RTX downstream/upstream parameters will have effect on lines supporting RTX, only when the retransmission feature in downstream/upstream is not "forbidden"

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure xdsl-bonding ( no group-rtx-profile (index) ) | ( group-rtx-profile (index) name <AsamProfileName> [
version <SignedInteger> ] [ no rtx-mode-dn | rtx-mode-dn <Xdsl::RtxMode> ] [ no rtx-mode-up | rtx-mode-up
<Xdsl::RtxMode> ] [ no min-exp-thrpt-dn | min-exp-thrpt-dn <Xdsl::BondingBitRate> ] [ no min-exp-thrpt-up |
min-exp-thrpt-up <Xdsl::BondingBitRate> ] [ no plan-exp-thrpt-dn | plan-exp-thrpt-dn <Xdsl::BondingBitRate> ] [
no plan-exp-thrpt-up | plan-exp-thrpt-up <Xdsl::BondingBitRate> ] [ no max-exp-thrpt-dn | max-exp-thrpt-dn
<Xdsl::BondingBitRate> ] [ no max-exp-thrpt-up | max-exp-thrpt-up <Xdsl::BondingBitRate> ] [ no
max-net-rate-dn | max-net-rate-dn <Xdsl::BondingBitRate> ] [ no max-net-rate-up | max-net-rate-up
<Xdsl::BondingBitRate> ] [ no min-delay-dn | min-delay-dn <Xdsl::RtxMinDelay> ] [ no min-delay-up |
min-delay-up <Xdsl::RtxMinDelay> ] [ no max-delay-dn | max-delay-dn <Xdsl::RtxMaxDelay> ] [ no
max-delay-up | max-delay-up <Xdsl::RtxMaxDelay> ] [ no min-inp-shine-dn | min-inp-shine-dn
<Xdsl::ShineImpNoiseProtection> ] [ no min-inp-shine-up | min-inp-shine-up <Xdsl::ShineImpNoiseProtection> ]

active ] )
```

Command Parameters

Table 35.4-1 "xDSL Bonding Group Rtx Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - a profile index value - range: [1...128]	index of the profile

Table 35.4-2 "xDSL Bonding Group Rtx Profile Configuration Command" Command Parameters

35 XDSL Bonding Configuration Commands

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> profile name
version	Parameter type: <SignedInteger> Format: - a signed integer	<i>optional parameter</i> version maintained by manager, usually 1 for new profile
[no] rtx-mode-dn	Parameter type: <Xdsl::RtxMode> Format: (forbidden preferred forced testmode) Possible values: - forbidden : retransmission forbidden in down/upstream - preferred : retransmission preferred in down/upstream - forced : retransmission forced in down/upstream - testmode : retransmission testmode in down/upstream	<i>optional parameter with default value: "preferred"</i> retransmission mode in downstream
[no] rtx-mode-up	Parameter type: <Xdsl::RtxMode> Format: (forbidden preferred forced testmode) Possible values: - forbidden : retransmission forbidden in down/upstream - preferred : retransmission preferred in down/upstream - forced : retransmission forced in down/upstream - testmode : retransmission testmode in down/upstream	<i>optional parameter with default value: "preferred"</i> retransmission mode in upstream
[no] min-exp-thrpt-dn	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 64</i> minimum expected throughput for downstream direction
[no] min-exp-thrpt-up	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 64</i> minimum expected throughput for upstream direction
[no] plan-exp-thrpt-dn	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 128</i> planned expected throughput for downstream direction
[no] plan-exp-thrpt-up	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 128</i> planned expected throughput for upstream direction
[no] max-exp-thrpt-dn	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 2147483647</i> maximum expected throughput for downstream direction
[no] max-exp-thrpt-up	Parameter type: <Xdsl::BondingBitRate> Format:	<i>optional parameter with default value: 2147483647</i>

Parameter	Type	Description
	- a bonding bit rate value - unit: kbps - range: [0...2147483647]	maximum expected throughput for upstream direction
[no] max-net-rate-dn	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 2147483647</i> maximum net data rate for downstream direction
[no] max-net-rate-up	Parameter type: <Xdsl::BondingBitRate> Format: - a bonding bit rate value - unit: kbps - range: [0...2147483647]	<i>optional parameter with default value: 2147483647</i> maximum net data rate for upstream direction
[no] min-delay-dn	Parameter type: <Xdsl::RtxMinDelay> Format: - a delay time period - unit: msec - range: [0...63]	<i>optional parameter with default value: 0</i> minimum instantaneous delay allowed (due to the effect of retransmission) for downstream direction
[no] min-delay-up	Parameter type: <Xdsl::RtxMinDelay> Format: - a delay time period - unit: msec - range: [0...63]	<i>optional parameter with default value: 0</i> minimum instantaneous delay allowed (due to the effect of retransmission) for upstream direction
[no] max-delay-dn	Parameter type: <Xdsl::RtxMaxDelay> Format: - a delay time period - unit: msec - range: [2...63]	<i>optional parameter with default value: 12</i> maximum instantaneous delay allowed (due to the effect of retransmission) for downstream direction Special value 0 means no delay bounds
[no] max-delay-up	Parameter type: <Xdsl::RtxMaxDelay> Format: - a delay time period - unit: msec - range: [2...63]	<i>optional parameter with default value: 12</i> maximum instantaneous delay allowed (due to the effect of retransmission) for upstream direction Special value 0 means no delay bounds
[no] min-inp-shine-dn	Parameter type: <Xdsl::ShineImpNoiseProtection> Format: - minimum impulse noise protection - unit: DMT symbols - range: [0...63]	<i>optional parameter with default value: 8</i> minimum impulse noise protection against shine for downstream direction
[no] min-inp-shine-up	Parameter type: <Xdsl::ShineImpNoiseProtection> Format: - minimum impulse noise protection - unit: DMT symbols - range: [0...63]	<i>optional parameter with default value: 8</i> minimum impulse noise protection against shine for upstream direction
[no] min-inp-rein-dn	Parameter type: <Xdsl::ReinImpNoiseProtection> Format: - minimum impulse noise protection - unit: DMT symbols - range: [0...7]	<i>optional parameter with default value: 0</i> minimum impulse noise protection against rein for downstream direction
[no] min-inp-rein-up	Parameter type: <Xdsl::ReinImpNoiseProtection> Format: - minimum impulse noise protection	<i>optional parameter with default value: 0</i> minimum impulse noise

35 XDSL Bonding Configuration Commands

Parameter	Type	Description
	- unit: DMT symbols - range: [0...7]	protection against rein for upstream direction
[no] int-arr-time-dn	Parameter type: <Xdsl::RtxInterArrivalTime> Format: (derivedfrom100hz derivedfrom120hz) Possible values: - derivedfrom100hz : inter-arrival time derived from 100hz - derivedfrom120hz : inter-arrival time derived from 120hz	<i>optional parameter with default value: "derivedfrom100hz"</i> assumed inter-arrival time for rein protection for downstream direction
[no] int-arr-time-up	Parameter type: <Xdsl::RtxInterArrivalTime> Format: (derivedfrom100hz derivedfrom120hz) Possible values: - derivedfrom100hz : inter-arrival time derived from 100hz - derivedfrom120hz : inter-arrival time derived from 120hz	<i>optional parameter with default value: "derivedfrom100hz"</i> assumed inter-arrival time for rein protection for upstream direction
[no] shine-ratio-dn	Parameter type: <Xdsl::RtxShineRatio> Format: - shine ratio - unit: 1/1000 - range: [0...100]	<i>optional parameter with default value: 10</i> shine ratio for downstream direction
[no] shine-ratio-up	Parameter type: <Xdsl::RtxShineRatio> Format: - shine ratio - unit: 1/1000 - range: [0...100]	<i>optional parameter with default value: 10</i> shine ratio for upstream direction
[no] leftr-thresh-dn	Parameter type: <Xdsl::RtxLeftrThreshold> Format: - near-end defect threshold - unit: 1/100 - range: [0,1...99]	<i>optional parameter with default value: 0</i> threshold for declaring a near-end defect in downstream direction
[no] leftr-thresh-up	Parameter type: <Xdsl::RtxLeftrThreshold> Format: - near-end defect threshold - unit: 1/100 - range: [0,1...99]	<i>optional parameter with default value: 0</i> threshold for declaring a near-end defect in upstream direction
[no] active	Parameter type: boolean	<i>optional parameter</i> to activate the profile

35.5 xDSL Bonding Configuration Command

Command Description

This command allows to configure a bonding group, which consists of assigning a predefined bonding group profile and optional assigning a group rtx-profile.

Configuring bonding group will fail when a service is already configured on the secondary DSL line of the bonding group

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure xdsl-bonding group (bonding-group-idx) [ no group-profile | group-profile
<Xdsl::GroupProfileIndexWithRemove> ] [ no group-rtx-profile | group-rtx-profile
<Xdsl::LineBondingRtxProfile> ] [ no ] admin-up [ [ no ] up ]
```

Command Parameters

Table 35.5-1 "xDSL Bonding Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(bonding-group-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	a unique interface index

Table 35.5-2 "xDSL Bonding Configuration Command" Command Parameters

Parameter	Type	Description
[no] group-profile	Parameter type: <Xdsl::GroupProfileIndexWithRemove> Format: (none <Xdsl::GroupProfileIndexWithRemove> name : <PrintableString>) Possible values: - none : no profile to associate - name : profile name Field type <Xdsl::GroupProfileIndexWithRemove>	<i>optional parameter with default value: "none"</i> a valid profile index for the interface

35 XDSL Bonding Configuration Commands

Parameter	Type	Description
	- bonding group profile index - range: [0...100] - Field type <PrintableString> - printable string	
[no] group-rtx-profile	Parameter type: <Xdsl::LineBondingRtxProfile> Format: (none <Xdsl::BondingRtxProfilePointer> name : <PrintableString>) Possible values: - none : no profile to associate - name : profile name Field type <Xdsl::BondingRtxProfilePointer> - profile index - range: [0...128] - Field type <PrintableString> - printable string	<i>optional parameter with default value: "none"</i> a valid bonding group rtx profile index for the interface
[no] admin-up	Parameter type: boolean	<i>obsolete parameter replaced by parameter "up"</i> set the admin-state of the group to up
[no] up	Parameter type: boolean	<i>optional parameter</i> <i>The parameter is not visible during creation.</i> admin-state of the group to up

Command Output

Table 35.5-3 "xDSL Bonding Configuration Command" Display parameters

Specific Information		
name	Type	Description
group-profile-name	Parameter type: <Xdsl::IgnoredPrintableString> - ignored printable string	name of the group profile <i>This element is only shown in detail mode.</i>
group-rtx-profile-name	Parameter type: <Xdsl::IgnoredPrintableString> - ignored printable string	name of the bonding group rtx profile <i>This element is only shown in detail mode.</i>

35.6 xDSL Bonding Configuration Command

Command Description

This node provides the provisioning of the bonding group, which consists of adding/removing links to/from the bonding group.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure xdsl-bonding group (bonding-group-idx) ( no link (bonding-link-id) ) | ( link (bonding-link-id) )
```

Command Parameters

Table 35.6-1 "xDSL Bonding Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(bonding-group-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	a unique interface index
(bonding-link-id)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	a bonding link interface index

35.7 xDSL Bonding Board Configuration Command

Command Description

This command allows the operator to configure xdsl bonding parameters related with a specific board.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

> configure xdsl-bonding board (board-index)

Command Parameters

Table 35.7-1 "xDSL Bonding Board Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(board-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	board index

35.8 xDSL Bonding Board Vectoring Fallback Configuration Command

Command Description

This command allows the operator to configure per board the profile selection in case the bonding group enters the vectoring fallback mode.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure xdsl-bonding board (board-index) vect-fallback [ no group-profile | group-profile
<Xdsl::VectFbGroupProfileIndex> ] [ no group-rtx-profile | group-rtx-profile <Xdsl::VectFbGroupRtxProfile> ]
```

Command Parameters

Table 35.8-1 "xDSL Bonding Board Vectoring Fallback Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(board-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	board index

Table 35.8-2 "xDSL Bonding Board Vectoring Fallback Configuration Command" Command Parameters

Parameter	Type	Description
[no] group-profile	Parameter type: <Xdsl::VectFbGroupProfileIndex> Format: (group-level <Xdsl::VectFbGroupProfilePointer> name : <PrintableString>) Possible values: - group-level : use the original group profile in fallback mode - name : profile name Field type <Xdsl::VectFbGroupProfilePointer>	<i>optional parameter with default value: "group-level"</i> a valid profile index for the interface

Parameter	Type	Description
	- bonding group profile index - range: [1...100] - Field type <PrintableString> - printable string	
[no] group-rtx-profile	Parameter type: <Xdsl::VectFbGroupRtxProfile> Format: (none group-level <Xdsl::VectFbGroupRtxProfilePointer> name : <PrintableString>) Possible values: - none : no fallback profile to associate - group-level : use the original group rtx profile in fallback mode - name : profile name Field type <Xdsl::VectFbGroupRtxProfilePointer> - a profile index value - range: [0...128] Field type <PrintableString> - printable string	<i>optional parameter with default value: "group-level"</i> a valid bonding group rtx profile index for the interface

Command Output

Table 35.8-3 "xDSL Bonding Board Vectoring Fallback Configuration Command" Display parameters

Specific Information		
name	Type	Description
group-profile-name	Parameter type: <Xdsl::IgnoredPrintableString> - ignored printable string	name of the group profile <i>This element is only shown in detail mode.</i>
group-rtx-profile-name	Parameter type: <Xdsl::IgnoredPrintableString> - ignored printable string	name of the bonding group rtx profile <i>This element is only shown in detail mode.</i>

36- CPE Remote Configuration Commands

36.1 CPE Remote Configuration Command Tree	36-1148
36.2 CPE Remote Management System Configuration Commands	36-1149
36.3 CPE Manager Configuration Command	36-1150
36.4 CPE IPProxy Session Configuration Command	36-1151

36.1 CPE Remote Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "CPE Remote Configuration Commands".

Command Tree

```
----configure
  ----cpe-management
    - [no] proxy-mode
    X vlan-id
  ----[no] manager
    - (address)
  ----X [no] session
    - (dslport)
    - connection
```

