persistent OMCI MIC failure - no : ont is normal	ont has been deactivated due to persistent OMCI MIC failure. <i>This element is only shown in detail mode.</i>

103.109 SFU ONT PLOAM Alarm Snapshot Status Command

Command Description

This command displays the SFU ONT PLOAM alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfu-ploam [ (index) ]
```

Command Parameters

Table 103.109-1 "SFU ONT PLOAM Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Table 103.109-2 "SFU ONT PLOAM Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	gpon ont equipment ifindex of ont <i>This element is only shown in detail mode.</i>

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
sfu-ploam-loss-sig	Parameter type: <Alarm::ONTPLOAMLOSO> (yes no) Possible values: - yes : loss of signal at ont - no : no loss of signal at ont	loss of signal at ont <i>This element is only shown in detail mode.</i>
sfu-ploam-loss-ack	Parameter type: <Alarm::ONTPLOAMLOA> (yes no) Possible values: - yes : loss of acknowledge from ont - no : no loss of acknowledge from ont	loss of acknowledge from ont <i>This element is only shown in detail mode.</i>
sfu-ploam-loss-cd	Parameter type: <Alarm::ONTPLOAMLCD> (yes no) Possible values: - yes : loss of gem/atm channel delineation of ont - no : gem/atm channel delineation of ont is normal	loss of gem/atm channel delineation of ont <i>This element is only shown in detail mode.</i>
sfu-ploam-phy-eqpt-err	Parameter type: <Alarm::ONTPLOAMPEE> (yes no) Possible values: - yes : physical equipment error of ont - no : no physical equipment error of ont	physical equipment error of ont <i>This element is only shown in detail mode.</i>
sfu-ploam-startup-fail	Parameter type: <Alarm::ONTPLOAMSUF> (yes no) Possible values: - yes : startup failure in ranging of ont - no : no startup failure in ranging of ont	startup failure in ranging of ont <i>This element is only shown in detail mode.</i>
sfu-ploam-sig-degrade	Parameter type: <Alarm::ONTPLOAMSD> (yes no) Possible values: - yes : signal degrade ber threshold exceeded from ont - no : signal degrade ber threshold is normal	signal degrade ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
sfu-ploam-disabled	Parameter type: <Alarm::ONTPLOAMONTDisabled> (yes no) Possible values: - yes : ont has been autonomously disabled - no : ont is enabled	ont has been autonomously disabled because of misbehaving transmissions <i>This element is only shown in detail mode.</i>
sfu-ploam-err-msg	Parameter type: <Alarm::ONTPLOAMMEM> (yes no) Possible values: - yes : message error message from ont - no : no message error message from ont	message error message from ont <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
sfu-ploam-inactive	Parameter type: <Alarm::ONTPLOAMInact> (yes no) Possible values: - yes : ont is inactive - no : ont is active	ont is inactive <i>This element is only shown in detail mode.</i>
sfu-ploam-sig-fail	Parameter type: <Alarm::ONTPLOAMSF> (yes no) Possible values: - yes : signal fail ber threshold exceeded from ont - no : no signal fail ber threshold exceeded from ont	signal fail ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
sfu-ploam-dying-gasp	Parameter type: <Alarm::ONTPLOAMDG> (yes no) Possible values: - yes : received dying gasp indication from ont - no : no received dying gasp indication from ont	received dying gasp indication from ont <i>This element is only shown in detail mode.</i>
sfu-ploam-deact-fail	Parameter type: <Alarm::ONTPLOAMDF> (yes no) Possible values: - yes : deactivate failure of ont - no : no deactivate failure of ont	deactivate failure of ont <i>This element is only shown in detail mode.</i>
sfu-ploam-oam	Parameter type: <Alarm::ONTPLOAMLOAM> (yes no) Possible values: - yes : loss of ploam for ont - no : no Loss of ploam for ont	loss of ploam for ont <i>This element is only shown in detail mode.</i>
sfu-ploam-win-drift	Parameter type: <Alarm::ONTPLOAMDOW> (yes no) Possible values: - yes : drift of window - no : no drift of window	drift of window. <i>This element is only shown in detail mode.</i>
sfu-ploam-rdi	Parameter type: <Alarm::ONTPLOAMRDI> (yes no) Possible values: - yes : remote defect indication from ont - no : no remote defect indication from ont	remote defect indication from ont. <i>This element is only shown in detail mode.</i>
sfu-ploam-loss-ks	Parameter type: <Alarm::ONTPLOAMLOKS> (yes no) Possible values: - yes : loss of key synchronization between olt and ont - no : key synchronization between olt and ont is ok	loss of key synchronization between olt and ont <i>This element is only shown in detail mode.</i>
sfu-ploam-pwr-burst	Parameter type: <Alarm::ONTPLOAMONTPWRERR> (yes no) Possible values: - yes : ont power up error - no : ont power up ok	ont power up error. <i>This element is only shown in detail mode.</i>
sfu-ploam-rog-disa	Parameter type: <Alarm::ONTPLOAMROGUEONTDIS> (yes no)	ont has been autonomously disabled because of misbehaving transmissions and is thought to be

name	Type	Description
	Possible values: - yes : ont has been autonomously disabled to be a rogue ont - no : ont is normal	a rogue ont. <i>This element is only shown in detail mode.</i>
sfu-ploam-diff-reach	Parameter type: <Alarm::ONTPLOAMDIFREACH> (yes no) Possible values: - yes : ont has been deactivated because its location on the pon has exceeded its differential reach capability - no : ont is normal	ont has been deactivated because its location on the pon has exceeded its differential reach capability. <i>This element is only shown in detail mode.</i>
sfu-ploam-looc	Parameter type: <Alarm::ONTPLOAMLOOC> (yes no) Possible values: - yes : ont has been deactivated due to persistent OMCI MIC failure - no : ont is normal	ont has been deactivated due to persistent OMCI MIC failure. <i>This element is only shown in detail mode.</i>

103.110 SOHO ONT PLOAM Alarm Snapshot Status Command

Command Description

This command displays the SOHO ONT PLOAM alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot soho-ploam [ (index) ]
```

Command Parameters

Table 103.110-1 "SOHO ONT PLOAM Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm log table index

Command Output

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	gpon ont equipment ifindex of ont <i>This element is only shown in detail mode.</i>

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status

name	Type	Description
soho-ploam-loss-sig	Parameter type: <Alarm::ONTPLOAMLOSO> (yes no) Possible values: - yes : loss of signal at ont - no : no loss of signal at ont	loss of signal at ont <i>This element is only shown in detail mode.</i>
soho-ploam-loss-ack	Parameter type: <Alarm::ONTPLOAMLOA> (yes no) Possible values: - yes : loss of acknowledge from ont - no : no loss of acknowledge from ont	loss of acknowledge from ont <i>This element is only shown in detail mode.</i>
soho-ploam-loss-cd	Parameter type: <Alarm::ONTPLOAMLCD> (yes no) Possible values: - yes : loss of gem/atm channel delineation of ont - no : gem/atm channel delineation of ont is normal	loss of gem/atm channel delineation of ont <i>This element is only shown in detail mode.</i>
soho-ploam-phy-eqpt-er	Parameter type: <Alarm::ONTPLOAMPEE> (yes no) Possible values: - yes : physical equipment error of ont - no : no physical equipment error of ont	physical equipment error of ont <i>This element is only shown in detail mode.</i>
soho-ploam-startup-fai	Parameter type: <Alarm::ONTPLOAMSUF> (yes no) Possible values: - yes : startup failure in ranging of ont - no : no startup failure in ranging of ont	startup failure in ranging of ont <i>This element is only shown in detail mode.</i>
soho-ploam-sig-degrade	Parameter type: <Alarm::ONTPLOAMSD> (yes no) Possible values: - yes : signal degrade ber threshold exceeded from ont - no : signal degrade ber threshold is normal	signal degrade ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
soho-ploam-disabled	Parameter type: <Alarm::ONTPLOAMONTDisabled> (yes no) Possible values: - yes : ont has been autonomously disabled - no : ont is enabled	ont has been autonomously disabled because of misbehaving transmissions <i>This element is only shown in detail mode.</i>
soho-ploam-err-msg	Parameter type: <Alarm::ONTPLOAMMEM> (yes no) Possible values: - yes : message error message from ont - no : no message error message from ont	message error message from ont <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
soho-ploam-inactive	Parameter type: <Alarm::ONTPLOAMInact> (yes no) Possible values: - yes : ont is inactive - no : ont is active	ont is inactive <i>This element is only shown in detail mode.</i>
soho-ploam-sig-fail	Parameter type: <Alarm::ONTPLOAMSF> (yes no) Possible values: - yes : signal fail ber threshold exceeded from ont - no : no signal fail ber threshold exceeded from ont	signal fail ber threshold exceeded from ont <i>This element is only shown in detail mode.</i>
soho-ploam-dying-gasp	Parameter type: <Alarm::ONTPLOAMDG> (yes no) Possible values: - yes : received dying gasp indication from ont - no : no received dying gasp indication from ont	received dying gasp indication from ont <i>This element is only shown in detail mode.</i>
soho-ploam-deact-fail	Parameter type: <Alarm::ONTPLOAMDF> (yes no) Possible values: - yes : deactivate failure of ont - no : no deactivate failure of ont	deactivate failure of ont <i>This element is only shown in detail mode.</i>
soho-ploam-oam	Parameter type: <Alarm::ONTPLOAMLOAM> (yes no) Possible values: - yes : loss of ploam for ont - no : no Loss of ploam for ont	loss of ploam for ont <i>This element is only shown in detail mode.</i>
soho-ploam-win-drift	Parameter type: <Alarm::ONTPLOAMDOW> (yes no) Possible values: - yes : drift of window - no : no drift of window	drift of window. <i>This element is only shown in detail mode.</i>
soho-ploam-rdi	Parameter type: <Alarm::ONTPLOAMRDI> (yes no) Possible values: - yes : remote defect indication from ont - no : no remote defect indication from ont	remote defect indication from ont. <i>This element is only shown in detail mode.</i>
soho-ploam-loss-ks	Parameter type: <Alarm::ONTPLOAMLOKS> (yes no) Possible values: - yes : loss of key synchronization between olt and ont - no : key synchronization between olt and ont is ok	loss of key synchronization between olt and ont <i>This element is only shown in detail mode.</i>
soho-ploam-pwr-burst	Parameter type: <Alarm::ONTPLOAMONTPWRERR> (yes no) Possible values: - yes : ont power up error - no : ont power up ok	ont power up error. <i>This element is only shown in detail mode.</i>
soho-ploam-rog-disa	Parameter type: <Alarm::ONTPLOAMROGUEONTDIS> (yes no)	ont has been autonomously disabled because of misbehaving transmissions and is thought to be

name	Type	Description
	Possible values: - yes : ont has been autonomously disabled to be a rogue ont - no : ont is normal	a rogue ont. <i>This element is only shown in detail mode.</i>
soho-ploam-diff-reach	Parameter type: <Alarm::ONTPLOAMDIFREACH> (yes no) Possible values: - yes : ont has been deactivated because its location on the pon has exceeded its differential reach capability - no : ont is normal	ont has been deactivated because its location on the pon has exceeded its differential reach capability. <i>This element is only shown in detail mode.</i>
soho-ploam-looc	Parameter type: <Alarm::ONTPLOAMLOOC> (yes no) Possible values: - yes : ont has been deactivated due to persistent OMCI MIC failure - no : ont is normal	ont has been deactivated due to persistent OMCI MIC failure. <i>This element is only shown in detail mode.</i>

103.111 MDU ONT PLOAM Alarm Snapshot Status Command

Command Description

This command displays the MDU ONT PLOAM alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot mdu-ploam [ (index) ]
```

Command Parameters

Table 103.111-1 "MDU ONT PLOAM Alarm Snapshot Status Command" Resource Parameters

mdu-ploam-win-drift	Parameter type: <Alarm::ONTPLOAMDOW> (yes no) Possible values: - yes : drift of window - no : no drift of window	drift of window. <i>This element is only shown in detail mode.</i>
mdu-ploam-rdi	Parameter type: <Alarm::ONTPLOAMRDI> (yes no) Possible values: - yes : remote defect indication from ont - no : no remote defect indication from ont	remote defect indication from ont. <i>This element is only shown in detail mode.</i>
mdu-ploam-loss-ks	Parameter type: <Alarm::ONTPLOAMLOKS> (yes no) Possible values: - yes : loss of key synchronization between olt and ont - no : key synchronization between olt and ont is ok	loss of key synchronization between olt and ont <i>This element is only shown in detail mode.</i>
mdu-ploam-pwr-burst	Parameter type: <Alarm::ONTPLOAMONTPWRERR> (yes no) Possible values: - yes : ont power up error - no : ont power up ok	ont power up error. <i>This element is only shown in detail mode.</i>
mdu-ploam-rog-disa	Parameter type: <Alarm::ONTPLOAMROGUEONTDIS> (yes no)	ont has been autonomously disabled because of misbehaving transmissions and is thought to be

name	Type	Description
	Possible values: - yes : ont has been autonomously disabled to be a rogue ont - no : ont is normal	a rogue ont. <i>This element is only shown in detail mode.</i>
mdu-ploam-diff-reach	Parameter type: <Alarm::ONTPLOAMDIFREACH> (yes no) Possible values: - yes : ont has been deactivated because its location on the pon has exceeded its differential reach capability - no : ont is normal	ont has been deactivated because its location on the pon has exceeded its differential reach capability. <i>This element is only shown in detail mode.</i>
mdu-ploam-looc	Parameter type: <Alarm::ONTPLOAMLOOC> (yes no) Possible values: - yes : ont has been deactivated due to persistent OMCI MIC failure - no : ont is normal	ont has been deactivated due to persistent OMCI MIC failure. <i>This element is only shown in detail mode.</i>

103.112 ONT General Alarm Snapshot Status Command

Command Description

This command displays the ONT general alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-gen [ (index) ]
```

Command Parameters

Table 103.112-1 "ONT General Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.112-2 "ONT General Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status

name	Type	Description
ont-gen-omci-fail	Parameter type: <Alarm::ONTGENERALOMCICOMM> (yes no) Possible values: - yes : ont fails to respond to omci message requests - no : ont responds to omci message requests works properly	ont fails to respond to omci message requests <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-selftest	Parameter type: <Alarm::ONTGENERALEQPT> (yes no) Possible values: - yes : ont has failed a self test - no : ont self test works properly	ont has failed a self-test <i>This element is only shown in detail mode.</i>
ont-gen-ac-pwr-fail	Parameter type: <Alarm::ONTGENERALACFAIL> (yes no) Possible values: - yes : loss of external ac power to the ont - no : external ac power to the ont is ok	loss of external ac power to the ont <i>This element is only shown in detail mode.</i>
ont-gen-bat-missing	Parameter type: <Alarm::ONTGENERALBATTMIS> (yes no) Possible values: - yes : battery is provisioned for ont but is missing - no : battery is provisioned and present for ont	battery is provisioned for ont but is missing <i>This element is only shown in detail mode.</i>
ont-gen-bat-low	Parameter type: <Alarm::ONTGENERALBATTLOW> (yes no) Possible values: - yes : battery charge is low - no : battery charge is ok	battery charge is low <i>This element is only shown in detail mode.</i>
ont-gen-bat-fail	Parameter type: <Alarm::ONTGENERALBATTFAIL> (yes no) Possible values: - yes : battery is provisioned and present but cannot recharge - no : battery is provisioned and present and can recharge	battery is provisioned and present but cannot recharge <i>This element is only shown in detail mode.</i>
ont-gen-phys-intrusion	Parameter type: <Alarm::ONTGENERALINTRUDER> (yes no) Possible values: - yes : unauthorized access to ont and door or box is open - no : authorized access to ont	unauthorized access to ont <i>This element is only shown in detail mode.</i>
ont-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes no) Possible values: - yes : download of software to ont has failed - no : download of software to ont works properly	download of software to ont has failed <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
ont-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes no) Possible values: - yes : ont failed to activate the passive image designated by the olt - no : ont works properly to activate the passive image designated by the olt	ont failed to activate the passive image designated by the olt <i>This element is only shown in detail mode.</i>
ont-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
ont-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
ont-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
ont-gen-mdv-env1	Parameter type: <Alarm::ONTGENERALENV1> (yes no) Possible values: - yes : mdv environmental alarm1 - no : do not detect the mdv environmental alarm1	mdv environmental alarm1 <i>This element is only shown in detail mode.</i>
ont-gen-mdv-env2	Parameter type: <Alarm::ONTGENERALENV2> (yes	mdv environmental alarm2 <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : mdu environmental alarm2 - no : do not detect the mdu environmental alarm2	<i>detail mode.</i>
ont-gen-mdv-env3	Parameter type: <Alarm::ONTGENERALENV3> (yes no) Possible values: - yes : mdu environmental alarm3 - no : do not detect the mdu environmental alarm3	mdv environmental alarm3 <i>This element is only shown in detail mode.</i>
ont-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
ont-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	optical signal level is too high <i>This element is only shown in detail mode.</i>
ont-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
ont-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

103.113 SFU ONT General Alarm Snapshot Status Command

Command Description

This command displays the SFU ONT general alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot sfu-gen [ (index) ]
```

Command Parameters

Table 103.113-1 "SFU ONT General Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.113-2 "SFU ONT General Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
sfu-gen-omci-fail	Parameter type: <Alarm::ONTGENERALOMCICOMM> (yes no) Possible values: - yes : ont fails to respond to omci message requests - no : ont responds to omci message requests works properly	ont fails to respond to omci message requests <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-selftest	Parameter type: <Alarm::ONTGENERALEQPT> (yes no) Possible values: - yes : ont has failed a self test - no : ont self test works properly	ont has failed a self-test <i>This element is only shown in detail mode.</i>
sfu-gen-ac-pwr-fail	Parameter type: <Alarm::ONTGENERALACFAIL> (yes no) Possible values: - yes : loss of external ac power to the ont - no : external ac power to the ont is ok	loss of external ac power to the ont" <i>This element is only shown in detail mode.</i>
sfu-gen-bat-missing	Parameter type: <Alarm::ONTGENERALBATTMIS> (yes no) Possible values: - yes : battery is provisioned for ont but is missing - no : battery is provisioned and present for ont	battery is provisioned for ont but is missing <i>This element is only shown in detail mode.</i>
sfu-gen-bat-low	Parameter type: <Alarm::ONTGENERALBATTLLOW> (yes no) Possible values: - yes : battery charge is low - no : battery charge is ok	battery charge is low <i>This element is only shown in detail mode.</i>
sfu-gen-bat-fail	Parameter type: <Alarm::ONTGENERALBATTFAIL> (yes no) Possible values: - yes : battery is provisioned and present but cannot recharge - no : battery is provisioned and present and can recharge	battery is provisioned and present but cannot recharge <i>This element is only shown in detail mode.</i>
sfu-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes no) Possible values: - yes : download of software to ont has failed - no : download of software to ont works properly	download of software to ont has failed <i>This element is only shown in detail mode.</i>
sfu-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes no) Possible values: - yes : ont failed to activate the passive image designated by the olt	ont failed to activate the passive image designated by the olt <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- no : ont works properly to activate the passive image designated by the olt	
sfu-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
sfu-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
sfu-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
sfu-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
sfu-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	optical signal level is too high <i>This element is only shown in detail mode.</i>

name	Type	Description
sfu-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
sfu-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

103.114 SOHO ONT General Alarm Snapshot Status Command

Command Description

This command displays the SOHO ONT general alarm snapshot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot soho-gen [(index)]

Command Parameters

Table 103.114-1 "SOHO ONT General Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

mdu-gen-phys-intrusion	Parameter type: <Alarm::ONTGENERALINTRUDER> (yes no) Possible values: - yes : unauthorized access to ont and door or box is open - no : authorized access to ont	unauthorized access to ont <i>This element is only shown in detail mode.</i>
mdu-gen-sw-dnload-f	Parameter type: <Alarm::ONTGENERALSWDLFAIL> (yes no) Possible values: - yes : download of software to ont has failed - no : download of software to ont works properly	download of software to ont has failed <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
mdu-gen-sw-act-fail	Parameter type: <Alarm::ONTGENERALSWACTFAIL> (yes no) Possible values: - yes : ont failed to activate the passive image designated by the olt - no : ont works properly to activate the passive image designated by the olt	ont failed to activate the passive image designated by the olt <i>This element is only shown in detail mode.</i>
mdu-gen-sw-dnload-p	Parameter type: <Alarm::ONTGENERALSWDLIP> (yes no) Possible values: - yes : a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted - no : a condition meaning that a transfer of ont software from the olt to the ont is not ready	a condition meaning that a transfer of ont software from the olt to the ont is pending or is actually being transmitted <i>This element is only shown in detail mode.</i>
mdu-gen-eqpt-vers-mis	Parameter type: <Alarm::ONTGENERALEQVERMIS> (yes no) Possible values: - yes : a condition meaning the provisioned ont equipment part number does not match the version reported by the ont - no : a condition meaning that provisioned ont equipment part number matches the version reported by the ont	a condition meaning the provisioned ont equipment part number does not match the version reported by the ont <i>This element is only shown in detail mode.</i>
mdu-gen-sw-vers-mis	Parameter type: <Alarm::ONTGENERALSWVER> (yes no) Possible values: - yes : a condition meaning that the planned software version does not equal the active software version - no : a condition meaning that the planned software version equals the active software version	a condition meaning that the planned software version does not equal the active software version <i>This element is only shown in detail mode.</i>
mdu-gen-us-rate-mis	Parameter type: <Alarm::ONTGENERALUSRATE> (yes no) Possible values: - yes : a condition meaning that the planned upstream rate and the actual upstream rate do not match - no : a condition meaning that the planned upstream rate and the actual upstream rate match	a condition meaning that the planned upstream rate and the actual upstream rate do not match <i>This element is only shown in detail mode.</i>
mdu-gen-eqpt-prov-sa	Parameter type: <Alarm::ONTGENERALONTMEA> (yes no) Possible values: - yes : mismatch between ont equipment and ont provisioning attributes - no : match between ont equipment and ont provisioning attributes	mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>
mdu-gen-mdu-env1	Parameter type: <Alarm::ONTGENERALENV1> (yes no) Possible values: - yes : mdu environmental alarm1 - no : do not detect the mdu environmental alarm1	mdu environmental alarm1 <i>This element is only shown in detail mode.</i>
mdu-gen-mdu-env2	Parameter type: <Alarm::ONTGENERALENV2> (yes	mdu environmental alarm2 <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : mdu environmental alarm2 - no : do not detect the mdu environmental alarm2	<i>detail mode.</i>
mdu-gen-mdv-env3	Parameter type: <Alarm::ONTGENERALENV3> (yes no) Possible values: - yes : mdu environmental alarm3 - no : do not detect the mdu environmental alarm3	mdv environmental alarm3 <i>This element is only shown in detail mode.</i>
mdv-gen-nw-time-err	Parameter type: <Alarm::ONTGENERALNTPERR> (yes no) Possible values: - yes : a condition meaning the ont is unable to establish timing from the ntp server(s) - no : a condition meaning the ont is able to establish timing from the ntp server(s)	a condition meaning the ont is unable to establish timing from the ntp server(s) <i>This element is only shown in detail mode.</i>
mdv-gen-opt-sig-high	Parameter type: <Alarm::ONTGENERALLEVELHI> (yes no) Possible values: - yes : optical signal level is too high - no : optical signal level is normal	optical signal level is too high <i>This element is only shown in detail mode.</i>
mdv-gen-opt-sig-low	Parameter type: <Alarm::ONTGENERALLEVELLO> (yes no) Possible values: - yes : optical signal level is too low - no : optical signal level is normal	Optical signal level is too low <i>This element is only shown in detail mode.</i>
mdv-gen-eqpt-prov-nsa	Parameter type: <Alarm::ONTGENERALONTNSAMEA> (yes no) Possible values: - yes : non service affects mismatch between ont equipment and ont provisioning attributes - no : ont is provisioned properly	non service affects mismatch between ont equipment and ont provisioning attributes <i>This element is only shown in detail mode.</i>

103.116 Alarm SnapShot ONT SUBSCRIBER CARD Status Command

Command Description

This command displays the snapshot ONT SUBSCRIBER CARD alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-card [(index)]

Command Parameters

Table 103.116-1 " Alarm SnapShot ONT SUBSCRIBER CARD Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.116-2 " Alarm SnapShot ONT SUBSCRIBER CARD Status Command" Display parameters

Specific Information		
name	Type	Description
ont-card	Parameter type: <Gpon::OntSlotAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14]	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-sbscr-lim-missing	Parameter type: <Alarm::ONTCARDLIMMISSING> (yes no) Possible values: - yes : provisioned ont card missing - no : provisioned ont card works properly	provisioned ont card missing <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-type-mis	Parameter type: <Alarm::ONTCARDLIMMEA> (yes no) Possible values: - yes : plug-in ont card is wrong type - no : ont card works properly	plug-in ont card is wrong type <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-removal	Parameter type: <Alarm::ONTCARDLIMIMPROPRMVL> (yes no) Possible values: - yes : ont card removed without being deprovisioned - no : ont card removed correctly	ont card removed without being deprovisioned <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-fail	Parameter type: <Alarm::ONTCARDLIMFAIL> (yes no) Possible values: - yes : ont card failed detected or failed self test - no : ont card works properly	ont card failed detected or failed self test <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-svc-mis	Parameter type: <Alarm::ONTCARDLIMSVCNIS> (yes no) Possible values: - yes : ont did not accept the omci configuration requests for the provisioned onu card - no : ont card works properly	ont did not accept the omci configuration requests for the provisioned onu card <i>This element is only shown in detail mode.</i>
ont-sbscr-lim-port-mis	Parameter type: <Alarm::ONTCARDLIMNUMPORTSMIS> (yes no) Possible values: - yes : the actual number of ports of a plug-in ont card is different from the planned number of ports - no : the actual number of ports of a plug-in ont card is the same to the planned number of ports	the actual number of ports of a plug-in ont card is different from the planned number of ports <i>This element is only shown in detail mode.</i>

103.117 Alarm SnapShot ONT SERVICES POTS Status Command

Command Description

This command displays the snapshot ONT SERVICES POTS alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-pots [(index)]

Command Parameters

Table 103.117-1 " Alarm SnapShot ONT SERVICES POTS Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.117-2 " Alarm SnapShot ONT SERVICES POTS Status Command" Display parameters

Specific Information		
name	Type	Description
ont-pots	Parameter type: <Gpon::OntPotsAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	gpon ont pots port index <i>This element is only shown in detail mode.</i>

name	Type	Description
	Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-pots-svc-mis	Parameter type: <Alarm::ONTPOTSSVCMIS> (yes no) Possible values: - yes : ont service mismatch for provisioned pots - no : ont service pots works properly	ont service mismatch for provisioned pots <i>This element is only shown in detail mode.</i>
ont-svc-pots-rtcp-lost	Parameter type: <Alarm::ONTPOTSRTCPSTREAMLOSS> (yes no) Possible values: - yes : pots realtime transport control protocol stream lost - no : ont service pots works properly	pots realtime transport control protocol stream lost <i>This element is only shown in detail mode.</i>
ont-svc-pots-icnf-sub	Parameter type: <Alarm::ONTPOTSICONFIGSUBFAIL> (yes no) Possible values: - yes : iconfig subscription of the pots line failed - no : ont service pots works properly	pots line iconfig subscription failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-icnf-ntfy	Parameter type: <Alarm::ONTPOTSICONFIGNOTIFYFAIL> (yes no) Possible values: - yes : iconfig notify failed for a pots line - no : ont service pots works properly	pots line iconfig notify failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-icnf-http	Parameter type: <Alarm::ONTPOTSICONFIGHTTPFAIL> (yes no) Possible values: - yes : iconfig http redirect failed for a pots line - no : ont service pots works properly	pots line iconfig http failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-sip-reg	Parameter type: <Alarm::ONTPOTSSIPREGFAIL> (yes no) Possible values: - yes : sip registration failed for the pots line - no : ont service pots works properly	pots line sip registration failure <i>This element is only shown in detail mode.</i>
ont-svc-pots-sip-inv	Parameter type: <Alarm::ONTPOTSSIPINVITEFAIL> (yes	pots line sip invite request failure <i>This element is only shown in</i>

ont-svc-pots-http-err	Parameter type: <Alarm::ONTPOTSICNFHTTPERR> (yes no) Possible values: - yes : iconfig doc retrieval failed because of response error - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-http-mal	Parameter type: <Alarm::ONTPOTSICNFHTTPMAL> (yes no) Possible values: - yes : iconfig doc retrieval failed because of a malformed message - no : ont service pots works properly	iconfig doc retrieval failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-insuff	Parameter type: <Alarm::ONTPOTSINSUFF> (yes no) Possible values: - yes : iconfig service failed because of insufficient data - no : ont VOIP service pots works properly	iconfig VOIP service failed <i>This element is only shown in detail mode.</i>
ont-svc-pots-poos	Parameter type: <Alarm::ONTPOTSPOOS> (yes no) Possible values: - yes : pots ports out of service - no : pots ports work properly	pots ports out of service <i>This element is only shown in detail mode.</i>

103.118 Alarm SnapShot ONT SERVICES LAN

Status Command

Command Description

This command displays the snapshot ONT SERVICES LAN alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-lan [ (index) ]
```

Command Parameters

Table 103.118-1 " Alarm SnapShot ONT SERVICES LAN Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.118-2 " Alarm SnapShot ONT SERVICES LAN Status Command" Display parameters

Specific Information		
name	Type	Description
ont-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	gpon ont port <i>This element is only shown in detail mode.</i>

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-lan-mismatch	Parameter type: <Alarm::ONTLANSVCMIS> (yes no) Possible values: - yes : the ont did not accept the omci configuration requests for the lan service - no : ont service lan works properly	ont service mismatch for lan <i>This element is only shown in detail mode.</i>
ont-svc-lan-loss-sig	Parameter type: <Alarm::ONTLANLOS> (yes no) Possible values: - yes : loss of signal on an ethernet port interface - no : ont service lan works properly	loss of signal on an ethernet port interface <i>This element is only shown in detail mode.</i>
ont-svc-enet-poos	Parameter type: <Alarm::ONTENETPOOS> (yes no) Possible values: - yes : ethernet ports out of service - no : ethernet ports work properly	ethernet ports out of service <i>This element is only shown in detail mode.</i>

103.119 ONT TCA Alarm Log Status Command

Command Description

This command displays the ONT TCA alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-tca [(index)]

Command Parameters

Table 103.119-1 "ONT TCA Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 103.119-2 "ONT TCA Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103.124 Alarm SnapShot OLT Channel Pair Utilization TCA Status Command

Command Description

This command displays the snapshot channel-pair utilization TCA alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot olt-chpr-util-tca [ (index) ]
```

Command Parameters

Specific Information		
name	Type	Description
channel-pair	Parameter type: <Gpon::ChannelPairId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel-pair ifindex <i>This element is only shown in detail mode.</i>
Only Show Details: alarm snap-shot status		
name	Type	Description
chpr-t-txmcutilhi	Parameter type: <Alarm::TXMCUTILHI>	channel-pair utilization tx

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : tx mcast utilization high tca - no : olt works properly	(downstream) multicast high threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txmcutilmd	Parameter type: <Alarm::TXMCUTILMD> (yes no) Possible values: - yes : tx mcast utilization medium tca - no : olt works properly	channel-pair utilization tx (downstream) multicast medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txmcutillo	Parameter type: <Alarm::TXMCUTILLO> (yes no) Possible values: - yes : tx mcast utilization low tca - no : olt works properly	channel-pair utilization tx (downstream) multicast low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txtotutilhi	Parameter type: <Alarm::TXTOTUTILHI> (yes no) Possible values: - yes : tx total utilization high tca - no : olt works properly	channel-pair utilization tx (downstream) total high threshold crossed <i>This element is only shown in detail mode.</i>
otutilmd	Parameter type: <Alarm::TXTOTUTILMD> (yes no) Possible values: - yes : tx total utilization medium tca - no : olt works properly	channel-pair utilization tx (downstream) total medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txtotutillo	Parameter type: <Alarm::TXTOTUTILLO> (yes no) Possible values: - yes : tx total utilization low tca - no : olt works properly	channel-pair utilization tx (downstream) total low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-rxtotutilhi	Parameter type: <Alarm::RXTOTUTILHI> (yes no) Possible values: - yes : rx total utilization high tca - no : olt works properly	channel-pair utilization rx (upstream) total high threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-rxtotutilmd	Parameter type: <Alarm::RXTOTUTILMD> (yes no) Possible values: - yes : rx total utilization medium tca - no : olt works properly	channel-pair utilization rx (upstream) total medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-rxtotutillo	Parameter type: <Alarm::RXTOTUTILLO> (yes no) Possible values: - yes : rx total utilization low tca - no : olt works properly	channel-pair utilization rx (upstream) total low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-dbacongperiodhi	Parameter type: <Alarm::DBACONGPERIODHI> (yes no) Possible values:	channel-pair utilization rx (upstream) dbacongperiod high threshold crossed <i>This element is only shown in</i>

name	Type	Description
	- yes : rx dba congestion period high tca - no : olt works properly	<i>detail mode.</i>
chpr-t-dbacongperiodmd	Parameter type: <Alarm::DBACONGPERIODMD> (yes no) Possible values: - yes : rx dba congestion period medium tca - no : olt works properly	channel-pair utilization rx (upstream) dbacongperiod medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-dbacongperiodlo	Parameter type: <Alarm::DBACONGPERIODLO> (yes no) Possible values: - yes : rx dba congestion period low tca - no : olt works properly	channel-pair utilization rx (upstream) dbacongperiod low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txucdropfrmhi	Parameter type: <Alarm::TXUCDROPFRMHI> (yes no) Possible values: - yes : tx unicast dropped packet high tca - no : olt works properly	channel-pair utilization tx (downstream) unicast drop frame high threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txucdropfrmmd	Parameter type: <Alarm::TXUCDROPFRMMD> (yes no) Possible values: - yes : tx unicast dropped packet medium tca - no : olt works properly	channel-pair utilization tx (downstream) unicast drop frame medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txucdropfrmlo	Parameter type: <Alarm::TXUCDROPFRMLO> (yes no) Possible values: - yes : tx unicast dropped packet low tca - no : olt works properly	channel-pair utilization tx (downstream) unicast drop frame low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txmcdropfrmhi	Parameter type: <Alarm::TXMCDROPFRMHI> (yes no) Possible values: - yes : tx multicast dropped packet high tca - no : olt works properly	channel-pair utilization tx (downstream) multicast drop frame high threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txmcdropfrmmd	Parameter type: <Alarm::TXMCDROPFRMMD> (yes no) Possible values: - yes : tx multicast dropped packet medium tca - no : olt works properly	channel-pair utilization tx (downstream) multicast drop frame medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txmcdropfrmlo	Parameter type: <Alarm::TXMCDROPFRMLO> (yes no) Possible values: - yes : tx multicast dropped packet low tca - no : olt works properly	channel-pair utilization tx (downstream) multicast drop frame low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txbcdropfrmhi	Parameter type: <Alarm::TXBCDROPFRMHI> (yes no) Possible values: - yes : tx broadcast dropped packet high tca - no : olt works properly	channel-pair utilization tx (downstream) broadcast drop frame high threshold crossed <i>This element is only shown in detail mode.</i>
chprt-txbcdropfrmmd	Parameter type: <Alarm::TXBCDROPFRMMD>	channel-pair utilization tx

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : tx broadcast dropped packet medium tca - no : olt works properly	(downstream) broadcast drop frame medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-txbcdropfrmlo	Parameter type: <Alarm::TXBCDROPPFRMLO> (yes no) Possible values: - yes : tx broadcast dropped packet low tca - no : olt works properly	channel-pair utilization tx (downstream) broadcast drop frame low threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-rxtotdropfrmhi	Parameter type: <Alarm::RXTOTDROPPFRMHI> (yes no) Possible values: - yes : rx total dropped packet high tca - no : olt works properly	channel-pair utilization rx (upstream) total drop frame high threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-rxtotdropfrmmd	Parameter type: <Alarm::RXTOTDROPPFRMMD> (yes no) Possible values: - yes : rx total dropped packet medium tca - no : olt works properly	channel-pair utilization rx (upstream) total drop frame medium threshold crossed <i>This element is only shown in detail mode.</i>
chpr-t-rxtotdropfrmlo	Parameter type: <Alarm::RXTOTDROPPFRMLO> (yes no) Possible values: - yes : rx total dropped packet low tca - no : olt works properly	channel-pair utilization rx (upstream) total drop frame low threshold crossed <i>This element is only shown in detail mode.</i>

103.125 Alarm SnapShot OLT ONT TC TCA Status Command

Command Description

This command displays the snapshot OLT ONT TC TCA alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot olt-ont-tc-tca [(index)]

Command Parameters

Table 103.125-1 " Alarm SnapShot OLT ONT TC TCA Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.125-2 " Alarm SnapShot OLT ONT TC TCA Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: alarm snap-shot status		
name	Type	Description
olt-ont-tc-err-frag-tc	Parameter <Alarm::OLTONTTCTCAERRFRAGSONT> (yes no) Possible values: - yes : ont errored fragments threshold crossed - no : olt works properly	type: ont errored fragments threshold crossed <i>This element is only shown in detail mode.</i>

103.126 Alarm SnapShot ONT POTS SUPPLEMENTAL Status Command

Command Description

This command displays the snapshot ONT POTS SUPPLEMENTAL alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-pots-supplemental [ (index) ]
```

Command Parameters

Table 103.126-1 " Alarm SnapShot ONT POTS SUPPLEMENTAL Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.126-2 " Alarm SnapShot ONT POTS SUPPLEMENTAL Status Command" Display parameters

Specific Information		
name	Type	Description
ont-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	gpon ont port <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-sip-reg-dns	Parameter type: <Alarm::ONTSERVICESPOTSSIPREGDNS> (yes no) Possible values: - yes : sip registration failed because the domain name could not be resolved - no : sip registration succeeds	ont services pots sip registration failed (resolving domain name) <i>This element is only shown in detail mode.</i>
ont-sip-reg-fail	Parameter type: <Alarm::ONTSERVICESPOTSSIPREGAUTH> (yes no) Possible values: - yes : sip registration failed because authentication failed - no : sip registration succeeds	ont services pots sip registration authentication failed <i>This element is only shown in detail mode.</i>
ont-sip-reg-timeout	Parameter type: <Alarm::ONTSERVICESPOTSSIPREGTO> (yes no) Possible values: - yes : sip registration failed because all attempted retransmissions timed out - no : sip registration succeeds	ont services pots sip registration timeout <i>This element is only shown in detail mode.</i>
ont-sip-reg-err-resps	Parameter type: <Alarm::ONTSERVICESPOTSSIPREGERR> (yes no) Possible values: - yes : sip registration failed because error response from the registration server - no : sip registration succeeds	ont services pots sip registration response error <i>This element is only shown in detail mode.</i>
ont-sip-inv-dns	Parameter type: <Alarm::ONTSERVICESPOTSSIPINVDNS> (yes no) Possible values: - yes : sip invite failed because the domain name could not be resolved - no : sip invite succeeds	ont services pots sip invite failed (resolving domain name) <i>This element is only shown in detail mode.</i>

name	Type	Description
ont-sip-inv-auth	Parameter type: <Alarm::ONTSERVICESPOTSSIPINVAUTH> (yes no) Possible values: - yes : sip invite failed because authentication failed - no : sip invite succeeds	ont services pots sip invite authentication failed <i>This element is only shown in detail mode.</i>
ont-sip-inv-timeout	Parameter type: <Alarm::ONTSERVICESPOTSSIPINVTO> (yes no) Possible values: - yes : sip invite failed because all attempted retransmissions timed out - no : sip invite succeeds	ont services pots sip invite timeout <i>This element is only shown in detail mode.</i>
ont-sip-inv-err	Parameter type: <Alarm::ONTSERVICESPOTSSIPINVERR> (yes no) Possible values: - yes : sip invite failed because error response from the registration server - no : sip invite succeeds	ont services pots sip invite response error <i>This element is only shown in detail mode.</i>
ont-svc-pots-subs-refr	Parameter type: <Alarm::ONTSERVICESPOTSSUBSREFR> (yes no) Possible values: - yes : pots iconfig subscription could not be refreshed - no : pots iconfig subscription refreshed	ont services pots iconfig subscription could not be refreshed <i>This element is only shown in detail mode.</i>
ont-svc-pots-not-refr	Parameter type: <Alarm::ONTSERVICESPOTSNOTREFR> (yes no) Possible values: - yes : pots iconfig notify response for refresh subscribe failed - no : pots iconfig notify response for refresh subscribe succeeds	ont services pots iconfig notification could not be refreshed <i>This element is only shown in detail mode.</i>
ont-svc-pots-icfg-err	Parameter type: <Alarm::ONTSERVICESPOTSICFGERR> (yes no) Possible values: - yes : pots service failed due to an unmapped iconfig error - no : pots service works properly	ont services pots service failed due to an unmapped iconfig error <i>This element is only shown in detail mode.</i>

103.127 Alarm SnapShot ONT VEIP Status Command

Command Description

This command displays the snapshot ONT VEIP alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-veip [(index)]

Command Parameters

Table 103.127-1 " Alarm SnapShot ONT VEIP Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.127-2 " Alarm SnapShot ONT VEIP Status Command" Display parameters

Specific Information		
name	Type	Description
ont-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	gpon ont port <i>This element is only shown in detail mode.</i>

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: alarm snap-shot status

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-ip-host-mismatch	Parameter type: <Alarm::ONTIPHOS TMIS> (yes no) Possible values: - yes : ont ip host mismatch - no : ont ip host match	ont ip host mismatch <i>This element is only shown in detail mode.</i>
ont-ip-host-ip-alloc	Parameter type: <Alarm::ONTIPHOS TFAIL> (yes no) Possible values: - yes : ont ip host IP allocation failure - no : ont ip host IP allocation works properly	ont ip host IP allocation failure <i>This element is only shown in detail mode.</i>

103.129 Alarm Table Snapshot Status Command

Command Description

This command displays the alarm-table snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot alarm-table [(index)]

Command Parameters

Table 103.129-1 "Alarm Table Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.129-2 "Alarm Table Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
alarm-tbl-overflow	Parameter type: <Alarm::AlrmTblOflow> (overflow no-overflow) Possible values: - overflow : alarm table overflow - no-overflow : no alarm table overflow	identify if the alarm table has overflowed <i>This element is only shown in detail mode.</i>

103.130 Alarm SnapShot ONT VIDEO Status Command

Command Description

This command displays the snapshot ONT VIDEO alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-video [(index)]

Command Parameters

Table 103.130-1 " Alarm SnapShot ONT VIDEO Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.130-2 " Alarm SnapShot ONT VIDEO Status Command" Display parameters

Specific Information		
name	Type	Description
video-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	video port <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	
Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-video-conf-mis	Parameter type: <Alarm::ONTVIDEOUNISVCMIS> (yes no) Possible values: - yes : config request failure for video service - no : ont service is ok	config request failure for video service <i>This element is only shown in detail mode.</i>
ont-svc-video-pw-high	Parameter type: <Alarm::ONTRFOUTHIGH> (yes no) Possible values: - yes : high power level for rf video signal - no : ont service is ok	high power level for rf video signal <i>This element is only shown in detail mode.</i>
ont-svc-video-pw-low	Parameter type: <Alarm::ONTRFOUTLOW> (yes no) Possible values: - yes : low power level for rf video signal - no : ont service is ok	low power level for rf video signal <i>This element is only shown in detail mode.</i>

103.131 Alarm SnapShot ONT CES Status Command

Command Description

This command displays the snapshot ONT CES alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-ces [ (index) ]
```

Command Parameters

Table 103.131-1 " Alarm SnapShot ONT CES Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.131-2 " Alarm SnapShot ONT CES Status Command" Display parameters

Specific Information		
name	Type	Description
cesds1-port	Parameter type: <Gpon::IfIndexAlarmIndex2> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	ces port <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-ces-ds1-mis	Parameter type: <Alarm::ONTCESDS1SVCNIS> (yes no) Possible values: - yes : ont service mismatch for provisioned ces ds1 - no : ont service is ok	ont service mismatch for provisioned ces ds1 <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-los	Parameter type: <Alarm::ONTCESDS1LOS> (yes no) Possible values: - yes : loss of signal at ds1 interface - no : ont service is ok	loss of signal at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-lof	Parameter type: <Alarm::ONTCESDS1LOF> (yes no) Possible values: - yes : loss of frame at ds1 interface - no : ont service is ok	loss of frame at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-rair	Parameter type: <Alarm::ONTCESDS1RAIR> (yes no) Possible values: - yes : receiving rai at ds1 interface - no : ont service is ok	receiving rai at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-ais	Parameter type: <Alarm::ONTCESDS1AISR> (yes no) Possible values: - yes : receiving ais at ds1 interface - no : ont service is ok	receiving ais at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-lnlpbk	Parameter type: <Alarm::ONTCESDS1LNLBPBK> (yes no) Possible values: - yes : receiving line loopback at ds1 interface - no : ont service is ok	receiving line loopback at ds1 interface <i>This element is only shown in detail mode.</i>
ont-svc-ces-ds1-tmlpbk	Parameter type: <Alarm::ONTCESDS1TMLPBK> (yes no) Possible values: - yes : receiving terminal loopback at ds1 interface	receiving terminal loopback at ds1 interface <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- no : ont service is ok	

103.132 Alarm SnapShot ONT VOIP Status Command

Command Description

This command displays the snapshot ONT VOIP alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-voip [(index)]

Command Parameters

Table 103.132-1 " Alarm SnapShot ONT VOIP Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.132-2 " Alarm SnapShot ONT VOIP Status Command" Display parameters

Specific Information		
name	Type	Description
voip-uni	Parameter type: <Gpon::VoipOntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / 1 ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / 1) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId>	voip uni ifindex <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the ONT identifier Possible values: - 1 : Gpon voip Port Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port	
client-number	Parameter type: <Gpon::AlarmIndex2Integer> - a signed integer	service client number <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-voip-cnf-file	Parameter type: <Alarm::ONTVOICONFIGFLERR> (yes no) Possible values: - yes : voice configuration file error - no : ont service is ok	voice configuration file error <i>This element is only shown in detail mode.</i>
ont-svc-voip-svc-mis	Parameter type: <Alarm::ONTVOICLISERMIS> (yes no) Possible values: - yes : service mismatch for provisioned client service - no : ont service is ok	service mismatch for provisioned client service <i>This element is only shown in detail mode.</i>
ont-svc-voip-gw-comm	Parameter type: <Alarm::ONTVOIGATWCOMFAIL> (yes no) Possible values: - yes : voice gateway communication failure - no : ont service is ok	voice gateway communication failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-fail	Parameter type: <Alarm::ONTVOIDHCPSEFAIL> (yes no) Possible values: - yes : voice gateway communication failure - no : ont service is ok	voice dhcp server failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-icnf-sub	Parameter type: <Alarm::ONTVOIICONSUBFAIL> (yes no) Possible values: - yes : voice iconfig subscription failure - no : ont service is ok	voice iconfig subscription failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-icnf-ntfy	Parameter type: <Alarm::ONTVOIICONNOTFAIL> (yes no) Possible values: - yes : voice iconfig notify failure - no : ont service is ok	voice iconfig notify failure <i>This element is only shown in detail mode.</i>
ont-svc-voip-icnf-http	Parameter type: <Alarm::ONTVOIICONHTTPFAIL> (yes no) Possible values: - yes : voice iconfig http failure	voice iconfig http failure <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- no : ont service is ok	
ont-svc-voip-dhcp-to	Parameter type: <Alarm::ONTVOIDHCPTO> (yes no) Possible values: - yes : DHCP server retransmissions timed out - no : ont service is ok	DHCP server retransmissions timed out <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-mal	Parameter type: <Alarm::ONTVOIDHCPMAL> (yes no) Possible values: - yes : DHCP response was malformed - no : ont service is ok	DHCP response was malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-noad	Parameter type: <Alarm::ONTVOIDHCPNOAD> (yes no) Possible values: - yes : DHCP server failed to issue the required parameters - no : ont service is ok	DHCP server failed to issue the required parameters <i>This element is only shown in detail mode.</i>
ont-svc-voip-dhcp-leas	Parameter type: <Alarm::ONTVOIDHCPLEAS> (yes no) Possible values: - yes : DHCP Server failure due to problem in lease renewal - no : ont service is ok	DHCP Server failure due to problem in lease renewal <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-dns	Parameter type: <Alarm::ONTVOIICONDNS> (yes no) Possible values: - yes : iConfig Subscription failure due to DNS problem - no : ont service is ok	iConfig Subscription failure due to DNS problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-tcp	Parameter type: <Alarm::ONTVOIICONTCP> (yes no) Possible values: - yes : iConfig Subscription failure due to TCP socket problem - no : ont service is ok	iConfig Subscription failure due to TCP socket problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-tls	Parameter type: <Alarm::ONTVOIICONTLS> (yes no) Possible values: - yes : iConfig Subscription failure due to TLS session problem - no : ont service is ok	iConfig Subscription failure due to TLS session problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-auth	Parameter type: <Alarm::ONTVOIICONAUTH> (yes no) Possible values: - yes : iConfig Subscription failure due to authentication error - no : ont service is ok	iConfig Subscription failure due to authentication error <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscription-to	Parameter type: <Alarm::ONTVOIICONSUBSTO> (yes no) Possible values: - yes : iConfig Subscription failure due to retransmission timeout - no : ont service is ok	iConfig Subscription failure due to retransmission timeout <i>This element is only shown in detail mode.</i>

name	Type	Description
	timeout - no : ont service is ok	
ont-svc-voip-sub-err	Parameter type: <Alarm::ONTVOIICONSUBERR> (yes no) Possible values: - yes : iConfig Subscription failure due to response error - no : ont service is ok	iConfig Subscription failure due to response error <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-to	Parameter type: <Alarm::ONTVOIICONNOTTO> (yes no) Possible values: - yes : iConfig Notify response timeout for new subscription - no : ont service is ok	iConfig Notify response is malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-notref-to	Parameter type: <Alarm::ONTVOIICONNOTREFTO> (yes no) Possible values: - yes : iConfig Notify response timeout for subscription refresh - no : ont service is ok	iConfig Notify response timeout for subscription refresh <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-mal	Parameter type: <Alarm::ONTVOIICONNOTMAL> (yes no) Possible values: - yes : iConfig Notify response is malformed - no : ont service is ok	iConfig Notify response is malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-rej	Parameter type: <Alarm::ONTVOIICONNOTREJ> (yes no) Possible values: - yes : iConfig subscription request rejected by configuration server - no : ont service is ok	iConfig subscription request rejected by configuration server <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-dns	Parameter type: <Alarm::ONTVOIHTTPDNS> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to DNS problem - no : ont service is ok	VOIP client can't retrieve config doc due to DNS problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-tcp	Parameter type: <Alarm::ONTVOIHTTPTCP> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to TCP socket problem - no : ont service is ok	VOIP client can't retrieve config doc due to TCP socket problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-tls	Parameter type: <Alarm::ONTVOIHTTPTLS> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to TLS session problem - no : ont service is ok	VOIP client can't retrieve config doc due to TLS session problem <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-auth	Parameter type: <Alarm::ONTVOIHTTPAUTH> (yes	VOIP client can't retrieve config doc due to auth error

name	Type	Description
	no) Possible values: - yes : VOIP client can't retrieve config doc due to auth error - no : ont service is ok	<i>This element is only shown in detail mode.</i>
ont-svc-voip-http-to	Parameter type: <Alarm::ONTVOIHTTPTO> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to re-tx timeout - no : ont service is ok	VOIP client can't retrieve config doc due to re-tx timeout <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-err	Parameter type: <Alarm::ONTVOIHTTPErr> (yes no) Possible values: - yes : VOIP client can't retrieve config doc due to response error - no : ont service is ok	VOIP client can't retrieve config doc due to response error <i>This element is only shown in detail mode.</i>
ont-svc-voip-http-mal	Parameter type: <Alarm::ONTVOIICONHTTPMAL> (yes no) Possible values: - yes : iConfig configuration document is malformed - no : ont service is ok	iConfig configuration document is malformed <i>This element is only shown in detail mode.</i>
ont-svc-voip-subscr-refer	Parameter type: <Alarm::ONTVOIICONSUBSREFER> (yes no) Possible values: - yes : iConfig Subscription refresh error - no : ont service is ok	iConfig Subscription refresh error <i>This element is only shown in detail mode.</i>
ont-svc-voip-not-refer	Parameter type: <Alarm::ONTVOIICONNOTREFER> (yes no) Possible values: - yes : iConfig Notify response for refresh subscribe failed - no : ont service is ok	iConfig Notify response for refresh subscribe failed <i>This element is only shown in detail mode.</i>
ont-svc-voip-icfg-err	Parameter type: <Alarm::ONTVOIICONERR> (yes no) Possible values: - yes : iConfig Configuration Error - no : ont service is ok	iConfig Configuration Error <i>This element is only shown in detail mode.</i>

103.133 Alarm SnapShot ONT VIDEO ANI Status Command

Command Description

This command displays the snapshot ONT VIDEO ANI alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-video-ani [(index)]

Command Parameters

Table 103.133-1 " Alarm SnapShot ONT VIDEO ANI Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.133-2 " Alarm SnapShot ONT VIDEO ANI Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
vedio-ani-index	Parameter type: <Gpon::AlarmIndex2Integer> - a signed integer	vedio ani index <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-v-ani-conf-mis	Parameter type: <Alarm::ONTVIDEOANISVCMIS> (yes no) Possible values: - yes : config request failure for video ani service - no : ont service is ok	config request failure for video ani service <i>This element is only shown in detail mode.</i>
ont-svc-v-ani-loss-sig	Parameter type: <Alarm::ONTVIDEOLOS> (yes no) Possible values: - yes : video loss of signal on ani - no : ont service is ok	video loss of signal on ani <i>This element is only shown in detail mode.</i>
ont-svc-v-ani-lv-high	Parameter <Alarm::ONTVIDEOOPTSIGLEVELHIGH> (yes no) Possible values: - yes : high video optical signal level - no : ont service is ok	type: high video optical signal level <i>This element is only shown in detail mode.</i>
ont-svc-v-ani-lv-low	Parameter <Alarm::ONTVIDEOOPTSIGLEVELLOW> (yes no) Possible values: - yes : low video optical signal level - no : ont service is ok	type: low video optical signal level <i>This element is only shown in detail mode.</i>

103.134 Alarm SnapShot ONT PWE Status Command

Command Description

This command displays the snapshot ONT PWE alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-pwe [ (index) ]
```

Command Parameters

Table 103.134-1 " Alarm SnapShot ONT PWE Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.134-2 " Alarm SnapShot ONT PWE Status Command" Display parameters

Specific Information		
name	Type	Description
ont-ces-uni	Parameter type: <Ces::InterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier	ont ces uni <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::OntPortId> - the ONT PORT identifier	
service-id	Parameter type: <Gpon::AlarmIndex2Integer> - a signed integer	service id <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
ont-svc-pwe-mismatch	Parameter type: <Alarm::ONTPWESVCMIS> (yes no) Possible values: - yes : service mismatch for provisioned pseudowire - no : ont service is ok	service mismatch for provisioned pseudowire <i>This element is only shown in detail mode.</i>
ont-svc-pwe-reordr-lof	Parameter type: <Alarm::ONTPWELOSSREORDER> (yes no) Possible values: - yes : pseudowire reordering and loss of frame - no : ont service is ok	pseudowire reordering and loss of frame <i>This element is only shown in detail mode.</i>
ont-svc-pwe-jitt-buf-o	Parameter type: <Alarm::ONTPWEJBOVRRUN> (yes no) Possible values: - yes : pseudowire jitter buffer overrun - no : ont service is ok	pseudowire jitter buffer overrun <i>This element is only shown in detail mode.</i>
ont-svc-pwe-jitt-buf-u	Parameter type: <Alarm::ONTPWEJBUNDRUN> (yes no) Possible values: - yes : pseudowire jitter buffer underrun - no : ont service is ok	pseudowire jitter buffer underrun <i>This element is only shown in detail mode.</i>
ont-svc-pwe-malf-frms	Parameter type: <Alarm::ONTPWEMALFORM> (yes no) Possible values: - yes : pseudowire malformed frames - no : ont service is ok	pseudowire malformed frames <i>This element is only shown in detail mode.</i>
ont-svc-pwe-late-frms	Parameter type: <Alarm::ONTPWELATEFRMS> (yes no) Possible values: - yes : pseudowire late frames - no : ont service is ok	pseudowire late frames <i>This element is only shown in detail mode.</i>
ont-svc-pwe-link-loss	Parameter type: <Alarm::ONTPWELINKLOSS> (yes no) Possible values: - yes : pseudowire link loss - no : ont service is ok	pseudowire link loss <i>This element is only shown in detail mode.</i>
ont-svc-pwe-arp-fail	Parameter type: <Alarm::ONTPWEARPFAIL> (yes no) Possible values: - yes : pseudowire arp failure - no : ont service is ok	pseudowire arp failure <i>This element is only shown in detail mode.</i>

103.135 Alarm SnapShot ONT CESE1 Status Command

Command Description

This command displays the snapshot ONT CESE1 alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ont-cese1 [(index)]

Command Parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
auto-switch-status	Parameter type: <Alarm::autoSwitchStatus> (yes no) Possible values: - yes : auto-switch alarm status	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- no : auto-switch alarm status clear	
queue-full-atm	Parameter type: <Alarm::auswqueuefullatm> (yes no) Possible values: - yes : auto-switch queue full for ATM - no : auto-switch queue full for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
cfg-data-bkup-fail-atm	Parameter type: <Alarm::auswbkpfailatm> (yes no) Possible values: - yes : auto-switch data backup failed for ATM - no : auto-switch data backup failed for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
recfg-fail-atm	Parameter type: <Alarm::auswrecfgfailatm> (yes no) Possible values: - yes : auto-switch reconfig failed for ATM - no : auto-switch reconfig failed for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
data-unavail-atm	Parameter type: <Alarm::auswdataunatm> (yes no) Possible values: - yes : auto-switch data unavailable for ATM - no : auto-switch data unavailable for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
queue-full-ptm	Parameter type: <Alarm::auswqueuefulptm> (yes no) Possible values: - yes : auto-switch queue full for PTM - no : auto-switch queue full for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
backup-fail-ptm	Parameter type: <Alarm::auswbkpfailptm> (yes no) Possible values: - yes : auto-switch data backup failed for PTM - no : auto-switch data backup failed for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
recfg-fail-ptm	Parameter type: <Alarm::auswrecfgfailptm> (yes no) Possible values: - yes : auto-switch reconfig failed for PTM - no : auto-switch reconfig failed for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
data-unavail-ptm	Parameter type: <Alarm::auswdataunptm> (yes no) Possible values: - yes : auto-switch data unavailable for PTM - no : auto-switch data unavailable for PTM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>
bakp-fail-atm	Parameter type: <Alarm::auswbakpfailatm> (yes no) Possible values: - yes : auto-switch backup fail for ATM - no : auto-switch bakcup fail for ATM clear	show auto-switch alarm status. <i>This element is only shown in detail mode.</i>

103.145 Ont Configuration Download Snapshot Status Command

Command Description

This command displays the ont configuration download snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot ont-cfg-dld [ (index) ]
```

Command Parameters

Table 103.145-1 "Ont Configuration Download Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.145-2 "Ont Configuration Download Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
cfgfile-idx	Parameter type: <Alarm::OntCfgFileIndex> (configure file 1 configure file 2) Possible values: - configure file 1 : configure file 1 generate the alarm - configure file 2 : configure file 2 generate the alarm	identifies the configure file which generate the alarm <i>This element is only shown in detail mode.</i>
cfg-dld-fail	Parameter type: <Alarm::OntCfgDldFail> (yes no) Possible values: - yes : download of configure file to ont is failed - no : download of configure file to ont is ok	specifies download of configure file to ont is failed or not <i>This element is only shown in detail mode.</i>
cfg-act-fail	Parameter type: <Alarm::OntCfgActFail> (yes no) Possible values: - yes : activate the passive config file failed - no : activate the passive config file ok	specifies activate of configure file to ont is failed or not <i>This element is only shown in detail mode.</i>
cfg-dld-ip	Parameter type: <Alarm::OntCfgDldIp> (yes no) Possible values: - yes : ont configure file download in progress - no : no ont configure file download detected	specifies whether downloading <i>This element is only shown in detail mode.</i>
cfg-ver-mismatch	Parameter type: <Alarm::OntCfgVerMismatch> (yes no) Possible values: - yes : the planned configure file does not match the active configure file - no : the planned configure file match the active configure file	specifies whether planned configure file match the active configure file or not <i>This element is only shown in detail mode.</i>
cfg-file-missing	Parameter type: <Alarm::OntCfgFileMissing> (yes no) Possible values: - yes : ont configure file missing or has an error - no : ont configure file ok	specifies whether ont configure file missing <i>This element is only shown in detail mode.</i>
cfg-verctrl-err	Parameter type: <Alarm::OntCfgVerCtrlErr> (yes no) Possible values: - yes : ont configure file version control error - no : ont configure file version control ok	specifies ont configure file version control error <i>This element is only shown in detail mode.</i>
cfg-not-supported	Parameter type: <Alarm::OntCfgNotSupported> (yes no) Possible values: - yes : ont not support the configure file download function - no : ont support the configure file download function	specifies ont not support configure file download function <i>This element is only shown in detail mode.</i>

103.146 Alarm Snapshot Channel Pair OLT TC TCA Status Command

Command Description

This command displays the snapshot Channel Pair OLT TC TCA alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot olt-chpair-tc-tca [ (index) ]
```

Command Parameters

Table 103.146-1 " Alarm Snapshot Channel Pair OLT TC TCA Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snapshot table index

Command Output

Table 103.146-2 " Alarm Snapshot Channel Pair OLT TC TCA Status Command" Display parameters

Specific Information		
name	Type	Description
channel-pair	Parameter type: <Gpon::ChannelPairId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	pon ifindex <i>This element is only shown in detail mode.</i>

Only Show Details: alarm snap-shot status		
name	Type	Description
olt-chpr-tc-err-frag	Parameter	type: channelpair errored fragments

name	Type	Description
	<Alarm::OLTCHPRTCTCAERRFRAGSPON> (yes no) Possible values: - yes : channelpair errored fragments threshold crossed - no : olt works properly	threshold crossed <i>This element is only shown in detail mode.</i>
olt-chpr-up-bw-tca	Parameter type: <Alarm::OLTCHPRTCTCAUPBWTCa> (yes no) Possible values: - yes : olt channelpair upstream bandwidth tca - no : olt works properly	OLT CHANNELPAIR upstream bandwidth TCA <i>This element is only shown in detail mode.</i>
olt-chpr-down-bw-tca	Parameter type: <Alarm::OLTCHPRTCTCADWBWTCA> (yes no) Possible values: - yes : olt channelpair downstream bandwidth tca - no : olt works properly	OLT CHANNELPAIR downstream bandwidth TCA <i>This element is only shown in detail mode.</i>

103.147 Alarm Snapshot Channel Pair Status Command

Command Description

This command displays the snapshot Channel Pair alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot channel-pair [(index)]

Command Parameters

Table 103.147-1 " Alarm Snapshot Channel Pair Status Command" Resource Parameters

Specific Information		
name	Type	Description
channel-pair	Parameter type: <Gpon::ChannelPairId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel-pair ifindex <i>This element is only shown in detail mode.</i>
Only Show Details: alarm snap-shot status		
name	Type	Description
comm-fail	Parameter type: <Alarm::ChnPairComm> ((failing fail) ok)	Channel pair Communication failure on channel Pair Port <i>This element is only shown in</i>

name	Type	Description
	Possible values: - failing : Channel pair Communication is failing - fail : Channel pair Communication is failing - ok : Channel pair Communication is ok	<i>detail mode.</i>
tx-fail	Parameter type: <Alarm::ChnPairTf> ((failing fail) ok) Possible values: - failing : Transmitte is failing - fail : Transmitte is failing - ok : Transmitte is ok	transmit failure on OLT port <i>This element is only shown in detail mode.</i>
new-ont	Parameter type: <Alarm::ChnPairNewOnt> ((failing fail) ok) Possible values: - failing : NEW ONT is failing - fail : NEW ONT is failing - ok : NEW ONT is ok	unprovisioned ont appearance <i>This element is only shown in detail mode.</i>
prov-mismatch	Parameter type: <Alarm::ChnPairMea> ((failing fail) ok) Possible values: - failing : Channel Pair Mismatch Provisioning is failing - fail : Channel Pair Mismatch Provisioning is failing - ok : Channel Pair Mismatch Provisioning is ok	channel Pair provision failure. <i>This element is only shown in detail mode.</i>
loss-sig	Parameter type: <Alarm::ChnPairLoss> ((failing fail) ok) Possible values: - failing : Channel Pair Loss of Signal is failing - fail : Channel Pair Loss of Signal is failing - ok : Channel Pair Loss of Signal is ok	channel Pair loss. <i>This element is only shown in detail mode.</i>
diagnostic	Parameter type: <Alarm::ChnPairRogueTest> ((failing fail) ok) Possible values: - failing : Rogue ONT detection mechanism effective is failing - fail : Rogue ONT detection mechanism effective is failing - ok : Rogue ONT detection mechanism effective is ok	diagnostic tests <i>This element is only shown in detail mode.</i>
loid-conflict	Parameter type: <Alarm::ChnPairLoidConflict> ((failing fail) ok) Possible values: - failing : ONT LOID Conflict is failing - fail : ONT LOID Conflict is failing - ok : LOID Conflict is ok	loid conflict ont. <i>This element is only shown in detail mode.</i>
loid-pwd-err	Parameter type: <Alarm::ChnPairLoidPwdErr> ((failing fail) ok) Possible values: - failing : ONT LOID PWD ERR is failing - fail : ONT LOID PWD ERR is failing - ok : ONT LOID PWD ERR is ok	loid password error. <i>This element is only shown in detail mode.</i>
stk-laser-dis	Parameter type: <Alarm::ChnPairStkLaserDis> ((failing fail) ok)	stuck laser disabled. <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - failing : Unranged ONT with stuck laser disabled is failing - fail : Unranged ONT with stuck laser disabled is failing - ok : Unranged ONT with stuck laser disabled is ok	
sfp-mismatch	Parameter type: <Alarm::ChnPairSfpMismatch> ((failing fail) ok) Possible values: - failing : sfp mismatch is failing - fail : sfp mismatch is failing - ok : sfp mismatch is ok	sfp mismatch. <i>This element is only shown in detail mode.</i>
rng-mismatch	Parameter type: <Alarm::ChnPairRngMismatch> ((failing fail) ok) Possible values: - failing : ranging mismatch is failing - fail : ranging mismatch is failing - ok : ranging mismatch is ok	current status of ranging mismatch. <i>This element is only shown in detail mode.</i>
alien-test	Parameter type: <Alarm::ChnPairAlienTest> ((failing fail) ok) Possible values: - failing : Alien ONT detection mechanism is active - fail : Alien ONT detection mechanism is active - ok : Alien ONT detection mechanism is not active	current status of alien diagnostic tests <i>This element is only shown in detail mode.</i>
alien-detect	Parameter type: <Alarm::ChnPairAlienDetected> ((failing fail) ok) Possible values: - failing : Alien ONT detected - fail : Alien ONT detected - ok : No alien ONT detected	current status of alien detect <i>This element is only shown in detail mode.</i>

103.148 HGU TR069 Snapshot Status Command

Command Description

This command displays the hgu tr069 snapshot-related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot hgu-tr069 [(index)]

Command Parameters

Table 103.148-1 "HGU TR069 Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.148-2 "HGU TR069 Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
cust-alm1	Parameter type: <Alarm::HguCustAlm1> (yes no) Possible values: - yes : customized alarm 1 exist - no : customized alarm 1 not exist	current status of customized alarm 1 <i>This element is only shown in detail mode.</i>
cust-alm2	Parameter type: <Alarm::HguCustAlm2> (yes no) Possible values: - yes : customized alarm 2 exist - no : customized alarm 2 not exist	current status of customized alarm 2 <i>This element is only shown in detail mode.</i>
cust-alm3	Parameter type: <Alarm::HguCustAlm3> (yes no) Possible values: - yes : customized alarm 3 exist - no : customized alarm 3 not exist	current status of customized alarm 3 <i>This element is only shown in detail mode.</i>
cust-alm4	Parameter type: <Alarm::HguCustAlm4> (yes no) Possible values: - yes : customized alarm 4 exist - no : customized alarm 4 not exist	current status of customized alarm 4 <i>This element is only shown in detail mode.</i>
cust-alm5	Parameter type: <Alarm::HguCustAlm5> (yes no) Possible values: - yes : customized alarm 5 exist - no : customized alarm 5 not exist	current status of customized alarm 5 <i>This element is only shown in detail mode.</i>
cust-alm6	Parameter type: <Alarm::HguCustAlm6> (yes no) Possible values: - yes : customized alarm 6 exist - no : customized alarm 6 not exist	current status of customized alarm 6 <i>This element is only shown in detail mode.</i>
cust-alm7	Parameter type: <Alarm::HguCustAlm7> (yes no) Possible values: - yes : customized alarm 7 exist - no : customized alarm 7 not exist	current status of customized alarm 7 <i>This element is only shown in detail mode.</i>
cust-alm8	Parameter type: <Alarm::HguCustAlm8> (yes no) Possible values: - yes : customized alarm 8 exist - no : customized alarm 8 not exist	current status of customized alarm 8 <i>This element is only shown in detail mode.</i>
cust-alm9	Parameter type: <Alarm::HguCustAlm9> (yes no) Possible values: - yes : customized alarm 9 exist - no : customized alarm 9 not exist	current status of customized alarm 9 <i>This element is only shown in detail mode.</i>

name	Type	Description
cust-alm10	Parameter type: <Alarm::HguCustAlm10> (yes no) Possible values: - yes : customized alarm 10 exist - no : customized alarm 10 not exist	current status of customized alarm 10 <i>This element is only shown in detail mode.</i>
cust-alm11	Parameter type: <Alarm::HguCustAlm11> (yes no) Possible values: - yes : customized alarm 11 exist - no : customized alarm 11 not exist	current status of customized alarm 11 <i>This element is only shown in detail mode.</i>
cust-alm12	Parameter type: <Alarm::HguCustAlm12> (yes no) Possible values: - yes : customized alarm 12 exist - no : customized alarm 12 not exist	current status of customized alarm 12 <i>This element is only shown in detail mode.</i>
cust-alm13	Parameter type: <Alarm::HguCustAlm13> (yes no) Possible values: - yes : customized alarm 13 exist - no : customized alarm 13 not exist	current status of customized alarm 13 <i>This element is only shown in detail mode.</i>
cust-alm14	Parameter type: <Alarm::HguCustAlm14> (yes no) Possible values: - yes : customized alarm 14 exist - no : customized alarm 14 not exist	current status of customized alarm 14 <i>This element is only shown in detail mode.</i>
cust-alm15	Parameter type: <Alarm::HguCustAlm15> (yes no) Possible values: - yes : customized alarm 15 exist - no : customized alarm 15 not exist	current status of customized alarm 15 <i>This element is only shown in detail mode.</i>
cust-alm16	Parameter type: <Alarm::HguCustAlm16> (yes no) Possible values: - yes : customized alarm 16 exist - no : customized alarm 16 not exist	current status of customized alarm 16 <i>This element is only shown in detail mode.</i>
cust-alm17	Parameter type: <Alarm::HguCustAlm17> (yes no) Possible values: - yes : customized alarm 17 exist - no : customized alarm 17 not exist	current status of customized alarm 17 <i>This element is only shown in detail mode.</i>
cust-alm18	Parameter type: <Alarm::HguCustAlm18> (yes no) Possible values: - yes : customized alarm 18 exist - no : customized alarm 18 not exist	current status of customized alarm 18 <i>This element is only shown in detail mode.</i>
cust-alm19	Parameter type: <Alarm::HguCustAlm19> (yes no)	current status of customized alarm 19 <i>This element is only shown in</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Possible values: - yes : customized alarm 19 exist - no : customized alarm 19 not exist	<i>detail mode.</i>
cust-alm20	Parameter type: <Alarm::HguCustAlm20> (yes no) Possible values: - yes : customized alarm 20 exist - no : customized alarm 20 not exist	current status of customized alarm 20 <i>This element is only shown in detail mode.</i>
cust-alm21	Parameter type: <Alarm::HguCustAlm21> (yes no) Possible values: - yes : customized alarm 21 exist - no : customized alarm 21 not exist	current status of customized alarm 21 <i>This element is only shown in detail mode.</i>
cust-alm22	Parameter type: <Alarm::HguCustAlm22> (yes no) Possible values: - yes : customized alarm 22 exist - no : customized alarm 22 not exist	current status of customized alarm 22 <i>This element is only shown in detail mode.</i>
cust-alm23	Parameter type: <Alarm::HguCustAlm23> (yes no) Possible values: - yes : customized alarm 23 exist - no : customized alarm 23 not exist	current status of customized alarm 23 <i>This element is only shown in detail mode.</i>
cust-alm24	Parameter type: <Alarm::HguCustAlm24> (yes no) Possible values: - yes : customized alarm 24 exist - no : customized alarm 24 not exist	current status of customized alarm 24 <i>This element is only shown in detail mode.</i>
cust-alm25	Parameter type: <Alarm::HguCustAlm25> (yes no) Possible values: - yes : customized alarm 25 exist - no : customized alarm 25 not exist	current status of customized alarm 25 <i>This element is only shown in detail mode.</i>
cust-alm26	Parameter type: <Alarm::HguCustAlm26> (yes no) Possible values: - yes : customized alarm 26 exist - no : customized alarm 26 not exist	current status of customized alarm 26 <i>This element is only shown in detail mode.</i>
cust-alm27	Parameter type: <Alarm::HguCustAlm27> (yes no) Possible values: - yes : customized alarm 27 exist - no : customized alarm 27 not exist	current status of customized alarm 27 <i>This element is only shown in detail mode.</i>
cust-alm28	Parameter type: <Alarm::HguCustAlm28> (yes no) Possible values: - yes : customized alarm 28 exist - no : customized alarm 28 not exist	current status of customized alarm 28 <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
cust-alm29	Parameter type: <Alarm::HguCustAlm29> (yes no) Possible values: - yes : customized alarm 29 exist - no : customized alarm 29 not exist	current status of customized alarm 29 <i>This element is only shown in detail mode.</i>
cust-alm30	Parameter type: <Alarm::HguCustAlm30> (yes no) Possible values: - yes : customized alarm 30 exist - no : customized alarm 30 not exist	current status of customized alarm 30 <i>This element is only shown in detail mode.</i>
cust-alm31	Parameter type: <Alarm::HguCustAlm31> (yes no) Possible values: - yes : customized alarm 31 exist - no : customized alarm 31 not exist	current status of customized alarm 31 <i>This element is only shown in detail mode.</i>