36.2 CPE Remote Management System Configuration Commands

Command Description

This command allows to configure CPE Remote Management System;

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure cpe-management [ no proxy-mode | proxy-mode <CpeProxy::SystemMode> ] [ vlan-id <CpeProxy::VlanIndex> ]
```

Command Parameters

Table 36.2-2 "CPE Remote Management System Configuration Commands" Command Parameters

Parameter	Type	Description
[no] proxy-mode	Parameter type: <CpeProxy::SystemMode> Format: (snmp none) Possible values: - snmp : this mode is relaying SNMP messages - none : disables the cpeproxy	<i>optional parameter with default value: "none"</i> set the CPE Proxy mode
vlan-id	Parameter type: <CpeProxy::VlanIndex> Format: - cpe ipproxy vlan number - range: [0...4093]	<i>obsolete parameter that will be ignored</i> configure the svlan number.

36.3 CPE Manager Configuration Command

Command Description

This command allows to configure a CPE manager.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure cpe-management ( no manager (address) ) | ( manager (address) )
```

Command Parameters

Table 36.3-1 "CPE Manager Configuration Command " Resource Parameters

Resource Identifier	Type	Description
(address)	Format: <CpeProxy::IPaddress> : <CpeProxy::PortNumber> Field type <CpeProxy::IPaddress> - IP address of CPE Management Station Field type <CpeProxy::PortNumber> - cpe management station udp port number - range: [1...65535]	the address of a CPE manager

36.4 CPE IPProxy Session Configuration Command

Command Description

Obsolete command.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure cpe-management ( no session (dslport) ) | ( session (dslport) connection
<CpeProxy::cpeIpProxySessionProtocolPort> )
```

Obsolete command.

Command Parameters

Table 36.4-1 "CPE IPProxy Session Configuration Command " Resource Parameters

Resource Identifier	Type	Description
(dslport)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identification of port to which the CPE is connected

Table 36.4-2 "CPE IPProxy Session Configuration Command " Command Parameters

Parameter	Type	Description
connection	Parameter type: <CpeProxy::cpeIpProxySessionProtocolPort> Format: - cpe ipproxy port number - range: [0,13410...13457]	mandatory parameter protocol port for ipproxy session.

37- SHDSL Configuration Commands

37.1 SHDSL Configuration Command Tree	37-1153
37.2 SHDSL Span Configuration Command	37-1155
37.3 SHDSL Unit Configuration Command	37-1160
37.4 SHDSL Segment Configuration Command	37-1162

37.1 SHDSL Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "SHDSL Configuration Commands".

Command Tree

```

----configure
  ----shdsl
    ----span
      - (if-index)
      - [no] active

```

37 SHDSL Configuration Commands

- [no] loopback
- [no] pbo-mode

37.2 SHDSL Span Configuration Command

Command Description

This command allows the operator to manage the SHDSL span profile.

The lines, which you can configure, are calculated via the next formula: $m*n + 1$

o where m is the number of pairs per modem

o where n is from 0 till $24/m - 1$

Mixing of different "wire mode" on the same LT is possible as long as the lines are not occupied yet.

User Level

The command can be accessed by operators with `xdsl` privileges, and executed by operators with `xdsl` privileges.

Command Syntax

The command has the following syntax:

```
> configure shdsl span (if-index) [ [ no ] active ] [ [ no ] admin-up ] [ no repeaters | repeaters
<Shdsl::SpanConfNumRepeaters> ] [ no op-mode | op-mode <Shdsl::SpanOperationalMode> ] [ no spectral-profile
| spectral-profile <Shdsl::SpanSpectralProfile> ] [ no wire-mode | wire-mode <Shdsl::SpanWireMode> ] [ [ no ]
mgmt-by-stu-r ] [ no regi-set | regi-set <Shdsl::SpanRegionalSetting> ] [ no min-line-rate | min-line-rate
<Shdsl::BitRate> ] [ no max-line-rate | max-line-rate <Shdsl::BitRate> ] [ no margin-down-worst |
margin-down-worst <Shdsl::NoiseMarginWC> ] [ no margin-down-curr | margin-down-curr
<Shdsl::NoiseMarginCC> ] [ no margin-up-worst | margin-up-worst <Shdsl::NoiseMarginWC> ] [ no
margin-up-curr | margin-up-curr <Shdsl::NoiseMarginCC> ] [ no probe | probe <Shdsl::SpanLineProbeEnable> ] [
no tc-pam-sele | tc-pam-sele <Shdsl::SpanTCPAMSelection> ] [ no efm-hs-sele | efm-hs-sele
<Shdsl::SpanEFMHandshakeSelection> ] [ no bonding-rate-mode | bonding-rate-mode
<Shdsl::SpanBondingRateControlMode> ] [ no min-rate-link1 | min-rate-link1 <Shdsl::BitRate> ] [ no
max-rate-link1 | max-rate-link1 <Shdsl::BitRate> ] [ no min-rate-link2 | min-rate-link2 <Shdsl::BitRate> ] [ no
max-rate-link2 | max-rate-link2 <Shdsl::BitRate> ] [ no min-rate-link3 | min-rate-link3 <Shdsl::BitRate> ] [ no
max-rate-link3 | max-rate-link3 <Shdsl::BitRate> ] [ no min-rate-link4 | min-rate-link4 <Shdsl::BitRate> ] [ no
max-rate-link4 | max-rate-link4 <Shdsl::BitRate> ] [ no tc-pam-link1 | tc-pam-link1
<Shdsl::SpanTCPAMSelection> ] [ no tc-pam-link2 | tc-pam-link2 <Shdsl::SpanTCPAMSelection> ] [ no
tc-pam-link3 | tc-pam-link3 <Shdsl::SpanTCPAMSelection> ] [ no tc-pam-link4 | tc-pam-link4
<Shdsl::SpanTCPAMSelection> ] [ no ctc | ctc <Shdsl::SpanCTCEnable> ]
```

Command Parameters

Table 37.2-1 "SHDSL Span Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	interface index of the port

Resource Identifier	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	

Table 37.2-2 "SHDSL Span Configuration Command" Command Parameters

Parameter	Type	Description
[no] active	Parameter type: boolean	<i>optional parameter</i> set the span-profile active
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> admin status is up
[no] repeaters	Parameter type: <Shdsl::SpanConfNumRepeaters> Format: - the number of SRUs to be configured for this span - range: [0...8]	<i>optional parameter with default value: 0</i> number of repeaters
[no] op-mode	Parameter type: <Shdsl::SpanOperationalMode> Format: (native ima efm tdm) Possible values: - native : the operational mode is native - ima : the operational mode is ima - efm : the operational mode is efm - tdm : the operational mode is tdm	<i>optional parameter with default value: "native"</i> span operational mode
[no] spectral-profile	Parameter type: <Shdsl::SpanSpectralProfile> Format: (symmetric asymmetric) Possible values: - symmetric : the spectral mode is symmetric - asymmetric : the spectral mode is asymmetric	<i>optional parameter with default value: "symmetric"</i> spectral mode
[no] wire-mode	Parameter type: <Shdsl::SpanWireMode> Format: (two-wire four-wire six-wire eight-wire) Possible values: - two-wire : the M-pair operation is one-pair - four-wire : the M-pair operation is two-pair - six-wire : the M-pair operation is three-pair - eight-wire : the M-pair operation is four-pair	<i>optional parameter with default value: "two-wire"</i> M-pair operation wire mode
[no] mgmt-by-stu-r	Parameter type: boolean	<i>optional parameter</i> enable the STU-R initiated management flow
[no] regi-set	Parameter type: <Shdsl::SpanRegionalSetting> Format: (annex-a/f annex-b/g) Possible values: - annex-a/f : Annex A/F Region 1 - annex-b/g : Annex B/G Region 2	<i>optional parameter with default value: "annex-b/g"</i> the number specifies regional setting
[no] min-line-rate	Parameter type: <Shdsl::BitRate> Format:	<i>optional parameter with default value: 192</i>

Parameter	Type	Description
	- bitrate - unit: kbits/sec	the minimum requested data rate
[no] max-line-rate	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 5696</i> the maximum requested data rate
[no] margin-down-worst	Parameter type: <Shdsl::NoiseMarginWC> Format: - a noise margin value of worst conditions - unit: db - range: [-11...10]	<i>optional parameter with default value: -11</i> target relative margin in dwnstrm for worst case noise
[no] margin-down-curr	Parameter type: <Shdsl::NoiseMarginCC> Format: - a noise margin value of current conditions - unit: db - range: [-11,0...10]	<i>optional parameter with default value: 5</i> relative margin in dwnstrm for current noise condition
[no] margin-up-worst	Parameter type: <Shdsl::NoiseMarginWC> Format: - a noise margin value of worst conditions - unit: db - range: [-11...10]	<i>optional parameter with default value: -11</i> target relative margin in upstrm for worst case noise
[no] margin-up-curr	Parameter type: <Shdsl::NoiseMarginCC> Format: - a noise margin value of current conditions - unit: db - range: [-11,0...10]	<i>optional parameter with default value: 5</i> relative margin in upstrm for current noise conditions
[no] probe	Parameter type: <Shdsl::SpanLineProbeEnable> Format: (disable enable) Possible values: - disable : disable the line probe - enable : enable the line probe	<i>optional parameter with default value: "enable"</i> the number enable/disable line probe
[no] tc-pam-sele	Parameter type: <Shdsl::SpanTCPAMSelection> Format: (auto tc-pam32 tc-pam16) Possible values: - auto : auto-tcPam selection - tc-pam32 : tcPam32 selection - tc-pam16 : tcPam16 selection	<i>optional parameter with default value: "auto"</i> the TC-PAM modulation selection for the span
[no] efm-hs-sele	Parameter type: <Shdsl::SpanEFMHandshakeSelection> Format: (auto ieee itu not-applicable) Possible values: - auto : auto select ieee/itu according to cpe - ieee : ieee 2base-tl - itu : itu-t g.991.2 ptm 64/65otc - not-applicable : not-applicable for atm/ima mode	<i>optional parameter with default value: "not-applicable"</i> the handshake mode selection for the span
[no] bonding-rate-mode	Parameter type: <Shdsl::SpanBondingRateControlMode> Format: (span-level link-level)	<i>optional parameter with default value: "span-level"</i> the bonding rate control mode on the span

37 SHDSL Configuration Commands

Parameter	Type	Description
	Possible values: - span-level : bonding rate control mode is span level - link-level : bonding rate control mode is span level	
[no] min-rate-link1	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 192</i> the minimum requested data rate of link 1
[no] max-rate-link1	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 5696</i> the maximum requested data rate of link 1
[no] min-rate-link2	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 192</i> the minimum requested data rate of link 2
[no] max-rate-link2	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 5696</i> the maximum requested data rate of link 2
[no] min-rate-link3	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 192</i> the minimum requested data rate of link 3
[no] max-rate-link3	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 5696</i> the maximum requested data rate of link 3
[no] min-rate-link4	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 192</i> the minimum requested data rate of link 4
[no] max-rate-link4	Parameter type: <Shdsl::BitRate> Format: - bitrate - unit: kbits/sec	<i>optional parameter with default value: 5696</i> the maximum requested data rate of link 4
[no] tc-pam-link1	Parameter type: <Shdsl::SpanTCPAMSelection> Format: (auto tc-pam32 tc-pam16) Possible values: - auto : auto-tcPam selection - tc-pam32 : tcPam32 selection - tc-pam16 : tcPam16 selection	<i>optional parameter with default value: "auto"</i> the TC-PAM modulation selection for the link 1
[no] tc-pam-link2	Parameter type: <Shdsl::SpanTCPAMSelection> Format: (auto tc-pam32 tc-pam16) Possible values: - auto : auto-tcPam selection - tc-pam32 : tcPam32 selection - tc-pam16 : tcPam16 selection	<i>optional parameter with default value: "auto"</i> the TC-PAM modulation selection for the link 2
[no] tc-pam-link3	Parameter type: <Shdsl::SpanTCPAMSelection> Format: (auto tc-pam32	<i>optional parameter with default value: "auto"</i> the TC-PAM modulation selection for the link 3

Parameter	Type	Description
	tc-pam16) Possible values: - auto : auto-tcPam selection - tc-pam32 : tcPam32 selection - tc-pam16 : tcPam16 selection	
[no] tc-pam-link4	Parameter type: <Shdsl::SpanTCPAMSelection> Format: (auto tc-pam32 tc-pam16) Possible values: - auto : auto-tcPam selection - tc-pam32 : tcPam32 selection - tc-pam16 : tcPam16 selection	<i>optional parameter with default value: "auto"</i> the TC-PAM modulation selection for the link 4
[no] ctc	Parameter type: <Shdsl::SpanCTCEnable> Format: (disable enable) Possible values: - disable : disable the cross-talk cancellation - enable : enable the cross-talk cancellation	<i>optional parameter with default value: "disable"</i> enable the cross-talk cancellation for the span

37.3 SHDSL Unit Configuration Command

Command Description

This command allows the operator to manage the SHDSL unit profile in one SHDSL span.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure shdsl unit (if-index) unit-id <Shdsl::UnitId> [ no loop-attenuation | loop-attenuation
<Shdsl::UnitLoopAttenThreshold> ] [ no snr-margin | snr-margin <Shdsl::UnitSnrMarginThreshold> ] [ no
loopback-timeout | loopback-timeout <Shdsl::UnitLoopbackTimeout> ]
```

Command Parameters

Table 37.3-1 "SHDSL Unit Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port
unit-id	Parameter type: <Shdsl::UnitId> Format: (stu-c stu-r sru-1 sru-2 sru-3 sru-4 sru-5 sru-6 sru-7 sru-8) Possible values: - stu-c : the SHDSL unit is STU-C - stu-r : the SHDSL unit is STU-R - sru-1 : the SHDSL unit is SRU-1	unit identifier in an SHDSL span

Resource Identifier	Type	Description
	- sru-2 : the SHDSL unit is SRU-2 - sru-3 : the SHDSL unit is SRU-3 - sru-4 : the SHDSL unit is SRU-4 - sru-5 : the SHDSL unit is SRU-5 - sru-6 : the SHDSL unit is SRU-6 - sru-7 : the SHDSL unit is SRU-7 - sru-8 : the SHDSL unit is SRU-8	