103.149 Equipment Holder Alarm Extended Log Status Command

Command Description

This command displays the snapshot equipment holder extended alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot eqpt-psu [(index)]

Command Parameters

Table 103.149-1 "Equipment Holder Alarm Extended Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.149-2 "Equipment Holder Alarm Extended Log Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
psu-fail-crit	Parameter type: <Alarm::psuFailCrit> (yes no) Possible values: - yes : General critical PSU alarm raised - no : General PSU state OK	current status of PSU general status <i>This element is only shown in detail mode.</i>
psu-a-fail-presence	Parameter type: <Alarm::psuAPresence> (yes no) Possible values:	current status of PSU A presence <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : PSU A presence failure - no : PSU A presence state OK	
psu-a-fail-vin-ac-nok	Parameter type: <Alarm::psuAFailVinACNOK> (yes no) Possible values: - yes : PSU A failure input AC voltage - no : PSU A input AC voltage OK	current status of PSU A input AC voltage alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-vin-uv	Parameter type: <Alarm::psuAFailVinUV> (yes no) Possible values: - yes : PSU A failure input under voltage - no : PSU A input voltage OK	current status of PSU A input under voltage alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-vin-ov	Parameter type: <Alarm::psuAFailVinOV> (yes no) Possible values: - yes : PSU A failure input over voltage - no : PSU A input voltage OK	current status of PSU A input over voltage alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-vout-uv	Parameter type: <Alarm::psuAFailVoutUV> (yes no) Possible values: - yes : PSU A failure output under voltage - no : PSU A output voltage OK	current status of PSU A output under voltage alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-vout-ov	Parameter type: <Alarm::psuAFailVoutOV> (yes no) Possible values: - yes : PSU A failure output over voltage - no : PSU A output voltage OK	current status of PSU A output over voltage alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-iout-oc	Parameter type: <Alarm::psuAFailIoutOC> (yes no) Possible values: - yes : PSU A failure output over current - no : PSU A output current OK	current status of PSU A output over current alarm <i>This element is only shown in detail mode.</i>
psu-a-fail-overtemp	Parameter type: <Alarm::psuAFailOverTemp> (yes no) Possible values: - yes : PSU A failure over temperature - no : PSU A temperature OK	current status of PSU A temperature alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-presence	Parameter type: <Alarm::psuBPresence> (yes no) Possible values: - yes : PSU B presence failure - no : PSU B presence state OK	current status of PSU B presence <i>This element is only shown in detail mode.</i>
psu-b-fail-vin-ac-nok	Parameter type: <Alarm::psuBFailVinACNOK> (yes no) Possible values: - yes : PSU B failure input AC voltage - no : PSU B input AC voltage OK	current status of PSU B input AC voltage alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-vin-uv	Parameter type: <Alarm::psuBFailVinUV>	current status of PSU B input

103 Alarm Snap-shot Status Commands

name	Type	Description
	(yes no) Possible values: - yes : PSU B failure input under voltage - no : PSU B input voltage OK	under voltage alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-vin-ov	Parameter type: <Alarm::psuBFailVinOV> (yes no) Possible values: - yes : PSU B failure input over voltage - no : PSU B input voltage OK	current status of PSU B input over voltage alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-vout-uv	Parameter type: <Alarm::psuBFailVoutUV> (yes no) Possible values: - yes : PSU B failure output under voltage - no : PSU B output voltage OK	current status of PSU B output under voltage alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-vout-ov	Parameter type: <Alarm::psuBFailVoutOV> (yes no) Possible values: - yes : PSU B failure output over voltage - no : PSU B output voltage OK	current status of PSU B output over voltage alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-iout-oc	Parameter type: <Alarm::psuBFailIoutOC> (yes no) Possible values: - yes : PSU B failure output over current - no : PSU B output current OK	current status of PSU B output over current alarm <i>This element is only shown in detail mode.</i>
psu-b-fail-overtemp	Parameter type: <Alarm::psuBFailOverTemp> (yes no) Possible values: - yes : PSU B failure over temperature - no : PSU B temperature OK	current status of PSU B temperature alarm <i>This element is only shown in detail mode.</i>

103.150 Ethernet Ring Alarm SnapShot Status Command

Command Description

This command displays ethernet ring Snapshot alarm status

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot ethernet-ring [(index)]

Command Parameters

Table 103.150-1 "Ethernet Ring Alarm SnapShot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	ethernet ring log table index

Command Output

Table 103.150-2 "Ethernet Ring Alarm SnapShot Status Command" Display parameters

Specific Information		
name	Type	Description
eth-ring-instance-id	Parameter type: <UnsignedSignedInteger> - an unsigned integer	ethernet ring instance id where the alarm has occurred <i>This element is only shown in detail mode.</i>
eth-ring-path	Parameter type: <Alarm::EthernetRingPath> (path-a path-b n/a) Possible values: - path-a : path-a of the ethernet ring instance - path-b : path-b of the ethernet ring instance - n/a : not applicable for the alarm, fop-pm	unique identification for the alarm, which identifies the path of the ethernet ring instance <i>This element is only shown in detail mode.</i>
Only Show Details: alarm snap-shot status		
name	Type	Description
eth-ring-fwd-st	Parameter type: <Alarm::EthernetRingPathFwdState> (blocked	specifies the forward state of the ethernet ring path

103 Alarm Snap-shot Status Commands

name	Type	Description
	unblocked) Possible values: - blocked : ethernet ring path fwd state blocked - unblocked : ethernet ring path fwd state unblocked	<i>This element is only shown in detail mode.</i>
eth-ring-fop-to	Parameter type: <Alarm::EthernetRingFOPTIMEOUT> (yes no) Possible values: - yes : fop-to occurred - no : fop-to not occurred	specifies ethernet ring fop-to failure of protocol timeout <i>This element is only shown in detail mode.</i>
eth-ring-fop-pm	Parameter type: <Alarm::EthernetRingFOPPM> (yes no) Possible values: - yes : fop-pm occurred - no : fop-pm not occurred	specifies ethernet ring failure of protocol provision mismatch alarm (fop-pm) <i>This element is only shown in detail mode.</i>

103.151 Lldpmed Alarm Snapshot Status Command

Command Description

This command displays the LLDP-MED alarm snap-shot status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm snap-shot lldpmed [ (index) ]
```

Command Parameters

Table 103.151-1 "Lldpmed Alarm Snapshot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.151-2 "Lldpmed Alarm Snapshot Status Command" Display parameters

Specific Information		
name	Type	Description
lldpmed	Parameter type: <LLDPMed::LLDPMedPort> (uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - uni : uni - uni:ng2 : ngpon2 UNI style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	identify the provisioned lldpmed port where the alarm has occurred. <i>This element is always shown.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	
lldpmed-portcfg-mis	Parameter type: <Alarm::LLDPMED-portcfg-mismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned lldpmed port is accepted or not. <i>This element is always shown.</i>
lldpmed-mediapl-mis	Parameter type: <Alarm::LLDPMED-mediapl-mismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned lldpmed port is accepted or not. <i>This element is always shown.</i>

103.152 Alarm Snap-shot Lag-group Status Command

Command Description

This command show the alarm snap-shot of lag group

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot link-aggr [(index)]

Command Parameters

Table 103.152-1 "Alarm Snap-shot Lag-group Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.152-2 "Alarm Snap-shot Lag-group Status Command" Display parameters

Specific Information		
name	Type	Description
group	Parameter type: <Itf::LaGroupIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies lag group index <i>This element is only shown in detail mode.</i>
la-oper-down	Parameter type: <Alarm::LaGroupDown> (yes no) Possible values: - yes : link group operation down	snap shot of link group operation down <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	- no : link group operation up	
standby-not-available	Parameter type: <Alarm::StandbyUnavailable> (yes no) Possible values: - yes : lack of link-up ports on standby slot - no : link-up ports enough on standby slot	snap shot of unavailable standby slot <i>This element is only shown in detail mode.</i>
switch-fail	Parameter type: <Alarm::LaSwitchFail> (yes no) Possible values: - yes : switchover failed for cross-lt la group - no : switchover is successful for cross-lt la group	snap shot of switchover failure <i>This element is only shown in detail mode.</i>
la-degrade	Parameter type: <Alarm::LaDegrade> (yes no) Possible values: - yes : lack of link-up ports on active slot - no : link-up ports enough on active slot	snap shot of lag degradation <i>This element is only shown in detail mode.</i>

103.153 Alarm Snap-shot 40GBase-KR4 fcs exceed Status Command

Command Description

This command show the alarm snap-shot of 40GBase-KR4 fcs exceed

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm snap-shot fcs-exceed [(index)]

Command Parameters

Table 103.153-1 "Alarm Snap-shot 40GBase-KR4 fcs exceed Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm snap shot table index

Command Output

Table 103.153-2 "Alarm Snap-shot 40GBase-KR4 fcs exceed Status Command" Display parameters

Specific Information		
name	Type	Description
slot	Parameter type: <Equipm::EqptSlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at	identifies index <i>This element is only shown in detail mode.</i>

103 Alarm Snap-shot Status Commands

name	Type	Description
	NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
nta/b	Parameter type: <UnsignedSignedInteger> - an unsigned integer	identifies index2 <i>This element is only shown in detail mode.</i>
fcs-is-exceed	Parameter type: <Alarm::almtypeFCSthreshexceed> (yes no) Possible values: - yes : FCS auto-recovery counter exceeded threshold - no : FCS auto-recovery counter not exceeded threshold	snap shot of whether fcs auto-recovery counter is exceed or not <i>This element is only shown in detail mode.</i>

104- Current Alarm Status Commands

104.1 Current Alarm Status Command Tree	104-4793
104.2 Alarm Current Status Command	104-4799
104.3 Equipment Current Alarm Status Command	104-4807
104.4 Equipment Holder Current Alarm Status Command	104-4810
104.5 Equipment Holder Extended Current Alarm Status Command	104-4812
104.6 Plug-in Unit Current Alarm Status Command	104-4814
104.7 ATM Current Alarm Status Command	104-4817
104.8 Ethernet Interface Current Alarm Status Command	104-4819
104.9 Software Management Current Alarm Status Command	104-4820
104.10 Temporal Filter Current Alarm Status Command	104-4822
104.11 Spatial Filter Current Alarm Status Command	104-4826
104.12 xDSL Current Alarm Status Command	104-4830

104.2 Alarm Current Status Command

Command Description

This command displays all current alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current table [(index)]

Command Parameters

Table 104.2-1 "Alarm Current Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.2-2 "Alarm Current Status Command" Display parameters

Specific Information		
name	Type	Description

name	Type	Description
	- alarm-table : alarm table related alarms - auto-switch : auto-switch related alarms - channel-pair : channel pair related alarms - ont-cfg-dld : ont configure file download related alarms - olt-chpair-tc-tca : OLT CHANNELPAIR TC TCA related alarms - hgu-tr069 : hgu tr069 related alarms - eqpt-psu : equipment psu alarms - ont-protection : ONT protection related alarms - secondary-megaco-term : secondary megaco termination related alarms - secondary-sip-term : secondary sip termination related alarms - cas-r2-channel : CAS R2 channel related alarms - lldpmed : lldpmed alarms - pseudo-wire : pseudo Wire related alarms - link-agg : Link aggregation related alarms - fcs-exceed : FCS auto-recovery related alarms - e1t1-interface : E1/T1 physical interfaces related alarms	
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	time in seconds when the entry was updated. <i>This element is always shown.</i>

Only Show Details: number of changes since start up and number of entries in the table

name	Type	Description
changes	Parameter type: <Counter> - 32 bit counter	number of changes that have occurred since startup. <i>This element is only shown in detail mode.</i>
entries	Parameter type: <Gauge> - gauge	number of entries <i>This element is only shown in detail mode.</i>
tot-delta-log	Parameter type: <UnsignedSignedInteger> - an unsigned integer	total number of delta log entries <i>This element is only shown in detail mode.</i>

Only Show Details: active severities in the table

name	Type	Description
indeterminate	Parameter type: <Alarm::IndetSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	status of the severity type indeterminate <i>This element is only shown in detail mode.</i>
warning	Parameter type: <Alarm::WarnSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	status of the severity type warning <i>This element is only shown in detail mode.</i>
minor	Parameter type: <Alarm::MinorSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	status of the severity type minor <i>This element is only shown in detail mode.</i>
major	Parameter type: <Alarm::MajorSevState> (active	status of the severity type major <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
	not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	<i>detail mode.</i>
critical	Parameter type: <Alarm::CriticalSevState> (active not-active) Possible values: - active : at least one entry of this severity is present - not-active : no entries of this severity	status of the severity type critical <i>This element is only shown in detail mode.</i>

104.3 Equipment Current Alarm Status Command

Command Description

This command displays the equipment current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current equipment [(index)]

Command Parameters

Table 104.3-1 "Equipment Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.3-2 "Equipment Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
persist-data	Parameter type: <Alarm::persistDataLoss> (lost not-lost) Possible values: - lost : persistant data is lost - not-lost : persistant data is not lost	current status specifying persistant data is lost or not <i>This element is only shown in detail mode.</i>
sntp-comm	Parameter type: <Alarm::sntpCommLoss> (lost not-lost) Possible values: - lost : SNTP communication lost - not-lost : SNTP communication is not lost	current status of sntp communication is lost or not <i>This element is only shown in detail mode.</i>
cf-error	Parameter type: <Alarm::cfError> ((error cfError) (no-error cfNoError)) Possible values: - error : CF access error - cfError : CF access error - no-error : CF no access error	Compact flash read or write error occurred <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- cfNoError : CF no access error	
board-with-cf-error	Parameter type: <Equipm::EqptNtSlotIndexOrNone> (nt-a nt-b nt <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> none none) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - none : board not specified - none : board not specified Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::EqSlotId> - the equipment slot number	Board identification with cf-error <i>This element is only shown in detail mode.</i>
nt-disk	Parameter type: <Alarm::ntDiskSpace> ((nintyfive-perc 95%-full) (less-nintyfive-perc less-than-95%)) Possible values: - nintyfive-perc : NT disk space is 95% full - 95%-full : NT disk space is 95% full - less-nintyfive-perc : NT disk space usage less that 95% - less-than-95% : NT disk space usage less that 95%	current status of nt disk space is 95% full or less than that <i>This element is only shown in detail mode.</i>
preferred-mode short name: pref-mode	Parameter type: <Alarm::clkPrefMode> (not-available available) Possible values: - not-available : Preferred timing mode is not available - available : Preferred Timing mode available	current status of preferred timing mode <i>This element is only shown in detail mode.</i>
timing-reference short name: time-ref	Parameter type: <Alarm::clkFreeMode> (failed available) Possible values: - failed : System is in holdover or free-run mode - available : System is not in holdover or free-run mode	current status of timing reference <i>This element is only shown in detail mode.</i>
connection-lost short name: conn-lost	Parameter type: <Alarm::ShubLoc> (lost not-lost) Possible values: - lost : NT shub communication lost - not-lost : NT shub communication intact	current status of nt shub communication is lost or intact <i>This element is only shown in detail mode.</i>
back-pnl-inv short name: bpnl-inv	Parameter type: <Alarm::BackPnlInv> (invalid valid) Possible values: - invalid : BackPanel-type Invalid - valid : BackPanel-type Valid	current status of BackPanel-type Invalid alarm. <i>This element is only shown in detail mode.</i>
shub-conf-lost short name: conf-lost	Parameter type: <Alarm::SHubCfgLost> (lost not-lost) Possible values: - lost : SHub configuration loss - recent changes lost	actual shub configuration may differ from lanx database on nt <i>This element is only shown in detail mode.</i>

name	Type	Description
	- not-lost : SHub configuration up to date	

104.4 Equipment Holder Current Alarm Status Command

Command Description

This command displays the equipment holder current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current eqpt-holder [ (index) ]
```

Command Parameters

Table 104.4-1 "Equipment Holder Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.4-2 "Equipment Holder Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
rack-power	Parameter type: <Alarm::rackPower> (failing ok) Possible values: - failing : the fuse is broken - ok : the fuse is intact	current status of rack power alarm, indicating fuse is broken or intact <i>This element is only shown in detail mode.</i>
fan-unit1 short name: fan1	Parameter type: <Alarm::fanUnit1> ((failing fail) ok) Possible values:	current status of fan-unit1 <i>This element is only shown in detail mode.</i>

name	Type	Description
	- failing : fan unit 1 is failing - fail : fan unit 1 is failing - ok : fan unit 1 is ok	
fan-unit2 short name: fan2	Parameter type: <Alarm::fanUnit2> ((failing fail) ok) Possible values: - failing : fan unit 2 is failing - fail : fan unit 2 is failing - ok : fan unit 2 is ok	current status of fan-unit2 <i>This element is only shown in detail mode.</i>
shelf-type-mismatch short name: shelf-type	Parameter type: <Alarm::shelfTypeMismatch> (mismatch no-mismatch) Possible values: - mismatch : installed and planned shelf types are different - no-mismatch : installed and planned shelf types are the same	current status specifies installed and planned shelf types are different <i>This element is only shown in detail mode.</i>
ext-chain-instl	Parameter type: <Alarm::extChainInstl> ((consistency-problem inconsistent) (no-consistency-problem ok)) Possible values: - consistency-problem : consistency problem detected for installation of extension chain - inconsistent : consistency problem detected for installation of extension chain - no-consistency-problem: no consistency problem - ok : no consistency problem	current alarm status of consistency problem detected for installation of extension chain <i>This element is only shown in detail mode.</i>
shelf-missing	Parameter type: <Alarm::shelfMissing> (missing not-missing) Possible values: - missing : detected shelf now missing - not-missing : detected shelf was missing, now reinserted	current status specifies once inserted shelf has gone missing <i>This element is only shown in detail mode.</i>
shelf-install-missing	Parameter type: <Alarm::shelfInstall> (yes no) Possible values: - yes : shelf now installed - no : shelf now not installed	current status specifies shelf is planned but not installed <i>This element is only shown in detail mode.</i>
door	Parameter type: <Alarm::door> ((failing fail) ok) Possible values: - failing : the cabinet door is opened - fail : the cabinet door is opened - ok : the cabinet door is closed	current status of door alarm, indicating the cabinet door is opened <i>This element is only shown in detail mode.</i>
ac-power-fail short name: ac-pwr	Parameter type: <Alarm::acPowerFail> ((failing fail) ok) Possible values: - failing : system AC power fails - fail : system AC power fails - ok : the system AC power works properly	current status of AC power failure alarm, indicating the AC Power is broken <i>This element is only shown in detail mode.</i>

104.5 Equipment Holder Extended Current Alarm Status Command

Command Description

This command displays the equipment holder extended current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current eqpt-holder-ext [(index)]

Command Parameters

Table 104.5-1 "Equipment Holder Extended Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.5-2 "Equipment Holder Extended Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
ctl-com-fail	Parameter type: <Alarm::ctlComFail> ((failing fail) ok) Possible values: - failing : shelf controller communication is failing - fail : shelf controller communication is failing - ok : shelf controller communication is ok	current status of shelf controller communication failure. <i>This element is only shown in detail mode.</i>
bat-a-fail	Parameter type: <Alarm::batAFail> (yes	current status of shelf power source A failure.

name	Type	Description
	no) Possible values: - yes : Power Source Battery A Failure - no : Power Source Battery A is OK	<i>This element is only shown in detail mode.</i>
bat-b-fail	Parameter type: <Alarm::batBFail> (yes no) Possible values: - yes : Power Source Battery B Failure - no : bfd stale entry not present	current status of shelf power source B failure. <i>This element is only shown in detail mode.</i>
water-seepage-in-box	Parameter type: <Alarm::waterSeepageInBox> (detected not-detected) Possible values: - detected : detected water seepage in the enclosure - not-detected : no water seepage detected in the enclosure	current status of detected water seepage in the enclosure <i>This element is only shown in detail mode.</i>
sealed-box-open	Parameter type: <Alarm::sealedBoxOpen> (detected not-detected) Possible values: - detected : detected open sealed box - not-detected : closed sealed box	current status of detected open sealed box <i>This element is only shown in detail mode.</i>

104.6 Plug-in Unit Current Alarm Status Command

Command Description

This command displays the plug-in unit current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current plug-in-unit [(index)]

Command Parameters

Table 104.6-1 "Plug-in Unit Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.6-2 "Plug-in Unit Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2 vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	NANT-E/FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot - iont : an nt applique slot - lp : an lt applique slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::LtAppliqueSlotId> - the LT Applique slot number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
board-mismatch	Parameter type: <Alarm::boardMismatch> (yes no) Possible values: - yes : planned and plugged-in types are different - no : planned and plugged-in types are same	alarm specifying the planned and plugged-in types are different <i>This element is only shown in detail mode.</i>
sw-download	Parameter type: <Alarm::swStatus> (waiting completed) Possible values: - waiting : not able to download all the applicable SW files - completed : download completed	alarm specifying download of the software is completed or not. <i>This element is only shown in detail mode.</i>
temperature	Parameter type: <Alarm::tempStatus> (above-thres below-thres) Possible values: - above-thres : temperature threshold on board exceeded - below-thres : board temperature within threshold	alarm specifying board temperature is crossed the threshold or not. <i>This element is only shown in detail mode.</i>
sem-power-fail	Parameter type: <Alarm::extPowerStatus> (sem-power-fail sem-power-ok) Possible values: - sem-power-fail : SEM external power failure - sem-power-ok : SEM external power ok	alarm specifying SEM external power failure. <i>This element is only shown in detail mode.</i>
sem-ups-fail	Parameter type: <Alarm::powerSupplyStatus> (sem-ups-fail sem-ups-ok) Possible values: - sem-ups-fail : SEM external power supply failure - sem-ups-ok : SEM external power supply ok	alarm specifying SEM external power supply failure. <i>This element is only shown in detail mode.</i>
temp-shutoff	Parameter type: <Alarm::tempShutoffStatus> (board-switched-off board-switched-on)	alarm specifying board is switched off because of excess temperature.

104 Current Alarm Status Commands

name	Type	Description
	Possible values: - board-switched-off : board switched off - excess temperature - board-switched-on : board switched on	<i>This element is only shown in detail mode.</i>
board-present	Parameter type: <Alarm::boardPresence> (missing yes) Possible values: - missing : board was present, but now missing - yes : board present	indicates the presence of the board. <i>This element is only shown in detail mode.</i>
board-inserted	Parameter type: <Alarm::boardInsertion> (never-inserted inserted) Possible values: - never-inserted : board was never inserted - inserted : board was inserted	indicates the status of board was inserted or not. <i>This element is only shown in detail mode.</i>
board-init	Parameter type: <Alarm::boardInit> (failed completed) Possible values: - failed : board initialization failed - completed : board initialization completed	specifies board initializaion is sucessful or failed. <i>This element is only shown in detail mode.</i>
board-reset-cf	Parameter type: <Alarm::boardResetCommFail> (yes ok) Possible values: - yes : board reset/communication failure occurred - ok : no board reset/communication failure	indicates there has been a reset and/or communication failure of the board. <i>This element is only shown in detail mode.</i>
shub-uplink	Parameter type: <Alarm::lanxuplinkbrkdown> (failure ok) Possible values: - failure : lanx uplink breakdown or removal - ok : no breakdown or removal of lanx uplink	indicates that lanx uplink breakdown or removal <i>This element is only shown in detail mode.</i>
backplane-data-failure	Parameter type: <Alarm::BackplaneMismatch> (yes no) Possible values: - yes : LT backplane ports data failure - no : LT backplane ports data normal	indicates the lt backplane data status <i>This element is only shown in detail mode.</i>

104.7 ATM Current Alarm Status Command

Command Description

This command displays the ATM current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current atm [ (index) ]
```

Command Parameters

Table 104.7-1 "ATM Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.7-2 "ATM Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Equipm::AtmIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
vpi-vci	Parameter type: <Alarm::VpiVciValues> - the vpi and vci value (vpi/vci)	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
cell-discard-up	Parameter type: <Alarm::CellDiscardUpstream> (discarded no-discard) Possible values:	specifies ATM cell is discarded or not in upstream direction. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- discarded : ATM cell discarded in upstream direction - no-discard : no ATM cell discarded in upstream direction	
cell-discard-down	Parameter type: <Alarm::CellDiscardDownstream> (discarded no-discard) Possible values: - discarded : ATM cell discarded in downstream direction - no-discard : no ATM cell discarded in downstream direction	specifies ATM cell is discarded or not in downstream direction. <i>This element is only shown in detail mode.</i>

104.8 Ethernet Interface Current Alarm Status Command

Command Description

This command displays the Ethernet Interface current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ether-itf [(index)]

Command Parameters

Table 104.8-1 "Ethernet Interface Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.8-2 "Ethernet Interface Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ether-ifindex	Parameter type: <Ether::InterfaceIndex> - index of the collision interface - range: [0...2147483647]	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

104.9 Software Management Current Alarm Status Command

Command Description

This command displays the software management current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sw-mgmt [ (index) ]
```

Command Parameters

Table 104.9-1 "Software Management Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.9-2 "Software Management Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identifies the physical position of the slot <i>This element is only shown in detail mode.</i>

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
sw-rollback	Parameter type: <Alarm::SwRollback> (yes no) Possible values: - yes : implicit software rollback performed - no : no implicit software rollback	specifies implicit software rollback is performed or not. <i>This element is only shown in detail mode.</i>
db-rollback	Parameter type: <Alarm::DbRollback> (yes no) Possible values: - yes : implicit database rollback performed - no : no implicit database rollback	specifies implicit database rollback is performed or not. <i>This element is only shown in detail mode.</i>
xvps-inv-dbase	Parameter type: <Alarm::XvpsInvalidDataBase> (invalid valid) Possible values: - invalid : invalid xvps dbbase is detected - valid : xvps dbase is valid	specifies implicit xvps dbase is valid or not. <i>This element is only shown in detail mode.</i>
inv-cde-file	Parameter type: <Alarm::XvpsInvalidCDEFile> (invalid valid) Possible values: - invalid : invalid xvps cde file is detected - valid : xvps cde file is valid	specifies implicit xvps cde file is valid or not. <i>This element is only shown in detail mode.</i>
miss-cde-file	Parameter type: <Alarm::MissingCDEProfile> (yes no) Possible values: - yes : cde profile is missed - no : cde profile is exist	specifies cde profile is missed or not. <i>This element is only shown in detail mode.</i>

104.10 Temporal Filter Current Alarm Status Command

Command Description

This command displays temporal filter current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current temporal [(index)]

Command Parameters

Table 104.10-1 "Temporal Filter Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.10-2 "Temporal Filter Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
tmp-filter1	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	current status for temporal filter1 <i>This element is only shown in detail mode.</i>
tmp-filter2	Parameter type: <Alarm::almFilter2> (yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	current status for temporal filter2 <i>This element is only shown in detail mode.</i>
tmp-filter3	Parameter type: <Alarm::almFilter3> (yes no) Possible values:	current status for temporal filter3 <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : derived filter3 alarm - no : not derived filter3 alarm	
tmp-filter4	Parameter type: <Alarm::almFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	current status for temporal filter4 <i>This element is only shown in detail mode.</i>
tmp-filter5	Parameter type: <Alarm::almFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	current status for temporal filter5 <i>This element is only shown in detail mode.</i>
tmp-filter6	Parameter type: <Alarm::almFilter6> (yes no) Possible values: - yes : derived filter6 alarm - no : not derived filter6 alarm	current status for temporal filter6 <i>This element is only shown in detail mode.</i>
tmp-filter7	Parameter type: <Alarm::almFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	current status for temporal filter7 <i>This element is only shown in detail mode.</i>
tmp-filter8	Parameter type: <Alarm::almFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	current status for temporal filter8 <i>This element is only shown in detail mode.</i>
tmp-filter9	Parameter type: <Alarm::almFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	current status for temporal filter9 <i>This element is only shown in detail mode.</i>
tmp-filter10	Parameter type: <Alarm::almFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	current status for temporal filter10 <i>This element is only shown in detail mode.</i>
tmp-filter11	Parameter type: <Alarm::almFilter11> (yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	current status for temporal filter11 <i>This element is only shown in detail mode.</i>
tmp-filter12	Parameter type: <Alarm::almFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	current status for temporal filter12 <i>This element is only shown in detail mode.</i>
tmp-filter13	Parameter type: <Alarm::almFilter13>	current status for temporal

104 Current Alarm Status Commands

name	Type	Description
	(yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	filter13 <i>This element is only shown in detail mode.</i>
tmp-filter14	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	current status for temporal filter14 <i>This element is only shown in detail mode.</i>
tmp-filter15	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	current status for temporal filter15 <i>This element is only shown in detail mode.</i>
tmp-filter16	Parameter type: <Alarm::almFilter16> (yes no) Possible values: - yes : derived filter16 alarm - no : not derived filter16 alarm	current status for temporal filter16 <i>This element is only shown in detail mode.</i>
tmp-filter17	Parameter type: <Alarm::almFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	current status for temporal filter17 <i>This element is only shown in detail mode.</i>
tmp-filter18	Parameter type: <Alarm::almFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	current status for temporal filter18 <i>This element is only shown in detail mode.</i>
tmp-filter19	Parameter type: <Alarm::almFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	current status for temporal filter19 <i>This element is only shown in detail mode.</i>
tmp-filter20	Parameter type: <Alarm::almFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	current status for temporal filter20 <i>This element is only shown in detail mode.</i>
tmp-filter21	Parameter type: <Alarm::almFilter21> (yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	current status for temporal filter21 <i>This element is only shown in detail mode.</i>
tmp-filter22	Parameter type: <Alarm::almFilter22> (yes no) Possible values:	current status for temporal filter22 <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : derived filter22 alarm - no : not derived filter22 alarm	
tmp-filter23	Parameter type: <Alarm::almFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	current status for temporal filter23 <i>This element is only shown in detail mode.</i>
tmp-filter24	Parameter type: <Alarm::almFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	current status for temporal filter24 <i>This element is only shown in detail mode.</i>
tmp-filter25	Parameter type: <Alarm::almFilter25> (yes no) Possible values: - yes : derived filter25 alarm - no : not derived filter25 alarm	current status for temporal filter25 <i>This element is only shown in detail mode.</i>
tmp-filter26	Parameter type: <Alarm::almFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	current status for temporal filter26 <i>This element is only shown in detail mode.</i>
tmp-filter27	Parameter type: <Alarm::almFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	current status for temporal filter27 <i>This element is only shown in detail mode.</i>
tmp-filter28	Parameter type: <Alarm::almFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	current status for temporal filter28 <i>This element is only shown in detail mode.</i>
tmp-filter29	Parameter type: <Alarm::almFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	current status for temporal filter29 <i>This element is only shown in detail mode.</i>
tmp-filter30	Parameter type: <Alarm::almFilter30> (yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	current status for temporal filter30 <i>This element is only shown in detail mode.</i>
tmp-filter31	Parameter type: <Alarm::almFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	current status for temporal filter31 <i>This element is only shown in detail mode.</i>

104.11 Spatial Filter Current Alarm Status Command

Command Description

This command displays spatial filter current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current spatial [(index)]

Command Parameters

Table 104.11-1 "Spatial Filter Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.11-2 "Spatial Filter Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
spa-filter1	Parameter type: <Alarm::almFilter1> (yes no) Possible values: - yes : derived filter1 alarm - no : not derived filter1 alarm	current status for spatial filter1 <i>This element is only shown in detail mode.</i>
spa-filter2	Parameter type: <Alarm::almFilter2> (yes no) Possible values: - yes : derived filter2 alarm - no : not derived filter2 alarm	current status for spatial filter2 <i>This element is only shown in detail mode.</i>
spa-filter3	Parameter type: <Alarm::almFilter3> (yes no) Possible values:	current status for spatial filter3 <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : derived filter3 alarm - no : not derived filter3 alarm	
spa-filter4	Parameter type: <Alarm::almFilter4> (yes no) Possible values: - yes : derived filter4 alarm - no : not derived filter4 alarm	current status for spatial filter4 <i>This element is only shown in detail mode.</i>
spa-filter5	Parameter type: <Alarm::almFilter5> (yes no) Possible values: - yes : derived filter5 alarm - no : not derived filter5 alarm	current status for spatial filter5 <i>This element is only shown in detail mode.</i>
spa-filter6	Parameter type: <Alarm::almFilter6> (yes no) Possible values: - yes : derived filter6 alarm - no : not derived filter6 alarm	current status for spatial filter6 <i>This element is only shown in detail mode.</i>
spa-filter7	Parameter type: <Alarm::almFilter7> (yes no) Possible values: - yes : derived filter7 alarm - no : not derived filter7 alarm	current status for spatial filter7 <i>This element is only shown in detail mode.</i>
spa-filter8	Parameter type: <Alarm::almFilter8> (yes no) Possible values: - yes : derived filter alarm - no : not derived filter alarm	current status for spatial filter8 <i>This element is only shown in detail mode.</i>
spa-filter9	Parameter type: <Alarm::almFilter9> (yes no) Possible values: - yes : derived filter9 alarm - no : not derived filter9 alarm	current status for spatial filter9 <i>This element is only shown in detail mode.</i>
spa-filter10	Parameter type: <Alarm::almFilter10> (yes no) Possible values: - yes : derived filter10 alarm - no : not derived filter alarm	current status for spatial filter10 <i>This element is only shown in detail mode.</i>
spa-filter11	Parameter type: <Alarm::almFilter11> (yes no) Possible values: - yes : derived filter11 alarm - no : not derived filter11 alarm	current status for spatial filter11 <i>This element is only shown in detail mode.</i>
spa-filter12	Parameter type: <Alarm::almFilter12> (yes no) Possible values: - yes : derived filter12 alarm - no : not derived filter12 alarm	current status for spatial filter12 <i>This element is only shown in detail mode.</i>
spa-filter13	Parameter type: <Alarm::almFilter13>	current status for spatial filter13

104 Current Alarm Status Commands

name	Type	Description
	(yes no) Possible values: - yes : derived filter13 alarm - no : not derived filter13 alarm	<i>This element is only shown in detail mode.</i>
spa-filter14	Parameter type: <Alarm::almFilter14> (yes no) Possible values: - yes : derived filter14 alarm - no : not derived filter14 alarm	current status for spatial filter14 <i>This element is only shown in detail mode.</i>
spa-filter15	Parameter type: <Alarm::almFilter15> (yes no) Possible values: - yes : derived filter15 alarm - no : not derived filter15 alarm	current status for spatial filter15 <i>This element is only shown in detail mode.</i>
spa-filter16	Parameter type: <Alarm::almFilter16> (yes no) Possible values: - yes : derived filter16 alarm - no : not derived filter16 alarm	current status for spatial filter16 <i>This element is only shown in detail mode.</i>
spa-filter17	Parameter type: <Alarm::almFilter17> (yes no) Possible values: - yes : derived filter17 alarm - no : not derived filter17 alarm	current status for spatial filter17 <i>This element is only shown in detail mode.</i>
spa-filter18	Parameter type: <Alarm::almFilter18> (yes no) Possible values: - yes : derived filter18 alarm - no : not derived filter18 alarm	current status for spatial filter18 <i>This element is only shown in detail mode.</i>
spa-filter19	Parameter type: <Alarm::almFilter19> (yes no) Possible values: - yes : derived filter19 alarm - no : not derived filter19 alarm	current status for spatial filter19 <i>This element is only shown in detail mode.</i>
spa-filter20	Parameter type: <Alarm::almFilter20> (yes no) Possible values: - yes : derived filter20 alarm - no : not derived filter20 alarm	current status for spatial filter20 <i>This element is only shown in detail mode.</i>
spa-filter21	Parameter type: <Alarm::almFilter21> (yes no) Possible values: - yes : derived filter21 alarm - no : not derived filter21 alarm	current status for spatial filter21 <i>This element is only shown in detail mode.</i>
spa-filter22	Parameter type: <Alarm::almFilter22> (yes no) Possible values:	current status for spatial filter22 <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : derived filter22 alarm - no : not derived filter22 alarm	
spa-filter23	Parameter type: <Alarm::almFilter23> (yes no) Possible values: - yes : derived filter23 alarm - no : not derived filter23 alarm	current status for spatial filter23 <i>This element is only shown in detail mode.</i>
spa-filter24	Parameter type: <Alarm::almFilter24> (yes no) Possible values: - yes : derived filter24 alarm - no : not derived filter24 alarm	current status for spatial filter24 <i>This element is only shown in detail mode.</i>
spa-filter25	Parameter type: <Alarm::almFilter25> (yes no) Possible values: - yes : derived filter25 alarm - no : not derived filter25 alarm	current status for spatial filter25 <i>This element is only shown in detail mode.</i>
spa-filter26	Parameter type: <Alarm::almFilter26> (yes no) Possible values: - yes : derived filter26 alarm - no : not derived filter26 alarm	current status for spatial filter26 <i>This element is only shown in detail mode.</i>
spa-filter27	Parameter type: <Alarm::almFilter27> (yes no) Possible values: - yes : derived filter27 alarm - no : not derived filter27 alarm	current status for spatial filter27 <i>This element is only shown in detail mode.</i>
spa-filter28	Parameter type: <Alarm::almFilter28> (yes no) Possible values: - yes : derived filter28 alarm - no : not derived filter28 alarm	current status for spatial filter28 <i>This element is only shown in detail mode.</i>
spa-filter29	Parameter type: <Alarm::almFilter29> (yes no) Possible values: - yes : derived filter29 alarm - no : not derived filter29 alarm	current status for spatial filter29 <i>This element is only shown in detail mode.</i>
spa-filter30	Parameter type: <Alarm::almFilter30> (yes no) Possible values: - yes : derived filter30 alarm - no : not derived filter30 alarm	current status for spatial filter30 <i>This element is only shown in detail mode.</i>
spa-filter31	Parameter type: <Alarm::almFilter31> (yes no) Possible values: - yes : derived filter31 alarm - no : not derived filter31 alarm	current status for spatial filter31 <i>This element is only shown in detail mode.</i>

104.12 xDSL Current Alarm Status Command

Command Description

This command displays the xDSL current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current xdsl [ (index) ]
```

Command Parameters

Table 104.12-1 "xDSL Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.12-2 "xDSL Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
near-end-los	Parameter type: <Alarm::NearEndLOS> (yes no) Possible values: - yes : near end loss of signal occurred - no : no near end loss of signal	specifies near end loss of signal occurred or not. <i>This element is only shown in detail mode.</i>
near-end-lof	Parameter type: <Alarm::NearEndLOF> (yes	specifies near end loss of frame occurred or not.

name	Type	Description
	no) Possible values: - yes : near end loss of frame occurred - no : no near end loss of frame	<i>This element is only shown in detail mode.</i>
near-end-lom	Parameter type: <Alarm::NearEndLOM> (yes no) Possible values: - yes : near end loss of margin occurred - no : no near end loss of margin	specifies near end loss of margin occurred or not. <i>This element is only shown in detail mode.</i>
near-end-ese	Parameter type: <Alarm::NearEndESE> (yes no) Possible values: - yes : near end excessive severe errors occurred - no : no near end excessive severe errors occurred	specifies near end excessive severe errors occurred or not. <i>This element is only shown in detail mode.</i>
line-config	Parameter type: <Alarm::LineConfig> (config-error config-ok) Possible values: - config-error : line configuration data cannot be used - config-ok : Line configuration data OK	specifies whether line configuration data is used or not. <i>This element is only shown in detail mode.</i>
line-capacity	Parameter type: <Alarm::LineCapacity> (below-requirement meets-requirement) Possible values: - below-requirement : line capacity not enough to set up requested profile - meets-requirement : line capacity enough to set up requested profile	specifies whether line capacity is set up or not. <i>This element is only shown in detail mode.</i>
near-end-bitrate	Parameter type: <Alarm::NearEndBRthres> (below-plan meets-plan) Possible values: - below-plan : upstream planned bitrate not reached after initialization - meets-plan : upstream planned bitrate reached	specifies whether upstream planned bitrate reached or not after initialization. <i>This element is only shown in detail mode.</i>
near-end-ncd	Parameter type: <Alarm::NearEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no near end cell delineation - cell-deline-occurred : near end cell delineation occurred	specifies whether near end cell delineation is occurred or not. <i>This element is only shown in detail mode.</i>
near-end-lcd	Parameter type: <Alarm::NearEndLCD> (yes no) Possible values: - yes : loss of near end cell deliniation - no : no loss of near end cell deliniation	specifies whether loss of near end cell deliniation is occurred or not. <i>This element is only shown in detail mode.</i>
far-end-los	Parameter type: <Alarm::FarEndLOS> (yes no) Possible values: - yes : far end loss of signal occurred - no : no far end loss of signal	specifies whether far end loss of signal occurred or not. <i>This element is only shown in detail mode.</i>
far-end-lof	Parameter type: <Alarm::FarEndLOF> (yes	specifies whether far end loss of frame occurred or not.

104 Current Alarm Status Commands

name	Type	Description
	no) Possible values: - yes : far end loss of frame occurred - no : no far end loss of frame	<i>This element is only shown in detail mode.</i>
far-end-lpr	Parameter type: <Alarm::FarEndLPR> (yes no) Possible values: - yes : far end loss of power detected - no : no far end loss of power	specifies whether far end loss of power detected or not. <i>This element is only shown in detail mode.</i>
far-end-lol	Parameter type: <Alarm::FarEndLOL> (yes no) Possible values: - yes : far end loss of link detected - no : no far end loss of link	specifies whether far end loss of link detected or not. <i>This element is only shown in detail mode.</i>
far-end-lom	Parameter type: <Alarm::FarEndLOM> (yes no) Possible values: - yes : far end loss of margin occurred - no : no far end loss of margin	specifies whether far end loss of margin occurred or not. <i>This element is only shown in detail mode.</i>
far-end-ese	Parameter type: <Alarm::FarEndESE> (yes no) Possible values: - yes : far end excessive severe errors occurred - no : no far end excessive severe errors occurred	specifies whether far end excessive severe errors occurred or not. <i>This element is only shown in detail mode.</i>
xdsl-init	Parameter type: <Alarm::Initialization> (failed successful) Possible values: - failed : initialization unsuccessful due to communication problem - successful : initialization successful	specifies xdsl line initialization is successful or not. <i>This element is only shown in detail mode.</i>
peer-modem	Parameter type: <Alarm::PeerModem> (no yes) Possible values: - no : no peer modem detected - yes : peer modem detected	specifies whether peer modem detected or not. <i>This element is only shown in detail mode.</i>
far-end-bitrate	Parameter type: <Alarm::FarEndBRthres> (below-plan meets-plan) Possible values: - below-plan : downstream planned bitrate not reached after initialization - meets-plan : downstream planned bitrate reached	specifies whether downstream planned bitrate reached or not. <i>This element is only shown in detail mode.</i>
far-end-ncd	Parameter type: <Alarm::FarEndNCD> (no-cell-deline cell-deline-occurred) Possible values: - no-cell-deline : no far end cell delineation - cell-deline-occurred : far end cell delineation occurred	specifies whether far end cell delineation occurred or not. <i>This element is only shown in detail mode.</i>
far-end-lcd	Parameter type: <Alarm::FarEndLCD> (yes no)	specifies there is loss of far end cell delineation or not. <i>This element is only shown in</i>

name	Type	Description
	Possible values: - yes : loss of far end cell deliniation - no : no loss of far end cell deliniation	<i>detail mode.</i>
far-end-upbo-vio	Parameter type: <Alarm::FarEndUPBO> (yes no) Possible values: - yes : UPBO violation - no : no UPBO violation	UPBO violation <i>This element is only shown in detail mode.</i>
far-end-mis-peer-35b	Parameter type: <Alarm::FarEndMismatchPeer35B> (yes no) Possible values: - yes : VDSL2 35b opmode mismatch between XTU-C and XTU-R - no : No VDSL2 35b opmode mismatch between XTU-C and XTU-R	VDSL2 35b opmode mismatch between XTU-C and XTU-R <i>This element is only shown in detail mode.</i>
far-end-cpe-pol	Parameter type: <Alarm::FarEndActFail> (yes no) Possible values: - yes : activation failure due to CPE policing - no : no activation failure due to CPE policing	activation failure due to CPE policing <i>This element is only shown in detail mode.</i>
tpstc-mis	Parameter type: <Alarm::TpstcMis> (yes no) Possible values: - yes : mismatch between the configured tps-tc mode and the mode supported by the connected cpe - no : no mismatch between the configured and the tpstc mode supported by connected cpe	mismatch between the configured tps-tc mode and the mode supported by the connected cpe <i>This element is only shown in detail mode.</i>
forced-rtx-init	Parameter type: <Alarm::ForcedRtxInit> (failed successful) Possible values: - failed : initialization unsuccessful due to forced retransmission - successful : initialization successful	specifies forced rtx initialization is successful or not <i>This element is only shown in detail mode.</i>
vect-dle	Parameter type: <Alarm::NearEndVectDle> (yes no) Possible values: - yes : loss of us signal due to disorderly leaving event - no : no disorderly leaving detected	specifies whether a disorderly leaving event occurred or not <i>This element is only shown in detail mode.</i>

104.13 TCA xDSL Current Alarm Status Command

Command Description

This command displays the xDSL threshold cross current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current xdsl-tca [ (index) ]
```

Command Parameters

Table 104.13-1 "TCA xDSL Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.13-2 "TCA xDSL Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies where the alarm occurred <i>This element is only shown in detail mode.</i>
errored-secs	Parameter type: <Alarm::ErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of errored seconds exceeded threshold - below-thres : number of errored seconds below threshold	number of errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
es-in-a-day	Parameter type: <Alarm::ErroredSecondsInAday>	errored seconds in a day

name	Type	Description
	(above-thres below-thres) Possible values: - above-thres : number of errored seconds in a day, exceeded threshold - below-thres : number of errored seconds in a day, below threshold	exceeded or below threshold <i>This element is only shown in detail mode.</i>
severely-es	Parameter type: <Alarm::SeverelyErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds exceeded threshold - below-thres : number of severely errored seconds below threshold	number of severely errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
severely-es-in-a-day	Parameter type: <Alarm::SevErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of severely errored seconds in a day, exceeded threshold - below-thres : number of severely errored seconds in a day, below threshold	number of severely errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
unavailable-secs	Parameter type: <Alarm::UnavailableSeconds> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds exceeded threshold - below-thres : number of unavailable seconds below threshold	number of unavailable seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
unavail-secs-in-a-day	Parameter type: <Alarm::UnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of unavailable seconds in a day, exceeded threshold - below-thres : number of unavailable seconds in a day, below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
far-end-es	Parameter type: <Alarm::FarEndErroredSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds exceeded threshold - below-thres : number of far end errored seconds below threshold	number of far end errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-severely-es	Parameter type: <Alarm::FarEndSevErroredSecs> (above-thres below-thres) Possible values: - above-thres : number of far end severely errored seconds exceeded threshold - below-thres : number of far end severely errored seconds below threshold	number of far end severely errored seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-severely-es/day	Parameter type: <Alarm::FarEndSevErroredSecsInAday> (above-thres	number of severely errored seconds in a day, exceeded or

104 Current Alarm Status Commands

name	Type	Description
	below-thres) Possible values: - above-thres : number of far end severely errored seconds in a day, exceeded threshold - below-thres : number of far end severely errored seconds in a day, below threshold	below threshold <i>This element is only shown in detail mode.</i>
fe-unavail-secs	Parameter type: <Alarm::FarEndUnavailSecs> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds exceeded threshold - below-thres : number of far end unavailable seconds below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-unavail-sec/day	Parameter type: <Alarm::FarEndUnavailSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end unavailable seconds in a day, exceeded threshold - below-thres : number of far end unavailable seconds in a day, below threshold	number of far end unavailable seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-es-in-a-day	Parameter type: <Alarm::FarEndErroredSecsInAday> (above-thres below-thres) Possible values: - above-thres : number of far end errored seconds in a day, exceeded threshold - below-thres : number of far end errored seconds in a day, below threshold	number of far end errored seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
leftrs	Parameter type: <Alarm::LeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds exceeded threshold - below-thres : number of low error free throughput seconds below threshold	number of low error free throughput seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
leftrs-in-a-day	Parameter type: <Alarm::LeftrSecondsInAday> (above-thres below-thres) Possible values: - above-thres : number of low error free throughput seconds in a day, exceeded threshold - below-thres : number of low error free throughput seconds in a day, below threshold	number of low error free throughput seconds in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-leftrs	Parameter type: <Alarm::FarEndLeftrSeconds> (above-thres below-thres) Possible values: - above-thres : number of far end low error free throughput seconds exceeded threshold - below-thres : number of far end low error free throughput seconds below threshold	number of far end low error free throughput seconds exceeded or below threshold <i>This element is only shown in detail mode.</i>
fe-leftrs-in-a-day	Parameter type: <Alarm::FarEndLeftrSecondsInAday> (above-thres below-thres)	number of far end low error free throughput seconds in a day, exceeded or below threshold

name	Type	Description
	Possible values: - above-thres : number of far end low error free throughput seconds in a day, exceeded threshold - below-thres : number of far end low error free throughput seconds in a day, below threshold	<i>This element is only shown in detail mode.</i>
xtca-auto-port-reset	Parameter type: <Alarm::AutoPortResetInAweek> (above-thres below-thres) Possible values: - above-thres : number of auto-port-resets reached threshold with in a week - below-thres : number of auto-port-resets below threshold	number of auto-port-resets in a week reached threshold <i>This element is only shown in detail mode.</i>
reinit	Parameter type: <Alarm::Reinit> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	number of Reinitialization count in 15min, exceeded or below threshold <i>This element is only shown in detail mode.</i>
reinit-in-a-day	Parameter type: <Alarm::ReinitInAday> (above-thres below-thres) Possible values: - above-thres : number of reinit counter exceeded threshold - below-thres : number of reinit counter below threshold	number of Reinitialization count in a day, exceeded or below threshold <i>This element is only shown in detail mode.</i>

104.14 OLT General Current Alarm Status Command

Command Description

This command displays the OLT general current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current olt-gen [ (index) ]
```

Command Parameters

Table 104.14-1 "OLT General Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.14-2 "OLT General Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Gpon::PonId> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

name	Type	Description
	Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	
Only Show Details: current alarm log status		
name	Type	Description
olt-pon-comm	Parameter type: <Alarm::OltPonComm> ((failing fail) ok) Possible values: - failing : OLT port communication is failing - fail : OLT port communication is failing - ok : port protection is ok	current status of PON Communication failure on OLT Port <i>This element is only shown in detail mode.</i>
olt-gen-tf	Parameter type: <Alarm::OltGenTf> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of transmit failure on OLT port <i>This element is only shown in detail mode.</i>
olt-new-ont	Parameter type: <Alarm::OltNewOnt> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of unprovisioned ont appearance <i>This element is only shown in detail mode.</i>
olt-pon-mea	Parameter type: <Alarm::OltPonMea> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of pon provision failure. <i>This element is only shown in detail mode.</i>
olt-pon-loss	Parameter type: <Alarm::OltPonLoss> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of pon loss. <i>This element is only shown in detail mode.</i>
pon-rogue-test	Parameter type: <Alarm::PonRogueTest> ((failing fail) ok) Possible values: - failing : Rogue ONT detection mechanism effective is failing - fail : Rogue ONT detection mechanism effective is failing - ok : Rogue ONT detection mechanism effective is ok	current status of diagnostic tests <i>This element is only shown in detail mode.</i>
onu-loid-conflict	Parameter type: <Alarm::OnuLoidConflict> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing	current status of loid conflict ont. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- ok : port protection is ok	
onu-loid-pwd-err	Parameter type: <Alarm::OnuLoidPwdErr> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of loid password error. <i>This element is only shown in detail mode.</i>
stk-laser-dis	Parameter type: <Alarm::StkLaserDis> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of stuck laser disabled. <i>This element is only shown in detail mode.</i>
pon-alien-test	Parameter type: <Alarm::PonAlienTest> ((failing fail) ok) Possible values: - failing : Alien ONT detection mechanism is active - fail : Alien ONT detection mechanism is active - ok : Alien ONT detection mechanism is not active	current status of alien diagnostic tests <i>This element is only shown in detail mode.</i>
pon-alien-detect	Parameter type: <Alarm::AlienDetected> ((failing fail) ok) Possible values: - failing : Alien ONT detected - fail : Alien ONT detected - ok : No alien ONT detected	current status of alien detect <i>This element is only shown in detail mode.</i>
pon-rng-mismatch	Parameter type: <Alarm::PonRngMismatch> ((failing fail) ok) Possible values: - failing : ranging mismatch detection mechanism effective is failing - fail : ranging mismatch detection mechanism effective is failing - ok : ranging mismatch detection mechanism effective is ok	current status of ranging mismatch <i>This element is only shown in detail mode.</i>
pon-sfp-mismatch	Parameter type: <Alarm::PonSfpMismatch> ((failing fail) ok) Possible values: - failing : pon sfp mismatch is failing - fail : pon sfp mismatch is failing - ok : pon sfp mismatch is ok	current status of sfp mismatch <i>This element is only shown in detail mode.</i>
deactont-high-tca	Parameter type: <Alarm::DeactOntHighTca> (failing ok) Possible values: - failing : pon deactivated ont amount exceed high threshold occurred - ok : pon deactivated ont amount is less than high threshold occurred	current status of deactont high tca <i>This element is only shown in detail mode.</i>
deactont-low-tca	Parameter type: <Alarm::DeactOntLowTca> (failing ok) Possible values:	current status of deactont low tca <i>This element is only shown in detail mode.</i>

name	Type	Description
	- failing : pon deactivated ont amount exceed low threshold occurred - ok : pon deactivated ont amount is less than low threshold occurred	
datapath-integ	Parameter type: <Alarm::DataPathInteg> (failing ok) Possible values: - failing : number of ONTs with SIPREGTO alarm exceeds threshold - ok : number of ONTs with SIPREGTO alarm does not exceed the threshold	current status of PON Data Path Integrity <i>This element is only shown in detail mode.</i>
ddr-fault	Parameter type: <Alarm::DdrFault> (failing ok) Possible values: - failing : pon failure due to ddr fault - ok : ddr ok	pon failure due to ddr fault <i>This element is only shown in detail mode.</i>

104.15 Vectoring Line Current Alarm Status Command

Command Description

This command displays the vectoring line current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current vect-line [(index)]

Command Parameters

Table 104.15-1 "Vectoring Line Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.15-2 "Vectoring Line Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::XdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port where the alarm has occurred. <i>This element is only shown in detail mode.</i>
xtc-variation-vict	Parameter type: <Alarm::VectXtcVariation> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc	excessive : abnormal amplitude variation in xtc coefficients <i>This element is only shown in detail mode.</i>

name	Type	Description
	coefficients - normal : no excessive xtc coefficients variation	
xtc-variation-dist	Parameter type: <Alarm::VectXtcVariationDist> (excessive normal) Possible values: - excessive : abnormal amplitude variation in xtc coefficients - normal : no excessive xtc coefficients variation	specifies if excessive outgoing crosstalk coefficient variation occurred or not <i>This element is only shown in detail mode.</i>
corrupted-errf	Parameter type: <Alarm::VectCorptErrf> (yes no) Possible values: - yes : at least 10% corrupted or missing errorf samples received - no : received errorf samples ok	specifies if corrupted or at least 10% missing errorf samples received occurred or not <i>This element is only shown in detail mode.</i>
vect-cpe-cap-mismatch	Parameter type: <Alarm::VectCpeCapMism> (yes no) Possible values: - yes : not allowed Vectoring CPE connected - no : allowed Vectoring CPE connected	specifies if an allowed Vectoring CPE is connected or not <i>This element is only shown in detail mode.</i>
vect-conf-not-feas	Parameter type: <Alarm::VectConfNotFeas> (yes no) Possible values: - yes : vectoring configuration not feasible - no : vectoring configuration feasible	specifies if the vectoring configuration is feasible <i>This element is only shown in detail mode.</i>

104.16 Vectoring Board Current Alarm Status Command

Command Description

This command displays the vectoring board current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current vect-board [(index)]

Command Parameters

Table 104.16-1 "Vectoring Board Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.16-2 "Vectoring Board Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-index	Parameter type: <Equipm::EqptVpSlotIndex> (ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	specifies where the alarm has occurred. <i>This element is only shown in detail mode.</i>
vp-link-index	Parameter type: <Alarm::VectVpLinkId2> - specifies the soft-link or the vp-link on the vp-board, or zero - range: [0,1...16]	this is the vplink id. This index has value zero when it is not used <i>This element is only shown in detail mode.</i>
vp-lt-mismatch	Parameter type: <Alarm::VectVpLtMism>	specifies if a mismatch between

name	Type	Description
	(yes no) Possible values: - yes : mismatch between expected and actual vp-lt mapping or incompatible sw version on vp and lt - no : expected and actual vp-lt in line or vp and lt have compatible sw versions, OR autodiscovery enabled on vp, autodiscovery disabled on lt	expected and actual vp-lt mapping OR incompatible sw version on vp and lt is detected or not. In case vplt-autodiscovery disabled on vp, failure reported on vp-board. In case vplt-autodiscovery enabled on lt, failure reported on lt-board. <i>This element is only shown in detail mode.</i>
qsfp-id	Parameter type: <Alarm::VectQsfpInvalidNokiaID> (invalid valid) Possible values: - invalid : QSFP does not have valid Nokia ID - valid : QSFP has valid Nokia ID OR no QSFP detected.	specifies if detected QSFP of the frontcable has a valid Nokia ID or not <i>This element is only shown in detail mode.</i>
vp-lt-link	Parameter type: <Alarm::VPLTLINKFAIL> (linkdown linkup) Possible values: - linkdown : vp-lt link problem - linkup : vp-lt link ok or no lt-expected OR autodiscovery enabled on vp, autodiscovery disabled on lt	specifies if a VP-LT link failure is detected or not. In case vplt-autodiscovery disabled on vp, failure reported on vp-board when an lt was expected but no valid connection between vp-lt. In case vplt-autodiscovery enabled on lt, failure reported on lt-board when no valid connection between vp-lt. <i>This element is only shown in detail mode.</i>
vect-no-gain-at-init	Parameter type: <Alarm::VECTNOGAINATINIT> (yes no) Possible values: - yes : Lines cannot train in gain-at-init mode - no : Lines can train in gain-at-init mode	vectoring gain-at-init mode is not feasible due to excessive number of non-FDPS capable CPEs <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::VpLtLinkFailAdditionalInfo> - string contains slot identifier (type-based slot-numbering), isam ipaddress, isam-id , qsfp-state of the peer slv-vp board - length: x<=512	AdditionalInfo in case a vp-lt link failure is reported, or empty string <i>This element is only shown in detail mode.</i>

104.17 Electrical-to-Optical Conversion Current Alarm Status Command

Command Description

This command displays the Electrical-to-Optical conversion current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current eo-conversion [(index)]

Command Parameters

Table 104.17-1 "Electrical-to-Optical Conversion Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.17-2 "Electrical-to-Optical Conversion Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <SignedInteger> - a signed integer	identifies where the alarm occurred. <i>This element is only shown in detail mode.</i>
loss-of-signal	Parameter type: <Alarm::EoConvLOS> (yes no) Possible values: - yes : loss of signal detected in the EO conversion module - no : no loss of signal detected in the EO conversion module	specifies whether loss of signal detected or not in the EO conversion module <i>This element is only shown in detail mode.</i>
transmission	Parameter type: <Alarm::EoConvTx> (faulty ok)	specifies whether transmission fault is occurred or not in the EO module

name	Type	Description
	Possible values: - faulty : transmission fault in the EO module - ok : transmission OK	<i>This element is only shown in detail mode.</i>

104.18 Authentication Current Alarm Status Command

Command Description

This command displays the authentication current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current authentication [(index)]

Command Parameters

Table 104.18-1 "Authentication Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.18-2 "Authentication Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
uni	Parameter type: <Itf::BridgePortItf> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> /	specify which uni the alarm occurred on. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE	
vlan-assign	Parameter type: <Alarm::VLANAssignment> (failed successful) Possible values: - failed : failure to assign a VLAN for a user session - successful : assigned a VLAN for a user session	specifies whether a VLAN for a user session is assigned or failed <i>This element is only shown in detail mode.</i>
vsa-info-invalid	Parameter type: <Alarm::VSAValid> (yes no) Possible values: - yes : invalid VSA info alarm from RADIUS - no : valid VSA info from RADIUS and no alarm	specifies whether vsa information valid or not from RADIUS server. <i>This element is only shown in detail mode.</i>
mac-conflict	Parameter type: <Alarm::MACConflict> (yes	specifies whether mac conflict occurred or not in mac based

104 Current Alarm Status Commands

name	Type	Description
	no) Possible values: - yes : status of auth-mac-conflict alarm occurred - no : no status of auth-mac-conflict alarm occurred	authentication. <i>This element is only shown in detail mode.</i>
user-pwd-fault	Parameter type: <Alarm::USRPWDFault> (yes no) Possible values: - yes : invalid user or password alarm occurred - no : valid user and password and no alarm	specifies whether user or password valid or not in mac based authenticaiton. <i>This element is only shown in detail mode.</i>

104.19 xDSL Bonding Current Alarm Status Command

Command Description

This command displays the xDSL Bonding current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current bonding-group [(index)]

Command Parameters

Table 104.19-1 "xDSL Bonding Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.19-2 "xDSL Bonding Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
group	Parameter type: <Xdsl::BondingInterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the bonding group interface index <i>This element is only shown in detail mode.</i>
up-plan-bitrate	Parameter type: <Alarm::UpPlannedBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum	specifies whether the actual group upstream bit rate is above the group upstream planned bit rate or not <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
	upstream bitrate but below the group upstream planned bitrate - ok : actual group bitrate is above the group upstream planned bitrate	<i>detail mode.</i>
down-plan-bitrate	Parameter type: <Alarm::DownPlanBitrate> (failure ok) Possible values: - failure : actual group bitrate is above the minimum downstream bitrate but below the group downstream planned bitrate - ok : actual group bitrate is above the group downstream planned bitrate	specifies whether the actual group downstream bit rate is above the group downstream planned bit rate or not <i>This element is only shown in detail mode.</i>
up-min-bitrate	Parameter type: <Alarm::UpMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group upstream minimum bitrate - ok : actual group bitrate is above the group upstream minimum bitrate	specifies whether the actual group upstream bit rate is above the group upstream minimum bit rate or not <i>This element is only shown in detail mode.</i>
down-min-bitrate	Parameter type: <Alarm::DownMinBitrate> (failure ok) Possible values: - failure : actual group bitrate is below the group downstream minimum bitrate - ok : actual group bitrate is above the group downstream minimum bitrate	specifies whether the actual group downstream bit rate is above the group downstream minimum bit rate or not <i>This element is only shown in detail mode.</i>
up-config	Parameter type: <Alarm::UpConfig> (not-feasible feasible) Possible values: - not-feasible : upstream configuration not feasible - feasible : upstream configuration feasible	specifies whether the upstream configuration is feasible or not <i>This element is only shown in detail mode.</i>
down-config	Parameter type: <Alarm::DownConfig> (not-feasible feasible) Possible values: - not-feasible : downstream configuration not feasible - feasible : downstream configuration feasible	specifies whether the downstream configuration is feasible or not <i>This element is only shown in detail mode.</i>
bond-cpe-conn	Parameter type: <Alarm::BondCPE> (not-connected connected) Possible values: - not-connected : bonding cpe modem not connected - connected : bonding cpe modem connected	specifies whether a bonding CPE modem is connected or not <i>This element is only shown in detail mode.</i>
multiple-cpes	Parameter type: <Alarm::BgConnCPE> (true false) Possible values: - true : bonding group has multiple cpe modems connected - false : bonding group has one cpe modem connected	specifies whether the lines of a bonding group are connected to multiple CPEs or only one <i>This element is only shown in detail mode.</i>
register	Parameter type: <Alarm::BgRegFail> (failure ok) Possible values:	specifies whether a discovery or aggregation failure is encountered or not <i>This element is only shown in</i>

name	Type	Description
	- failure : bonding group discovery or aggregation register failure detected - ok : bonding group discovery or aggregation register failure not detected	<i>detail mode.</i>
group-incomplete	Parameter type: <Alarm::BgNotCompl> (true false) Possible values: - true : bonding group is incomplete - false : bonding group is complete	specifies whether all configured lines of the bonding group are part of the bonding group <i>This element is only shown in detail mode.</i>

104.20 Redundancy Current Alarm Status Command

Command Description

This command displays the redundancy current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current redundancy [(index)]

Command Parameters

Table 104.20-1 "Redundancy Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.20-2 "Redundancy Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
loss-swo-cap	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	identify the swichover capability in a redundant system. <i>This element is only shown in detail mode.</i>
ping-check-fail	Parameter type: <Alarm::PingCheck> (failure successful) Possible values: - failure : system failure of ping check - successful : system successful of ping check	identify the ping check in a redundant system. <i>This element is only shown in detail mode.</i>

104.21 Custom Current Alarm Status Command

Command Description

This command displays the custom current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current custom [(index)]

Command Parameters

Table 104.21-1 "Custom Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.21-2 "Custom Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
custom-alarm1	Parameter type: <Alarm::custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm1 . <i>This element is only shown in detail mode.</i>
custom-alarm2	Parameter type: <Alarm::custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm2 . <i>This element is only shown in detail mode.</i>
custom-alarm3	Parameter type: <Alarm::custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm3 . <i>This element is only shown in detail mode.</i>
custom-alarm4	Parameter type: <Alarm::custom4>	identify the customizableAlarm4

104 Current Alarm Status Commands

name	Type	Description
	(yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	. <i>This element is only shown in detail mode.</i>
custom-alarm5	Parameter type: <Alarm::custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm5 . <i>This element is only shown in detail mode.</i>
custom-alarm6	Parameter type: <Alarm::custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm6 . <i>This element is only shown in detail mode.</i>
custom-alarm7	Parameter type: <Alarm::custom7> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm7 . <i>This element is only shown in detail mode.</i>
custom-alarm8	Parameter type: <Alarm::custom8> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm8 . <i>This element is only shown in detail mode.</i>
custom-alarm9	Parameter type: <Alarm::custom9> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm9 . <i>This element is only shown in detail mode.</i>
custom-alarm10	Parameter type: <Alarm::custom10> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm10 . <i>This element is only shown in detail mode.</i>
custom-alarm11	Parameter type: <Alarm::custom11> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm11 . <i>This element is only shown in detail mode.</i>
custom-alarm12	Parameter type: <Alarm::custom12> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm12 . <i>This element is only shown in detail mode.</i>
custom-alarm13	Parameter type: <Alarm::custom13> (yes no) Possible values:	identify the customizableAlarm13 . <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	
custom-alarm14	Parameter type: <Alarm::custom14> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm14 . <i>This element is only shown in detail mode.</i>
custom-alarm15	Parameter type: <Alarm::custom15> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm15 . <i>This element is only shown in detail mode.</i>
custom-alarm16	Parameter type: <Alarm::custom16> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm16 . <i>This element is only shown in detail mode.</i>
custom-alarm17	Parameter type: <Alarm::custom17> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the customizableAlarm17 . <i>This element is only shown in detail mode.</i>

Only Show Details: host expansion shelves customizable alarms

name	Type	Description
shelf	Parameter type: <Equipm::HolderId> (<Eqpt::RackId> / <Eqpt::ShelfId> not-applicable) Possible values: - not-applicable : not applicable Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	this is the shelf id (equipment holder id) for host expansion alarms, otherwise it is the rack ID <i>This element is only shown in detail mode.</i>
he-custom-alarm1	Parameter type: <Alarm::he-custom1> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm1 . <i>This element is only shown in detail mode.</i>
he-custom-alarm2	Parameter type: <Alarm::he-custom2> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm2 . <i>This element is only shown in detail mode.</i>
he-custom-alarm3	Parameter type: <Alarm::he-custom3> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm3 . <i>This element is only shown in detail mode.</i>
he-custom-alarm4	Parameter type: <Alarm::he-custom4> (yes	identify the host expansion shelf's customizableAlarm4 .

104 Current Alarm Status Commands

name	Type	Description
	no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	<i>This element is only shown in detail mode.</i>
he-custom-alarm5	Parameter type: <Alarm::he-custom5> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm5 . <i>This element is only shown in detail mode.</i>
he-custom-alarm6	Parameter type: <Alarm::he-custom6> (yes no) Possible values: - yes : Miscellaneous environment alarm - no : no Miscellaneous environment alarm	identify the host expansion shelf's customizableAlarm6 . <i>This element is only shown in detail mode.</i>

104.22 SFP Current Alarm Status Command

Command Description

This command displays the SFP current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sfp [ (index) ]
```

Command Parameters

Table 104.22-1 "SFP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.22-2 "SFP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
alarm index 1	Parameter type: <Alarm::SfpAlarmIdx1Type> (<Alarm::SfpAlarmIdx1> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - lt : the lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::SfpAlarmIdx1> - the host port faceplate number or the equipment slot-id for expansion shelf alarm	this is the host sfp faceplate number for host alarms or it is the equipment slot id for expansion shelf alarms <i>This element is only shown in detail mode.</i>
alarm index 2	Parameter type: <Ihub::EthernetPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex>	this is the ethernet port id or LT slot for host alarms, this index is not used for expansion shelf alarms <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
	nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> not-applicable lt-slot : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - lt-slot : the port in lt slot - not-applicable : no port Possible values: - sfp : SFP port - xfp : XFP port - eth : RJ45 or lemi port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number	detail mode.