Table 37.3-2 "SHDSL Unit Configuration Command" Command Parameters

Parameter	Type	Description
[no] loop-attenuation	Parameter type: <Shdsl::UnitLoopAttenThreshold> Format: - a loop attenuation threshold value for an SHDSL unit - unit: db - range: [0...127]	<i>optional parameter with default value: 0</i> the loop attenuation threshold value
[no] snr-margin	Parameter type: <Shdsl::UnitSnrMarginThreshold> Format: - an SNR margin threshold value for an SHDSL unit - unit: db - range: [0...15]	<i>optional parameter with default value: 0</i> the snr margin threshold value
[no] loopback-timeout	Parameter type: <Shdsl::UnitLoopbackTimeout> Format: - a loopback timeout duration value for an SHDSL unit - unit: min - range: [0...4095]	<i>optional parameter with default value: 0</i> the loopback timeout value

37.4 SHDSL Segment Configuration Command

Command Description

This command allows the operator to manage the SHDSL segment points on either sides of an SHDSL unit.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure shdsl segment (if-index) unit-id <Shdsl::UnitId> side <Shdsl::SegmentSide> [ no loopback | loopback
<Shdsl::SegmentTermLoopbackConf> ] [ no pbo-mode | pbo-mode <Shdsl::SegmentTermPowerBackoff> ]
```

Command Parameters

Table 37.4-1 "SHDSL Segment Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port
unit-id	Parameter type: <Shdsl::UnitId> Format: (stu-c stu-r sru-1 sru-2 sru-3 sru-4 sru-5 sru-6 sru-7 sru-8) Possible values: - stu-c : the SHDSL unit is STU-C - stu-r : the SHDSL unit is STU-R - sru-1 : the SHDSL unit is SRU-1 - sru-2 : the SHDSL unit is SRU-2	unit identifier in an SHDSL span

Resource Identifier	Type	Description
	- sru-3 : the SHDSL unit is SRU-3 - sru-4 : the SHDSL unit is SRU-4 - sru-5 : the SHDSL unit is SRU-5 - sru-6 : the SHDSL unit is SRU-6 - sru-7 : the SHDSL unit is SRU-7 - sru-8 : the SHDSL unit is SRU-8	
side	Parameter type: <Shdsl::SegmentSide> Format: (network customer) Possible values: - network : the network side - customer : the customer side	the particular side of an SHDSL unit in an SHDSL segment

Table 37.4-2 "SHDSL Segment Configuration Command" Command Parameters

Parameter	Type	Description
[no] loopback	Parameter type: <Shdsl::SegmentTermLoopbackConf> Format: (none normal) Possible values: - none : no loopback - normal : normal loopback	<i>optional parameter with default value: "none"</i> the loopback mode for the associated side
[no] pbo-mode	Parameter type: <Shdsl::SegmentTermPowerBackoff> Format: (default selected disabled) Possible values: - default : the default mode - selected : the selected mode - disabled : disable PBO	<i>optional parameter with default value: "default"</i> the power backoff mode for the associated side

38- IMA Configuration Commands

38.1 IMA Configuration Command Tree	38-1165
38.2 IMA Group Configuration Commands	38-1166
38.3 IMA Link Configuration Commands	38-1168

38.1 IMA Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "IMA Configuration Commands".

Command Tree

```
----configure
  ----ima
    ----group
      - (if-index)
      - [no] activate
      - [no] admin-up
      - [no] min-tx-links
      - [no] min-rx-links
      - near-end-ima-id
    ----[no] link
      - (link-if-index)
      - grp-index
```

38.2 IMA Group Configuration Commands

Command Description

This command allows the operator to manage the IMA group profile.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure ima group (if-index) [ [ no ] activate ] [ [ no ] admin-up ] [ no min-tx-links | min-tx-links
<Ima::GroupMinNumTxLinks> ] [ no min-rx-links | min-rx-links <Ima::GroupMinNumRxLinks> ] [
near-end-ima-id <Ima::GroupTxImaId> ]
```

Command Parameters

Table 38.2-1 "IMA Group Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port

Table 38.2-2 "IMA Group Configuration Commands" Command Parameters

Parameter	Type	Description
[no] activate	Parameter type: boolean	<i>optional parameter</i>
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> admin status is up
[no] min-tx-links	Parameter type: <Ima::GroupMinNumTxLinks> Format: - a minimum number of transmit links required to be active - range: [1...8]	<i>optional parameter with default value: 1</i> the minimum number of transmit links
[no] min-rx-links	Parameter type: <Ima::GroupMinNumRxLinks> Format: - a minimum number of receive links required to be active - range: [1...8]	<i>optional parameter with default value: 1</i> the minimum number of receive links
near-end-ima-id	Parameter type: <Ima::GroupTxImaId> Format:	<i>optional parameter</i> the imd id used by the near-end

Parameter	Type	Description
	- an imd id used by the near-end ima function - range: [0...255]	ima function

38.3 IMA Link Configuration Commands

Command Description

This command allows the operator to manage the IMA link profile.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure ima ( no link (link-if-index) ) | ( link (link-if-index) grp-index <Itf::ImaLine> )
```

Command Parameters

Table 38.3-1 "IMA Link Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(link-if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port

Table 38.3-2 "IMA Link Configuration Commands" Command Parameters

Parameter	Type	Description
grp-index	Parameter type: <Itf::ImaLine> Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	<i>mandatory parameter</i> logical interface number assigned to this IMA grp Link

39- L2CP Configuration Commands

39.1 L2CP Configuration Command Tree	39-1170
39.2 L2CP Configuration Command	39-1171
39.3 L2CP Session Configuration Command	39-1172
39.4 L2CP User Port Partition Configuration Command	39-1175

39.1 L2CP Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "L2CP Configuration Commands".

Command Tree

```
----configure
----l2cp
  - [no] partition-type
  ----[no] session
    - (index)
    - bras-ip-address
    - [no] gsmp-version
    - [no] gsmp-sub-version
    - [no] encap-type
    - [no] topo-discovery
    - [no] layer2-oam
    - [no] alive-timer
    - [no] port-reprt-shaper
    - [no] aggr-reprt-shaper
    - [no] tcp-retry-time
    - [no] gsmp-retry-time
    - [no] dslam-name
    - [no] partition-id
    - [no] window-size
    - [no] tcp-port
    - [no] router-instance
    - [no] sig-partition-id
  ----[no] user-port
    - (user-port)
    - partition-id
```

39.2 L2CP Configuration Command

Command Description

This command allows the operator to configure the L2CP parameters.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure l2cp [ no partition-type | partition-type <L2cp::PartitionType> ]
```

Command Parameters

Table 39.2-2 "L2CP Configuration Command" Command Parameters

Parameter	Type	Description
[no] partition-type	Parameter type: <L2cp::PartitionType> Format: (no-partition fixed-assigned) Possible values: - no-partition : no partitioning is supported - fixed-assigned : partitioning is supported	<i>optional parameter with default value: "no-partition"</i> partition type

39.3 L2CP Session Configuration Command

Command Description

This command allows the operator to configure the L2CP session parameters for a given session id.

In current version, ISAM supports L2CP only on top of TCP/IP; as result of this command, ISAM shall start a TCP connection to a BRAS identified by a configured IP address. Then depending on the setting of the GSMP Retry Timer, the ISAM shall start the GSMP Adjacency Protocol to setup a L2CP session with that BRAS.

This means:

- *if TCP Retry Timer is zero, ISAM shall not start the TCP connection. If TCP Retry Timer is not zero, ISAM shall start the setup of a TCP connection to a BRAS whose IP address must be configured too. In no way the ISAM accepts that a (unknown) BRAS tries to start a TCP connection*
- *if GSMP Retry Timer is zero, ISAM shall not start the GSMP Adjacency Protocol but instead be prepared to handle GSMP Adjacency Protocol messages from that BRAS. If GSMP Retry Timer is not zero, ISAM shall start the GSMP Adjacency Protocol in addition to being prepared to handle GSMP Adjacency Protocol messages from that BRAS*

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure l2cp ( no session (index) ) | ( session (index) bras-ip-address <L2cp::InetAddress> [ no gsmp-version |
gsmp-version <L2cp::Version> ] [ no gsmp-sub-version | gsmp-sub-version <L2cp::SubVersion> ] [ no encap-type |
encap-type <L2cp::EncapType> ] [ no topo-discovery | topo-discovery <L2cp::AccessTopologyDiscovery> ] [ no
layer2-oam | layer2-oam <L2cp::Layer2OAM> ] [ no alive-timer | alive-timer <L2cp::AliveTimer> ] [ no
port-reprt-shaper | port-reprt-shaper <L2cp::ReportShaper> ] [ no aggr-reprt-shaper | aggr-reprt-shaper
<L2cp::AggrReportShaper> ] [ no tcp-retry-time | tcp-retry-time <L2cp::TcpRetryTimer> ] [ no gsmp-retry-time |
gsmp-retry-time <L2cp::GsmprRetryTimer> ] [ no dslam-name | dslam-name <L2cp::DslamName> ] [ no
partition-id | partition-id <L2cp::PartitionId2> ] [ no window-size | window-size <L2cp::WindowSize> ] [ no
tcp-port | tcp-port <L2cp::InetPortNumber> ] [ no router-instance | router-instance <Ihub::RouterVplsMgmt> ] [ [ no
] sig-partition-id ] )
```

Command Parameters

Table 39.3-1 "L2CP Session Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - identity of the l2cp session - range: [1...255]	index to the l2cp session table

Table 39.3-2 "L2CP Session Configuration Command" Command Parameters

Parameter	Type	Description
bras-ip-address	Parameter type: <L2cp::InetAddress> Format: - IPv4-address	<i>mandatory parameter</i> The parameter is not visible during modification. IPv4 address used for the L2cp session peer
[no] gsmpp-version	Parameter type: <L2cp::Version> Format: - version of the GSMP protocol - range: [3]	<i>optional parameter with default value: 3</i> The parameter is not visible during modification. version of gsmpp protocol
[no] gsmpp-sub-version	Parameter type: <L2cp::SubVersion> Format: - sub version of the GSMP protocol - range: [1...2]	<i>optional parameter with default value: 1</i> The parameter is not visible during modification. sub version of gsmpp protocol
[no] encap-type	Parameter type: <L2cp::EncapType> Format: tcp Possible values: - tcp : tcp encapsulation type	<i>optional parameter with default value: "tcp"</i> The parameter is not visible during modification. encapsulation type
[no] topo-discovery	Parameter type: <L2cp::AccessTopologyDiscovery> Format: (disabled enabled) Possible values: - disabled : no topology discovery - enabled : topology discovery	<i>optional parameter with default value: "enabled"</i> The parameter is not visible during modification. topology discovery capability
[no] layer2-oam	Parameter type: <L2cp::Layer2OAM> Format: (disabled enabled) Possible values: - disabled : no layer2 oam - enabled : layer2 oam	<i>optional parameter with default value: "enabled"</i> The parameter is not visible during modification. layer2 OAM is supported
[no] alive-timer	Parameter type: <L2cp::AliveTimer> Format: - adjacency protocol watchdog alive time - unit: 100 msec - range: [1...255]	<i>optional parameter with default value: 250</i> adjacency protocol watchdog alive time.
[no] port-reprt-shaper	Parameter type: <L2cp::ReportShaper> Format: - time between two EventReport msgs related to same port, should be >= aggr-reprt-shaper - unit: 100 msec - range: [1...255]	<i>optional parameter with default value: 10</i> The parameter is not visible during modification. time between 2 EventReport msgs on the same port, should be >= aggr-reprt-shaper
[no] aggr-reprt-shaper	Parameter type: <L2cp::AggrReportShaper> Format: - time between two EventReport msgs related to any port - unit: 10 msec - range: [1...2550]	<i>optional parameter with default value: 10</i> The parameter is not visible during modification. time between 2 EventReport msgs on any port
[no] tcp-retry-time	Parameter type: <L2cp::TcpRetryTimer> Format: - time between 2 TCP connection setup attempts. - unit: 100 msec - range: [0...255]	<i>optional parameter with default value: 10</i> time between 2 TCP connection setup attempts

39 L2CP Configuration Commands

Parameter	Type	Description
[no] gsmpp-retry-time	Parameter type: <L2cp::GsmppRetryTimer> Format: - time between 2 GSMP/L2CP connection setup attempts. - unit: 100 msec - range: [0...255]	<i>optional parameter with default value: 10</i> time between 2 GSMP/L2CP connection setup attempts
[no] dslam-name	Parameter type: <L2cp::DslamName> Format: - a mac-address (example : 01:02:03:04:05:06) - length: 6	<i>optional parameter with default value: "00 : 00 : 00 : 00 : 00 : 00"</i> <i>The parameter is not visible during modification.</i> l2cp name of the DSLAM
[no] partition-id	Parameter type: <L2cp::PartitionId2> Format: - partition id - range: [0...127]	<i>optional parameter with default value: 0</i> <i>The parameter is not visible during modification.</i> identity for this session's specific DSLAM partition
[no] window-size	Parameter type: <L2cp::WindowSize> Format: - max no.of unacknow req msgs to be transmttd in a window - range: [10]	<i>optional parameter with default value: 10</i> <i>The parameter is not visible during modification.</i> max no.of unacknow req msgs to be transmitted in a window
[no] tcp-port	Parameter type: <L2cp::InetPortNumber> Format: - tcp port number - range: [0...65535]	<i>optional parameter with default value: 6068</i> <i>The parameter is not visible during modification.</i> tcp port number of the session established to the peer.
[no] router-instance	Parameter type: <Ihub::RouterVplsMgmt> Format: (base vpls-management <Ihub::L2cpRouter>) Possible values: - base : base router - vpls-management : vpls-management router Field type <Ihub::L2cpRouter> - vprn service-id - range: [1...2147483646]	<i>optional parameter with default value: "base"</i> <i>The parameter is not visible during modification.</i> router-instance to be used to obtain connectivity to the peer.
[no] sig-partition-id	Parameter type: boolean	<i>optional parameter</i> <i>The parameter is not visible during modification.</i> indicates if partition ID is signalled

39.4 L2CP User Port Partition Configuration Command

Command Description

This command allows the operator to configure the partition id for the given user-port.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure l2cp ( no user-port (user-port) partition-id <L2cp::PartitionId> ) | ( user-port (user-port) partition-id <L2cp::PartitionId> )
```