Only Show Details: host shelf alarms		
name	Type	Description
host-sfp-los	Parameter type: <Alarm::hostSFPLOS> (failing ok) Possible values: - failing : host downlink SFP loss of signal - ok : host downlink SFP signal ok	current status of SFP alarm, Host downlink SFP loss of signal <i>This element is only shown in detail mode.</i>
host-sfp-tx	Parameter type: <Alarm::hostSFPTxFail> (failing ok) Possible values: - failing : host downlink SFP tx failure - ok : host downlink SFP tx ok	current status of SFP alarm, host downlink SFP Tx failure <i>This element is only shown in detail mode.</i>
host-sfp-pres	Parameter type: <Alarm::hostSFPMissing> (not-present present) Possible values: - not-present : host downlink SFP not present - present : host downlink SFP present	current status of SFP alarm, Host downlink SFP not present <i>This element is only shown in detail mode.</i>
host-sfp-id	Parameter type: <Alarm::hostSFPInvalidNokiaID> (invalid valid) Possible values: - invalid : host downlink SFP does not have valid Nokia ID - valid : host downlink SFP has valid Nokia ID	current status of SFP alarm, host downlink SFP does not have valid Nokia ID <i>This element is only shown in detail mode.</i>
host-sfp-ctrl	Parameter type: <Alarm::hostSFPControlFail>	current status of SFP alarm, host

name	Type	Description
	(failing ok) Possible values: - failing : host downlink SFP control failure - ok : host downlink SFP control ok	downlink SFP control failure <i>This element is only shown in detail mode.</i>
host-sfp-rmtlt	Parameter type: <Alarm::hostSFPUnexpectedRemoteLT> (yes no) Possible values: - yes : host shelf SFP unexpected remote LT plug-in - no : host shelf SFP expected remote LT plug-in	current status of SFP alarm, host downlink SFP unexpected remote plug-in <i>This element is only shown in detail mode.</i>
host-sfp-mismatch	Parameter type: <Alarm::hostSFPAssignmentMismatch> (yes no) Possible values: - yes : host shelf SFP assignment does not match reported rack/shelf/slot - no : host shelf SFP assignment matches reported rack/shelf/slot	current status of SFP alarm, host downlink SFP assignment does not match reported rack/shelf/slot <i>This element is only shown in detail mode.</i>
host-sfp-incompt	Parameter type: <Alarm::hostSFPIncompatibleShelf> (yes no) Possible values: - yes : host shelf SFP incompatible shelf type detected - no : host shelf SFP compatible shelf type detected	current status of SFP alarm, host downlink SFP detected incompatible shelf type <i>This element is only shown in detail mode.</i>

Only Show Details: expansion shelf alarms

name	Type	Description
exp-sfp-los	Parameter type: <Alarm::expansionShelfSFPLos> (failing ok) Possible values: - failing : expansion shelf downlink SFP loss of signal - ok : expansion shelf downlink SFP signal ok	current status of SFP alarm, Expansion side SFP loss of signal <i>This element is only shown in detail mode.</i>
exp-sfp-tx	Parameter type: <Alarm::expansionShelfSFPTxFail> (failing ok) Possible values: - failing : expansion shelf host downlink SFP tx failure - ok : expansion shelf downlink SFP tx ok	current status of SFP alarm, Expansion shelf SFP Tx failure <i>This element is only shown in detail mode.</i>
exp-sfp-pres	Parameter type: <Alarm::expansionShelfSFPMissing> (not-present present) Possible values: - not-present : expansion shelf downlink SFP not present - present : expansion shelf downlink SFP present	current status of SFP alarm, expansion shelf SFP not present <i>This element is only shown in detail mode.</i>
exp-sfp-id	Parameter type: <Alarm::expShelfSFPInvalidNokiaID> (invalid valid) Possible values: - invalid : expansion shelf downlink SFP does not have valid Nokia ID - valid : expansion shelf downlink SFP has valid Nokia ID	current status of SFP alarm, expansion shelf SFP does not have valid Nokia ID <i>This element is only shown in detail mode.</i>
exp-sfp-ctrl	Parameter type: <Alarm::expansionShelfSFPCtrlFail> (failing ok) Possible values: - failing : expansion shelf downlink SFP control failure	current status of SFP alarm, expansion shelf downlink SFP control failure <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- ok : expansion shelf downlink SFP control ok	
exp-sfp-1-los	Parameter type: <Alarm::expansionShelfSFP1Los> (failing ok) Possible values: - failing : expansion shelf downlink SFP1 loss of signal - ok : expansion shelf downlink SFP1 signal ok	current status of SFP1 alarm, Expansion side SFP1 loss of signal <i>This element is only shown in detail mode.</i>
exp-sfp-2-los	Parameter type: <Alarm::expansionShelfSFP2Los> (failing ok) Possible values: - failing : expansion shelf downlink SFP2 loss of signal - ok : expansion shelf downlink SFP2 signal ok	current status of SFP2 alarm, Expansion side SFP2 loss of signal <i>This element is only shown in detail mode.</i>

104.23 Custom External Current Alarm Status Command

Command Description

This command displays the custom external current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current custom-ext-alarm [(index)]

Command Parameters

Table 104.23-1 "Custom External Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.23-2 "Custom External Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify where the alarm has occurred. <i>This element is always shown.</i>

104 Current Alarm Status Commands

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
ext-alarm1	Parameter type: <Alarm::custExtAlarm1> (yes no) Possible values: - yes : customizable external alarm 1 - no : no customizable external alarm 1	current status specifying external alarm 1 is present or not <i>This element is always shown.</i>
ext-alarm2	Parameter type: <Alarm::custExtAlarm2> (yes no) Possible values: - yes : customizable external alarm 2 - no : no customizable external alarm 2	current status specifying external alarm 2 is present or not <i>This element is always shown.</i>
ext-alarm3	Parameter type: <Alarm::custExtAlarm3> (yes no) Possible values: - yes : customizable external alarm 3 - no : no customizable external alarm 3	current status specifying external alarm 3 is present or not <i>This element is always shown.</i>
ext-alarm4	Parameter type: <Alarm::custExtAlarm4> (yes no) Possible values: - yes : customizable external alarm 4 - no : no customizable external alarm 4	current status specifying external alarm 4 is present or not <i>This element is always shown.</i>
ext-alarm5	Parameter type: <Alarm::custExtAlarm5> (yes no) Possible values: - yes : customizable external alarm 5 - no : no customizable external alarm 5	current status specifying external alarm 5 is present or not <i>This element is always shown.</i>

104.24 SFP RSSI Current Alarm Status Command

Command Description

This command displays the SFP RSSI current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sfrssi [(index)]

Command Parameters

Table 104.24-1 "SFP RSSI Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

temp-low-warn	Parameter type: <Alarm::NTNTIOTEMPELOWARN> (yes no) Possible values: - yes : temperature is too high than the configured warning low threshold - no : temperature is ok	current status temperature is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>

104.25 PPP Cross-Connect Engine TCA Current Alarm Status Command

Command Description

This command displays the pppcc engine tca current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current pppcc-engine-tca [(index)]

Command Parameters

Table 104.25-1 "PPP Cross-Connect Engine TCA Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.25-2 "PPP Cross-Connect Engine TCA Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
engine	Parameter type: <Vlan::StackedVlanSigned> (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndex> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndex> - service vlan identity - range: [2...4093,4094] Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093,4094,4095,4096]	this is the ppp-cc engine number <i>This element is only shown in detail mode.</i>

Only Show Details: pppoe cross-connect engine tca alarms		
name	Type	Description
pppcce-trans-15min-tca	Parameter type: <Alarm::PPPCCETRANS15MIN> (yes no) Possible values: - yes : 15 minutes transaction timeout count exceeds configured TCA - no : 15 minutes transaction timeout count is OK	current 15 minutes transaction timeout count exceeds configured tca <i>This element is only shown in detail mode.</i>
pppcce-sess-15min-tca	Parameter type: <Alarm::PPPCCESESS15MIN> (yes no) Possible values: - yes : 15 minutes session timeout count exceeds configured TCA - no : 15 minutes session timeout count is OK	15 minutes session timeout count exceeds configured TCA <i>This element is only shown in detail mode.</i>
pppcce-trans-1day-tca	Parameter type: <Alarm::PPPCCETRANS1DAY> (yes no) Possible values: - yes : 1day transaction timeout count exceeds configured TCA - no : 1day transaction timeout count is OK	1day transaction timeout count exceeds configured TCA <i>This element is only shown in detail mode.</i>
pppcce-sess-1day-tca	Parameter type: <Alarm::PPPCCESESS1DAY> (yes no) Possible values: - yes : 1day session timeout count exceeds configured TCA - no : 1day session timeout count is OK	1day session timeout count exceeds configured TCA <i>This element is only shown in detail mode.</i>

104.26 Epon Olt Sfp RSSI Current Alarm Status Command

Command Description

This command displays the Epon Olt Sfp RSSI Current alarm.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current eoltrssi [ (index) ]
```

Command Parameters

Table 104.26-1 "Epon Olt Sfp RSSI Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

eolt-txpwr-lw-warn	Parameter type: <Alarm::OLTTPWLOWARN> (yes no) Possible values: - yes : Olt sfp Tx power is lower than the configured warning low threshold - no : Olt sfp Tx power current is ok	current status Tx optical power is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-txbias-hi-warn	Parameter type: <Alarm::OLTTXBIASHIWARN> (yes no) Possible values: - yes : Olt sfp Bias is higher than the configured warning high threshold - no : Olt sfp Bias current is ok	current status bias is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-txbias-lw-warn	Parameter type: <Alarm::OLTTXBIASLOWARN> (yes no) Possible values: - yes : Olt sfp Bias is lower than the configured warning low threshold - no : Olt sfp Bias current is ok	current status bias is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-volt-hi-warn	Parameter type: <Alarm::OLTVOLHIWARN> (yes no) Possible values: - yes : Olt sfp voltage is higher than the configured warning high threshold - no : Olt sfp voltage current is ok	current status voltage is too low than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-volt-lw-warn	Parameter type: <Alarm::OLTVOLLOWARN> (yes no) Possible values: - yes : Olt sfp voltage is lower than the configured warning low threshold - no : Olt sfp voltage current is ok	current status voltage is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-temp-hi-warn	Parameter type: <Alarm::OLTTEMPEHIWARN> (yes no) Possible values: - yes : Olt sfp temperature is higher than the configured warning high threshold - no : Olt sfp temperature current is ok	current status temperature is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-temp-lw-warn	Parameter type: <Alarm::OLTTEMPELOWARN> (yes no) Possible values: - yes : Olt sfp temperature is lower than the configured warning low threshold - no : Olt sfp temperature current is ok	current status temperature is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-txpwr-hi-alm	Parameter type: <Alarm::OLTEXTTPWHI> (yes no) Possible values: - yes : Olt xfp Tx power is higher than the configured alarm	current status Xfp Tx optical power is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>

name	Type	Description
	high threshold - no : Olt xfp Tx power current is ok	
eolt-xfp-txpwr-lw-alm	Parameter type: <Alarm::OLTEXTTXPWLO> (yes no) Possible values: - yes : Olt xfp Tx power is lower than the configured alarm low threshold - no : Olt xfp Tx power current is ok	current status Xfp Tx optical power is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-hi-alm	Parameter type: <Alarm::OLTEXTTXBIASHI> (yes no) Possible values: - yes : Olt xfp Bias is higher than the configured alarm high threshold - no : Olt xfp Bias current is ok	current status Xfp bias is too high than the configured alarm high threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-lw-alm	Parameter type: <Alarm::OLTEXTTXBIASLO> (yes no) Possible values: - yes : Olt xfp Bias is lower than the configured alarm low threshold - no : Olt xfp Bias current is ok	current status Xfp bias is too low than the configured alarm low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-txpwr-hi-warn	Parameter type: <Alarm::OLTEXTTXPWHIWARN> (yes no) Possible values: - yes : Olt xfp Tx power is higher than the configured warning high threshold - no : Olt xfp Tx power current is ok	current status Xfp Tx optical power is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-txpwr-lw-warn	Parameter type: <Alarm::OLTEXTTXPWLOWARN> (yes no) Possible values: - yes : Olt xfp Tx power is lower than the configured warning low threshold - no : Olt xfp Tx power current is ok	current status Xfp Tx optical power is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-hi-warn	Parameter type: <Alarm::OLTEXTTXBIASHIWARN> (yes no) Possible values: - yes : Olt xfp Bias is higher than the configured warning high threshold - no : Olt xfp Bias current is ok	current status Xfp bias is too high than the configured warning high threshold <i>This element is only shown in detail mode.</i>
eolt-xfp-bias-lw-warn	Parameter type: <Alarm::OLTEXTTXBIASLOWARN> (yes no) Possible values: - yes : Olt xfp Bias is lower than the configured warning low threshold - no : Olt xfp Bias current is ok	current status Xfp bias is too low than the configured warning low threshold <i>This element is only shown in detail mode.</i>

104.27 2xE1/DS1 SFP Clock Current Alarm Status Command

Command Description

This command displays the 2xE1/DS1 SFP Clock current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sfpe1t1-clock [ (index) ]
```

Command Parameters

Table 104.27-1 "2xE1/DS1 SFP Clock Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.27-2 "2xE1/DS1 SFP Clock Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
alarm index 1	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2 vlt : <Eqpt::RackId> / <Eqpt::ShelfId> /	this is the nt/ntio slot id for host alarms. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E/FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot - iont : an nt applique slot - lp : an lt applique slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::LtAppliqueSlotId> - the LT Applique slot number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
alarm index 2	Parameter type: <Alarm::e1t1Port> (sfp : <Alarm::E1t1FramerPort> xfp : <Alarm::E1t1FramerPort>) Possible values: - sfp : e1t1 sfp port - xfp : e1t1 xfp port Field type <Alarm::E1t1FramerPort> - value - range: [0...35]	this is the host sfp faceplate number <i>This element is only shown in detail mode.</i>

Only Show Details: e1t1 sfp clock alarms

name	Type	Description
dsx1-serdes-fail	Parameter type: <Alarm::DSX1SERDESFAIL> (yes no) Possible values: - yes : SERDES clock failure alarm - no : SERDES Clock no failure	SERDES clock failure alarm <i>This element is only shown in detail mode.</i>
dsx1-tributary1-fail	Parameter type: <Alarm::DSX1TRIB1FAIL> (yes no) Possible values: - yes : Tributary 1 clock failure alarm - no : Tributary 1 clock no failure	tributary 1 clock failure alarm <i>This element is only shown in detail mode.</i>
dsx1-tributary2-fail	Parameter type: <Alarm::DSX1TRIB2FAIL> (yes no) Possible values: - yes : Tributary 2 clock failure alarm - no : Tributary 2 clock no failure	tributary 2 clock failure alarm <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
dsx1-los-fail	Parameter type: <Alarm::DSX1LOSFAIL> (yes no) Possible values: - yes : All selected tributaries in Loss Of Signal - no : No All selected tributaries in Loss Of Signal	all selected tributaries in loss of signal <i>This element is only shown in detail mode.</i>
dsx1-ais-sync	Parameter type: <Alarm::DSX1AISFAIL> (yes no) Possible values: - yes : Alarm Indication Signal on the tributary selected sync source - no : No Alarm Indication Signal on the tributary selected sync source	alarm indication signal on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-lof-sync	Parameter type: <Alarm::DSX1LOFSYNCFAIL> (yes no) Possible values: - yes : Loss of Frame on the tributary selected sync source - no : No Loss of Frame on the tributary selected sync source	loss of frame on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-los-sync	Parameter type: <Alarm::DSX1LOSSYNCFAIL> (yes no) Possible values: - yes : Loss of Signal on the tributary selected sync source - no : No Loss of Signal on the tributary selected sync source	loss of signal on the tributary selected as sync source <i>This element is only shown in detail mode.</i>
dsx1-deg-fail	Parameter type: <Alarm::DSX1DEGFAIL> (yes no) Possible values: - yes : Signal degrade alarm - no : Signal degrade alarm	signal degrade alarm <i>This element is only shown in detail mode.</i>

104.28 2xE1/DS1 SFP Framer Alarm Status Command

Command Description

This command displays the 2xE1/DS1 SFP Framer current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sfpe1t1-framer [ (index) ]
```

Command Parameters

Table 104.28-1 "2xE1/DS1 SFP Framer Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.28-2 "2xE1/DS1 SFP Framer Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
alarm index 1	Parameter type: <Alarm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> iont : <Eqpt::RackId> / <Eqpt::ShelfId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2 vlt : <Eqpt::RackId> / <Eqpt::ShelfId> /	this is the nt/ntio slot id for host alarms. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	<Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E/FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot - iont : an nt applique slot - lp : an lt applique slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::LtAppliqueSlotId> - the LT Applique slot number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
alarm index 2	Parameter type: <Alarm::e1t1framerPort> (sfp : <Alarm::E1t1FramerPort> : <Alarm::tributary> xfp : <Alarm::E1t1FramerPort> : <Alarm::tributary>) Possible values: - sfp : e1t1 sfp port - xfp : e1t1 xfp port Field type <Alarm::E1t1FramerPort> - value - range: [0...35] Field type <Alarm::tributary> - value - range: [1...2]	this is the host sfp faceplate number <i>This element is only shown in detail mode.</i>

Only Show Details: e1t1 framer alarms		
name	Type	Description
rei-from-liu	Parameter type: <Alarm::DSX1REILIU> (yes no) Possible values: - yes : e1t1 sfp Remote Error Indication Alarm from LIU - no : No e1t1 sfp Remote Error Indication Alarm from LIU	remote error indication alarm from LIU <i>This element is only shown in detail mode.</i>
rdi-from-liu	Parameter type: <Alarm::DSX1RDILIU> (yes no) Possible values: - yes : e1t1 sfp Remote Defect Alarmn from LIU - no : No e1t1 sfp Remote Defect Alarmn from LIU	remote defect indication alarm from LIU <i>This element is only shown in detail mode.</i>
crc6-from-liu	Parameter type: <Alarm::DSX1CRC6LIU> (yes no)	cyclic redundancy check 6 from LIU <i>This element is only shown in</i>

name	Type	Description
	Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 6 from LIU - no : No e1t1 sfp Cyclic Redundancy Check 6 from LIU	<i>detail mode.</i>
crc4-from-liu	Parameter type: <Alarm::DSX1CRC4LIU> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 from LIU - no : No e1t1 sfp Cyclic Redundancy Check 4 from LIU	cyclic redundancy check 4 from LIU <i>This element is only shown in detail mode.</i>
crc4-threshold-from-liu	Parameter type: <Alarm::DSX1CRC4THLIU> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from LIU - no : No e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from LIU	cyclic redundancy check 4 threshold alarm from LIU <i>This element is only shown in detail mode.</i>
ais-from-liu	Parameter type: <Alarm::DSX1AISLIU> (yes no) Possible values: - yes : e1t1 sfp Alarm Indication Signal alarm from LIU - no : No e1t1 sfp Alarm Indication Signal alarm from LIU	alarm indication signal alarm from LIU <i>This element is only shown in detail mode.</i>
los-from-liu	Parameter type: <Alarm::DSX1LOSLIU> (yes no) Possible values: - yes : e1t1 sfp Loss of signal alarm from LIU - no : No e1t1 sfp Loss of signal alarm from LIU	loss of signal alarm from LIU <i>This element is only shown in detail mode.</i>
lof-from-liu	Parameter type: <Alarm::DSX1LOFLIU> (yes no) Possible values: - yes : e1t1 sfp Loss of frame alarm from LIU - no : No e1t1 sfp Loss of frame alarm from LIU	loss of frame alarm from LIU <i>This element is only shown in detail mode.</i>
lomf-from-liu	Parameter type: <Alarm::DSX1LOMFLIU> (yes no) Possible values: - yes : e1t1 sfp Loss of multi frame alarm from LIU - no : No e1t1 sfp Loss of multi frame alarm from LIU	loss of multi frame alarm from LIU <i>This element is only shown in detail mode.</i>
rei-from-iwf	Parameter type: <Alarm::DSX1REIIWF> (yes no) Possible values: - yes : e1t1 sfp Remote Error Indication Alarm from IWF - no : No e1t1 sfp Remote Error Indication Alarm from IWF	remote error indication alarm from IWF <i>This element is only shown in detail mode.</i>
rdi-from-iwf	Parameter type: <Alarm::DSX1RDIIWF> (yes no) Possible values: - yes : e1t1 sfp Remote Defect Alarm from IWF - no : No e1t1 sfp Remote Defect Alarm from IWF	remote defect indication alarm from IWF <i>This element is only shown in detail mode.</i>
crc6-from-iwf	Parameter type: <Alarm::DSX1CRC6IWF> (yes no) Possible values:	cyclic redundancy check 6 from IWF <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- yes : e1t1 sfp Cyclic Redundancy Check 6 from IWF - no : No e1t1 sfp Cyclic Redundancy Check 6 from IWF	
crc4-from-iwf	Parameter type: <Alarm::DSX1CRC4IWF> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 from IWF - no : No e1t1 sfp Cyclic Redundancy Check 4 from IWF	cyclic redundancy check 4 from IWF <i>This element is only shown in detail mode.</i>
crc4-threshold-from-iwf	Parameter type: <Alarm::DSX1CRC4THIWF> (yes no) Possible values: - yes : e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from IWF - no : No e1t1 sfp Cyclic Redundancy Check 4 threshold alarm from IWF	cyclic redundancy check 4 threshold alarm from IWF <i>This element is only shown in detail mode.</i>
ais-from-iwf	Parameter type: <Alarm::DSX1AISIWF> (yes no) Possible values: - yes : e1t1 sfp Alarm Indication Signal alarm from IWF - no : No e1t1 sfp Alarm Indication Signal alarm from IWF	alarm indication signal alarm from IWF <i>This element is only shown in detail mode.</i>
los-from-iwf	Parameter type: <Alarm::DSX1LOSIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of signal alarm from IWF - no : No e1t1 sfp Loss of signal alarm from IWF	loss of signal alarm from IWF <i>This element is only shown in detail mode.</i>
lof-from-iwf	Parameter type: <Alarm::DSX1LOFIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of frame alarm from IWF - no : No e1t1 sfp Loss of frame alarm from IWF	loss of frame alarm from IWF <i>This element is only shown in detail mode.</i>
lomf-from-iwf	Parameter type: <Alarm::DSX1LOMFIWF> (yes no) Possible values: - yes : e1t1 sfp Loss of multi frame alarm from IWF - no : No e1t1 sfp Loss of multi frame alarm from IWF	loss of multi frame alarm from LIU <i>This element is only shown in detail mode.</i>

104.29 Plug In Unit Extended Current Alarm Status Command

Command Description

This command shows the plug-in unit extended current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current plug-in-unit-ext [(index)]

Command Parameters

Table 104.29-1 "Plug In Unit Extended Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.29-2 "Plug In Unit Extended Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
ctrl-dnld-addinfo	Parameter type: <PrintableString> - printable string	displays the current version of controller card. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
fan-alarm	Parameter type: <Alarm::pluginFan> (yes no) Possible values: - yes : fan alarm - no : no fan alarm	current status specifying fan alarm is present or not <i>This element is only shown in detail mode.</i>
dc-a-alarm	Parameter type: <Alarm::plugin-dc-a> (yes no) Possible values: - yes : dc a failure alarm - no : no dc a failure alarm	current status specifying dc-a failure alarm is present or not <i>This element is only shown in detail mode.</i>
dc-b-alarm	Parameter type: <Alarm::plugin-dc-b> (yes no) Possible values: - yes : dc b failure alarm - no : no dc b failure alarm	current status specifying dc-b failure alarm is present or not <i>This element is only shown in detail mode.</i>
dg-alarm	Parameter type: <Alarm::plugin-dg> (yes no) Possible values: - yes : dying gasp alarm - no : no dying gasp alarm	current status specifying dying gasp alarm is present or not <i>This element is only shown in detail mode.</i>
apsf-alarm	Parameter type: <Alarm::pluginApsf> (yes no) Possible values: - yes : apsf failure alarm - no : no apsf failure alarm	power for the applique is available or not <i>This element is only shown in detail mode.</i>
ntr-a-loss	Parameter type: <Alarm::NTRALoss> (yes no) Possible values:	current status specifying NTR-A loss alarm is present or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ntr-a signal unavailable - no : ntr-a signal available	
ntr-b-loss	Parameter type: <Alarm::NTRBLoss> (yes no) Possible values: - yes : ntr-b signal unavailable - no : ntr-b signal available	current status specifying NTR-B loss alarm is present or not <i>This element is only shown in detail mode.</i>
xvps-conf-loss	Parameter type: <Alarm::XvpsConfLoss> (yes no) Possible values: - yes : implicit xvps configuration loss. - no : no implicit xvps configuration loss.	implicit xvps configuration loss or not. <i>This element is only shown in detail mode.</i>
mac-entry-nofree	Parameter type: <Alarm::MacNofree> (nofree free) Possible values: - nofree : no free mac entry in the mac table on the lt board. - free : file transfer server available.	current status specifying no free mac entry in the mac table on the lt board <i>This element is only shown in detail mode.</i>
fibre-conn-mismatch	Parameter type: <Alarm::FibreConnMismatch> (yes no) Possible values: - yes : REM fibre connection mismatch alarm - no : no REM fibre connection mismatch alarm	current status specifying fibre connection mismatch on detected control card. <i>This element is only shown in detail mode.</i>
link-cap-mismatch	Parameter type: <Alarm::LinkCapMismatch> (yes no) Possible values: - yes : actual link speed is not inline with the end-to-end link capability between NT and LT - no : actual link speed is inline with the end-to-end link capability between NT and LT	current status actual link speed is not in line with the end-to-end link capability between NT and LT. <i>This element is only shown in detail mode.</i>
eqpt-cap-mismatch	Parameter type: <Alarm::EqptCapMismatch> (yes no) Possible values: - yes : not all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed. - no : all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed.	current status not all equipment between NT and LT can support the speed that NT and LT can support within the configured MaxLinkSpeed. <i>This element is only shown in detail mode.</i>
ctrl-dnld-failed	Parameter type: <Alarm::CtrlDownloadFailure> (yes no) Possible values: - yes : The downloading of the Software image to the controller card failed.. - no : The downloading of the Software image to the controller card passed.	current status The downloading of the Software image to the controller card failed. <i>This element is only shown in detail mode.</i>
melt-hw-issue	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue	current status MELT hardware issue. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- no : No Board hardware issue.	
melt-board-reset	Parameter type: <Alarm::BoardHWIssue> (yes no) Possible values: - yes : Board hardware issue - no : No Board hardware issue.	current status MELT Board reset. <i>This element is only shown in detail mode.</i>
board-shelf-mismatch	Parameter type: <Alarm::boardShelfMismatch> (yes no) Possible values: - yes : plugged-in board and shelf type are mismatch - no : plugged-in board and shelf type are match	alarm specifying the shelf type and plugged-in board types are mismatch. <i>This element is only shown in detail mode.</i>
single-fan-fail	Parameter type: <Alarm::SINGLEFANFAILURE> (yes no) Possible values: - yes : single fan failure` - no : no single fan failure	current status of single fan failure <i>This element is only shown in detail mode.</i>
multi-fan-fail	Parameter type: <Alarm::MULTIFANFAILURE> (yes no) Possible values: - yes : more than one fan failed - no : NO MULTIPLE fans are failed	current status of MULTIPLE fan failure <i>This element is only shown in detail mode.</i>
fan-tray-missing	Parameter type: <Alarm::FANTRAYMISSING> (yes no) Possible values: - yes : fan tray missing - no : fans tray is present	current status of fan tray <i>This element is only shown in detail mode.</i>

104.30 SIP Server Current Alarm Status Command

Command Description

This command displays the SIP Server current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sip-server [(index)]

Command Parameters

Table 104.30-1 "SIP Server Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.30-2 "SIP Server Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
server-index	Parameter type: <Sip::ServerId> - the SIP server table index - range: [1...128]	identifies sip server <i>This element is only shown in detail mode.</i>
transport-mismatch	Parameter type: <Alarm::transportMismatch> (yes no) Possible values: - yes : mismatch - no : not mismatch	specifies isamv and server transport mismatch or not. <i>This element is only shown in detail mode.</i>
dns-lookup-failure	Parameter type: <Alarm::dnsLookUpFailure> (yes no) Possible values: - yes : fail - no : not fail	specifies dns look up fail or not. <i>This element is only shown in detail mode.</i>

104.31 SIP VSP Current Alarm Status Command

Command Description

This command displays the SIP VSP current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sip-vsp [(index)]

Command Parameters

Table 104.31-1 "SIP VSP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.31-2 "SIP VSP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
vsp-index	Parameter type: <Sip::DialPlanId> - the dial plan table index - range: [1...255]	identifies sip vsp <i>This element is only shown in detail mode.</i>
none-dns-srv	Parameter type: <Alarm::noneDNSSRV> (yes no) Possible values: - yes : none of dns server give reply to to DNS look up - no : dns server give reply to to DNS look up	specifies none of dns server give reply to to DNS look up or not. <i>This element is only shown in detail mode.</i>
no-dns-srv	Parameter type: <Alarm::noDNSSRV> (yes no) Possible values: - yes : no dns server configured when sip request - no : dns server configured when sip request	specifies no dns server configured when sip request or not. <i>This element is only shown in detail mode.</i>
none-srv	Parameter type: <Alarm::noneSRV> (yes no) Possible values:	specifies none sip server give reply when send sip request or not. <i>This element is only shown in</i>

name	Type	Description
	- yes : none sip server give reply when send sip request - no : sip server give reply when send sip request	<i>detail mode.</i>
no-srv	Parameter type: <Alarm::noSRV> (yes no) Possible values: - yes : no sip proxy server configured when send sip request - no : sip proxy server configured when send sip request	specifies no sip proxy server configured when send sip request or not. <i>This element is only shown in detail mode.</i>
reg-srv-unreach	Parameter type: <Alarm::noRegSRV> (yes no) Possible values: - yes : no sip register server give reply when send sip register - no : sip register server give reply when send sip register	specifies no sip register servers give reply when send sip register or not. <i>This element is only shown in detail mode.</i>
prxy-srv-unreach	Parameter type: <Alarm::noPrxySRV> (yes no) Possible values: - yes : no sip proxy server give reply when send sip request - no : sip proxy server give reply when send sip request	specifies no sip proxy servers give reply when send sip request or not. <i>This element is only shown in detail mode.</i>
fo-trigger	Parameter type: <Alarm::foTrigger> (yes no) Possible values: - yes : fail over triggered - no : fail over is not triggered	specifies fail-over is triggered or not. <i>This element is only shown in detail mode.</i>
fb-trigger	Parameter type: <Alarm::fbTrigger> (yes no) Possible values: - yes : fail back triggered - no : fail back is not triggered	specifies fail-back is triggered or not. <i>This element is only shown in detail mode.</i>
du-trigger	Parameter type: <Alarm::duTrigger> (yes no) Possible values: - yes : deliberate update triggered - no : deliberate update is not triggered	specifies deliberate-update is triggered or not. <i>This element is only shown in detail mode.</i>
ssp-missing	Parameter type: <Alarm::sspMissing> (yes no) Possible values: - yes : SSP missing in CDE - no : SSP exist in CDE	specifies ssp missing in cde or not. <i>This element is only shown in detail mode.</i>
dns-pool-exceed	Parameter type: <Alarm::dnsPoolExceed> (yes no) Possible values: - yes : Number of different SG associated DNS pools exceed - no : Number of different SG associated DNS pools exceed	specifies Number of different SG associated DNS pools exceed or not. <i>This element is only shown in detail mode.</i>
lsa-fo-trigger	Parameter type: <Alarm::lsaFoTrigger> (yes no) Possible values: - yes : SIP voice service degraded - fail-over to LSA server - no : fail-over to LSA server is not triggered	specifies lsa-fail-over is triggered or not. <i>This element is only shown in detail mode.</i>

104.32 SIP Dial Plan Current Alarm Status Command

Command Description

This command displays the SIP dial plan current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sip-dial-plan [(index)]

Command Parameters

Table 104.32-1 "SIP Dial Plan Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.32-2 "SIP Dial Plan Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
dialplan-index	Parameter type: <Sip::DialPlanId> - the dial plan table index - range: [1...255]	identifies the dial plan <i>This element is only shown in detail mode.</i>
bad-digitmap	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	specifies sip digitmap status. <i>This element is only shown in detail mode.</i>

104.33 SIP User Agent Current Alarm Status Command

Command Description

This command displays the SIP user agent current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sip-user-agent [(index)]

Command Parameters

Table 104.33-1 "SIP User Agent Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.33-2 "SIP User Agent Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ua-index	Parameter type: <Sip::UserAgentId> - SIP user agent table index - range: [1...255]	identifies the user agent <i>This element is only shown in detail mode.</i>
slot-index	Parameter type: <Equipm::EqptSlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values:	identifies the board <i>This element is only shown in detail mode.</i>

name	Type	Description
	- lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
bad-digitmap	Parameter type: <Alarm::badDigitMap> (yes no) Possible values: - yes : digit map unusable - no : digit map usable	specifies sip digitmap status. <i>This element is only shown in detail mode.</i>
dhcp-unreach	Parameter type: <Alarm::dhcpUnreach> (yes no) Possible values: - yes : The DHCP server is unreachable - no : The DHCP server is reachable	specifies the DHCP server is unreachable or not <i>This element is only shown in detail mode.</i>
dhcp-no-srv	Parameter type: <Alarm::dhcpNoSrv> (yes no) Possible values: - yes : The address in DHCP reply is NULL - no : The address in DHCP reply is not NULL	specifies the address in DHCP reply is NULL or not <i>This element is only shown in detail mode.</i>
dhcp-inv-srv	Parameter type: <Alarm::dhcpInvSrv> (yes no) Possible values: - yes : The address in DHCP reply is invalid - no : The address in DHCP reply is OK	specifies the address in DHCP reply is invalid or not <i>This element is only shown in detail mode.</i>

104.34 SIP Slot Current Alarm Status Command

Command Description

This command displays the SIP slot current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sip-plugin-unit [(index)]

Command Parameters

Table 104.34-1 "SIP Slot Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.34-2 "SIP Slot Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
slot-index	Parameter type: <Equipm::LtSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	identifies the board <i>This element is only shown in detail mode.</i>
short-res	Parameter type: <Alarm::shortResource> (yes no) Possible values: - yes : short call resource - no : have call resource	sepcifies the call resource short or not. <i>This element is only shown in detail mode.</i>
norpniewithsoftdsp	Parameter type: <Alarm::noRpniEWithSoftDsp> (yes no) Possible values:	sepcifies if plan / plug-in RPNI-E board with SoftDsp SW image or not. <i>This element is only shown in</i>

name	Type	Description
	- yes : plan / plug-in RPNI-E board with SoftDsp SW image - no : no plan / plug-in RPNI-E board with SoftDsp SW image	<i>detail mode.</i>

104.35 SIP Termination Current Alarm Status Command

Command Description

This command displays the SIP termination current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sip-termination [(index)]

Command Parameters

Table 104.35-1 "SIP Termination Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.35-2 "SIP Termination Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
term-index	Parameter type: <Itf::PotsLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the termination <i>This element is only shown in detail mode.</i>
unknown-sub	Parameter type: <Alarm::unknownSubscriber> (yes no) Possible values: - yes : wrong subscriber	specifies the sip subscriber unknown or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : right subscriber	
ground-key	Parameter type: <Alarm::groundKey> (yes no) Possible values: - yes : current to ground - no : current not to ground	status of the ground key. <i>This element is only shown in detail mode.</i>
port-hightemp	Parameter type: <Alarm::highTemperature> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of the port temperature. <i>This element is only shown in detail mode.</i>
l1-act-failure	Parameter type: <Alarm::l1ActFailure> (yes no) Possible values: - yes : high temperature - no : not high temperature	status of the layer 1 activation. <i>This element is only shown in detail mode.</i>
port-overcurrent	Parameter type: <Alarm::overCurrent> (yes no) Possible values: - yes : over current - no : not over current	status of the port current. <i>This element is only shown in detail mode.</i>
port-jbfltca	Parameter type: <Alarm::jbflTca> (yes no) Possible values: - yes : high jb fill level - no : not high jb fill level	status of the port jitter buffer fill level tca. <i>This element is only shown in detail mode.</i>
reg-domainname	Parameter type: <Alarm::regdomainname> (yes no) Possible values: - yes : register - resolving domain name failed - no : register - resolving domain name successful	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>
reg-auth	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
reg-timeout	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
reg-srvfailresp	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
inv-domainname	Parameter type: <Alarm::invdomainname> (yes	status of resolving domain name (invite).

104 Current Alarm Status Commands

name	Type	Description
	no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	<i>This element is only shown in detail mode.</i>
inv-auth	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
inv-timeout	Parameter type: <Alarm::invtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite). <i>This element is only shown in detail mode.</i>
inv-srvfailresp	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
subs-srvfailresp	Parameter type: <Alarm::subsrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe). <i>This element is only shown in detail mode.</i>
subs-domainname	Parameter type: <Alarm::subsdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe). <i>This element is only shown in detail mode.</i>
subs-auth	Parameter type: <Alarm::subsauth> (yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	status of authentication(subscribe). <i>This element is only shown in detail mode.</i>
subs-refreshfail	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received (refresh subscribe). <i>This element is only shown in detail mode.</i>
subs-inittimeout	Parameter type: <Alarm::subsintimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout (initial subscribe). <i>This element is only shown in detail mode.</i>
emergency-call	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : emergency call is not ongoing	
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	Additional information regarding the reg-srvfailresp alarm. <i>This element is only shown in detail mode.</i>

104.36 Secondary SIP Termination Current Alarm Status Command

Command Description

This command displays the secondary SIP termination current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current secondary-sip-term [(index)]

Command Parameters

Table 104.36-1 "Secondary SIP Termination Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.36-2 "Secondary SIP Termination Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
term-index	Parameter type: <Itf::PotsLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the secondary term <i>This element is only shown in detail mode.</i>
reg-domainname-sec	Parameter type: <Alarm::regdomainname> (yes no) Possible values:	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : register - resolving domain name failed - no : register - resolving domain name successful	
reg-auth-sec	Parameter type: <Alarm::regauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
reg-timeout-sec	Parameter type: <Alarm::regtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
reg-srvfailresp-sec	Parameter type: <Alarm::regsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
inv-domainname-sec	Parameter type: <Alarm::invdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
inv-auth-sec	Parameter type: <Alarm::invauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
inv-timeout-sec	Parameter type: <Alarm::invtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite). <i>This element is only shown in detail mode.</i>
inv-srvfailresp-sec	Parameter type: <Alarm::invsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
subs-srvfailresp-sec	Parameter type: <Alarm::subssrvfailresp> (yes no) Possible values: - yes : subscribe - failure response from server - no : subscribe - successful response from server	status of failure response from server (subscribe). <i>This element is only shown in detail mode.</i>
subs-domainname-sec	Parameter type: <Alarm::subsdomainname> (yes no) Possible values: - yes : Subscribe - resolving domain name failed - no : Subscribe - resolving domain name successful	status of resolving domain name (subscribe). <i>This element is only shown in detail mode.</i>
subs-auth-sec	Parameter type: <Alarm::subsauth>	status of

104 Current Alarm Status Commands

name	Type	Description
	(yes no) Possible values: - yes : Subscribe - authentication failed - no : Subscribe - authentication successful	authentication(subscribe). <i>This element is only shown in detail mode.</i>
subs-refreshfail-sec	Parameter type: <Alarm::subsrefreshfail> (yes no) Possible values: - yes : Subscribe - refresh failure - no : Subscribe - refresh failure	status of message timeout or 481 received (refresh subscribe). <i>This element is only shown in detail mode.</i>
subs-inittimeout-sec	Parameter type: <Alarm::subsinittimeout> (yes no) Possible values: - yes : Subscribe - initial REQ timeout - no : Subscribe - initial REQ timeout	status of message timeout (initial subscribe). <i>This element is only shown in detail mode.</i>
emergency-call-sec	Parameter type: <Alarm::emergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	Additional information regarding the reg-srvfailresp alarm. <i>This element is only shown in detail mode.</i>

104.37 SIP Termination Current Alarm Status Command

Command Description

This command displays the SIP termination current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current e1-sip-termination [(index)]

Command Parameters

Table 104.37-1 "SIP Termination Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.37-2 "SIP Termination Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
term-index	Parameter type: <Itf::IsdnLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the termination <i>This element is only shown in detail mode.</i>
reg-domainname	Parameter type: <Alarm::isdnregdomainname> (yes no) Possible values: - yes : register - resolving domain name failed	status of resolving domain name (register). <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- no : register - resolving domain name successful	
reg-auth	Parameter type: <Alarm::isdnregauth> (yes no) Possible values: - yes : register - authentication failed - no : register - authentication successful	status of authentication (register). <i>This element is only shown in detail mode.</i>
reg-timeout	Parameter type: <Alarm::isdnregtimeout> (yes no) Possible values: - yes : register - message timeout - no : register - message not timeout	status of message timeout (register). <i>This element is only shown in detail mode.</i>
reg-srvfailresp	Parameter type: <Alarm::isdnregsrvfailresp> (yes no) Possible values: - yes : register - failure response from server - no : register - successful response from server	status of failure response from server (register). <i>This element is only shown in detail mode.</i>
inv-domainname	Parameter type: <Alarm::isdninvdomainname> (yes no) Possible values: - yes : invite - resolving domain name failed - no : invite - resolving domain name successful	status of resolving domain name (invite). <i>This element is only shown in detail mode.</i>
inv-auth	Parameter type: <Alarm::isdninvauth> (yes no) Possible values: - yes : invite - authentication failed - no : invite - authentication successful	status of authentication (invite). <i>This element is only shown in detail mode.</i>
inv-timeout	Parameter type: <Alarm::isdninvtimeout> (yes no) Possible values: - yes : invite - message timeout - no : invite - message not timeout	status of message timeout (invite). <i>This element is only shown in detail mode.</i>
inv-srvfailresp	Parameter type: <Alarm::isdninvsrvfailresp> (yes no) Possible values: - yes : invite - failure response from server - no : invite - successful response from server	status of failure response from server (invite). <i>This element is only shown in detail mode.</i>
emergency-call	Parameter type: <Alarm::isdnemergencycall> (yes no) Possible values: - yes : emergency call is ongoing - no : emergency call is not ongoing	status of emergency call. <i>This element is only shown in detail mode.</i>
ais-signal	Parameter type: <Alarm::isdnaissignal> (yes no) Possible values: - yes : Alarm Indication Signal detected at E1 interface - no : no Alarm Indication Signal detected at E1 interface	status of Alarm Indication Signal. <i>This element is only shown in detail mode.</i>
los-signal	Parameter type: <Alarm::isdnlossignal> (yes	status of Loss Of Signal Alarm. <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : Loss Of Signal detected at E1 interface - no : no Loss Of Signal detected at E1 interface	<i>detail mode.</i>
rai-signal	Parameter type: <Alarm::isdnraisignal> (yes no) Possible values: - yes : Remote Alarm Indication detected at E1 interface - no : no Remote Alarm Indication detected at E1 interface	status of Remote Alarm Indication. <i>This element is only shown in detail mode.</i>
e1sip-misconfig-mgc10	Parameter type: <Alarm::sipmiscfgmgc10> (yes no) Possible values: - yes : Configuration not conform with the core network entity - no : no Configuration not conform with the core network entity	status of config error when connect to mgc10. <i>This element is only shown in detail mode.</i>
e1sip-nsmprf-missed	Parameter type: <Alarm::sipnsmprofmis> (yes no) Possible values: - yes : The SIP termination requires a NSM profile - no : no The SIP termination requires a NSM profile	status of requires a NSM profile. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	Additional information regarding the reg-srvfailresp alarm. <i>This element is only shown in detail mode.</i>

104.38 E1T1 Interface Current Alarm Status Command

Command Description

This command shows the status of E1T1 interface alarm

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current e1t1-interface [(index)]

Command Parameters

Table 104.38-1 "E1T1 Interface Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.38-2 "E1T1 Interface Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ifindex	Parameter type: <Itf::IsdnLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	value of the Ifindex of the SIP termination <i>This element is only shown in detail mode.</i>
e1t1itf-recv-ais	Parameter type: <Alarm::itfaissignal> (yes no) Possible values: - yes : Alarm Indication Signal received at interface	status of Alarm Indication Signal detected at interface. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no Alarm Indication Signal received at interface	
e1t1itf-recv-los	Parameter type: <Alarm::itflossignal> (yes no) Possible values: - yes : Loss Of Signal received at interface - no : no Loss Of Signal received at interface	status of Loss Of Signal Alarm detected at interface. <i>This element is only shown in detail mode.</i>
e1t1itf-recv-rai	Parameter type: <Alarm::itfraissignal> (yes no) Possible values: - yes : Remote Alarm Indication received at interface - no : no Remote Alarm Indication received at interface	status of Remote Alarm Indication detected at interface. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	Additional information regarding the E1/T1 interface alarm. <i>This element is only shown in detail mode.</i>

104.39 SIP Termination Current Alarm Status Command

Command Description

This command displays the SIP termination current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current cas-r2-channel [ (index) ]
```