Command Parameters

Table 39.4-1 "L2CP User Port Partition Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(user-port)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the DSL port
partition-id	Parameter type: <L2cp::PartitionId> Format: - partition id - range: [1...127]	partition id

40.23 Voice Sip Manipulation Rule Configuration Commands	40-1267
40.24 Voice Sip Cas R2 Timer Configuration Commands	40-1269
40.25 Voice Sip PUID Configuration Commands	40-1271
40.26 Voice Sip PUID Configuration Commands	40-1273
40.27 Voice Sip Isdn Nsm Profile Configuration Commands	40-1275
40.28 Voice Sip Cas Nsm Profile Configuration Commands	40-1278
40.29 Voice Sip Pri User To User Profile Configuration Commands	40-1280
40.30 Voice Sip Isdn/Cas trunk sub-group Configuration Commands	40-1282
40.31 Voice Sip Physical Interface Configuration Commands	40-1285
40.32 Voice Sip Cas Signaling Profile Configuration Commands	40-1289
40.33 Central Access Point Table Configuration	40-1292

Commands	
40.34 Central Access Point Table Configuration	40-1294
Commands	
40.35 Voice Sip Cas Timer Profile Configuration	40-1296
Commands	
40.36 Network Element Table Configuration Commands	40-1301
40.37 Voice Sip Call Query Configuration Commands	40-1303
40.38 Voice Cluster Configuration Commands	40-1305
40.39 Voice Megaco IP Configuration Commands	40-1306
40.40 Voice Megaco Equipment Configuration Commands	40-1308
40.41 Voice Megaco Equipment Board Configuration	40-1310
Commands	
40.42 Voice Megaco Equipment Termination Configuration	40-1312
Commands	
40.43 Voice Megaco Termination Configuration	40-1316
Commands	
40.44 Voice Megaco Termination Lawful Intercept	40-1318
Configuration Commands	
40.45 Voice Megaco Equipment Secondary Termination	40-1320
Configuration Commands	
40.46 Voice Megaco Media Gateway Configuration	40-1322
Commands	
40.47 Voice Megaco Signal Gateway Configuration	40-1333
Commands	
40.48 Epon Ont Voice SIP UserAgent Configuration	40-1335
40.49 Epon Ont Pots Configuration Command	40-1338
40.50 Epon Ont Voice Common Configuration Command	40-1340
40.51 Epon Ont Voice media gateway Configuration	40-1343
Command	
40.52 Voice Sip LSA Server Configuration Commands	40-1346
40.53 Voice Sip LSA Server Configuration Commands	40-1348
40.54 Voice Sip LSA Server Emergency Service	40-1351
Configuration Commands	
40.55 Voice extline Configuration Commands	40-1353
40.56 Voice Pseudo Wire Configuration Commands	40-1357

40.1 Voice Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Voice Configuration Commands".

Command Tree

40.2 Voice Sip Server Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Server profile.

IPv6 is actually not supported. All references to IPv6 must be ignored since mentioned for future usage only.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no server (name) ) | ( server (name) [ no admin-status | admin-status
<Sip::ServerAdminStatus> ] address <Sip::ServerAddr> [ no port | port <Sip::ServerPort> ] [ no server-role |
server-role <Sip::ServerRole> ] [ no priority | priority <Sip::ServerPriority> ] [ no weight | weight

```

Command Parameters

Table 40.2-1 "Voice Sip Server Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identifies this voice server - length: x<=32	uniquely identify of this voice server

Table 40.2-2 "Voice Sip Server Configuration Commands" Command Parameters

Parameter	Type	Description
[no] admin-status	Parameter type: <Sip::ServerAdminStatus> Format: (up down) Possible values: - up : unlock the sip server - down : lock the sip server	<i>optional parameter with default value: "down"</i> administrative status of this sip server
address	Parameter type: <Sip::ServerAddr> Format: (ipv4 : <Ip::V4Address> ipv6 : <Ip::V6Address> dns : <Sip::ServerAddr>) Possible values: - ipv4 : the address type of the server is IPv4 - ipv6 : the address type of the server is IPv6 - dns : the address type of the server is DNS	<i>mandatory parameter</i> The address(IPv4 or IPv6 or DNS or FQDN) of this SIP server

Parameter	Type	Description
	Field type <Ip::V4Address> - IPv4-address Field type <Ip::V6Address> - IPv6-address Field type <Sip::ServerAddr> - name of the SipServer that can be resolved to an IP address via a DNS Server - length: 7<=x<=64	
[no] port	Parameter type: <Sip::ServerPort> Format: - the SIP server port - range: [1...65534]	<i>optional parameter with default value: 5060</i> port of voice server
[no] server-role	Parameter type: <Sip::ServerRole> Format: (proxy-server registrar-server registrar-and-proxy lsa-server) Possible values: - proxy-server : proxy server - registrar-server : registrar server - registrar-and-proxy : served as a registrarServer and a proxyServer - lsa-server : served as a LSAServer	<i>optional parameter with default value: "proxy-server"</i> The role of voice application server. When redundancy is DISABLED, the operator can configure 4 different server roles, role = Proxy server, role = Registrar server, role = Proxy server AND Registrar server, role = LSA server. System will behave in accordance with configured role. When redundancy is ENABLED, the system always assume role = Proxy server AND Registrar server, irrespective of what has been configured by the operator. Thus the system always behaves according to the role = proxyAndRegistrarServer(20), and does not look at the value been configured by the operator
[no] priority	Parameter type: <Sip::ServerPriority> Format: - the SIP server priority - range: [0...65535]	<i>optional parameter with default value: 100</i> The priority of voice application server
[no] weight	Parameter type: <Sip::ServerWeight> Format: - the SIP server weight - range: [0...65535]	<i>optional parameter with default value: 100</i> The weight of voice application server
[no] site	Parameter type: <Sip::ServerSite> Format: (primary-site geo-backup-site sos-backup-site) Possible values: - primary-site : the server belongs to the GEO primary site - geo-backup-site : the server belongs to the GEO secondary site - sos-backup-site : the server belongs to the SOS secondary site	<i>optional parameter with default value: "primary-site"</i> The site of voice application server
[no] transproto	Parameter type: <Sip::ServerTransproto> Format: (udp tcp	<i>optional parameter with default value: "udp"</i> The transport protocol of voice application server

Parameter	Type	Description
	udp_tcp tls_over_tcp udp_tls tcp_tls udp_tcp_tls udp_swo_tcp) Possible values: - udp : the transport protocol used in connecting to the server is UDP - tcp : the transport protocol used in connecting to the server is TCP - udp_tcp : the transport protocol used in connecting to the server is TCP or UDP, TCP is the preferred transport protocol - tls_over_tcp : the transport protocol used in connecting to the server is TLSSoTCP - udp_tls : the transport protocol used in connecting to the server is UDP or TLSSoTCP. TLSSoTCP is the preferred transport protocol - tcp_tls : the transport protocol used in connecting to the server is TCP or TLSSoTCP. TLSSoTCP is the preferred transport protocol - udp_tcp_tls : the transport protocol used in connecting to the server is UDP, TCP or TLSSoTCP. TLSSoTCP is the preferred transport protocol. The next preferred transport protocol is TCP and finally UDP. If UDP would be used and the size of the message exceeds a configured threshold then a switch can be made to TCP - udp_swo_tcp : the transport protocol used in connecting to the server is UDP or TCP, when size of message exceeds a configured threshold will switchover to TCP	
[no] dnsname-type	Parameter type: <Sip::DnsDomNameType> Format: (none dn fqdn) Possible values: - none : If sipServerAddrType is provisioned with value ipv4 or ipv6, this object should set to none - dn : If sipServerAddrType is provisioned with value dns, it means the sipserver address is provisioned with DNS. - fqdn : If sipServerAddrType is provisioned with value dns, it means the sipserver address is provisioned with FQDN.	<i>optional parameter with default value: "none"</i> The clarification of whether a Domain Name (dn) or Fully qualified Domain Name (fqdn) was provisioned for the object sipServerAddr.
admin-domain-name	Parameter type: <Sip::AdminDomName> Format: - uniquely name of this element - length: x<=32	<i>mandatory parameter</i> The administrative domain name of the (farm of) SIP First hop(s). The administrative domain might be the VoIP Access Seeker Network or the Connectivity Serving Network.
[no] tls-port	Parameter type: <Sip::ServerPort> Format: - the SIP server port - range: [1...65534]	<i>optional parameter with default value: 5061</i> TLSSoTCP port of voice server
[no] tls-cafile	Parameter type: <Sip::ServerCAFileName> Format: - the ca file name	<i>optional parameter with default value: ""</i> The name of the Certification

40 Voice Configuration Commands

Parameter	Type	Description
	- length: x<=13	Authority (CA) file that applies when TLSoTCP used as underlying transport protocol for SIP

40.3 Voice Sip LineId Syntax Profile Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip LineId Syntax profile. This command can help operator to get different types of sip termination contact-user-info: physicallineid or terminationuriordn. If the syntax is 'physicalLineId', then the system will construct a value according the syntax as specified in the next parameters (depending of the type of line being pots or isdn). In case the value is 'terminationuriordn', then the value will be taken from the corresponding parameter of the SipTermination object (chapter 38.9); the uri will be taken firstly if it is valid, otherwise the dn can be taken. The keywords apply to the profile syntax include: "Access_Node_ID", "Rack", "Frame", "Slot", "ShSlT", "Port", "ShPrt", "Channel". The sip termination contact-user-info can be learned using the show command: show voice sip termination.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip lineid-syn-prof (name) [ no syntax-pattern | syntax-pattern <SIP::LineIdSyntaxPattern> ] [ no pots-syntax | pots-syntax <SIP::PotsSyntax> ] [ no isdn-syntax | isdn-syntax <SIP::IsdnSyntax> ] [ no cas-r2-syntax | cas-r2-syntax <SIP::CasR2Syntax> ] [ no cas-r1-syntax | cas-r1-syntax <SIP::CasR1Syntax> ]
```

Command Parameters

Table 40.3-1 "Voice Sip LineId Syntax Profile Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - the lineid syntax profile name, can only be profile1 - length: x<=32	uniquely identify of this lineid syntax profile, can only be profile1

Table 40.3-2 "Voice Sip LineId Syntax Profile Configuration Commands" Command Parameters

Parameter	Type	Description
[no] syntax-pattern	Parameter type: <SIP::LineIdSyntaxPattern> Format: (rregisterdialog rregister physicallineid terminationuriordn) Possible values: - rregisterdialog : random per register and dialog - rregister : random per register - physicallineid : physical line id - terminationuriordn : termination uri	optional parameter with default value: "terminationuriordn" pattern of the sip LineID Syntax

40 Voice Configuration Commands

Parameter	Type	Description
[no] pots-syntax	Parameter type: <SIP::PotsSyntax> Format: - syntax of the POTS SIP LineID - length: x<=128	<i>optional parameter with default value:</i> "a/Channel/Port/Slot/Frame/Rack/AccessID/syntax of the Pots sip LineID
[no] isdn-syntax	Parameter type: <SIP::IsdnSyntax> Format: - syntax of the ISDN SIP LineID - length: x<=128	<i>optional parameter with default value:</i> "pra/Channel/Port/Slot/Frame/Rack/AccessID/syntax of the Isdn sip LineID
[no] cas-r2-syntax	Parameter type: <SIP::CasR2Syntax> Format: - syntax of the Cas R2 SIP LineID - length: x<=128	<i>optional parameter with default value:</i> "r2/Channel/Port/Slot/Frame/Rack/AccessID/syntax of the Cas R2 sip LineID
[no] cas-r1-syntax	Parameter type: <SIP::CasR1Syntax> Format: - syntax of the Cas R1 SIP LineID - length: x<=128	<i>optional parameter with default value:</i> "r1/Channel/Port/Slot/Frame/Rack/AccessID/syntax of the Cas R1 sip LineID

40.4 Voice Sip User Agent Configuration

Commands

Command Description

This command allows the operator to manage the Voice Sip user agent profile.

DESCRIPTION FOR THE COMMAND PARAMETER ip-addr-policy:

- The parameter allows to configure the internal ip address policy of the voice node can be set to the values 'distributed' or 'centralized'.

DISTRIBUTED: Each of the voice LT boards owns (a) different IP address(es) for the signaling and media plane.

- This mode isn't applicable to NGVR and ANSI MDU equipment i.e. only applicable to ISAM FD and ISAM FX equipment.
- In case the distinct VLAN approach applies, each of the voice LT boards owns 2 IP addresses i.e. a signaling IP address and a media IP address and these are different IP addresses. It is mandatory to configure for each of the SIP User Access Points a signaling and media IP address.
- In case the shared VLAN approach applies, each of the voice LT boards owns a single IP address i.e. the signaling IP address and the media IP address are the same. It is mandatory to configure for each of the SIP User Access Points a shared signaling and media IP address.

CENTRALIZED: All voice LT boards shared the same IP address(es) for the signaling and media plane.

- ISAM FD and ISAM FX equipment: the configuration of the signaling and media IP addresses in the SIP User Agent Points is optional. If configured and the distinct VLAN approach applies, all SIP User Agent points share the same signaling IP address and all SIP User Agent Access points share the same media IP address. The signaling IP address and the media IP address are the same as configured at the xHUB. The IP address of the signaling and the IP address of the media plane are different. If configured and the shared VLAN approach applies, then all SIP User Agent Access points must be configured with the same shared signaling/media IP address.
- NGVR and ANSI MDU equipment: the configuration of the signaling and media IP address in the SIP User Agent Access Point is mandatory. In case the distinct VLAN approach applies, the signaling and media plane own a different IP address. In case the shared VLAN approach applies, the signaling and media plane share the same IP address.

DESCRIPTION FOR THE COMMAND PARAMETER ip-config-mode:

- The parameter allows to configure the configuration mode of the IP related data required by the SIP User Agent, the SIP User Agent Access Point, the SIP server and the DNS server management entities and can be set to the values 'dhcp' or 'manual'.

DHCP: The IP related data is acquired from the DHCP server.