Command Parameters

Table 104.39-1 "SIP Termination Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.39-2 "SIP Termination Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
term-index	Parameter type: <Itf::IsdnLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the termination <i>This element is only shown in detail mode.</i>
channel-id	Parameter type: <Alarm::E1ChannelId> - The E1 channel Id - range: [0...31]	identifies the E1 channel <i>This element is only shown in detail mode.</i>
exp-seizureack	Parameter type: <Alarm::ExpSeizureAck> (yes	status of seizure ack signal <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : Channel was blocked due to failure in the reception of the SEIZURE ACK signal - no : Channel was not blocked due to failure in the reception of the SEIZURE ACK signal	<i>detail mode.</i>
exp-disconack	Parameter type: <Alarm::ExpDisconnectAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the DISCONNECTION ACK signal - no : Channel was not blocked due to failure in the reception of the DISCONNECTION ACK signal	status of disconnect ack signal <i>This element is only shown in detail mode.</i>
exp-forcerelack	Parameter type: <Alarm::ExpForceRelAck> (yes no) Possible values: - yes : Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal - no : No Channel was blocked due to failure in the reception of the BACKWARD DISCONNECTION ACK signal	status of forced release ack signal <i>This element is only shown in detail mode.</i>

104.40 Pseudo Wire Current Alarm Status Command

Command Description

This command displays current alarm status of the Pseudo Wire.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current pseudo-wire [(index)]

Command Parameters

Table 104.40-1 "Pseudo Wire Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.40-2 "Pseudo Wire Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
term-index	Parameter type: <Itf::IsdnLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify the pseudo wire. <i>This element is only shown in detail mode.</i>
packet-loss	Parameter type: <Alarm::PacketLoss> (yes no) Possible values: - yes : Pseudo Wire entered the Packet loss state	specifies the packet loss is unknown or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : Pseudo Wire not entered the Packet loss state	
remote-packet-loss	Parameter type: <Alarm::RemotePacketLoss> (yes no) Possible values: - yes : Remote Packet loss detected - no : Remote Packet loss not detected	specifies the remote packet loss or not. <i>This element is only shown in detail mode.</i>
no-dsp-resource	Parameter type: <Alarm::NoDspResource> (yes no) Possible values: - yes : DSP resource allocation failed - no : DSP resource allocation failed	specifies no DSP resource or not. <i>This element is only shown in detail mode.</i>

104.41 Megaco Media Gateway Current Alarm Status Command

Command Description

This command displays the Megaco media gateway current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current megaco-media-gw [ (index) ]
```

Command Parameters

Table 104.41-1 "Megaco Media Gateway Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.41-2 "Megaco Media Gateway Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::EqptSlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F)	identify the board where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf - ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
mgc-unreachable	Parameter type: <Alarm::mgcUnreachable> (yes no) Possible values: - yes : media gateway controller is unreachable - no : media gateway controller is reachable	specifies the media gateway controller is unreachable or not. <i>This element is only shown in detail mode.</i>
failover-to-esamgc	Parameter type: <Alarm::failoverttoESAMGC> (yes no) Possible values: - yes : failover to esa mgc - no : normal mgc is in service	specifies the media gateway failover to esa mgc or not. <i>This element is only shown in detail mode.</i>

104.42 Megaco Signaling Gateway Current Alarm Status Command

Command Description

This command displays the Megaco signaling gateway current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current megaco-sig-gw [ (index) ]
```

Command Parameters

Table 104.42-1 "Megaco Signaling Gateway Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.42-2 "Megaco Signaling Gateway Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::LtSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	identify the board where the alarm has occurred. <i>This element is only shown in detail mode.</i>
sgc-unreachable	Parameter type: <Alarm::sgcUnreachable> (yes no) Possible values: - yes : signalling gateway controller is unreachable - no : signalling gateway controller is reachable	specifies the signaling gateway controller is unreachable or not. <i>This element is only shown in detail mode.</i>

104.43 Megaco Plugin Unit Current Alarm Status Command

Command Description

This command displays the Megaco plugin unit current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current megaco-plug-unit [(index)]

Command Parameters

Table 104.43-1 "Megaco Plugin Unit Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.43-2 "Megaco Plugin Unit Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::PortSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number	identify the board where the alarm has occurred. <i>This element is only shown in detail mode.</i>
lcard-unreach-srvcard	Parameter type: <Alarm::lineCardUnreachSrvCard> (yes no) Possible values: - yes : line card is unreachable with server card - no : line card is reachable with server card	specifies the line card is unreachable with server card or not. <i>This element is only shown in detail mode.</i>
lcard-type-mismatch	Parameter type: <Alarm::lineCardTypeMismatchch>	specifies the line card type is

name	Type	Description
	(yes no) Possible values: - yes : line card type is mismatch - no : line card type is match	mismatch or not. <i>This element is only shown in detail mode.</i>

104.44 Megaco Termination Current Alarm Status Command

Command Description

This command displays the Megaco termination current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current megaco-term [(index)]

Command Parameters

Table 104.44-1 "Megaco Termination Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.44-2 "Megaco Termination Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::MegacoPotsLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	identify the physical position of the port. <i>This element is only shown in detail mode.</i>
meg-unknown-sub	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no) Possible values: - yes : unknown wrong megaco subscriber	specifies the megaco subscriber is unknown or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no wrong megaco subscriber	
meg-ground-key	Parameter type: <Alarm::voicePortGroundKey> (yes no) Possible values: - yes : voice port ground key - no : voice port not ground key	specifies the voice port ground key or not. <i>This element is only shown in detail mode.</i>
meg-high-temp	Parameter type: <Alarm::voicePortHighTemp> (yes no) Possible values: - yes : voice port high temperature - no : voice port not high temperature	specifies the voice port high temperature or not. <i>This element is only shown in detail mode.</i>
l1-act-fail	Parameter type: <Alarm::voicePortL1ActFail> (yes no) Possible values: - yes : voice port l1 act failure - no : voice port l1 act not failure	specifies the voice port l1 act failure or not. <i>This element is only shown in detail mode.</i>
over-current	Parameter type: <Alarm::voicePortOverCurrent> (yes no) Possible values: - yes : voice port over current - no : voice port not over current	specifies the voice port over current or not. <i>This element is only shown in detail mode.</i>
line-showering	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	specifies the line showering or not. <i>This element is only shown in detail mode.</i>
low-qos-packetloss	Parameter type: <Alarm::lowQosPacketLoss> (yes no) Possible values: - yes : the total packet loss has exceeded the configured threshold - no : the total packet loss has not exceeded the configured threshold	specifies the megaco total packet loss has exceeded the configured threshold or not. <i>This element is only shown in detail mode.</i>
low-qos-jitter	Parameter type: <Alarm::lowQosJitter> (yes no) Possible values: - yes : the rtp jitter has exceeded the configured threshold - no : the rtp jitter has not exceeded the configured threshold	specifies the megaco rtp jitter has exceeded the configured threshold or not. <i>This element is only shown in detail mode.</i>
low-qos-delay	Parameter type: <Alarm::lowQosDelay> (yes no) Possible values: - yes : the rtp delay has exceeded the configured threshold - no : the rtp delay has not exceeded the configured threshold	specifies the megaco rtp delay has exceeded the configured threshold or not. <i>This element is only shown in detail mode.</i>

104.45 Secondary Megaco Termination Current Alarm Status Command

Command Description

This command displays current alarm status of the secondary Megaco termination.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current secondary-megaco-term [(index)]

Command Parameters

Table 104.45-1 "Secondary Megaco Termination Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.45-2 "Secondary Megaco Termination Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::MegacoPotsLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	identify the physical position of the port. <i>This element is only shown in detail mode.</i>
meg-unknown-sub-sec	Parameter type: <Alarm::megacoUnknownSubscriber> (yes no)	specifies the megaco subscriber is unknown or not. <i>This element is only shown in</i>

name	Type	Description
	Possible values: - yes : unknown wrong megaco subscriber - no : no wrong megaco subscriber	<i>detail mode.</i>
line-showering-sec	Parameter type: <Alarm::lineshowering> (yes no) Possible values: - yes : line showering - no : no line showering	specifies the line showering or not. <i>This element is only shown in detail mode.</i>

104.46 Megaco Signaling Lt Current Alarm Status Command

Command Description

This command displays the Megaco signaling Lt current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current megaco-sig-lt [ (index) ]
```

Command Parameters

Table 104.46-1 "Megaco Signaling Lt Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.46-2 "Megaco Signaling Lt Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::LtSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	identify the board where the alarm has occurred. <i>This element is only shown in detail mode.</i>
sig-brd-persist-loss	Parameter type: <Alarm::megacoSigBoardPersDataLoss> (yes no) Possible values: - yes : the voice signaling board persistenet data loss - no : the voice signaling board persistenet data not loss	specifies the voice signaling board persistenet data loss or not. <i>This element is only shown in detail mode.</i>
sig-brd-disk-full	Parameter type: <Alarm::voiceSigBoard90PercentFull>	specifies the voice signaling

name	Type	Description
	(yes no) Possible values: - yes : specifies the voice signaling board disk 90% full - no : specifies the voice signaling board disk no 90% full	board disk 90% full or not. <i>This element is only shown in detail mode.</i>
sig-brd-db-rollback	Parameter type: <Alarm::sigBoardDBRollback> (yes no) Possible values: - yes : specifies the voice signaling board implicit db rollback - no : specifies the voice signaling board implicit db no rollback	specifies the voice signaling board implicit db rollback or not. <i>This element is only shown in detail mode.</i>
mg-overload	Parameter type: <Alarm::megMGOverLoad> (yes no) Possible values: - yes : specifies the mg overload - no : specifies the mg no overload	specifies the mg overload or not. <i>This element is only shown in detail mode.</i>

104.47 E1Current Alarm Status Command

Command Description

This command displays the E1 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current e1 [ (index) ]
```

Command Parameters

Table 104.47-1 "E1Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.47-2 "E1Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::E1Line> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
rx-rai	Parameter type: <Alarm::E1RxRai> (yes no) Possible values: - yes : recieving RAI - no : no recieving RAI	current status of e1 recieving RAI <i>This element is only shown in detail mode.</i>
tx-rai	Parameter type: <Alarm::E1TxRai> (yes	current status of e1 transmitting RAI

name	Type	Description
	no) Possible values: - yes : transmitting RAI - no : no transmitting RAI	<i>This element is only shown in detail mode.</i>
rx-ais	Parameter type: <Alarm::E1RxAis> (yes no) Possible values: - yes : recieving AIS - no : no recieving AIS	current status of e1 recieving AIS <i>This element is only shown in detail mode.</i>
tx-ais	Parameter type: <Alarm::E1TxAis> (yes no) Possible values: - yes : transmitting AIS - no : no transmitting AIS	current status of e1 transmitting AIS <i>This element is only shown in detail mode.</i>
lof	Parameter type: <Alarm::E1LOF> (yes no) Possible values: - yes : loss of frame - no : no loss of frame	current status of e1 loss of frame <i>This element is only shown in detail mode.</i>
los	Parameter type: <Alarm::E1LOS> (yes no) Possible values: - yes : loss of signal - no : no loss of signal	current status of e1 loss of signal <i>This element is only shown in detail mode.</i>
loopback	Parameter type: <Alarm::E1Loopback> (yes no) Possible values: - yes : facility in loopback - no : facility not in loopback	current status of e1 loopback <i>This element is only shown in detail mode.</i>

104.48 Shdsl Current Alarm Status Command

Command Description

This command displays the Shdsl current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current shdsl [ (index) ]
```

Command Parameters

Table 104.48-1 "Shdsl Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.48-2 "Shdsl Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
unit	Parameter type: <Alarm::LinkDeviceValues> - a signed integer	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
loop-act-net	Parameter type: <Alarm::LoopbackActiveNetwork> (yes no) Possible values:	current status of loopback active at the network side <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : loopback active - no : no loopback active	
loop-act-cus	Parameter type: <Alarm::LoopbackActiveCustom> (yes no) Possible values: - yes : loopback active - no : no loopback active	current status of loopback active at the custom side <i>This element is only shown in detail mode.</i>
config-error	Parameter type: <Alarm::ConfigError> (yes no) Possible values: - yes : config error - no : no config error	current status of configuration error <i>This element is only shown in detail mode.</i>
loss-atm	Parameter type: <Alarm::LossATMCellDel> (yes no) Possible values: - yes : loss atm cell delineation - no : no loss atm cell delineation	current status of loss of atm cell delineation <i>This element is only shown in detail mode.</i>
loss-pr	Parameter type: <Alarm::LossPowerSTUR> (yes no) Possible values: - yes : loss power at stu-r - no : no loss power at stu-r	current status of loss of power at stu-r <i>This element is only shown in detail mode.</i>
secu-error	Parameter type: <Alarm::UnableDisableSTUR> (yes no) Possible values: - yes : loss ability at stu-r - no : no loss ability at stu-r	current status of loss of ability to disable stu-r access <i>This element is only shown in detail mode.</i>
dev-fault	Parameter type: <Alarm::DeviceFault> (yes no) Possible values: - yes : device fault - no : no device fault	current status of fault of device <i>This element is only shown in detail mode.</i>
atm-ncd	Parameter type: <Alarm::ATMCellDel> (yes no) Possible values: - yes : no atm cell delineation - no : atm cell delineation	current status of none of atm cell delineation <i>This element is only shown in detail mode.</i>

104.49 Shdsl Current Alarm Status Command

Command Description

This command displays the Shdsl current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current shdsl-isam [(index)]

Command Parameters

Table 104.49-1 "Shdsl Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.49-2 "Shdsl Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
wire-pair	Parameter type: <Alarm::LinkDeviceValuesHigh> - identify where the alarm occurred	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
unit	Parameter type: <Alarm::LinkDeviceValuesLow> - identify where the alarm occurred	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>

name	Type	Description
loss-syn-net	Parameter type: <Alarm::LossSyncWordNetwork> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	current status of loss of sync word at the network side on each pair <i>This element is only shown in detail mode.</i>
loss-syn-cus	Parameter type: <Alarm::LossSyncWordCustom> (yes no) Possible values: - yes : loss sync word - no : no loss sync word	current status of loss of sync word at the custom side on each pair <i>This element is only shown in detail mode.</i>
loop-att-net	Parameter type: <Alarm::LoopAttenuationNetwork> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	current status of loop attenuation alarm at the network side on each pair <i>This element is only shown in detail mode.</i>
loop-att-cus	Parameter type: <Alarm::LoopAttenuationCustom> (yes no) Possible values: - yes : loop attenuation - no : no loop attenuation	current status of loop attenuation alarm at the custom side on each pair <i>This element is only shown in detail mode.</i>
snr-net	Parameter type: <Alarm::SNRNetwork> (yes no) Possible values: - yes : snr margin - no : no snr margin	current status of snr margin alarm at the network side each pair <i>This element is only shown in detail mode.</i>
snr-cus	Parameter type: <Alarm::SNRCustom> (yes no) Possible values: - yes : snr margin - no : no snr margin	current status of snr margin alarm at the custom side each pair <i>This element is only shown in detail mode.</i>
dc-net	Parameter type: <Alarm::DCContinuityFaultNetwork> (yes no) Possible values: - yes : dc fault - no : no dc fault	current status of dc continuity fault at the network side on each pair <i>This element is only shown in detail mode.</i>
dc-cus	Parameter type: <Alarm::DCContinuityFaultCustom> (yes no) Possible values: - yes : dc fault - no : no dc fault	current status of dc continuity fault at the custom side on each pair <i>This element is only shown in detail mode.</i>

104.50 Ima-Group Current Alarm Status Command

Command Description

This command displays the Ima-Group current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ima-group [(index)]

Command Parameters

Table 104.50-1 "Ima-Group Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.50-2 "Ima-Group Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Equipm::AtmImaIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
far-end-start	Parameter type: <Alarm::FarEndStartup> (yes no) Possible values: - yes : far-end startup - no : no far-end startup	current status of far-end starting up <i>This element is only shown in detail mode.</i>
far-end-fconf	Parameter type: <Alarm::FarEndFailedConfig> (yes	current status of failed configuration of far-end

name	Type	Description
	no) Possible values: - yes : far-end failed config - no : no far-end failed config	<i>This element is only shown in detail mode.</i>
near-end-fconf	Parameter type: <Alarm::NearEndFailedConfig> (yes no) Possible values: - yes : near-end failed config - no : no near-end failed config	current status of failed configuration of near-end <i>This element is only shown in detail mode.</i>
far-end-ins-lnk	Parameter type: <Alarm::FarEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at far-end - no : no insufficient number of links at far-end	current status of insufficient number of links at far-end <i>This element is only shown in detail mode.</i>
near-end-ins-lnk	Parameter type: <Alarm::NearEndInsuffLinkNum> (yes no) Possible values: - yes : insufficient number of links at near-end - no : no insufficient number of links at near-end	current status of insufficient number of links at near-end <i>This element is only shown in detail mode.</i>
far-end-blk	Parameter type: <Alarm::FarEndBlocked> (yes no) Possible values: - yes : far-end blocked - no : no far-end blocked	current status of status that far-end is blocked <i>This element is only shown in detail mode.</i>

104.51 Ima-Link Current Alarm Status Command

Command Description

This command displays the Ima-Link current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ima-link [(index)]

Command Parameters

Table 104.51-1 "Ima-Link Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.51-2 "Ima-Link Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::ShdslLine> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identifies the physical position of the port <i>This element is only shown in detail mode.</i>
loss-ima-frm	Parameter type: <Alarm::LossImaFrame> (yes no) Possible values: - yes : loss ima frame - no : no loss ima frame	current status of loss of ima frame <i>This element is only shown in detail mode.</i>
lods	Parameter type: <Alarm::LinkOutOfDelaySynch> (yes	current status of link out of delay synchronization

name	Type	Description
	no) Possible values: - yes : link out of delay - no : no link out of delay	<i>This element is only shown in detail mode.</i>
link-misc	Parameter type: <Alarm::LinkMisconnect> (yes no) Possible values: - yes : link misconnect - no : no link misconnect	current status of link of misconnecting <i>This element is only shown in detail mode.</i>
link-rfi	Parameter type: <Alarm::LinkRemoteFailureIndication> (yes no) Possible values: - yes : link remote failure indication - no : no link remote failure indication	current status of link of remote failure indication <i>This element is only shown in detail mode.</i>
link-fault	Parameter type: <Alarm::LinkFault> (yes no) Possible values: - yes : fault in link facility - no : no fault in link facility	current status of fault of link <i>This element is only shown in detail mode.</i>
fe-tx-blk	Parameter type: <Alarm::FarEndTXBlocked> (yes no) Possible values: - yes : transmit blocked due to far-end - no : no transmit blocked due to far-end	current status of transmit blocked due to far-end <i>This element is only shown in detail mode.</i>
fe-rec-blk	Parameter type: <Alarm::FarEndRXBlocked> (yes no) Possible values: - yes : receive blocked due to far-end - no : no receive blocked due to far-end	current status of receive blocked due to far-end <i>This element is only shown in detail mode.</i>

104.52 Alarm Current Ether-Tca Status Command

Command Description

This command displays the Ether-Tca related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ether-tca [(index)]

Command Parameters

Table 104.52-1 "Alarm Current Ether-Tca Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.52-2 "Alarm Current Ether-Tca Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
etca-los	Parameter type: <Alarm::EthTcaLos> (yes no) Possible values: - yes : ethernet loss of signal errors exceeds - no : ethernet loss of signal errors normal	current status of ethernet los in 15 min <i>This element is only shown in detail mode.</i>
etca-fcs	Parameter type: <Alarm::EthTcaFcs> (yes	current status of ethernet fcs in 15 min

name	Type	Description
	no) Possible values: - yes : ethernet frame check sequence errors exceeds - no : ethernet frame check sequence errors normal	<i>This element is only shown in detail mode.</i>
etca-rx-octets	Parameter type: <Alarm::EthTcaRxb> (yes no) Possible values: - yes : received octets exceeds - no : received octets normal	current status of received octets in 15 min <i>This element is only shown in detail mode.</i>
etca-tx-octets	Parameter type: <Alarm::EthTcaTxb> (yes no) Possible values: - yes : transmitted octets exceeds - no : transmitted octets normal	current status of transmitted octets in 15 min <i>This element is only shown in detail mode.</i>
etca-day-los	Parameter type: <Alarm::EthDayLos> (yes no) Possible values: - yes : ethernet day los errors exceeds - no : ethernet day los errors normal	current status of ethernet day los <i>This element is only shown in detail mode.</i>
etca-day-fcs	Parameter type: <Alarm::EthDayFcs> (yes no) Possible values: - yes : ethernet day fcs errors exceeds - no : ethernet day fcs errors normal	current status of ethernet day fcs <i>This element is only shown in detail mode.</i>
etca-day-rx-octets	Parameter type: <Alarm::EthDayRxb> (yes no) Possible values: - yes : received octets day exceeds - no : received octets day normal	current status of received octets in 1 day <i>This element is only shown in detail mode.</i>
etca-day-tx-octets	Parameter type: <Alarm::EthDayTxb> (yes no) Possible values: - yes : transmitted octets day exceeds - no : transmitted octets day normal	current status of transmitted octets in 1 day <i>This element is only shown in detail mode.</i>

104.53 Alarm Current Ether-Sfp Status Command

Command Description

This command displays the Ether-Sfp related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ether-sfp [(index)]

Command Parameters

Table 104.53-1 "Alarm Current Ether-Sfp Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.53-2 "Alarm Current Ether-Sfp Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <If::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
user-sfp-los	Parameter type: <Alarm::EthSfpLos> (yes no) Possible values: - yes : ethernet sfp los error - no : ethernet sfp los normal	current status of ethernet sfp los <i>This element is only shown in detail mode.</i>
user-sfp-tx-fail	Parameter type: <Alarm::EthSfpTxFail> (yes	current status of ethernet sfp tx <i>This element is only shown in</i>

name	Type	Description
	no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	<i>detail mode.</i>
user-sfp-not-prst	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	current status of ethernet sfp presence <i>This element is only shown in detail mode.</i>
user-sfp-inv-id	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	current status of ethernet sfp id <i>This element is only shown in detail mode.</i>
user-sfp-t-exceed	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed - no : ethernet sfp temperature normal	current status of ethernet sfp temperature <i>This element is only shown in detail mode.</i>
user-sfp-mismatch	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	current status of ethernet sfp type <i>This element is only shown in detail mode.</i>

104.54 Alarm Current Ether-Sfp Status Command

Command Description

This command displays the Ether-Sfp related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current uplink-ether-sfp [(index)]

Command Parameters

Table 104.54-1 "Alarm Current Ether-Sfp Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.54-2 "Alarm Current Ether-Sfp Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::EthernetPortIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identify where the alarm has occurred <i>This element is only shown in detail mode.</i>
uplink-sfp-los	Parameter type: <Alarm::EthSfpLos> (yes no) Possible values: - yes : ethernet sfp los error - no : ethernet sfp los normal	current status of uplink ethernet sfp los <i>This element is only shown in detail mode.</i>
uplink-sfp-tx-fail	Parameter type: <Alarm::EthSfpTxFail> (yes	current status of uplink ethernet sfp tx

name	Type	Description
	no) Possible values: - yes : ethernet sfp Tx Failure - no : ethernet sfp Tx normal	<i>This element is only shown in detail mode.</i>
uplink-sfp-not-prst	Parameter type: <Alarm::EthSfpNotPrst> (yes no) Possible values: - yes : ethernet sfp not detected - no : ethernet sfp detected	current status of uplink ethernet sfp presence <i>This element is only shown in detail mode.</i>
uplink-sfp-inv-id	Parameter type: <Alarm::EthSfpInvalid> (yes no) Possible values: - yes : ethernet sfp id invalid - no : ethernet sfp id normal	current status of uplink ethernet sfp id <i>This element is only shown in detail mode.</i>
uplink-sfp-t-exceed	Parameter type: <Alarm::EthSfpTempExceed> (yes no) Possible values: - yes : ethernet sfp temperature exceed - no : ethernet sfp temperature normal	current status of uplink ethernet sfp temperature <i>This element is only shown in detail mode.</i>
uplink-sfp-mismatch	Parameter type: <Alarm::EthSfpMismatch> (yes no) Possible values: - yes : ethernet sfp mismatch the configured type - no : ethernet sfp match the configured type	current status of uplink ethernet sfp type <i>This element is only shown in detail mode.</i>

104.55 Alarm Current Qos Slot Status Command

Command Description

This command displays the Qos Slot related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current qos-slot [(index)]

Command Parameters

Table 104.55-1 "Alarm Current Qos Slot Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.55-2 "Alarm Current Qos Slot Status Command" Display parameters

Specific Information		
name	Type	Description
board-position	Parameter type: <Equipm::SlotIndex> (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt acu : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ext-a : <Eqpt::RackId> / <Eqpt::ShelfId> ext-b : <Eqpt::RackId> / <Eqpt::ShelfId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - ext-a : nt-a slot in an extension shelf	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- ext-b : nt-b slot in an extension shelf - acu : acu slot - ctrl : ctrl-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
up-overflow	Parameter type: <Alarm::up-overflow> (yes no) Possible values: - yes : up overflow alarm - no : no up overflow alarm	check LT load in upstream. <i>This element is only shown in detail mode.</i>
dw-overflow	Parameter type: <Alarm::dw-overflow> (yes no) Possible values: - yes : down overflow alarm - no : no down overflow alarm	check LT load in downstream. <i>This element is only shown in detail mode.</i>
upobc-overflow	Parameter type: <Alarm::upobc-overflow> (yes no) Possible values: - yes : up to obc overflow alarm - no : no up to obc overflow alarm	check LT load to OBC in upstream. <i>This element is only shown in detail mode.</i>
dwobc-overflow	Parameter type: <Alarm::dwobc-overflow> (yes no) Possible values: - yes : down to obc overflow alarm - no : no down to obc overflow alarm	check LT load to OBC in downstream. <i>This element is only shown in detail mode.</i>
lwpriority-overflow	Parameter type: <Alarm::lwpriority-overflow> (yes no) Possible values: - yes : alarm - no : no dying gasp alarm	check Voice and Video load. <i>This element is only shown in detail mode.</i>
fanout	Parameter type: <Alarm::fanout> (yes no) Possible values: - yes : fan out alarm - no : no fan out alarm	check LT Load. <i>This element is only shown in detail mode.</i>

104.56 Alarm Current Qos Queue Status Command

Command Description

This command displays the Qos Queue related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current qos-queue [(index)]

Command Parameters

Table 104.56-1 "Alarm Current Qos Queue Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.56-2 "Alarm Current Qos Queue Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Itf::PhyLine> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ont.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values:	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

name	Type	Description
	- ont : ont - ont:ng2 : ngpon2 ONT style identification - uni:ng2 : ngpon2 UNI style identification - Field type <Eqpt::RackId> - the rack number - Field type <Eqpt::ShelfId> - the shelf number - Field type <Eqpt::SlotId> - the LT slot number - Field type <Eqpt::PortId> - the port number - Field type <Eqpt::PonId> - the PON identifier - Field type <Eqpt::OntId> - the ONT identifier - Field type <Eqpt::ChannelGroupId> - the channel group identifier - Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier - Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier - Possible values: - voip : virtual uni identifier - obsolete alternative replaced by vuni - vuni : virtual uni identifier - Possible values: - vuni : virtual NGPON2 uni identifier - Field type <Eqpt::OntSlotId> - the ONT SLOT identifier - Field type <Eqpt::OntPortId> - the ONT PORT identifier - Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier - Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	
queue	Parameter type: <Qos::AlarmQueues> - identify where the alarm has occurred - range: [0...7]	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
queue-discard-overflow	Parameter type: <Alarm::queue-discard-overflow> (yes no) Possible values: - yes : queue discard alarm - no : no queue discard alarm	check the corresponding queue discard overflow. <i>This element is only shown in detail mode.</i>
queue-load	Parameter type: <Alarm::queue-load> (yes no) Possible values: - yes : queue load alarm - no : no queue load alarm	check the corresponding queue Load. <i>This element is only shown in detail mode.</i>
queue-peak-usage	Parameter type: <Alarm::queue-peak-usage> (yes no) Possible values: - yes : queue peak usage alarm - no : no queue peak usage alarm	check the corresponding queue peak usage. <i>This element is only shown in detail mode.</i>

104.57 Alarm File Transfer Server Status Command

Command Description

This command displays the file transfer server related current alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current filetransfer [(index)]

Command Parameters

Table 104.57-1 "Alarm File Transfer Server Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.57-2 "Alarm File Transfer Server Status Command" Display parameters

Specific Information		
name	Type	Description
server-id	Parameter type: <Alarm::FileTransfer> - next hop IP address	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
fileserv-unavail	Parameter type: <Alarm::FileTransferUnavail> (unavailable available) Possible values: - unavailable : file transfer Server unavailable or file transfer failed - available : file transfer server available	current status specifying that whether file transfer server available <i>This element is only shown in detail mode.</i>

104.58 Alarm LSM Redundancy Status Command

Command Description

This command displays the LSM Redundancy related current alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current lsmredundancy [(index)]

Command Parameters

Table 104.58-1 "Alarm LSM Redundancy Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.58-2 "Alarm LSM Redundancy Status Command" Display parameters

Specific Information		
name	Type	Description
board-station	Parameter type: <Equipm::LtSlotIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	physical number of the slot for lsm redundancy alarms <i>This element is only shown in detail mode.</i>
loss-lsmswp-cap	Parameter type: <Alarm::SwoCap> (loss not-loss) Possible values: - loss : system loss of the swichover capability - not-loss : system not loss of the swichover capability	current status specifying the swichover capability <i>This element is only shown in detail mode.</i>
data-xvps-diff	Parameter type: <Alarm::DataXvps> (invalid valid) Possible values:	log status of the data of xvps pair <i>This element is only shown in detail mode.</i>

name	Type	Description
	- invalid : data of xvps pair is not the same - valid : data of xvps pair is same	

104.59 Alarm L2 Forward Status Command

Command Description

This command displays the l2 forward related current alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current l2forward [ (index) ]
```

Command Parameters

Table 104.59-1 "Alarm L2 Forward Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.59-2 "Alarm L2 Forward Status Command" Display parameters

Specific Information		
name	Type	Description
bridgeport	Parameter type: <Vlan::BridgePort> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VcId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni) Possible values:	identify the bridge port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- ng2 : ngpon2 vlan bridge port - Field type <Eqpt::RackId> - the rack number - Field type <Eqpt::ShelfId> - the shelf number - Field type <Eqpt::SlotId> - the LT slot number - Field type <Eqpt::PortId> - the port number - Field type <Eqpt::VpiId> - atm VPI - Field type <Eqpt::VciId> - atm VCI - Field type <Eqpt::PonId> - the PON identifier - Field type <Eqpt::ChannelGroupId> - the channel group identifier - Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier - Possible values: - voip : virtual uni identifier - obsolete alternative replaced by vuni - vuni : virtual uni identifier - Possible values: - vuni : virtual NGPON2 uni identifier - Field type <Eqpt::OntSlotId> - the ONT SLOT identifier - Field type <Eqpt::OntPortId> - the ONT PORT identifier - Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier - Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier - Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE	
vlan-id	Parameter type: <Vlan::StackedVlanSigned> (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndex> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity - Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] - Field type <Vlan::SVlanIndex> - service vlan identity - range: [2...4093,4094] - Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093,4094,4095,4096]	identify the vlan id where the alarm has occurred. <i>This element is only shown in detail mode.</i>
mac-conflict	Parameter type: <Alarm::MACconflict> (yes no) Possible values:	specifies whether duplicate mac address from the bridge port. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- yes : duplicate mac address from this bridge port - no : no duplicate mac address from this bridge port	
vmac-full	Parameter type: <Alarm::VMACFull> (yes no) Possible values: - yes : virtual mac entry full on this bridge port - no : no virtual mac entry full on this bridge port	specifies whether virtual mac is full on the bridge port. <i>This element is only shown in detail mode.</i>

104.60 Alarm Current External Device Status Command

Command Description

This command displays the external-device related alarms.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current external-device [(index)]

Command Parameters

Table 104.60-1 "Alarm Current External Device Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.60-2 "Alarm Current External Device Status Command" Display parameters

Specific Information		
name	Type	Description
loss-env-mon	Parameter type: <Alarm::LossEnvMon> (lost not-lost) Possible values: - lost : env-mon box lost or not alive - not-lost : env-mon box exists	current status of env-monitor box <i>This element is only shown in detail mode.</i>

104.61 Multicast Source Current Alarm Status Command

Command Description

This command displays the multicast source current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current mcsrc [ (index) ]
```

Command Parameters

Table 104.61-1 "Multicast Source Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.61-2 "Multicast Source Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
grp-ip-addr	Parameter type: <Alarm::IpAddress> - IPv4-address	identify the mcast address where the alarm has occurred. <i>This element is only shown in detail mode.</i>
slot-id	Parameter type: <Equipm::FullLtSlotIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> Possible values: - lt : lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	identify where the alarm has occurred. <i>This element is only shown in detail mode.</i>
stream-lost	Parameter type: <Alarm::McastLoss> (yes	current status of the alarm specifying if the pon mcast video

name	Type	Description
	no) Possible values: - yes : pon mcast video stream lost - no : pon mcast video stream not lost	stream is lost or not <i>This element is only shown in detail mode.</i>

104.62 Vlanport Current Alarm Status Command

Command Description

This command displays the vlanport current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current vlanport [(index)]

Command Parameters

Table 104.62-1 "Vlanport Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.62-2 "Vlanport Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
vlanport	Parameter type: <Itf::VlanPortInterface> (vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan>	identify the vlan port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	<pre> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Ng2::OntId> / vuni : <Eqpt::UnstackedVlan>) Possible values: - vlan-port : vlan port - vlan-port:ng2 : ngpon2 vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Ng2::OntId> - the ONT identifier </pre>	

104 Current Alarm Status Commands

name	Type	Description
	Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	
svc-mismatch	Parameter type: <Alarm::SVCMismatch> (yes no) Possible values: - yes : configuration request not accepted - no : configuration accepted	current status of the alarm specifying if the configuration for a provisioned vlanport is accepted or not. <i>This element is only shown in detail mode.</i>

104.63 BGP Current Alarm Status Command

Command Description

This command displays the bgp current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current bgp [(index)]

Command Parameters

Table 104.63-1 "BGP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.63-2 "BGP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::AlarmIdentifIdxOrZero> - an unsigned integer	unique reference for the neighbor where the alarm occurred or zero when not applicable, neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the neighbor where the alarm occurred or empty string if not applicable. <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
		<i>detail mode.</i>
Only Show Details: current alarm status		
name	Type	Description
peer-down	Parameter type: <Alarm::PeerDown> (yes no) Possible values: - yes : operational state down - no : operational state up	specifies whether the BGP peer operational state is up or down <i>This element is only shown in detail mode.</i>
routes-mid-limit	Parameter type: <Alarm::RoutesMidLimit> (reached not-reached) Possible values: - reached : reached: 90% of max allowed routes learned - not-reached : less than 90% of max allowed routes learned	specifies whether 90% of the max nbr of routes BGP can learn from a peer is reached or not <i>This element is only shown in detail mode.</i>

104.64 RIP Current Alarm Status Command

Command Description

This command displays the rip current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current rip [(index)]

Command Parameters

Table 104.64-1 "RIP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.64-2 "RIP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
instance-down	Parameter type: <Alarm::InstanceDown> (yes no) Possible values: - yes : RIP instance down - no : RIP instance up	specifies whether RIP instance is down or not <i>This element is only shown in detail mode.</i>

104.65 LAG Current Alarm Status Command

Command Description

This command displays the lag current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current lag [ (index) ]
```

Command Parameters

Table 104.65-1 "LAG Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.65-2 "LAG Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
lag-id	Parameter type: <Alarm::LagId> - link aggregation group id - range: [1...64]	Identifies the lag where the alarm has occurred <i>This element is only shown in detail mode.</i>
sub-group	Parameter type: <Alarm::AlarmIdentifIdxOrZero> - an unsigned integer	Identifies the lag subgroup for which the alarm has occurred or zero when not applicable <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
lag-down	Parameter type: <Alarm::EthLagDown> (yes no) Possible values: - yes : lag down - no : lag not down	specifies whether the link aggregation group is down or not <i>This element is only shown in detail mode.</i>
subgrp-thres-reach	Parameter type: <Alarm::LagSubgrpThresReach> (reached	specifies whether the lag sub-group threshold is reached or

name	Type	Description
	not-reached) Possible values: - reached : sub-group threshold reached - not-reached : sub-group threshold not reached	not <i>This element is only shown in detail mode.</i>
subgrp-switch-fail	Parameter type: <Alarm::LagSubgrpSwitchFail> (yes no) Possible values: - yes : lag subgroup switchover failed - no : lag subgroup switchover did not fail	specifies whether the lag sub-group switchover failed or not <i>This element is only shown in detail mode.</i>
no-free-port-inbase	Parameter type: <Alarm::LagNoUnpinFreePorts> (yes no) Possible values: - yes : No free ports available for un pinned traffic - no : free ports available for un pinned traffic	specifies whether the free ports available for unpinned traffic or not <i>This element is only shown in detail mode.</i>

104.66 ihub-general Current Alarm Status Command

Command Description

This command displays the ihub-general current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ihub-general [(index)]

Command Parameters

Table 104.66-1 "ihub-general Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.66-2 "ihub-general Current Alarm Status Command" Display parameters

Only Show Details: current alarm status		
name	Type	Description
arp-limit	Parameter type: <Alarm::ArpLimit> (reached not-reached) Possible values: - reached : ARP tbl threshold reached or exceeded - not-reached : ARP tbl entries below threshold	specifies whether the nbr of ARP entries has reached the max threshold or not <i>This element is only shown in detail mode.</i>
switch-out-of-res	Parameter type: <Alarm::IhubSwitchOutOfResource> (yes no) Possible values: - yes : lack of resources in switch - no : no resource issues detected	specifies whether e.g. storing a configuration in the hardware has failed or not, due to a lack of resources in the switch. <i>This element is only shown in detail mode.</i>
ipv6-nc-limit	Parameter type: <Alarm::IPv6NeighborCacheLimit> (reached not-reached) Possible values:	specifies whether the number of ipv6 neighbor cache entries reached maximum threshold or not.

name	Type	Description
	- reached : neighbor cache up threshold reached - not-reached : neighbor cache entries within limit	<i>This element is only shown in detail mode.</i>
dhcp-session-oor	Parameter type: <Alarm::DhcpSessionOutOfResource> (yes no) Possible values: - yes : lack of resources for dhcp - no : no resource issues detected for dhcp	specifies whether dhcp session is out of resources or not. <i>This element is only shown in detail mode.</i>
fdb-limit	Parameter type: <Alarm::IhubL2FdbFull> (reached not-reached) Possible values: - reached : layer 2 fdb table entries reached upper threshold for the node - not-reached : layer 2 fdb table entries within limit for the node	specifies whether the number of layer 2 fdb table entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>
mac-limit	Parameter type: <Alarm::IhubL2MacFull> (reached not-reached) Possible values: - reached : Internal Mac entries reached upper - not-reached : Internal Mac entries within limit	specifies whether the number of internal Mac entries reached maximum threshold or not. <i>This element is only shown in detail mode.</i>

104.67 VPRN Current Alarm Status Command

Command Description

This command displays the vprn current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current vprn [ (index) ]
```

Command Parameters

Table 104.67-1 "VPRN Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.67-2 "VPRN Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
if-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the interface for which the alarm occurred or zero when not applicable. <i>This element is only shown in detail mode.</i>
interface	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the interface for which the alarm occurred or empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status

name	Type	Description
routes-limit	Parameter type: <Alarm::RoutesLimit> (reached not-reached) Possible values: - reached : ip routes limit reached or exceeded - not-reached : ip routes within limit	specifies whether the limit of dynamic routes is reached/exceeded or not <i>This element is only shown in detail mode.</i>
ipv6-routes-limit	Parameter type: <Alarm::IPv6RoutesLimit> (reached not-reached) Possible values: - reached : ipv6 routes limit reached or exceeded - not-reached : ipv6 routes within limit	specifies whether the number of dynamic ipv6 routes is approaching or has reached its limit <i>This element is only shown in detail mode.</i>
dhcpv6-lease-limit	Parameter type: <Alarm::DHCPV6LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv6 relay leases limit reached or exceeded - not-reached : dhcpv6 relay leases within limit	specifies whether the limit of dhcpv6 relay leases is reached or not <i>This element is only shown in detail mode.</i>
dhcpv4-lease-limit	Parameter type: <Alarm::DHCPV4LeaseLimit> (reached not-reached) Possible values: - reached : dhcpv4 relay leases limit reached or exceeded - not-reached : dhcpv4 relay leases within limit	specifies whether the limit of dhcpv4 relay leases is reached or not <i>This element is only shown in detail mode.</i>

104.68 ISIS Current Alarm Status Command

Command Description

This command displays the isis current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current isis [(index)]

Command Parameters

Table 104.68-1 "ISIS Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.68-2 "ISIS Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
adjacency-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the adjacency where the alarm occurred or zero when not applicable, adjacency is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the adjacency:instance/interface where the alarm occurred or empty string if not applicable.

name	Type	Description
		<i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
adjacency-down	Parameter type: <Alarm::AdjacencyDown> (yes no) Possible values: - yes : interface down - no : interface up	specifies whether isis adjacency is down or not <i>This element is only shown in detail mode.</i>
adjacency-reject	Parameter type: <Alarm::AdjacencyReject> (yes no) Possible values: - yes : interface mismatch - no : no interface mismatch	specifies whether isis adjacency is rejected or not <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::IsisDown> (yes no) Possible values: - yes : ISIS instance down - no : ISIS instance up	specifies whether ISIS instance is down or not <i>This element is only shown in detail mode.</i>

104.69 Ospf Current Alarm Status Command

Command Description

This command displays the ospf current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ospf [(index)]

Command Parameters

Table 104.69-1 "Ospf Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.69-2 "Ospf Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the neighbor where the alarm occurred or zero when not applicable, neighbor is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the neighbor/instance where the alarm occurred or empty string if not applicable <i>This element is only shown in</i>

name	Type	Description
		<i>detail mode.</i>

Only Show Details: current alarm status

name	Type	Description
lsa-limit	Parameter type: <Alarm::LsaLimit> (reached not-reached) Possible values: - reached : external LSA limit reached - not-reached : external LSAs within limitation	specifies whether the limit of received external LSAs is reached or not <i>This element is only shown in detail mode.</i>
lsa-mid-limit	Parameter type: <Alarm::LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of LSA limit reached - not-reached : less than 90% of LSA limit	specifies whether 90% of the limit of received external LSAs is reached or not <i>This element is only shown in detail mode.</i>
neighbor-down	Parameter type: <Alarm::NeighborDown> (yes no) Possible values: - yes : OSPF neighbor down - no : OSPF neighbor up	specifies whether ospf neighbour is down or not <i>This element is only shown in detail mode.</i>
instance-down	Parameter type: <Alarm::OspfDown> (yes no) Possible values: - yes : OSPF instance down - no : OSPF instance up	specifies whether OSPF instance is down or not <i>This element is only shown in detail mode.</i>
v3-lsa-limit	Parameter type: <Alarm::V3LsaLimit> (reached not-reached) Possible values: - reached : external OSPFv3 LSA limit reached - not-reached : external OSPFv3 LSAs within limitation	specifies whether the limit of received external OSPFv3 LSAs is reached or not <i>This element is only shown in detail mode.</i>
v3-lsa-mid-limit	Parameter type: <Alarm::V3LsaMidLimit> (reached not-reached) Possible values: - reached : 90% of OSPFv3 LSA limit reached - not-reached : less than 90% of OSPFv3 LSA limit	specifies whether 90% of the limit of received external OSPFv3 LSAs is reached or not <i>This element is only shown in detail mode.</i>
v3-neighbor-down	Parameter type: <Alarm::V3NeighborDown> (yes no) Possible values: - yes : OSPFv3 neighbor down - no : OSPFv3 neighbor up	specifies whether OSPFv3 neighbour is down or not <i>This element is only shown in detail mode.</i>
v3-instance-down	Parameter type: <Alarm::V3OspfDown> (yes no) Possible values: - yes : OSPFv3 instance down - no : OSPFv3 instance up	specifies whether OSPFv3 instance is down or not <i>This element is only shown in detail mode.</i>

104.70 ihub-l2forward Current Alarm Status Command

Command Description

This command displays the ihub-l2forward current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ihub-l2forward [ (index) ]
```

Command Parameters

Table 104.70-1 "ihub-l2forward Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.70-2 "ihub-l2forward Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Ihub::EtherPortAndLag> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex> ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>	identifies the physical position of the port <i>This element is only shown in detail mode.</i>

name	Type	Description
	<pre>lag : <Alarm::IhubLagId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>)</pre> Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - lag : key word to specify link aggregation group - nt-a : the nt-a slot - nt-b : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - eth : RJ45 or lemi port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::IhubLagId> - link aggregation group id Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the vpls service-id where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status

name	Type	Description
stp-exception	Parameter type: <Alarm::StpException> (yes no) Possible values: - yes : stp exception condition detected on the port - no : no stp exception condition detected	specifies whether an STP exception condition is present on the port or not <i>This element is only shown in detail mode.</i>
stp-root-guard	Parameter type: <Alarm::StpRootGuard> (violation no violation) Possible values: - violation : stp root guard violation detected on the port - no violation : no stp root guard violation detected	specifies whether an STP root-guard violation present or not <i>This element is only shown in detail mode.</i>

104.71 VPLS Current Alarm Status Command

Command Description

This command displays the vpls current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current vpls [ (index) ]
```

Command Parameters

Table 104.71-1 "VPLS Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.71-2 "VPLS Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the vpls service-id where the alarm has occurred. <i>This element is only shown in detail mode.</i>
mac-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the duplicate mac alarm and zero for all other alarms; duplicate mac is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringVpls> - additional alarm information	Additional information regarding duplicate MAC alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
mfib-limit	Parameter type: <Alarm::MfibLimit> (reached not-reached)	specifies whether the number of entries in the multicast FIB table reached its limit or not

name	Type	Description
	Possible values: - reached : mfib table size limit reached - not-reached : mfib table size below limit.	<i>This element is only shown in detail mode.</i>
duplicate-mac	Parameter type: <Alarm::DuplicateMac> (yes no) Possible values: - yes : duplicate mac detected on vpls - no : no duplicate mac on the vpls	specifies whether a duplicate MAC address is detected or not <i>This element is only shown in detail mode.</i>
fdb-limit	Parameter type: <Alarm::FdbLimit> (reached not-reached) Possible values: - reached : fdb table size limit reached - not-reached : fdb table size below low limit	specifies whether the number of entries in the fdb table reached the upper limit or dropped below the lower limit. <i>This element is only shown in detail mode.</i>
self-duplic-mac	Parameter type: <Alarm::Selfduplic> (yes no) Possible values: - yes : self duplicate mac detected on a sap of the vpls - no : no self duplicate mac on a sap of the vpls	specifies whether a duplicate of a system owned mac address is detected on a sap of the vpls service or not <i>This element is only shown in detail mode.</i>
sdp-self-dup-mac	Parameter type: <Alarm::SdpSelfdupMac> (yes no) Possible values: - yes : self duplicate mac detected on sdp binding of the vpls - no : no self duplicate mac on a sdp binding of the vpls	specifies whether a duplicate of a system owned mac address is detected on a sdp binding of the vpls service or not <i>This element is only shown in detail mode.</i>

104.72 IHUB-Equip Current Alarm Status Command

Command Description

This command displays the ihub-equip current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ihub-equip [ (index) ]
```

Command Parameters

Table 104.72-1 "IHUB-Equip Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.72-2 "IHUB-Equip Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
slot	Parameter type: <Alarm::NtSlotId> (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	identifies the slot where the alarm has been detected. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	additional information regarding the out-of-mem alarm, containing the name of the Software Module triggering this alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
peer-comm	Parameter type: <Alarm::PeerComm> (fail no fail) Possible values: - fail : peer-to-peer communication failure	specifies whether peer-to-peer communication has failed or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no fail : no peer-to-peer communication failure	
sw-fail	Parameter type: <Alarm::SwFail> (yes no) Possible values: - yes : software failure detected - no : no software failure	specifies whether a software failure has occurred or not <i>This element is only shown in detail mode.</i>
hw-fail	Parameter type: <Alarm::HwFail> (yes no) Possible values: - yes : hardware failure detected - no : no hardware failure	specifies whether a hardware failure has occurred or not <i>This element is only shown in detail mode.</i>
link-fail	Parameter type: <Alarm::LinkFail> (yes no) Possible values: - yes : link failure detected - no : no link failure	specifies whether a link failure has occurred or not <i>This element is only shown in detail mode.</i>
proc-overload	Parameter type: <Alarm::ProcOverload> (yes no) Possible values: - yes : processor overload detected - no : no processor overload	specifies whether an overload condition exists for the processor at ihub side <i>This element is only shown in detail mode.</i>
out-of-mem	Parameter type: <Alarm::OutOfMem> (yes no) Possible values: - yes : memory allocation failure - no : memory allocation successful	specifies whether memory allocation in ihub failed or not <i>This element is only shown in detail mode.</i>
ntp-comm	Parameter type: <Alarm::ntpCommLoss> (lost not-lost) Possible values: - lost : NTP communication lost - not-lost : NTP communication is not lost	specifies whether ntp communication is lost or not <i>This element is only shown in detail mode.</i>

104.73 ihub-link Current Alarm Status Command

Command Description

This command displays the ihub-link current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ihub-link [ (index) ]
```

Command Parameters

Table 104.73-1 "ihub-link Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.73-2 "ihub-link Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Ihub::EtherPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : cfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-a : ieee1588 : <Alarm::FacePlatePortIndex> nt-a : ai : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : cfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> nt-b : ieee1588 : <Alarm::FacePlatePortIndex> nt-b : ai : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-1 : cfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex>	identifies the ihub port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description
	ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : cfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> ntio-1 : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - cfp : CFP port - eth : RJ45 or lemi port - ieee1588 : IEEE1588 port - ai : AI port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	additional information regarding the lagport-add-fail alarm, containing the failure reason: Either of these will apply: - unknown - adminkey-mismatch - - sysid-mismatch - - lacp-passive-both-ends - - link-down <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status

name	Type	Description
link-down	Parameter type: <Alarm::IhubLink> (yes no) Possible values: - yes : link down - no : link up	specifies whether the link is down or not <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
lagport-add-fail	Parameter type: <Alarm::LagportAddFail> (yes no) Possible values: - yes : lag-port not added - no : lag-port successfully added	specifies whether a port was successfully added to a link aggregation group or not <i>This element is only shown in detail mode.</i>
conf-mismatch	Parameter type: <Alarm::SpeedMismatch> (yes no) Possible values: - yes : port configuration mismatch - no : no port configuration mismatch	specifies whether the inserted SFP or SFP+ type matches the planned speed and/or auto-negotiation for the port or not <i>This element is only shown in detail mode.</i>

104.74 ihub-tca Current Alarm Status Command

Command Description

This command displays the ihub-tca current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ihub-tca [(index)]

Command Parameters

Table 104.74-1 "ihub-tca Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.74-2 "ihub-tca Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <Ihub::EtherPort> (nt-a : sfp : <Alarm::FacePlatePortIndex> nt-a : xfp : <Alarm::FacePlatePortIndex> nt-a : qsfp : <Alarm::FacePlatePortIndex> nt-a : cfp : <Alarm::FacePlatePortIndex> nt-a : eth : <Alarm::FacePlatePortIndex> nt-a : ieee1588 : <Alarm::FacePlatePortIndex> nt-a : ai : <Alarm::FacePlatePortIndex> nt-b : sfp : <Alarm::FacePlatePortIndex> nt-b : xfp : <Alarm::FacePlatePortIndex> nt-b : qsfp : <Alarm::FacePlatePortIndex> nt-b : cfp : <Alarm::FacePlatePortIndex> nt-b : eth : <Alarm::FacePlatePortIndex> nt-b : ieee1588 : <Alarm::FacePlatePortIndex> nt-b : ai : <Alarm::FacePlatePortIndex> ntio-1 : sfp : <Alarm::FacePlatePortIndex> ntio-1 : xfp : <Alarm::FacePlatePortIndex> ntio-1 : qsfp : <Alarm::FacePlatePortIndex> ntio-1 : cfp : <Alarm::FacePlatePortIndex> ntio-2 : sfp : <Alarm::FacePlatePortIndex>	identifies the ihub port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	ntio-2 : xfp : <Alarm::FacePlatePortIndex> ntio-2 : qsfp : <Alarm::FacePlatePortIndex> ntio-2 : cfp : <Alarm::FacePlatePortIndex> lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> nt-b : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex> ntio-1 : qsfp : <Alarm::QsfpPortIndex> - <Alarm::LaneIndex>) Possible values: - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - lt : the lt slot - nt-a : the nt-a slot - nt-b : the nt-b slot - ntio-1 : the nt-b slot Possible values: - sfp : SFP port - xfp : XFP port - qsfp : QSFP port - cfp : CFP port - eth : RJ45 or lemi port - ieee1588 : IEEE1588 port - ai : AI port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Alarm::FacePlatePortIndex> - the faceplate port number Field type <Alarm::QsfpPortIndex> - the qsfp port number Field type <Alarm::LaneIndex> - the lane number of qsfp port	

Only Show Details: current and previous alarm log status		
name	Type	Description
tca-outputbw	Parameter type: <Alarm::TcaOutputBw> (yes no) Possible values: - yes : tca output bandwidth crossed threshold - no : tca output bandwidth did not crossed threshold	specifies whether the tca output bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputbw	Parameter type: <Alarm::TcaInputBw> (yes no) Possible values: - yes : tca input bandwidth crossed threshold - no : tca input bandwidth did not crossed threshold	specifies whether the tca input bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-rxcrcalign	Parameter type: <Alarm::TcaRxCrcAlign> (yes no) Possible values:	specifies whether the tca rxrcr align errors has crossed threshold or not <i>This element is only shown in</i>

name	Type	Description
	- yes : tca rxcrc align errors crossed threshold - no : tca rxcrc align errors did not crossed threshold	<i>detail mode.</i>
tca-txcrcalign	Parameter type: <Alarm::TcaTxCrcAlign> (yes no) Possible values: - yes : tca txcrc align errors crossed threshold - no : tca txcrc align errors did not crossed threshold	specifies whether the tca txcrc align errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-txcollisions	Parameter type: <Alarm::TcaTxCollisions> (yes no) Possible values: - yes : tca txcollisions errors crossed threshold - no : tca txcollisions errors did not crossed threshold	specifies whether the tca tx collisions errors has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-outputhighbw	Parameter type: <Alarm::TcaOutputHighBw> (yes no) Possible values: - yes : tca output high bandwidth crossed threshold - no : tca output high bandwidth did not crossed threshold	specifies whether the continous output high bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-outputmedbw	Parameter type: <Alarm::TcaOutputMediumBw> (yes no) Possible values: - yes : tca output medium bandwidth crossed threshold - no : tca output medium bandwidth did not crossed threshold	specifies whether the continous output medium bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-outputlowbw	Parameter type: <Alarm::TcaOutputLowBw> (yes no) Possible values: - yes : tca output low bandwidth crossed threshold - no : tca output low bandwidth did not crossed threshold	specifies whether the continous output low bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputhighbw	Parameter type: <Alarm::TcaInputHighBw> (yes no) Possible values: - yes : tca input high bandwidth crossed threshold - no : tca input high bandwidth did not crossed threshold	specifies whether the continous input high bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputmediumbw	Parameter type: <Alarm::TcaInputMediumBw> (yes no) Possible values: - yes : tca input medium bandwidth crossed threshold - no : tca input medium bandwidth did not crossed threshold	specifies whether the continous input medium bw has crossed threshold or not <i>This element is only shown in detail mode.</i>
tca-inputlowbw	Parameter type: <Alarm::TcaInputLowBw> (yes no) Possible values: - yes : tca input low bandwidth crossed threshold - no : tca input low bandwidth did not crossed threshold	specifies whether the continous input low bw has crossed threshold or not <i>This element is only shown in detail mode.</i>

104.75 LDP Current Alarm Status Command

Command Description

This command displays the current Label Distribution Protocol alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ldp [ (index) ]
```

Command Parameters

Table 104.75-1 "LDP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.75-2 "LDP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
ip-address	Parameter type: <Alarm::IPAddressOrZero> (not-applicable <IPv4::address>) Possible values: - not-applicable : not applicable Field type <IPv4::address> - IPv4-address	identifies the ip-address of the LDP targeted Peer <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
instance-down	Parameter type: <Alarm::LdpInstanceDown> (yes no) Possible values: - yes : ldp is down - no : ldp is up or not configured	specifies whether the LDP instance is down or not <i>This element is only shown in detail mode.</i>

name	Type	Description
session-down	Parameter type: <Alarm::SessionDown> (yes no) Possible values: - yes : TCP session down - no : Connection re-established or ldp not configured or explicit configured peer is removed	specifies whether the LDP session is down or not <i>This element is only shown in detail mode.</i>

104.76 MPLS Current Alarm Status Command

Command Description

This command displays the current MPLS alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current mpls [ (index) ]
```

Command Parameters

Table 104.76-1 "MPLS Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.76-2 "MPLS Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::baseRouter> base Possible values: - base : base router	identifies the base router <i>This element is only shown in detail mode.</i>
lsp-id-or-lsp-path-idx	Parameter type: <Alarm::LspIdOrLspPathIndexOrZero> - a signed integer	Lsp id or Lsp path index (unique identifier) where the alarm occurred or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoString> - additional alarm information	identifies the alarm additional info specific to an mpls alarm. Empty string if not applicable. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
instance-down	Parameter type: <Alarm::MplsInstanceDown>	specifies whether the MPLS

name	Type	Description
	(yes no) Possible values: - yes : mpls is down - no : mpls is up or not configured	instance is down or not <i>This element is only shown in detail mode.</i>
lsp-down	Parameter type: <Alarm::LspDown> (yes no) Possible values: - yes : lsp is down - no : lsp is up or shutdown, or mpls instance is stopped or not configured	specifies whether the LSP is down or not <i>This element is only shown in detail mode.</i>
lsp-path-down	Parameter type: <Alarm::LspPathDown> (yes no) Possible values: - yes : lsp path is down - no : lsp path is up or shutdown, or lsp is shutdown, or mpls instance is stopped or not configured	specifies whether the Lsp Path is down or not <i>This element is only shown in detail mode.</i>

104.77 SDP Current Alarm Status Command

Command Description

This command displays the current Service Delivery Point alarm status

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current sdp [(index)]

Command Parameters

Table 104.77-1 "SDP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.77-2 "SDP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
sdp-id	Parameter type: <Alarm::SdpId> - sdp-id value - range: [1...17407]	identifies the sdp-id of the sdp binding where the alarm has occurred <i>This element is only shown in detail mode.</i>
vc-id	Parameter type: <Alarm::SvcIdOrZero> - vc-id value or zero - range: [0,1...4294967295]	identifies the vc-id of the sdp binding where the alarm occurred or zero when not applicable, the sdp binding is further specified in additional-info <i>This element is only shown in detail mode.</i>
Only Show Details: current alarm status		
name	Type	Description
instance-down	Parameter type: <Alarm::SdpInstanceDown> (yes no) Possible values: - yes : sdp is operationl down	specifies whether the SDP instance is down or not <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : sdp is operational up or shutdown	
binding-down	Parameter type: <Alarm::BindlingDown> (yes no) Possible values: - yes : sdp binding is operational down - no : sdp binding is operational up or shutdown, or the sdp or service is shutdown	specifies whether the SDP binding is down or not <i>This element is only shown in detail mode.</i>

104.78 IHUB IPV6 Current Alarm Status Command

Command Description

This command displays the ihub-ipv6 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ihub-ipv6 [ (index) ]
```

Command Parameters

Table 104.78-1 "IHUB IPV6 Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.78-2 "IHUB IPV6 Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the vprn service-id or the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
duplicate-index	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the duplicate address for which the alarm has occurred or zero when not applicable, duplicate address is further specified in additional-info. <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringVprn> - additional alarm information	identifies the ipv6 alarm additional info or empty string if not applicable.

name	Type	Description
		<i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
duplicate-address-own	Parameter type: <Alarm::SelfDuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for own ipv6 address - no : no duplicate address detected for own ipv6 address	specifies whether a duplicate address is detected for own IPV6 address or not <i>This element is only shown in detail mode.</i>
duplicate-address	Parameter type: <Alarm::DuplicateIPv6Addr> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 address - no : no duplicate address detected for user's ipv6 address	specifies whether a duplicate address is detected for a user's IPV6 address or not <i>This element is only shown in detail mode.</i>
ipv6-dup-pd-route	Parameter type: <Alarm::Ipv6DupPdRoute> (yes no) Possible values: - yes : duplicate address detected for user's ipv6 PD route - no : no duplicate address detected for user's ipv6 PD route	status of ipv6-dup-pd-route <i>This element is only shown in detail mode.</i>

104.79 EPIPE Current Alarm Status Command

Command Description

This command displays the current Ethernet Pipe alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current epipe [(index)]

Command Parameters

Table 104.79-1 "EPIPE Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.79-2 "EPIPE Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
service-id	Parameter type: <Alarm::ServiceId> - a profile index value - range: [1...2147483647]	identifies the epipe service-id where the alarm has occurred <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status		
name	Type	Description
instance-down	Parameter type: <Alarm::EpipeInstanceDown> (yes no) Possible values: - yes : epipe service is operationl down - no : epipe service is operational up or shutdown	specifies whether the epipe instance is down or not <i>This element is only shown in detail mode.</i>

104.80 PIM Current Alarm Status Command

Command Description

This command displays the current PIM alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current pim [(index)]

Command Parameters

Table 104.80-1 "PIM Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.80-2 "PIM Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
router-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vprn service-id - range: [1...2147483647]	identifies the base router where the alarm has occurred <i>This element is only shown in detail mode.</i>
neighbor-idx	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique reference for the neighbor where the alarm occurred <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringPim> - additional alarm information	identifies the neighbor/instance where the alarm occurred or empty string if not applicable <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status

104 Current Alarm Status Commands

name	Type	Description
pim-neighbor-down	Parameter type: <Alarm::IhubPimDown> (yes no) Possible values: - yes : pim neighbor down - no : pim neighbor up	specifies whether the neighbor instance is down or not <i>This element is only shown in detail mode.</i>
mc-maximum-routes	Parameter type: <Alarm::IhubMaxRoutes> (yes no) Possible values: - yes : maximum routes reached - no : maximum routes not reached	specifies whether the max mc routes is reached <i>This element is only shown in detail mode.</i>