- ISAM FD and ISAM FX equipment: this mode can only be set when (1) the parameter ip-addr-policy is configured as 'distributed' and (2) the shared signaling/media VLAN approach applies.
- NGVR and ANSI MDU equipment: this mode can only be set when the shared signaling/media VLAN approach applies.

MANUAL: The IP related data must be manually configured.

DESCRIPTION FOR THE COMMAND PARAMETER signal-gateway-ip:

- The parameter allows to configure the IPv4 or IPv6 address of the signalling IP gateway.
- ISAM FD and ISAM FX equipment: A mandatory input when the parameter ip-config-mode is configured as 'manual' and the parameter ip-addr-policy is configured as 'distributed'.
- NGVR and ANSI MDU equipment: A mandatory input when the parameter ip-config-mode is configured as

'manual'.

DESCRIPTION FOR THE COMMAND PARAMETER rtp-gateway-ip:

- *The parameter that allows to configure the IPv4 address of the media IP gateway.*
- *ISAM FD and ISAM FX equipment: A mandatory input parameter when the parameter ip-config-mode is configured as 'manual' and the parameter ip-addr-policy is configured as 'distributed' and the distinct VLAN approach applies. In case of the shared VLAN approach, the value configured for the parameter signal-gateway-ip is inherited.*
- *NGVR and ANSI MDU equipment: A mandatory input parameter when parameter ip-config-mode is configured as 'manual' and the distinct VLAN approach applies. In case of the shared VLAN approach, the value configured for the parameter signal-gateway-ip is inherited.*

DESCRIPTION FOR THE COMMAND PARAMETER rtp-link-mtu:

- *The parameter allows to configure the link mtu of the IPv4 media vlan. Only relevant in case of the distinct signaling/media VLAN approach. In case of the shared signaling/media VLAN approach, the value configured for the parameter signal-link-mtu is inherited.*

DESCRIPTION FOR THE COMMAND PARAMETER dhcp-optreq-list:

- *The parameter allows to configure the list of DHCPv4 options the SIP User Agent wants the DHCPv4 server to return in option 55.*
- *ISAM FD and ISAM FX equipment: only relevant in case the parameter ip-config-mode is configured as 'dhcp' (parameter ip-addr-policy is configured as 'distributed' and the shared signaling/media VLAN approach applies).*
- *NGVR and ANSI MDU equipment: only relevant in case the parameter ip-config-mode is configured as 'dhcp' (parameter ip-addr-policy is configured as 'centralized' and the shared signaling/media VLAN approach applies).*

DESCRIPTION FOR THE COMMAND PARAMETER lsa-md5-realm:

- *The parameter allows to configure the realm to be used for the registration of SIP terminations to the LSA server.*
- *The parameter lsa-md5-realm must be configured with the same value as configured for the parameter lsa-md5-realm of the LSA server instance.*

DESCRIPTION FOR THE COMMAND PARAMETER lsa-md5-password:

- *The parameter allows to configure the password to be used for the registration of SIP terminations to the LSA server.*
- *The parameter lsa-md5-password must be configured with the same value as configured for the parameter lsa-md5-password of the LSA server instance.*

DESCRIPTION FOR THE COMMAND PARAMETER rtp-ipv6-gateway:

- *The parameter allows to configure the IPv6 address of the media IP gateway.*
- *ISAM FD and ISAM FX equipment: A mandatory input parameter when (1) the parameter media-ipmode is configured as 'ipv6' and (2) the parameter ip-config-mode is configured as 'manual' and (3) the parameter ip-addr-policy is configured as 'distributed' and (4) the distinct VLAN approach applies. In case of the shared VLAN approach, the parameter rtp-ipv6-gateway inherits the value configured for the parameter signal-gateway-ip.*
- *NGVR and ANSI MDU equipment: A mandatory input parameter when (1) the parameter media-ipmode is configured as 'ipv6' and (2) the parameter ip-config-mode is configured as 'manual' and (3) the distinct VLAN approach applies. In case of the shared VLAN approach, the parameter rtp-IPv6-gateway inherits the value configured for the parameter signal-gateway-ip.*

DESCRIPTION FOR THE COMMAND PARAMETER rtp-ipv6-link-mtu:

- *The parameter allows to configure the link mtu of the IPv6 media vlan.*
- *This parameter is only relevant when (1) the parameter media-ipmode is configured as 'ipv6' and (2) the distinct signaling/media VLAN approach applies. In case of the shared signaling/media VLAN approach, the parameter rtp-ipv6-link-mtu inherits the value configured for the parameter signal-link-mtu.*

The parameters rtp-ipv6-gateway, rtp-ipv6-vlan-id, rtp-ipv6-dscp, rtp-ipv6-pbits, rtp-ipv6-link-mtu are defined for