104.81 IHUB Lawful Intercept Current Alarm Status Command

Command Description

This command displays the lawful intercept current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current li [ (index) ]
```

Command Parameters

Table 104.81-1 "IHUB Lawful Intercept Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.81-2 "IHUB Lawful Intercept Current Alarm Status Command" Display parameters

Only Show Details: current alarm status		
name	Type	Description
li-traf-disabled	Parameter type: <Alarm::LiTrafficDisabled> (yes no) Possible values: - yes : lawful interception of traffic disabled - no : lawful interception of traffic enabled	specifies whether a lawful intercept traffic is disabled or not <i>This element is only shown in detail mode.</i>
li-bandwidth	Parameter type: <Alarm::LiBandwidthLimit> (reached not-reached) Possible values: - reached : lawful intercept reached bandwidth limit - not-reached : lawful intercept within bandwidth limit	specifies whether lawful intercept reached bandwidth limit or not <i>This element is only shown in detail mode.</i>
li-out-of-res	Parameter type: <Alarm::LiOutOfRes> (yes no) Possible values:	specifies whether lawful intercept is out of resources or not <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- yes : lack of resources for lawful intercept - no : no resource issues for lawful intercept	

104.82 Sync Clock Current Alarm Status Command

Command Description

This command displays the synce and bits current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sync [ (index) ]
```

Command Parameters

Table 104.82-1 "Sync Clock Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.82-2 "Sync Clock Current Alarm Status Command" Display parameters

Only Show Details: slot information		
name	Type	Description
slot	Parameter type: <Alarm::SynceSlot> (ntio-1 ntio-2 nt-a nt-b lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> not-used nt) Possible values: - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf - nt-a : nt-a slot - nt-b : nt-b slot - nt : active nt slot - lt : lt slot - not-used : no interface Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	identifies the synce port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number	
port	Parameter type: <Alarm::SyncePort> (sfp : <Alarm::SynceClk> xfp : <Alarm::SynceClk> bits-a bits-b ieee1588-a not-used ieee1588-b gnssrj45-a gnssrj45-b ieee1588-hybrid-a ieee1588-hybrid-b cfp : <Alarm::SynceClk> <Alarm::SynceClk> qsfps : <Alarm::SynceClk> ieee1588 internal-clk-a internal-clk-b) Possible values: - sfp : synce reference on sfp port - xfp : synce reference on xfp port - bits-a : bits clock source on nt-a - bits-b : bits clock source on nt-b - ieee1588-a : ieee1588 clock source on nt-a - ieee1588-b : ieee1588 clock source on nt-b - gnssrj45-a : gnss tod source on nt-a - gnssrj45-b : gnss tod source on nt-b - ieee1588-hybrid-a : 1588 hybrid tod source on nt-a - ieee1588-hybrid-b : 1588 hybrid tod source on nt-b - cfp : synce reference on cfp port - qsfps : synce reference on qsfps port - ieee1588 : ieee1588 clock source on nt - internal-clk-a : internal clock on nt-a - internal-clk-b : internal clock on nt-b - not-used : not-used Field type <Alarm::SynceClk> - value - range: [0...36]	identifies the synce port where the alarm has occurred. <i>This element is only shown in detail mode.</i>

Only Show Details: current and previous alarm log status		
name	Type	Description
bits-fail	Parameter type: <Alarm::BitsFail> (yes no) Possible values: - yes : bits source failed - no : no bits source failed	specifies whether bits clock source has failed or not <i>This element is only shown in detail mode.</i>
synce-fail	Parameter type: <Alarm::SynceFail> (yes no) Possible values: - yes : synce source failed - no : no synce source failed	specifies whether synce clock source has failed or not <i>This element is only shown in detail mode.</i>
bits-output-shutoff	Parameter type: <Alarm::BitsOutputShutoffFail> (yes no)	specifies whether bits output failed or not <i>This element is only shown in</i>

name	Type	Description
	Possible values: - yes : bits output shutoff - no : no bits output shutoff	<i>detail mode.</i>
ieee1588-fail	Parameter type: <Alarm::ieee1588Fail> (yes no) Possible values: - yes : bits output shutoff - no : no bits output shutoff	ieee1588 clock source failure <i>This element is only shown in detail mode.</i>
gnss-fail	Parameter type: <Alarm::gnssFail> (yes no) Possible values: - yes : gnss tod fail - no : no gnss tod fail	gnss time source failure <i>This element is only shown in detail mode.</i>
ieee1588hybrid-fail	Parameter type: <Alarm::ieee1588hybridFail> (yes no) Possible values: - yes : 1588 hybrid tod fail - no : no 1588 hybrid tod fail	ieee1588 hybrid tod source failure <i>This element is only shown in detail mode.</i>
signal-loss	Parameter type: <Alarm::ClockLoss> (yes no) Possible values: - yes : synce or bits clock signal loss - no : no synce or bits clock signal loss	specifies whether synce or bits clock signal loss or not <i>This element is only shown in detail mode.</i>
signal-efd	Parameter type: <Alarm::ClockEfd> (yes no) Possible values: - yes : synce or bits clock signal exceed frequency deviation - no : no synce or bits clock signal exceed frequency deviation	specifies whether synce or bits clock signal exceed frequency deviation or not <i>This element is only shown in detail mode.</i>
esmc-loss	Parameter type: <Alarm::ClockEsmcLoss> (yes no) Possible values: - yes : clock source SSM infomation loss - no : no clock source SSM infomation loss	specifies whether clock source loss SSM infomation or not <i>This element is only shown in detail mode.</i>
bits-output-exceed	Parameter type: <Alarm::BitsOutputQlThreshExceed> (yes no) Possible values: - yes : bitout ql threshold exceed - no : no bitout ql threshold exceed	specifies whether bits output ql threshold exceeded or not <i>This element is only shown in detail mode.</i>
ql-input-exceed	Parameter type: <Alarm::ClockExceed> (yes no) Possible values: - yes : input clock source threshold exceed - no : no input clock source threshold exceed	specifies whether exceed input clock source threshold or not <i>This element is only shown in detail mode.</i>
holdover	Parameter type: <Alarm::ClockHoldover> (yes no) Possible values: - yes : Clock system is in the holdover	specifies whether clock system is in the holdover or not <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- no : Clock system is not in the holdover	
lti	Parameter type: <Alarm::ClockLTI> (yes no) Possible values: - yes : all clock source failed - no : no all clock source failed	specifies whether all clock source failed or not <i>This element is only shown in detail mode.</i>
tod-reference-fail	Parameter type: <Alarm::ToDHoldover> (yes no) Possible values: - yes : Clock system ToD reference is failed - no : Clock system ToD reference is OK	specifies whether clock system tod reference is failed or not <i>This element is only shown in detail mode.</i>
internal-clk-fail	Parameter type: <Alarm::ClockOCXOFail> (yes no) Possible values: - yes : Internal CLK is failed - no : Internal CLK is OK	specifies whether internal clock is failed or not <i>This element is only shown in detail mode.</i>

104.83 Equipment Supplemental Current Alarm Status Command

Command Description

This command displays the equipment supplemental current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current eqpt-supplemental [(index)]

Command Parameters

Table 104.83-1 "Equipment Supplemental Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.83-2 "Equipment Supplemental Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
shelf	Parameter type: <Equipm::Shelf> <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	specify which shelf the alarm occurred on. <i>This element is only shown in detail mode.</i>
syslog-upload	Parameter type: <Alarm::uploadFailed> (failed ok) Possible values: - failed : upload of syslog file to remote server failed - ok : no syslog file upload failure detected	current status of the alarm specifying whether a failure occurred during upload of the NE's system log file to the syslog server or not <i>This element is only shown in detail mode.</i>
ont-sw-dnload	Parameter type: <Alarm::ontSoftwareDownload> (in-progress ok)	current status of the alarm specifying whether downloading of ont sw from version control to

104 Current Alarm Status Commands

name	Type	Description
	Possible values: - in-progress : ont software download in progress - ok : no ont software download detected	ont is in progress or not <i>This element is only shown in detail mode.</i>
cf-75%-used	Parameter type: <Alarm::cf75Percent> (above below) Possible values: - above : Compact flash exceeds 75% of life expectancy - below : Compact flash is below 75% of life expectancy	current status of CF utilization which could be more than 75% or less than that <i>This element is only shown in detail mode.</i>
cf-90%-used	Parameter type: <Alarm::cf90Percent> (above below) Possible values: - above : Compact flash exceeds 90% of life expectancy - below : Compact flash is below 90% of life expectancy	current status of CF utilization which could be more than 90% or less than that <i>This element is only shown in detail mode.</i>

104.84 Otdr Current Alarm Status Command

Command Description

This command displays the otdr current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current otdr [ (index) ]
```

Command Parameters

Table 104.84-1 "Otdr Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.84-2 "Otdr Current Alarm Status Command" Display parameters

Only Show Details: sfp information		
name	Type	Description
ponindex	Parameter type: <Itf::ComplexPortType> (xdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> voicefxs : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> xdsl-channel : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-if : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> atm-pvc : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> bridge-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> vlan-port:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan> l2-vlan : <Eqpt::VlanId>	identifies the spf where the alarm has occurred. <i>This element is only shown in detail mode.</i>

name	Type	Description

name	Type	Description
	- mpm : multi-pon module - Possible values: - vlan : vlan port - Possible values: - slot-vlan : slot unstacked - slot-stacked : slot vlan port - Field type <Eqpt::RackId> - the rack number - Field type <Eqpt::ShelfId> - the shelf number - Field type <Eqpt::SlotId> - the LT slot number - Field type <Eqpt::PortId> - the port number - Field type <Eqpt::VpiId> - atm VPI - Field type <Eqpt::VciId> - atm VCI - Field type <Eqpt::PonId> - the PON identifier - Field type <Eqpt::XPonId> - the XGS PON identifier - Field type <Eqpt::M25GPonId> - the 25G PON identifier - Field type <Eqpt::ComboPonId> - the comboPON identifier - Field type <Eqpt::ChannelPairId> - the channel pair identifier - Field type <Eqpt::ChannelGroupId> - the channel group identifier - Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier - Field type <Eqpt::BundleId> - the BUNDLE identifier - Field type <Eqpt::OntId> - the ONT identifier - Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier - Possible values: - voip : virtual uni identifier - obsolete alternative replaced by vuni - vuni : virtual uni identifier - Possible values: - vuni : virtual NGPON2 uni identifier - Field type <Eqpt::OntSlotId> - the ONT SLOT identifier - Field type <Eqpt::OntPortId> - the ONT PORT identifier - Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier - Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier - Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE - Possible values: - stacked : stacked vlan identity - Field type <Eqpt::UnstackedVlan>	

104 Current Alarm Status Commands

name	Type	Description
	- unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id Field type <Eqpt::VlanId> - VLAN id Field type <Eqpt::LogicalId> - logical id Field type <Eqpt::VrflId> - VRF id	

Only Show Details: current and previous alarm log status		
name	Type	Description
capability-mismatch	Parameter type: <Alarm::OTDRmismatch> (yes no) Possible values: - yes : otdr capability mismatch - no : no otdr capability mismatch	specifies whether otdr capability mismatch has occurred. <i>This element is only shown in detail mode.</i>

104.85 Management Security Access Current Alarm Status Command

Command Description

This command displays the management security access current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current mgmt-sec-access [(index)]

Command Parameters

Table 104.85-1 "Management Security Access Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.85-2 "Management Security Access Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is only shown in detail mode.</i>
ip-address	Parameter type: <Alarm::IpAddress> - IPv4-address	address of the operator <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <PrintableString> - printable string	displays the timestamp and operator name separated by semicolon. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status

104 Current Alarm Status Commands

name	Type	Description
login-successful	Parameter type: <Alarm::MgmtAccess> (yes no) Possible values: - yes : successfully logged in via management access - no : successfully logged out via management access	current status specifying whether successfully logged in or logged out via Management access <i>This element is only shown in detail mode.</i>
login-failure	Parameter type: <Alarm::InvalidAccess> (yes no) Possible values: - yes : invalid login via management access crossed the threshold - no : invalid login via management access within the threshold	current status specifying invalid attempts to login via management access crossed the threshold or not <i>This element is only shown in detail mode.</i>

104.86 IHUB BFD Current Alarm Status Command

Command Description

This command displays the bfd current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current bfd [ (index) ]
```

Command Parameters

Table 104.86-1 "IHUB BFD Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.86-2 "IHUB BFD Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
vpn-id	Parameter type: <Ihub::Router> (base <Ihub::Router>) Possible values: - base : base router Field type <Ihub::Router> - vpn service-id - range: [1...2147483647]	identifies the vpn service-id or the base router where the alarm has occurred. <i>This element is only shown in detail mode.</i>
bfd-unique-id	Parameter type: <Alarm::IdentificationIdxOrZero> - a signed integer	unique identification for the alarm or zero when not applicable, alarm entry is further specified in additional-info <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringBfd> - additional alarm information	Additional information regarding the bfd alarm <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm status

104 Current Alarm Status Commands

name	Type	Description
bfd-session-down	Parameter type: <Alarm::BfdSessionDown> (yes no) Possible values: - yes : bfd session down - no : bfd session not down	specifies whether a bfd session went down or not <i>This element is only shown in detail mode.</i>
bfd-max-resource	Parameter type: <Alarm::BfdMaxResource> (yes no) Possible values: - yes : bfd maximum resources reached - no : no resource issues for bfd	specifies whether bfd has reached maximum resources or not <i>This element is only shown in detail mode.</i>
bfd-stale-entry	Parameter type: <Alarm::BfdStaleEntry> (yes no) Possible values: - yes : bfd stale entry present - no : bfd stale entry not present	specifies whether a bfd entry has become stale or not <i>This element is only shown in detail mode.</i>

104.87 Application Intelligence Current Alarm Status Command

Command Description

This command displays the current Application Intelligence alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ai [ (index) ]
```

Command Parameters

Table 104.87-1 "Application Intelligence Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.87-2 "Application Intelligence Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
slot-id	Parameter type: <Equipm::NtSlotIndex> (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	identifies the board hosting the AI Platform for which the alarm has occurred. <i>This element is only shown in detail mode.</i>
application-virtplatf	Parameter type: <SignedInteger> - a signed integer	identifies the Application and/or the virtualplatform for which the alarm occurred <i>This element is only shown in detail mode.</i>
additional-info	Parameter type: <Alarm::AddInfoStringAI> - Additional info: Application Name - length: x<=32	Additional information regarding the AI alarm (Application name or none) <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

Only Show Details: current alarm status		
name	Type	Description
ai-platform-down	Parameter type: <Alarm::AIPlatformDown> (yes no) Possible values: - yes : AI Platform down - no : AI Platform not down	specifies whether an AI Platform went down or not <i>This element is only shown in detail mode.</i>
ai-appl-install-fail	Parameter type: <Alarm::AIApplInstallFail> (yes no) Possible values: - yes : Application installation failed - no : Application installation successful	specifies whether an Application 'download and installation' failed or was successful <i>This element is only shown in detail mode.</i>
ip-assign-fail	Parameter type: <Alarm::IpAddrAssignFail> (yes no) Possible values: - yes : Dhcp assigned address failure - no : Dhcp assigned address successful	specifies whether dhcp client 'assigned ip address' failed or was successful <i>This element is only shown in detail mode.</i>

104.88 Tr069 Alarm Status Command

Command Description

This command displays the tr069 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current tr069serv [ (index) ]
```

Command Parameters

Table 104.88-1 "Tr069 Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.88-2 "Tr069 Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
tr069serv	Parameter type: <Gpon::UniInterfaceIndexSnpAgent> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId>	identifies the tr069 serv entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier - the ONT SLOT identifier Field type <Eqpt::OntSlotId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Only Show Details: current alarm status		
name	Type	Description
ont-tr069-serv-mis	Parameter type: <Alarm::Tr069ServMis> (yes no) Possible values: - yes : ont tr069 server mismatch occurred - no : no ont tr069 server mismatch	specifies ont tr069 server mismatch occurred or not. <i>This element is only shown in detail mode.</i>

104.89 ONT SNMP Current Alarm Status Command

Command Description

This command displays the ont snmp current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ontsnmp [(index)]

Command Parameters

Table 104.89-1 "ONT SNMP Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.89-2 "ONT SNMP Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
uni-index	Parameter type: <Ces::InterfaceIndex> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	identification of the uni interface index <i>This element is only shown in detail mode.</i>
snmp-mismatch	Parameter type: <Alarm::OntSnmpMismatch>	current status specifying ont snmp

104 Current Alarm Status Commands

name	Type	Description
	(mismatch not-mismatch) Possible values: - mismatch : ont snmp agent configuration data is mismatch - not-mismatch : ont snmp agent configuration data is not mismatch	is mismatch or not <i>This element is only shown in detail mode.</i>

104.90 Bulk Sync Alarm Log Status Command

Command Description

This command displays the bulk sync alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current bulk-sync [(index)]

Command Parameters

Table 104.90-1 "Bulk Sync Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.90-2 "Bulk Sync Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <RedPort::PortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

Only Show Details: current alarm log status

104 Current Alarm Status Commands

name	Type	Description
bsf-dhcpv4-fail	Parameter type: <Alarm::BsfDHCPv4> ((failing fail) ok) Possible values: - failing : dhcpv4 bulk-sync is failing - fail : dhcpv4 bulk-sync is failing - ok : dhcpv4 bulk-sync is ok	current status of dhcpv4 bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-dhcpv6-fail	Parameter type: <Alarm::BsfDHCPv6> ((failing fail) ok) Possible values: - failing : dhcpv6 bulk-sync is failing - fail : dhcpv6 bulk-sync is failing - ok : dhcpv6 bulk-sync is ok	current status of dhcpv6 bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-pon-fail	Parameter type: <Alarm::BsfPON> ((failing fail) ok) Possible values: - failing : pon bulk-sync is failing - fail : pon bulk-sync is failing - ok : pon bulk-sync is ok	current status of pon bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-vlan-bridge-fail	Parameter type: <Alarm::BsfVBridge> ((failing fail) ok) Possible values: - failing : vlan-bridge bulk-sync is failing - fail : vlan-bridge bulk-sync is failing - ok : vlan-bridge bulk-sync is ok	current status of vlan-bridge bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-qos-fail	Parameter type: <Alarm::BsfQoS> ((failing fail) ok) Possible values: - failing : qos bulk-sync is failing - fail : qos bulk-sync is failing - ok : qos bulk-sync is ok	current status of qos bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-igmp-fail	Parameter type: <Alarm::BsfIGMP> ((failing fail) ok) Possible values: - failing : igmp bulk-sync is failing - fail : igmp bulk-sync is failing - ok : igmp bulk-sync is ok	current status of igmp bulk-sync failure. <i>This element is only shown in detail mode.</i>
bsf-lxfwd-fail	Parameter type: <Alarm::BsfLxFwd> ((failing fail) ok) Possible values: - failing : LxFwd bulk-sync is failing - fail : LxFwd bulk-sync is failing - ok : LxFwd bulk-sync is ok	current status of lxfwd bulk-sync failure. <i>This element is only shown in detail mode.</i>

104.91 Protection Group Alarm Log Status Command

Command Description

This command displays the protection group alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current protection-group [(index)]

Command Parameters

Table 104.91-1 "Protection Group Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.91-2 "Protection Group Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
port	Parameter type: <RedPort::PortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	specify which port the alarm occurred on. <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	Field type <Eqpt::ChannelPairId> - the channel pair identifier	

Only Show Details: current alarm log status		
name	Type	Description
port-protection-fail	Parameter type: <Alarm::ProtNotAvail> ((failing fail) ok) Possible values: - failing : port protection is failing - fail : port protection is failing - ok : port protection is ok	current status of port protection failure. <i>This element is only shown in detail mode.</i>
port-switchover-fail	Parameter type: <Alarm::ProtSwFail> ((failing fail) ok) Possible values: - failing : port protection switchover failing - fail : port protection switchover failing - ok : port protection switchover is ok	current status of port switchover failure. <i>This element is only shown in detail mode.</i>

104.92 Ont protection Alarm Log Status Command

Command Description

This command displays the ont protection alarm log status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ont-protection [(index)]

Command Parameters

Table 104.92-1 "Ont protection Alarm Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.92-2 "Ont protection Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm log status		
name	Type	Description
ont-prot-fail	Parameter type: <Alarm::OntProtNotAvail> ((failing fail) ok) Possible values: - failing : ont protection is failing - fail : ont protection is failing - ok : ont protection is ok	current status of ont protection failure. <i>This element is only shown in detail mode.</i>

104.93 ONT General Supplemental Current Alarm Status Command

Command Description

This command displays the ONT general supplemental current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current ont [(index)]

Command Parameters

Table 104.93-1 "ONT General Supplemental Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.93-2 "ONT General Supplemental Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	identifies the ont entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
ont-gen-sw-dnload-file	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	ont sw download file missing <i>This element is only shown in detail mode.</i>
ont-gen-fan-fail	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	ont fan failure <i>This element is only shown in detail mode.</i>
ont-gen-high-temp	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	ont high temperature <i>This element is only shown in detail mode.</i>
ont-gen-high-temp-ex	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	ont excessive high temperature <i>This element is only shown in detail mode.</i>
ont-gen-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	ont emergency call <i>This element is only shown in detail mode.</i>
ont-gen-sw-version	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	ont sw version control error <i>This element is only shown in detail mode.</i>
ont-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values: - yes : ont poe exceed max occurred	specifies ont poe exceed max occurred or not. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- no : no ont poe exceed max	
ont-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	specifies ont poe is nearing its maximum ability to supply power. <i>This element is only shown in detail mode.</i>
ont-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
ont-gen-cfgdld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	specifies download of voice xml file to ont failed or not. <i>This element is only shown in detail mode.</i>
ont-loopdetect-mis	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	ONT loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
ont-gen-rssi-mis	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	rssi mismatch status <i>This element is only shown in detail mode.</i>
ont-gen-tx-pwr-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	tx pwr low alarm status <i>This element is only shown in detail mode.</i>
ont-gen-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	temp alarm high status <i>This element is only shown in detail mode.</i>
ont-gen-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	voltage alarm high status <i>This element is only shown in detail mode.</i>
ont-gen-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values: - yes : bias at ont side is too high	bias alarm high status <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- no : bias at ont side is normal	
ont-olt-rx-pw-hig	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	bias alarm high status <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-warnhig	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	bias alarm high status <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-warnlo	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	bias alarm high status <i>This element is only shown in detail mode.</i>
ont-olt-rx-pw-lo	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	bias alarm high status <i>This element is only shown in detail mode.</i>
ont-gen-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	tod is out-sync with olt <i>This element is only shown in detail mode.</i>
ont-gen-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	ONU has failed to tune to Pref-ChnlPair <i>This element is only shown in detail mode.</i>
hgu-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
ont-gen-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	tod is mismatch <i>This element is only shown in detail mode.</i>

104.94 SFU ONT General Supplemental Current Alarm Status Command

Command Description

This command displays the SFU ONT general supplemental current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sfu-sup [ (index) ]
```

Command Parameters

Table 104.94-1 "SFU ONT General Supplemental Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.94-2 "SFU ONT General Supplemental Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
sfu-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	SFU ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
sfu-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	SFU ONT - Fan failure <i>This element is only shown in detail mode.</i>
sfu-sup-temp-high-warn	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	SFU ONT - High temperature warning <i>This element is only shown in detail mode.</i>
sfu-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	SFU ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
sfu-sup-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	SFU ONT - Emergency call active <i>This element is only shown in detail mode.</i>
sfu-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTRLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	SFU ONT - Software version control error <i>This element is only shown in detail mode.</i>
sfu-sup-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	SFU ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
sfu-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	SFU ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
sfu-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
sfu-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SFU ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
sfu-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	SFU ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	SFU ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	SFU ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	SFU ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SFU ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
sfu-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	SFU ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
sfu-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	SFU ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-hi-warn	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	SFU ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-lo-warn	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	SFU ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
sfu-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	SFU ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
sfu-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	SFU ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
sfu-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	SFU ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
sfu-tr069-parm-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	SFU ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
sfu-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	SFU ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

104.95 SOHO ONT General Supplemental Current Alarm Status Command

Command Description

This command displays the SOHO ONT general supplemental current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current soho-sup [(index)]

Command Parameters

Table 104.95-1 "SOHO ONT General Supplemental Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.95-2 "SOHO ONT General Supplemental Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
soho-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	SOHO ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
soho-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	SOHO ONT - Fan failure <i>This element is only shown in detail mode.</i>
soho-sup-temp-high-war	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	SOHO ONT - High temperature warning <i>This element is only shown in detail mode.</i>
soho-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	SOHO ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
soho-sup-emergency-cal	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	SOHO ONT - Emergency call active <i>This element is only shown in detail mode.</i>
soho-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTRLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	SOHO ONT - Software version control error <i>This element is only shown in detail mode.</i>
soho-sup-poe-exceed-ma	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	SOHO ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
soho-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	SOHO ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
soho-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
soho-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	SOHO ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
soho-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	SOHO ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
soho-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	SOHO ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
soho-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	SOHO ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	SOHO ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	SOHO ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
soho-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	SOHO ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
soho-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	SOHO ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-hi-war	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	SOHO ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-lo-war	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	SOHO ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
soho-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	SOHO ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
soho-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	SOHO ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
soho-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	SOHO ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
soho-tr069-param-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	SOHO ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
soho-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	SOHO ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

104.96 MDU ONT General Supplemental Current Alarm Status Command

Command Description

This command displays the MDU ONT general supplemental current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm current mdu-sup [(index)]

Command Parameters

Table 104.96-1 "MDU ONT General Supplemental Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.96-2 "MDU ONT General Supplemental Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- the PON identifier - Field type <Ng2::ChannelGroup> - channel group number - Field type <Ng2::SubchannelGroup> - subchannel group number - Field type <Eqpt::OntId> - the ONT identifier - Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
mdu-sup-sw-file-error	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWDLFILE> (yes no) Possible values: - yes : ont sw download file missing - no : ont works properly	MDU ONT - Software file has error or is missing <i>This element is only shown in detail mode.</i>
mdu-sup-fan-failure	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALFANALM> (yes no) Possible values: - yes : ont fan failure - no : ont works properly	MDU ONT - Fan failure <i>This element is only shown in detail mode.</i>
mdu-sup-temp-high-warn	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPWARN> (yes no) Possible values: - yes : high temperature warning - no : ont works properly	MDU ONT - High temperature warning <i>This element is only shown in detail mode.</i>
mdu-sup-temp-shutoff	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALHITEMPSHUTOFF> (yes no) Possible values: - yes : high temperature shutoff - no : ont works properly	MDU ONT - Service disabled due to excessive temperature <i>This element is only shown in detail mode.</i>
mdu-sup-emergency-call	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALECALLACT> (yes no) Possible values: - yes : ont emergency call - no : ont works properly	MDU ONT - Emergency call active <i>This element is only shown in detail mode.</i>
mdu-sup-swverctrl-err	Parameter type: <Alarm::ONTGENERALSUPPLEMENTALSWVERCTRLERR> (yes no) Possible values: - yes : ont sw version control error - no : ont works properly	MDU ONT - Software version control error <i>This element is only shown in detail mode.</i>
mdu-sup-poe-exceed-max	Parameter type: <Alarm::OntPoE> (yes no) Possible values:	MDU ONT - Configured PoE feeding exceeds ONT maximum <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : ont poe exceed max occurred - no : no ont poe exceed max	
mdu-sup-poe-over-yell	Parameter type: <Alarm::OntPoEY> (yes no) Possible values: - yes : ont poe is nearing its maximum ability to supply the power - no : ont poe is not nearing its maximum ability to supply the power	MDU ONT - specifies ont poe is nearing its maximum ability to supply power <i>This element is only shown in detail mode.</i>
mdu-opti-malfunc	Parameter type: <Alarm::OntTransMal> (yes no) Possible values: - yes : ONT detects the malfunction of its optical transceiver - no : ONT not detects the malfunction of its optical transceiver	ONT detects the malfunction of its optical transceiver <i>This element is only shown in detail mode.</i>
mdu-sup-cfg-dnld-fail	Parameter type: <Alarm::OntCfgDld> (yes no) Possible values: - yes : ont poe exceed max occurred - no : no ont poe exceed max	MDU ONT - Download of voice xml file to ONT failed <i>This element is only shown in detail mode.</i>
mdu-sup-ld-cfg-mism	Parameter type: <Alarm::OntLoopDetectMis> (yes no) Possible values: - yes : ont loop detect mismatch occurred - no : no ont loop detect mismatch	MDU ONT - Loop detection configuration mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-rssi-cfg-mism	Parameter type: <Alarm::OntRssiMismatch> (yes no) Possible values: - yes : ont dose not support rssi feature - no : ont supports rssi feature	MDU ONT - RSSI configuration mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-tx-low	Parameter type: <Alarm::OntTxPwrAlrmLow> (yes no) Possible values: - yes : tx pwr at ont side is too low - no : tx pwr at ont side is normal	MDU ONT - SFP Tx Power below configured low-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-temp-high	Parameter type: <Alarm::OntTempAlrmHigh> (yes no) Possible values: - yes : temperature at ont side is too high - no : temperature at ont side is normal	MDU ONT - SFP Temperature above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-volt-high	Parameter type: <Alarm::OntVoltAlrmHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	MDU ONT - SFP Voltage above configured high-level alarm threshold <i>This element is only shown in detail mode.</i>
mdu-sup-sfp-bias-high	Parameter type: <Alarm::OntBiasAlrmHigh> (yes no) Possible values:	MDU ONT - SFP Bias above configured high-level alarm threshold <i>This element is only shown in</i>

104 Current Alarm Status Commands

name	Type	Description
	- yes : bias at ont side is too high - no : bias at ont side is normal	<i>detail mode.</i>
mdu-sup-olt-rx-high	Parameter type: <Alarm::OltRxPwrAlrmH> (yes no) Possible values: - yes : rx power at olt side is too high - no : rx power at olt side is normal	MDU ONT - OLT Rx power above receiver operating range <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-hi-warn	Parameter type: <Alarm::OltRxPwrWarnH> (yes no) Possible values: - yes : rx power at olt side is warn high - no : rx power at olt side is normal	MDU ONT - OLT Rx power above high-level warning threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-lo-warn	Parameter type: <Alarm::OltRxPwrWarnL> (yes no) Possible values: - yes : rx power at olt side is warn low - no : rx power at olt side is normal	MDU ONT - OLT Rx power below low-level warning threshold <i>This element is only shown in detail mode.</i>
mdu-sup-olt-rx-low	Parameter type: <Alarm::OltRxPwrAlrmL> (yes no) Possible values: - yes : rx power at olt side is too low - no : rx power at olt side is normal	MDU ONT - OLT Rx power below receiver operating range <i>This element is only shown in detail mode.</i>
mdu-sup-tod-out-sync	Parameter type: <Alarm::TODOUTSYNC> (yes no) Possible values: - yes : tod is out-sync with olt - no : tod is sync with olt	MDU ONT - ONU TOD is out-sync with OLT <i>This element is only shown in detail mode.</i>
mdu-sup-ont-tune-fail	Parameter type: <Alarm::TUNEFAIL> (yes no) Possible values: - yes : Ont has failed to tune to Target-ChnlPair - no : Ont is to tune to Target-ChnlPair	MDU ONT - ONU has failed to tune to Target-ChnlPair <i>This element is only shown in detail mode.</i>
mdu-tr069-param-fail	Parameter type: <Alarm::HGUTR69FAIL> (yes no) Possible values: - yes : hgu tr069 parameters mismatch - no : hgu tr069 parameters not mismatch	MDU ONT - hgu tr069 parameters mismatch <i>This element is only shown in detail mode.</i>
mdu-sup-tod-mismatch	Parameter type: <Alarm::TODMISMATCH> (yes no) Possible values: - yes : tod is mismatch - no : tod is ok	MDU ONT - ONU TOD MISMATCH <i>This element is only shown in detail mode.</i>

104.97 ONT General Supplemental 2 Current Alarm Status Command

Command Description

This command displays the ONT general supplemental 2 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current ont-ani [ (index) ]
```

Command Parameters

Table 104.97-1 "ONT General Supplemental 2 Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.97-2 "ONT General Supplemental 2 Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

104 Current Alarm Status Commands

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
temp-alm-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	temp alarm low status <i>This element is only shown in detail mode.</i>
volt-alm-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	voltage alarm low status <i>This element is only shown in detail mode.</i>
bias-alm-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	bias alarm low status <i>This element is only shown in detail mode.</i>
tx-pwr-alm-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	tx pwr high alarm status <i>This element is only shown in detail mode.</i>
rx-pwr-warn-high	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	rx pwr warning high status <i>This element is only shown in detail mode.</i>
rx-pwr-warn-low	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	rx pwr warning high status <i>This element is only shown in detail mode.</i>
tx-pwr-warn-high	Parameter type: <Alarm::OntTxPwrWarnHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	tx pwr warning high status <i>This element is only shown in detail mode.</i>
tx-pwr-warn-low	Parameter type: <Alarm::OntTxPwrWarnLow> (yes no) Possible values:	tx pwr warning low status <i>This element is only shown in detail mode.</i>

name	Type	Description
	- yes : tx power at ont side is too low - no : tx power at ont side is normal	
temp-warn-high	Parameter type: <Alarm::OntTempWarnHigh> (yes no) Possible values: - yes : temp at ont side is too high - no : temp at ont side is normal	temp warning high status <i>This element is only shown in detail mode.</i>
temp-warn-low	Parameter type: <Alarm::OntTempWarnLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	temp warning low status <i>This element is only shown in detail mode.</i>
volt-warn-high	Parameter type: <Alarm::OntVoltWarnHigh> (yes no) Possible values: - yes : voltage at ont side is too high - no : voltage at ont side is normal	voltage warning high status <i>This element is only shown in detail mode.</i>
volt-warn-low	Parameter type: <Alarm::OntVoltWarnLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	voltage warning low status <i>This element is only shown in detail mode.</i>
bias-warn-high	Parameter type: <Alarm::OntBiasWarnHigh> (yes no) Possible values: - yes : bias at ont side is too high - no : bias at ont side is normal	bias warning high status <i>This element is only shown in detail mode.</i>
bias-warn-low	Parameter type: <Alarm::OntBiasWarnLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	bias warning low status <i>This element is only shown in detail mode.</i>

104.98 SFU ONT General Supplemental 2 Current Alarm Status Command

Command Description

This command displays the SFU ONT general supplemental 2 current alarm status.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm current sfu-sup2 [ (index) ]
```

Command Parameters

Table 104.98-1 "SFU ONT General Supplemental 2 Current Alarm Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	alarm type

Command Output

Table 104.98-2 "SFU ONT General Supplemental 2 Current Alarm Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId>	identifies the ont entry <i>This element is only shown in detail mode.</i>

name	Type	Description
	- the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Only Show Details: current alarm status		
name	Type	Description
sfu-sup2-temp-low	Parameter type: <Alarm::OntTempAlrmLow> (yes no) Possible values: - yes : temp at ont side is too low - no : temp at ont side is normal	SFU ONT - SFP Temperature is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-volt-low	Parameter type: <Alarm::OntVoltAlrmLow> (yes no) Possible values: - yes : voltage at ont side is too low - no : voltage at ont side is normal	SFU ONT - SFP Voltage is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-bias-low	Parameter type: <Alarm::OntBiasAlrmLow> (yes no) Possible values: - yes : bias at ont side is too low - no : bias at ont side is normal	SFU ONT - SFP Bias is lower than configured alarm low threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-tx-high	Parameter type: <Alarm::OntTxPwrAlrmHigh> (yes no) Possible values: - yes : tx power at ont side is too high - no : tx power at ont side is normal	SFU ONT - SFP tx power is higher than configured alarm high threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-rx-hwarn	Parameter type: <Alarm::OntRxPwrWarnHigh> (yes no) Possible values: - yes : rx power at ont side is too high - no : rx power at ont side is normal	SFU ONT - SFP Rx power is higher than configured warn threshold <i>This element is only shown in detail mode.</i>
sfu-sup2-rx-lwarn	Parameter type: <Alarm::OntRxPwrWarnLow> (yes no) Possible values: - yes : rx power at ont side is too low - no : rx power at ont side is normal	SFU ONT - SFP Rx power is lower than configured warn threshold <i>This element is only shown in detail mode.</i>