future usage only and thus actually not supported. IPv6 is actually not supported. All references to IPv6 must be ignored since mentioned for future usage only.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no user-agent (name) ) | ( user-agent (name) [ no ip-addr-policy | ip-addr-policy
<Sip::IpAddrPolicy> ] [ no ip-config-mode | ip-config-mode <Sip::IpConfigMode> ] [ no signal-gateway-ip |
signal-gateway-ip <Sip::UserAgentIpAddr> ] signal-vlan-id <Sip::UserAgentVlanId> [ no signal-dscp | signal-dscp
<Sip::UserAgentSignalDscp> ] [ no signal-pbits | signal-pbits <Sip::UserAgentSignalPbits> ] [ no signal-link-mtu |
signal-link-mtu <Sip::UserAgentLinkMTU> ] [ no rtp-gateway-ip | rtp-gateway-ip <Sip::UserAgentIPv4Addr> ] [
no rtp-vlan-id | rtp-vlan-id <Sip::UserAgentRtpVlanId> ] [ no rtp-dscp | rtp-dscp <Sip::UserAgentRtpDscp> ] [ no
rtp-pbits | rtp-pbits <Sip::UserAgentRtpPbits> ] [ no rtp-link-mtu | rtp-link-mtu <Sip::UserAgentLinkMTU> ] [ no
dhcp-optreq-list | dhcp-optreq-list <Sip::UserAgentDHCPOptionReqList> ] [ no admin-status | admin-status
<Sip::UserAgentAdminStatus> ] [ no provider-name | provider-name <Sip::UserAgentProviderName> ] [ no
lsa-rtp-gw-ip | lsa-rtp-gw-ip <Sip::UserAgentIPv4Addr> ] [ no lsa-rtp-vlan-id | lsa-rtp-vlan-id
<Sip::UASAVlanId> ] [ no lsa-md5-realm | lsa-md5-realm <Sip::MD5Realm> ] [ no lsa-md5-password |
lsa-md5-password <Security::Password4> ] [ no rtp-ipv6-gateway | rtp-ipv6-gateway <Sip::UserAgentIPv6Addr> ]
[ no rtp-ipv6-vlan-id | rtp-ipv6-vlan-id <Sip::UserAgentRtpVlanId> ] [ no rtp-ipv6-dscp | rtp-ipv6-dscp
<Sip::UserAgentRtpDscp> ] [ no rtp-ipv6-pbits | rtp-ipv6-pbits <Sip::UserAgentRtpPbits> ] [ no rtp-ipv6-link-mtu |
rtp-ipv6-link-mtu <Sip::UserAgentV6LinkMTU> ] )
```

Command Parameters

Table 40.4-1 "Voice Sip User Agent Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identifies the User Agent - length: 1<=x<=32	uniquely identify of this user agent

Table 40.4-2 "Voice Sip User Agent Configuration Commands" Command Parameters

Parameter	Type	Description
[no] ip-addr-policy	Parameter type: <Sip::IpAddrPolicy> Format: (distributed centralized) Possible values: - distributed : Each of the voice LT boards owns (a) different IP address(es) for the signaling and media plane. - centralized : All voice LT boards shared the same IP address(es) for the signaling and media plane.	<i>optional parameter with default value: "distributed"</i> the internal ip address policy of the voice node
[no] ip-config-mode	Parameter type: <Sip::IpConfigMode> Format: (dhcp manual) Possible values: - dhcp : The IP related data is acquired from the DHCP server. - manual : The IP related data must be manually configured.	<i>optional parameter with default value: "dhcp"</i> the configuration mode of the IP related data.

40 Voice Configuration Commands

Parameter	Type	Description
[no] signal-gateway-ip	Parameter type: <Sip::UserAgentIpAddr> Format: (ipv6 : <Ip::V6Address> <Ip::V4Address>) Possible values: - ipv6 : IPv6-address Field type <Ip::V6Address> - IPv6-address Field type <Ip::V4Address> - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> The IPv4 or IPv6 address of the signalling IP gateway.
signal-vlan-id	Parameter type: <Sip::UserAgentVlanId> Format: - vlan id - range: [1...4093]	<i>mandatory parameter</i> the vlan id for IPv4 or IPv6 signaling traffic
[no] signal-dscp	Parameter type: <Sip::UserAgentSignalDscp> Format: - dscp mark for rtp or rtcp packets - range: [0...63]	<i>optional parameter with default value: 46</i> the dscp mark for the transmitted sip IPv4 or IPv6 signaling traffic
[no] signal-pbits	Parameter type: <Sip::UserAgentSignalPbits> Format: - the dot-1p bit value - range: [0...7]	<i>optional parameter with default value: 6</i> the 802.1p bits for the transmitted sip IPv4 or IPv6 signaling traffic
[no] signal-link-mtu	Parameter type: <Sip::UserAgentLinkMTU> Format: - minimum value: 576 for IPv4 - range: [576...1500]	<i>optional parameter with default value: 1500</i> the linkmtu for the IPv4 or IPv6 signaling vlan
[no] rtp-gateway-ip	Parameter type: <Sip::UserAgentIPv4Addr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> IPv4 address of the media IP gateway.
[no] rtp-vlan-id	Parameter type: <Sip::UserAgentRtpVlanId> Format: - rtp vlan id - range: [0...4093]	<i>optional parameter with default value: 0</i> vlan id for IPv4 media traffic
[no] rtp-dscp	Parameter type: <Sip::UserAgentRtpDscp> Format: - dscp mark for rtp or rtcp packets - range: [0...63]	<i>optional parameter with default value: 46</i> dscp mark for transmitted IPv4 rtp or rtcp traffic
[no] rtp-pbits	Parameter type: <Sip::UserAgentRtpPbits> Format: - the dot-1p bit value - range: [0...7]	<i>optional parameter with default value: 6</i> 802.1p bits for transmitted IPv4 rtp or rtcp traffic
[no] rtp-link-mtu	Parameter type: <Sip::UserAgentLinkMTU> Format: - minimum value: 576 for IPv4 - range: [576...1500]	<i>optional parameter with default value: 1500</i> link mtu of the IPv4 media vlan.
[no] dhcp-optreq-list	Parameter type: <Sip::UserAgentDHCPOptionReqList> Format: - the list of DHCPv4 options to be returned in option 55. - length: x<=63	<i>optional parameter with default value: "1,3,6,120"</i> the list of DHCPv4 options to be returned in option 55.
[no] admin-status	Parameter type: <Sip::UserAgentAdminStatus> Format: (up down) Possible values: - up : unlock the sip user agent - down : lock the sip user agent	<i>optional parameter with default value: "down"</i> administrative status of this sip user agent

Parameter	Type	Description
[no] provider-name	Parameter type: <Sip::UserAgentProviderName> Format: - uniquely identifies the user agent provider name - length: x<=32	<i>optional parameter with default value: "vsp1"</i> the provider name
[no] lsa-rtp-gw-ip	Parameter type: <Sip::UserAgentIPv4Addr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> media gateway IP address for the LSA mode
[no] lsa-rtp-vlan-id	Parameter type: <Sip::UALSAVlanId> Format: - lsa vlan id - range: [0...4093]	<i>optional parameter with default value: 0</i> media vlan ID for the LSA mode
[no] lsa-md5-realm	Parameter type: <Sip::MD5Realm> Format: - the realm identifier (Due to legacy reasons, the MD5 character string was included in the object name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication realm identifier.) - length: x<=64	<i>optional parameter with default value: ""</i> realm for the registration of SIP terminations to the LSA server.
[no] lsa-md5-password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) - length: x<=64	<i>optional parameter with default value: "plain : "</i> password for the registration of SIP terminations to the LSA server.
[no] rtp-ipv6-gateway	Parameter type: <Sip::UserAgentIPv6Addr> Format: - IPv6-address	<i>optional parameter with default value: " : : "</i> IPv6 address of the media IP gateway.
[no] rtp-ipv6-vlan-id	Parameter type: <Sip::UserAgentRtpVlanId> Format: - rtp vlan id - range: [0...4093]	<i>optional parameter with default value: 0</i> vlan id for IPv6 media traffic

40 Voice Configuration Commands

Parameter	Type	Description
[no] rtp-ipv6-dscp	Parameter type: <Sip::UserAgentRtpDscp> Format: - dscp mark for rtp or rtcp packets - range: [0...63]	<i>optional parameter with default value: 46</i> dscp mark for the transmitted IPv6 rtp and rtcp traffic
[no] rtp-ipv6-pbits	Parameter type: <Sip::UserAgentRtpPbits> Format: - the dot-1p bit value - range: [0...7]	<i>optional parameter with default value: 6</i> 802.1p bits for the transmitted IPv6 rtp and rtcp traffic
[no] rtp-ipv6-link-mtu	Parameter type: <Sip::UserAgentV6LinkMTU> Format: - minimum value: 1280 for IPv6 - range: [1280...1500]	<i>optional parameter with default value: 1500</i> linkmtu of the IPv6 media vlan

40.5 Sip Voice Service Gateway Configuration Commands

Command Description

This command allows the operator to configure the Voice Service Gateway.

The parameters signaling-ipmode and media-ipmode are defined for future usage only and thus actually not supported. IPv6 is actually not supported. All references to IPv6 must be ignored since mentioned for future usage only.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no vsp (name) ) | ( vsp (name) domain-name <Sip::VspDomainName> [ no admin-status |
admin-status <Sip::VspAdminStatus> ] [ no tinfo | tinfo <Sip::VspTinfo> ] [ no ta4 | ta4 <Sip::VspTa4> ] [ no ttir1
| ttir1 <Sip::VspTtir1> ] [ no t-acm-delta | t-acm-delta <Sip::VspTAcmDelta> ] [ no access-held-time |
access-held-time <Sip::VSPAAccessHeldTimer> ] [ no awaiting-time | awaiting-time <Sip::VSPAawaitingTimer> ] [
no digit-send-mode | digit-send-mode <Sip::VSPDigitSendingMode> ] [ no overlap-484-act | overlap-484-act
<Sip::VSPOverlap484Action> ] [ no dmpm-intdgt-expid | dmpm-intdgt-expid <Sip::VSPDMPMIntDgtExpid> ] [
no dial-start-timer | dial-start-timer <Sip::VSPDialStartTimer> ] [ no dial-long-timer | dial-long-timer
<Sip::VSPDialLongTimer> ] [ no dial-short-timer | dial-short-timer <Sip::VSPDialShortTimer> ] [ no uri-type |
uri-type <Sip::VSPURIType> ] [ no rfc2833-pl-type | rfc2833-pl-type <Sip::VSPRfc2833PayloadType> ] [ no
rfc2833-process | rfc2833-process <Sip::VSPRfc2833Process> ] [ no min-data-jitter | min-data-jitter
<Sip::VSPDataJitter> ] [ no init-data-jitter | init-data-jitter <Sip::VSPDataJitter> ] [ no max-data-jitter |
max-data-jitter <Sip::VSPDataJitter> ] [ no release-mode | release-mode <Sip::VSPReleaseMode> ] [ no
dyn-pt-nego-type | dyn-pt-nego-type <Sip::VSPDynamicPTNegoType> ] [ no vbd-g711a-pl-type |
vbd-g711a-pl-type <Sip::VSPVbdG711APayloadType> ] [ no vbd-g711u-pl-type | vbd-g711u-pl-type

Command Parameters

Table 40.5-1 "Sip Voice Service Gateway Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identify of this SIP voice service gateway - length: x<=32	uniquely identify of this sip voice service gateway

Table 40.5-2 "Sip Voice Service Gateway Configuration Commands" Command Parameters

Parameter	Type	Description
domain-name	Parameter type: <Sip::VspDomainName> Format: - domain name of the SIP VSG - length: 1<=x<=64	<i>mandatory parameter</i> domain name of the sip VSG
[no] admin-status	Parameter type: <Sip::VspAdminStatus> Format: (up down) Possible values: - up : unlock the sip VSG - down : lock the sip VSG	<i>optional parameter with default value: "down"</i> administrative status of this sip voice service gateway
[no] tinfo	Parameter type: <Sip::VspTinfo> Format: - tinfo of this SIP voice service gateway - range: [1...3600000]	<i>optional parameter with default value: 1000</i> value of tinfo in milli-second of this sip voice service gateway, the timer to collect digits before an INVITE is sent to reduce the amount of INVITE requests sent as defined in ETSI TS 183 036 V0.10.1
[no] ta4	Parameter type: <Sip::VspTa4> Format: - Ta4 timer expire of this SIP voice service gateway - unit: millisecond - range: [1...3600000]	<i>optional parameter with default value: 4000</i> value of Ta4 timer expire in milli-second. The timer Ta4 starts on receipt of first dialed digit. If the dialed digits are not matched with digitmap, the expiry of Ta4 will trigger the sending of initial INVITE.
[no] ttir1	Parameter type: <Sip::VspTtir1> Format: - ttir1 of this SIP voice service gateway - range: [1...3600000]	<i>optional parameter with default value: 100</i> value of ttir1 in milli-second of this sip voice service gateway, in the case 'from-change' is indicated, UA has to wait for an UPDATE, the timer assures that the call can continue if the UPDATE is missing as defined in ETSI TS 183 036 V0.10.1
[no] t-acm-delta	Parameter type: <Sip::VspTAcmDelta> Format: - T-acm-delta timer expire of this SIP voice service gateway - unit: millisecond - range: [1...3600000]	<i>optional parameter with default value: 18000</i> value of T-acm-delta timer expire in milli-second. The timer T-acm-delta starts on the situation that T-interdigit timer expires and there is INVITE transaction ongoing. The system will start T-acm-delta. The expiry of T-acm-delta will end the attempt of the call establishment.
[no] access-held-time	Parameter type: <Sip::VSPAccessHeldTimer>	<i>optional parameter with default</i>

Parameter	Type	Description
	Format: - Value of access-held-timer expires which is used in the release control procedure. - unit: second - range: [1...65535]	<i>value: 600</i> this value is used in the release control procedure. it is started when receiving INVITE with No Ring and no SDP and stopped when sending 200 OK (INVITE).
[no] awaiting-time	Parameter type: <Sip::VSPAwaitingTimer> Format: - value of awaiting-timer expires which is used in the release control procedure. - unit: second - range: [1...65535]	<i>optional parameter with default value: 60</i> this value is used in the release control procedure. it is started when receiving 200 OK (Bye) with X-Service-indicator and stopped when receiving INVITE with No Ring and No SDP.
[no] digit-send-mode	Parameter type: <Sip::VSPDigitSendingMode> Format: (en-bloc overlap-invite overlap-indialog) Possible values: - en-bloc : en-block mode - overlap-invite : overlap-invite mode - overlap-indialog : overlap-indialog mode	<i>optional parameter with default value: "en-bloc"</i> digit sending mode of this sip voice service gateway
[no] overlap-484-act	Parameter type: <Sip::VSPOverlap484Action> Format: (release-call continue) Possible values: - release-call : terminate the call. - continue : continue the digit collection for the call attempt.	<i>optional parameter with default value: "release-call"</i> release call or not when 484 is received for INVITE before early dialog is established for digit sending in overlap dialing in-dialog method.
[no] dmpm-intdgt-expid	Parameter type: <Sip::VSPDMPMIntDgtExpid> Format: (send-invite release-call) Possible values: - send-invite : send out invite with the collected digits. - release-call : terminate the call.	<i>optional parameter with default value: "send-invite"</i> The action if inter-digit timer expired when digitmap partial matched.
[no] dial-start-timer	Parameter type: <Sip::VSPDialStartTimer> Format: - Dialing start timer in second - unit: second - range: [1...60]	<i>optional parameter with default value: 10</i> Default maximum waiting time in seconds for dialing the first digit
[no] dial-long-timer	Parameter type: <Sip::VSPDialLongTimer> Format: - dialing long timer in second - unit: second - range: [1...60]	<i>optional parameter with default value: 20</i> Default maximum waiting time in seconds for dialing when no matching found in the digitmap
[no] dial-short-timer	Parameter type: <Sip::VSPDialShortTimer> Format: - dialing short timer in second - unit: second - range: [1...60]	<i>optional parameter with default value: 5</i> Default maximum waiting time in seconds for dialing when matching found in the digitmap
[no] uri-type	Parameter type: <Sip::VSPURIType> Format: (sip-uri tel-uri sips-uri)	<i>optional parameter with default value: "sip-uri"</i> uri type of this sip voice service gateway

Parameter	Type	Description
	Possible values: - sip-uri : sip-uri mode - tel-uri : tel-uri mode - sips-uri : sips-uri mode	
[no] rfc2833-pl-type	Parameter type: <Sip::VSPRfc2833PayloadType> Format: - payload type of rfc2833 - range: [96...127]	<i>optional parameter with default value: 96</i> payload type of rfc2833
[no] rfc2833-process	Parameter type: <Sip::VSPRfc2833Process> Format: (audio rfc2833 both mandatory-audio) Possible values: - audio : processing procedure is audio - rfc2833 : processing procedure is rfc2833 - both : processing procedure is both - mandatory-audio : processing procedure is audio first	<i>optional parameter with default value: "audio"</i> processing procedure for the dtmf event tones
[no] min-data-jitter	Parameter type: <Sip::VSPDataJitter> Format: - data jitter buffer for calls working in rtp mode in millisecond - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> minimum jitter buffer for data calls working in rtp mode
[no] init-data-jitter	Parameter type: <Sip::VSPDataJitter> Format: - data jitter buffer for calls working in rtp mode in millisecond - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> initial jitter buffer for data calls working in rtp mode
[no] max-data-jitter	Parameter type: <Sip::VSPDataJitter> Format: - data jitter buffer for calls working in rtp mode in millisecond - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> maximum jitter buffer for data calls working in rtp mode
[no] release-mode	Parameter type: <Sip::VSPReleaseMode> Format: (normal caller callee both) Possible values: - normal : sending BYE immediately, applicable for the normal call release procedure - caller : postpone BYE until access-held-time times out for caller, only postpone BYE in case the subscriber is caller - callee : postpone BYE until access-held-time times out for callee, only postpone BYE in case the subscriber is callee - both : postpone BYE until access-held-time times out for caller and callee, postpone BYE in case the subscriber is caller or callee	<i>optional parameter with default value: "normal"</i> send BYE immediately or not after caller/callee/both onhook
[no] dyn-pt-nego-type	Parameter type: <Sip::VSPDynamicPTNegoType> Format: (far-end asymmetric)	<i>optional parameter with default value: "far-end"</i> how to negotiate dynamic payload type

Parameter	Type	Description
	Possible values: - far-end : negotiate with supported by far-end - asymmetric : negotiate with different payload type for sending and receiving	
[no] vbd-g711a-pl-type	Parameter type: <Sip::VSPVbdG711APayloadType> Format: - dynamic payload type of Vbd G711A - range: [96...127]	<i>optional parameter with default value: 97</i> dynamic payload type of vbd g711a
[no] vbd-g711u-pl-type	Parameter type: <Sip::VSPVbdG711UPayloadType> Format: - dynamic payload type of Vbd G711U - range: [96...127]	<i>optional parameter with default value: 98</i> dynamic payload type of vbd g711u
[no] vbd-mode	Parameter type: <Sip::VSPVbdMode> Format: (autoswitch renegotiation v152fb-autoswitch v152fb-reneg) Possible values: - autoswitch : auto switch without negotiation - renegotiation : renegotiation - v152fb-autoswitch : V152. If V152 negotiation fails, act as autoswitch (ISDN and CASR2 not support this) - v152fb-reneg : V152. If V152 negotiation fails, act as renegotiation (ISDN and CASR2 not support this)	<i>optional parameter with default value: "autoswitch"</i> vbd negotiation mode
[no] warmline-dl-timer	Parameter type: <Sip::VSPWarmlineDelayTimer> Format: - warmline delay timer in second - unit: second - range: [1...60]	<i>optional parameter with default value: 4</i> warmline-delay-timer, range from 1 to 60 sec
timer-b	Parameter type: <Sip::CommonCfgTimerB> Format: - value of SIP CommonCfgTimerB for rfc4780 - unit: millisecond - range: [2000...64000]	<i>optional parameter</i> This object reflects the maximum time a SIP entity will wait to receive a response to an INVITE. The timer is started upon transmission of the initial INVITE request.
timer-f	Parameter type: <Sip::CommonCfgTimerF> Format: - value of SIP CommonCfgTimerF for rfc4780 - unit: millisecond - range: [2000...64000]	<i>optional parameter</i> This object reflects the maximum time a SIP entity will wait to receive a final response to a non-INVITE request. The timer is started upon transmission of the initial request.
timer-t1	Parameter type: <Sip::CommonCfgTimerT1> Format: - value of SIP CommonCfgTimerT1 for rfc4780 - unit: millisecond - range: [200...10000]	<i>optional parameter</i> This object reflects the T1 timer for a SIP entity. T1 is an estimate of the round-trip time (RTT) between the client and server transactions.
timer-t2	Parameter type: <Sip::CommonCfgTimerT2> Format: - value of SIP CommonCfgTimerT2 for rfc4780 - unit: millisecond - range: [200...10000]	<i>optional parameter</i> This object reflects the T2 timer for a SIP entity. T2 is the maximum retransmit interval for non-INVITE requests and INVITE responses. It is used in various parts of the protocol to

Parameter	Type	Description
		reset other Timer* objects to this value.
[no] reg-sub	Parameter type: <Sip::VSPRegSubscribe> Format: (disable enable) Possible values: - disable : do not send reg SUBSCRIBE - enable : send reg SUBSCRIBE	<i>optional parameter with default value: "disable"</i> This object indicates whether the system should send the reg SUBSCRIBE method.
[no] dtmf-sip-info	Parameter type: <Sip::VSPDtmfRelaySipInfo> Format: (disable enable) Possible values: - disable : do not send DTMF Info - enable : send DTMF Info	<i>optional parameter with default value: "disable"</i> This objects indicates whether dtmf-events will be sent on top of RFC2833 configuration also in the SIP signalling path in the message-body of SIP INFO message with content-type set to application/dtmf-relay.
[no] sub-period	Parameter type: <Sip::VSPSubscribePeriod> Format: - This object indicates subscription expiration time that the client will propose by including it in an Expires header of a SUBSCRIBE request. If this property is set to a value of zero, the client SHALL NOT refresh a subscription even if the server specifies an expiration interval. Accept value greater than or equal to 60 [0 (60..86400)] - unit: second - range: [0,60...86400]	<i>optional parameter with default value: 3600</i> This object indicates subscription expiration time that the client will propose by including it in an Expires header of a SUBSCRIBE request. If this property is set to a value of zero, the client SHALL NOT refresh a subscription even if the server specifies an expiration interval.
[no] sub-head-start	Parameter type: <Sip::VSPSubscribeHeadStart> Format: - This object indicates number of seconds prior to expiration of a subscription at which the client sends a SUBSCRIBE request to refresh the subscription. Accept value greater than or equal to 60 [0 (32..86400)] - unit: second - range: [0,32...86400]	<i>optional parameter with default value: 600</i> This object indicates number of seconds prior to expiration of a subscription at which the client sends a SUBSCRIBE request to refresh the subscription.
[no] t38-same-udp	Parameter type: <Sip::VSPT38withSameUDP> Format: (disable enable) Possible values: - disable : T38 use different port as voice - enable : T38 use same port as voice	<i>optional parameter with default value: "disable"</i> Whether T38 use same UDP port with voice,disable(1),enable(2)
[no] dhcp-option82	Parameter type: <Sip::DHCPOption82> Format: (enable disable) Possible values: - enable : enable to send option 82 in DHCP mode - disable : disable to send option 82 in DHCP mode	<i>optional parameter with default value: "disable"</i> dhcp option82 mode
[no] sspprofile	Parameter type: <Sip::SSPProfile> Format: - The name of the SIP Service Profile assigned to a voice service gateway - length: x<=64	<i>optional parameter with default value: ""</i> The name of the SIP Service Profile assigned to a VSG
[no] signaling-ipmode	Parameter type: <Sip::VSPSignalingIpMode>	<i>optional parameter with default</i>

Parameter	Type	Description
	Format: (legacy-ipv4 ipv4 ipv6) Possible values: - legacy-ipv4 : the SIP signaling path is based on IPv4 addressing, for backward compatibility of legacy CLI management interface. Only allowed when media-ipmode set as 'legacy-ipv4' - ipv4 : the SIP signaling path is based on IPv4 addressing, for changed CLI management interface. Only allowed when media-ipmode set as 'ipv4' - ipv6 : the SIP signaling path is based on IPv6 addressing, for changed CLI management interface. Only allowed when media-ipmode set as 'ipv6'	<i>value: "legacy-ipv4"</i> The variable allows the operator to specify the IP mode of the SIP signaling path.
[no] tls-cafile	Parameter type: <Sip::VSPCAFileName> Format: - the ca file name - length: x<=13	<i>optional parameter with default value: ""</i> The name of Certification Authority (CA) file configured for VSP entry.
[no] media-ipmode	Parameter type: <Sip::VSPMediaIpMode> Format: (legacy-ipv4 ipv4 ipv6) Possible values: - legacy-ipv4 : the media path is based on IPv4 addressing, for backward compatibility of legacy CLI management interface. Only allowed when signaling-ipmode set as 'legacy-ipv4' - ipv4 : the media path is based on IPv4 addressing, for changed CLI management interface. Only allowed when signaling-ipmode set as 'ipv4' - ipv6 : the media path is based on IPv6 addressing, for changed CLI management interface. Only allowed when signaling-ipmode set as 'ipv6'	<i>optional parameter with default value: "legacy-ipv4"</i> The variable allows the operator to specify the IP mode of the SIP media path.

40.6 Voice Sip User Agent Access Point Configuration Command

Command Description

This command allows the operator to configure the Voice Sip User Agent Access Point. This command depends on the Voice Sip UserAgent Configuration command. When a SIP User Agent is created/deleted, the user agent access point(s) will be created/deleted automatically according to the SIP UA ip-address-policy. The user agent access point(s) can be learned using the show command: show voice sip user-agent-ap.

The parameter rtp-ipv6-address is defined for future usage only and thus actually not supported. IPv6 is actually not supported. All references to IPv6 must be ignored since mentioned for future usage only.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip user-agent-ap (ua-name) slot-id <SIP::SlotIndex> [ signal-ip <SIP::IpAddressWithPrefix> ] [
no rtp-ip | rtp-ip <SIP::IpAddressAndMask> ] [ no dhcp-fqdn | dhcp-fqdn <Sip::UaApDHCPFQDN> ] [ no
dhcp-customer-id | dhcp-customer-id <Sip::UaApDHCPCustomerID> ] [ no admin-status | admin-status
<Sip::UaApAdminStatus> ] [ no lsa-rtp-ip | lsa-rtp-ip <SIP::IpAddressAndMask> ] [ no rtp-ipv6-address |
rtp-ipv6-address <SIP::IPv6AddressWithPrefix> ]
```

Command Parameters

Table 40.6-1 "Voice Sip User Agent Access Point Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ua-name)	Format: - uniquely identifies the User Agent - length: 1<=x<=32	uniquely identify of the user agent
slot-id	Parameter type: <SIP::SlotIndex> Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt ntio <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId>) Possible values: - lt : lt-slot - nt : nt-slot - ntio : ntio-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	slot id associated with this user agent access point

Resource Identifier	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	

Table 40.6-2 "Voice Sip User Agent Access Point Configuration Command" Command Parameters

Parameter	Type	Description
signal-ip	Parameter type: <SIP::IpAddressWithPrefix> Format: (ipv6 : <Ip::V6Address> / <Ip::V6PrefixLength> <Ip::V4Address> / <Sip::PrefixLength>) Possible values: - ipv6 : IPv6-address Field type <Ip::V6Address> - IPv6-address Field type <Ip::V4Address> - IPv4-address Field type <Ip::V6PrefixLength> - prefix length of IPv6-address - range: [0...128] Field type <Sip::PrefixLength> - prefix length of the subnet - range: [0...128]	<i>optional parameter</i> signalling ip address and prefix length of the sip user agent access point
[no] rtp-ip	Parameter type: <SIP::IpAddressAndMask> Format: <Ip::V4Address> / <Sip::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <Sip::PrefixLength> - prefix length of the subnet - range: [0...128]	<i>optional parameter with default value: "0.0.0.0/0"</i> rtp ip address and prefix length of the sip user agent access point
[no] dhcp-fqdn	Parameter type: <Sip::UaApDHCPFQDN> Format: - the string for FQDN in Option81 When UA send out DHCP request - length: x<=255	<i>optional parameter with default value: ""</i> the FQDN in Option81 When UA send out DHCP request
[no] dhcp-customer-id	Parameter type: <Sip::UaApDHCPCustomerID> Format: - the string for Customer id in Option82 When UA send out DHCP request - length: x<=64	<i>optional parameter with default value: "Physical-ID"</i> the Customer id in Option82 When UA send out DHCP request
[no] admin-status	Parameter type: <Sip::UaApAdminStatus> Format: (up down) Possible values: - up : unlock the sip Ua AccessPoint - down : lock the sip Ua AccessPoint	<i>optional parameter with default value: "down"</i> administrative status of this sip user agent access point
[no] lsa-rtp-ip	Parameter type: <SIP::IpAddressAndMask> Format: <Ip::V4Address> / <Sip::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <Sip::PrefixLength> - prefix length of the subnet - range: [0...128]	<i>optional parameter with default value: "0.0.0.0/0"</i> media IP address + prefix length used when connected to the LSA server

40 Voice Configuration Commands

Parameter	Type	Description
[no] rtp-ipv6-address	Parameter type: <SIP::IPv6AddressWithPrefix> Format: <Ip::V6Address> / <Ip::V6PrefixLength> Field type <Ip::V6Address> - IPv6-address Field type <Ip::V6PrefixLength> - prefix length of IPv6-address - range: [0...128]	<i>optional parameter with default value: " : : /0"</i> rtp IPv6 address and prefix length of the sip user agent access point

40.7 Voice Sip Dial Plan Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip dial plan profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no dialplan (name) ) | ( dialplan (name) [ no pre-activated | pre-activated
<Sip::DialPlanPreActivated> ] [ no static-prefix | static-prefix <Sip::DialPlanStaticPrefix> ] [ no static-suffix |
static-suffix <Sip::DialPlanStaticSuffix> ] [ no digitmap-mode | digitmap-mode <Sip::DialPlanDigitMapMode> ] [
no provider-name | provider-name <Sip::DialPlanProviderName> ] )
```

Command Parameters

Table 40.7-1 "Voice Sip Dial Plan Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identifies the dial plan - length: 1<=x<=32	unique identity of a voice sip dial plan

Table 40.7-2 "Voice Sip Dial Plan Configuration Commands" Command Parameters

Parameter	Type	Description
[no] pre-activated	Parameter type: <Sip::DialPlanPreActivated> Format: (on off) Possible values: - on : Prefix activated of dial plan is on - off : Prefix activated of dial plan is off	<i>optional parameter with default value: "off"</i> identify the status for sip dial plan prefix
[no] static-prefix	Parameter type: <Sip::DialPlanStaticPrefix> Format: - static prefix added to all valid DNs - length: x<=32	<i>optional parameter with default value: ""</i> identify static prefix(uri type + area code) added to valid DNs.If the format is 'uri type + area code',the uri type will overwrite the uri type in vsp; If the format is area code without uri type, uri type will depend on the uri type in vsp.
[no] static-suffix	Parameter type: <Sip::DialPlanStaticSuffix> Format: - static suffix added to all valid DNs	<i>optional parameter with default value: ""</i> identify static suffix(area code)

40 Voice Configuration Commands

Parameter	Type	Description
	- length: x<=32	added all valid DNs
[no] digitmap-mode	Parameter type: <Sip::DialPlanDigitMapMode> Format: (maximum minimum) Possible values: - maximum : standard match mode - minimum : system should send out INVITE immediately when an exact full match dial string is detected	<i>optional parameter with default value: "maximum"</i> identify the digit match mode for dial plan
[no] provider-name	Parameter type: <Sip::DialPlanProviderName> Format: - uniquely identifies the dial plan provider name - length: x<=32	<i>optional parameter with default value: "vsp1"</i> identify the sip dial plan provider name

40.8 Voice Sip Dial Plan Digitmap Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip dialplan digitmap profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no digitmap (name) type <Sip::DialPlanDigitmapType> rule
<Sip::DialPlanDigitmapValue> ) | ( digitmap (name) type <Sip::DialPlanDigitmapType> rule
<Sip::DialPlanDigitmapValue> [ no access-type | access-type <Sip::DialPlanDigitmapAccessType> ] )
```

Command Parameters

Table 40.8-1 "Voice Sip Dial Plan Digitmap Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identifies the dial plan - length: 1<=x<=32	identify voice application dial plan within the scope
type	Parameter type: <Sip::DialPlanDigitmapType> Format: regular Possible values: - regular : digitmap type	identify the type of sip dial plan digitmap
rule	Parameter type: <Sip::DialPlanDigitmapValue> Format: - identity the value of digitmap - length: 1<=x<=100	identify the value of sip dial plan digitmap

Table 40.8-2 "Voice Sip Dial Plan Digitmap Configuration Commands" Command Parameters

Parameter	Type	Description
[no] access-type	Parameter type: <Sip::DialPlanDigitmapAccessType> Format: allowed Possible values: - allowed : the digitmap can be used	<i>optional parameter with default value: "allowed"</i> <i>The parameter is not visible during creation.</i> The access type of digitmap

40.9 Voice Sip Termination Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip termination profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no termination (if-index) ) | ( termination (if-index) [ no directory-number |
directory-number <Sip::TermDnumber> ] [ no user-name | user-name <Sip::TermUserName> ] [ no display-name |
display-name <Sip::TermDisplayName> ] [ no uri | uri <Sip::TermUri> ] [ no direct-uri | direct-uri <Sip::TermUri>
] [ no line-feed | line-feed <Sip::TermLineCharacter> ] [ no md5-realm | md5-realm <Sip::MD5Realm> ] [ no
md5-password | md5-password <Security::Password4> ] [ no aka-secret-key | aka-secret-key
<Security::Password8> ] [ no admin-status | admin-status <Sip::TermAdminStatus> ] [ no clip-mode | clip-mode
<Sip::TermETSIClipDataMode> ] [ no telc-clip-mode | telc-clip-mode <Sip::TermTelcordiaClipDataMode> ] [ no
anti-tapping | anti-tapping <Sip::TermAntiTapping> ] [ no impedance | impedance <Sip::TermImpedance> ] [ no
rx-gain | rx-gain <Sip::TermRxGain> ] [ no tx-gain | tx-gain <Sip::TermTxGain> ] [ no warmline-service |
warmline-service <Sip::TermWarmlineService> ] [ no linesig-remanswer | linesig-remanswer
<Sip::TermLineSignalOnRemoteAnswer> ] [ no line-id | line-id <Sip::TermLineId> ] [ no force-hold | force-hold
<Sip::TermService> ] [ no callwait-service | callwait-service <Sip::TermCallwaitingService> ] [ no callhold-service
| callhold-service <Sip::TermSupplementaryService> ] [ no callconf-service | callconf-service
<Sip::TermSupplementaryService> ] [ no calltras-service | calltras-service <Sip::TermSupplementaryService> ] [
no fast-guard | fast-guard <Sip::TermFastGuardOnInvite> ] [ no clear-forward | clear-forward
<Sip::TermClearForwardOnBye> ] [ no testaccessstate | testaccessstate <Sip::TestAccessState> ] [ no
busyoverwrite | busyoverwrite <Sip::TestAccessBusyOverWrite> ] [ no accessontimeout | accessontimeout
<Sip::TestAccessonTimeout> ] [ no provider-name | provider-name <Sip::TermUserProviderName> ] [ no
register_recall | register_recall <Sip::TermRegisterRecall> ] [ no sip-rule-set | sip-rule-set
<Sip::PotsManipulationRuleSet> ] [ no reserved | reserved <Sip::TermReserved> ] [ no pulse-dialing | pulse-dialing
<Sip::TermPulseDialing> ] [ no auto-answer | auto-answer <Sip::TermAutoAnswer> ] )
```

Command Parameters

Table 40.9-1 "Voice Sip Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	The unique internal identifier of the termination port

Resource Identifier	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	

Table 40.9-2 "Voice Sip Termination Configuration Commands" Command Parameters

Parameter	Type	Description
[no] directory-number	Parameter type: <Sip::TermDnumber> Format: - identify the DN of the subscriber line - length: x<=32	<i>optional parameter with default value: ""</i> identify the directory (telephone) number of the subscriber line
[no] user-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> identify the user name for this termination port
[no] display-name	Parameter type: <Sip::TermDisplayName> Format: - identify the display name for this port - length: x<=64	<i>optional parameter with default value: ""</i> display name for this termination port
[no] uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> sip uri by which user agent identifies subscriber line
[no] direct-uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> a call will be automatically established to this SIP-URI after an off-hook
[no] line-feed	Parameter type: <Sip::TermLineCharacter> Format: (25 40) Possible values: - 25 : the line character of this port is 25, unit: ma - 40 : the line character of this port is 40, unit: ma	<i>optional parameter with default value: "25"</i> the characteristic of the subscriber line
[no] md5-realm	Parameter type: <Sip::MD5Realm> Format: - the realm identifier (Due to legacy reasons, the MD5 character string was included in the object name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication realm identifier.) - length: x<=64	<i>optional parameter with default value: ""</i> realm identifier corresponding to service gateway domain
[no] md5-password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the	<i>optional parameter with default value: "plain : "</i> the password associated with the user

Parameter	Type	Description
	parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) - length: x<=64	
[no] aka-secret-key	Parameter type: <Security::Password8> Format: (prompt plain : <Security::PlainPassword8>) Possible values: - prompt : prompts the operator for AKA shared secret key - plain : the AKA shared secret key in plain text, each character should be 0-f, and the length can only be 0 or 32 Field type <Security::PlainPassword8> - the AKA shared secret key, each character should be 0-f, and the length can only be 0 or 32 - length: x<=32	<i>optional parameter with default value: "plain : "</i> the AKA shared secret key
[no] admin-status	Parameter type: <Sip::TermAdminStatus> Format: (up down) Possible values: - up : unlock the sip termination - down : lock the sip termination	<i>optional parameter with default value: "down"</i> identify the status of this port administration
[no] clip-mode	Parameter type: <Sip::TermETSIClipDataMode> Format: (cdevalue fsk dtmf) Possible values: - cdevalue : cde configuration will be applied for etsi clip - fsk : fsk will be applied for etsi clip - dtmf : dtmf will be applied for etsi clip	<i>optional parameter with default value: "cdevalue"</i> the etsi clip data transmission protocol of this sip termination
[no] telc-clip-mode	Parameter type: <Sip::TermTelcordiaClipDataMode> Format: (cdevalue fsk) Possible values: - cdevalue : cde configuration will be applied for Telcordia clip - fsk : fsk will be applied for Telcordia clip	<i>optional parameter with default value: "cdevalue"</i> the TELCORDIA clip data transmission protocol of this sip termination
[no] anti-tapping	Parameter type: <Sip::TermAntiTapping> Format: (enable disable) Possible values:	<i>optional parameter with default value: "disable"</i> enable/disable the anti-tapping service of this sip termination

Parameter	Type	Description
	- enable : Enable Anti-Tapping service - disable : Disable Anti-Tapping service	
[no] impedance	Parameter type: <Sip::TermImpedance> Format: (default 200 220 220minisplitter 270 300 370 600 900 370minisplitter 600splitter 370nvlsasplitter 370skinnysplitter 270duratelsplitter 2703msplitter 100 150 220splitter reserv19 reserv20 reserv21) Possible values: - default : the impedance is default value - 200 : the line impedance is 200 ohm - 220 : the line impedance is 220 ohm - 220minisplitter : the line impedance is 220 ohm+ miniSplitter - 270 : the line impedance is 270 ohm - 300 : the line impedance is 300 ohm - 370 : the line impedance is 370 ohm - 600 : the line impedance is 600 ohm - 900 : the line impedance is 900 ohm - 370minisplitter : the line impedance is 370 ohm+ miniSplitter - 600splitter : the line impedance is 600 ohm+splitter - 370nvlsasplitter : the line impedance is 370 ohm+ NVLSASplitter - 370skinnysplitter : the line impedance is 370 ohm+ SkinnySplitter - 270duratelsplitter : the line impedance is 270 ohm+ DuratelSplitter - 2703msplitter : the line impedance is 270 ohm+ 3MDplitter - 100 : the line impedance is 100 ohm - 150 : the line impedance is 150 ohm - 220splitter : the line impedance is 220 ohm+ splitter - reserv19 : reserved for future use 19 - reserv20 : reserved for future use 20 - reserv21 : reserved for future use 21	<i>optional parameter with default value: "default"</i> configure the line impedance of this sip termination
[no] rx-gain	Parameter type: <Sip::TermRxGain> Format: - the line rx_gain range -14...6 - range: [-14...6]	<i>optional parameter with default value: "0"</i> configure the line rx_gain of this sip termination

Parameter	Type	Description
[no] tx-gain	Parameter type: <Sip::TermTxGain> Format: - the line tx_gain range -14...6 - range: [-14...6]	<i>optional parameter with default value: "0"</i> configure the line tx_gain of this sip termination
[no] warmline-service	Parameter type: <Sip::TermWarmlineService> Format: (disabled activated subscribed) Possible values: - disabled : When warmline-service=disabled and direct-uri is null, warmline service is controlled by SIP Service Profile. The SSP will tell whether this service is controlled by UA-Profile or the MIB disable value is applied (e.g. when the IMS core does not support the UA-profile approach). - activated : Warmline is activated - subscribed : Warmline can be subscribed by end user	<i>optional parameter with default value: "disabled"</i> warmline administrative status
[no] linesig-remanswer	Parameter type: <Sip::TermLineSignalOnRemoteAnswer> Format: (no-signal line-reversal single-meteringpulse) Possible values: - no-signal : send no signal - line-reversal : send line reversal signal - single-meteringpulse : send single metering pulse signal	<i>optional parameter with default value: "no-signal"</i> line signal on remote answer
[no] line-id	Parameter type: <Sip::TermLineId> Format: - The cli-timing (cli) and/or VBD rx-gain/tx-gain (vbdrx/vbdtx) and/or the Fax Mode (fm) and/or the Voice Activity Detection (vad) and/or the warmline delay timer (wldt) and/or the processing procedure for the dtmf event tones(2833) and/or the vbd-mode (vm) and/or the UDP port usage for T38 to voice switching (and vice versa) (udp) and/or the Pani header line ID. Format : [cli:prior cli:during];[vbdtx:(value(-14:6))];[vbdrx:(value(-14:6))];[fm:(value(1:3))];[vad:e vad:d] A semi-colon must be inserted between the configuration input strings. The configuration input must be given in lower case characters. No space allowed anywhere; no leading zero(es) allowed anywhere. In case the configuration input for one or multiple input strings must be changed, the configuration input for all other input strings must be repeated too i.e. the new configuration input for the line id parameter fully overwrites the previous configuration input. - Keyword : cli (Only applicable to CLIP ETSI standard.) Values : prior during. prior: clip-procedure is priorDT (for FSK) or priorNoLR (for DTMF). during: clip-procedure is duringRinging. In case this keyword is not found in the configuration input of the line-id parameter, the pre-provisioned value in the CDE file applies. - Keyword : vbdtx Values : range [-14:6] The '+' sign is not allowed; only the '-' sign is allowed. In case this keyword is not found in the configuration input of the line-id parameter, for a voice call, the value configured at SIP termination level applies. After switching to VBD, the hardcoded value Tx gain = 0 applies. - Keyword : vbdrx	<i>optional parameter with default value: ""</i> identify the line id for this termination port

Parameter	Type	Description
	Values : range [-14:6]\n The '+' sign is not allowed; only the '-' sign is allowed.\n In case this keyword is not found in the configuration input of the line-id parameter, for a voice call, the value configured at SIP termination level applies. After switching to VBD, the hardcoded value Rx gain = 0 applies.\n - Keyword : fm\n Values : range [1:3]\n 1 : g711vbd\n 2 : t.38-with-g711vbd-fallback-with-signaling\n 3 : t.38-with-g711vbd-fallback-without-signaling\n In case this keyword is not found in the configuration input of the line-id parameter, the pre-provisioned value in the CDE file applies.\n - Keyword : vad\n Values : e d\n e : vad is enabled (sending comfort noise packets during silent periods)\n d : vad is disabled (do not send comfort noise packets during silent periods)\n In case this keyword is not found in the configuration input of the line-id parameter, the pre-provisioned value in the CDE file applies.\n - Keyword : wldt\n Values : range [1:60] seconds\n In case this keyword is not found in the configuration input of the line-id parameter, the system wide configuration input applies.\n - Keyword : 2833\n Values : range [1:4]\n 1 : the processing procedure is audio\n 2 : the processing procedure is rfc2833\n 3 : the processing procedure is both, audio and rfc2833\n 4 : audio has priority in the processing procedure\n In case this keyword is not found in the configuration input of the line-id parameter, the system wide configuration input applies.\n - Keyword : vm\n Values: range [1:4]\n 1 : auto switch without negotiation\n 2 : renegotiation\n 3 : If V152 negotiation fails, autoswitch applies\n 4 : If V152 negotiation fails, renegotiation applies\n In case this keyword is not found in the configuration input of the line-id parameter, the system wide configuration input applies.\n - Keyword : udp\n Values : e d\n e : the same UDP port is used for Voice and T38\n d : a different UDP port is used for Voice and T38\n In case this keyword is not found in the configuration input of the line-id parameter, the system wide configuration input applies.\n - Pani header line id : \n must always appear at the end of the configuration string; The configuration input is not bounded to any format i.e. It is the responsibility of the customer to define the desired line ID format; There is no restriction on the character set being used - length: x<=63	
[no] force-hold	Parameter type: <Sip::TermService> Format: (disable enable) Possible values: - disable : field is disabled - enable : field is enabled	<i>optional parameter with default value: "disable"</i> force hold functionality
[no] callwait-service	Parameter type: <Sip::TermCallwaitingService> Format: (disabled activated subscribed) Possible values: - disabled : Callwaiting is disabled - activated : Callwaiting is activated	<i>optional parameter with default value: "disabled"</i> callwaiting administrative status

40 Voice Configuration Commands

Parameter	Type	Description
	- subscribed : Callwaiting can be subscribed by end user	
[no] callhold-service	Parameter type: <Sip::TermSupplementaryService> Format: (disabled activated) Possible values: - disabled : the service is disabled - activated : the service is activated	<i>optional parameter with default value: "disabled"</i> callhold administrative status
[no] callconf-service	Parameter type: <Sip::TermSupplementaryService> Format: (disabled activated) Possible values: - disabled : the service is disabled - activated : the service is activated	<i>optional parameter with default value: "disabled"</i> callconference administrative status
[no] calltras-service	Parameter type: <Sip::TermSupplementaryService> Format: (disabled activated) Possible values: - disabled : the service is disabled - activated : the service is activated	<i>optional parameter with default value: "disabled"</i> calltransfer administrative status
[no] fast-guard	Parameter type: <Sip::TermFastGuardOnInvite> Format: (cde-profile enabled disabled) Possible values: - cde-profile : legacy behaviour that applies CDE profile settings - enabled : enable Fast Guard on incoming INVITE - disabled : disable Fast Guard on incoming INVITE	<i>optional parameter with default value: "cde-profile"</i> fast guard administrative status
[no] clear-forward	Parameter type: <Sip::TermClearForwardOnBye> Format: (sip-service-profile enabled disabled) Possible values: - sip-service-profile : legacy behaviour that applies SSP profile settings - enabled : enable Clear Forward on Bye - disabled : disable Clear Forward on Bye	<i>optional parameter with default value: "sip-service-profile"</i> clear forward administrative status
[no] testaccessstate	Parameter type: <Sip::TestAccessState> Format: (on off) Possible values: - on : turn on TestAccessState - off : turn off TestAccessState	<i>optional parameter with default value: "off"</i> test access status
[no] busyoverwrite	Parameter type: <Sip::TestAccessBusyOverWrite> Format: (true false) Possible values: - true : enable TestAccessBusyOverWrite parameter - false : disable TestAccessBusyOverWrite parameter	<i>optional parameter with default value: "false"</i> test access busyoverwrite
[no] accessontimeout	Parameter type: <Sip::TestAccessonTimeout>	<i>optional parameter with default</i>

Parameter	Type	Description
	Format: - value of test access on expires. - unit: second - range: [0...900]	<i>value: "900"</i> time to go until test access timeout. In case test access state is off, the value will be 0. In case test access state is on, this parameter is optional with default initial value 900. The value will start counting down, until value 0 and test access state will be off again.
[no] provider-name	Parameter type: <Sip::TermUserProviderName> Format: - identify the user VSG name for this port - length: x<=32	<i>optional parameter with default value: "vsp1"</i> identify the user VSG name for this termination port
[no] register_recall	Parameter type: <Sip::TermRegisterRecall> Format: - identify the register_recall value. Format: min-max. such as: 100-300, range for min and max is [30...2000]. CDE value will work if configure \"\" or no register_recall. Any other formats are all invalid. - unit: milliseconds - length: x<=16	<i>optional parameter with default value: ""</i> overrule register_recall and on_hook_timer in CDE for this port
[no] sip-rule-set	Parameter type: <Sip::PotsManipulationRuleSet> Format: - the POTS manipulation rule set, at most 32 rule ids can be configured - length: x<=32	<i>optional parameter with default value: ""</i> identify the rules this termination can apply
[no] reserved	Parameter type: <Sip::TermReserved> Format: - reserved for future usage for this port - length: x<=32	<i>optional parameter with default value: ""</i> reserved for future usage for this port
[no] pulse-dialing	Parameter type: <Sip::TermPulseDialing> Format: (disabled enabled) Possible values: - disabled : the pulse dialing is disabled - enabled : the pulse dialing is enabled	<i>optional parameter with default value: "enabled"</i> Termination pulse dialing status
[no] auto-answer	Parameter type: <Sip::TermAutoAnswer> Format: (disable enable) Possible values: - disable : The auto-answer feature is disabled - enable : The auto-answer feature is enabled	<i>optional parameter with default value: "disable"</i> This object allows to enable the auto-answer feature for this termination

40.10 Voice Sip Termination TCA Threshold Configuration Command

Command Description

This command allows the operator to enable/disable tca or configure the high/low threshold for jitter buffer fill level of the sip termination.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip termination (if-index) tca [ [ no ] enable ] [ no high-jbfl | high-jbfl <Sip::JBFL> ] [ no low-jbfl | low-jbfl <Sip::JBFL> ]
```

Command Parameters

Table 40.10-1 "Voice Sip Termination TCA Threshold Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The unique internal identifier of the termination port

Table 40.10-2 "Voice Sip Termination TCA Threshold Configuration Command" Command Parameters

Parameter	Type	Description
[no] enable	Parameter type: boolean	<i>optional parameter</i> Enable the reporting of tca for sip termination
[no] high-jbfl	Parameter type: <Sip::JBFL> Format: - average of jitter buffer fill level percentage for the termination - unit: percentage	<i>optional parameter with default value: 90</i> the high threshold for jitter buffer fill level. it can not be smaller than low-jbfl. 100 mean

Parameter	Type	Description
	- range: [0...100]	that this parameter shall be omitted by the system.
[no] low-jbfl	Parameter type: <Sip::JBFL> Format: - average of jitter buffer fill level percentage for the termination - unit: percentage - range: [0...100]	<i>optional parameter with default value: 80</i> the low threshold for jitter buffer fill level. it can not be bigger than high-jbfl. 0 mean that this parameter shall be omitted by the system.

40.11 Voice Sip Shared Line Termination Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip shared line termination profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no sharedline (if-index) ) | ( sharedline (if-index) [ no directory-number | directory-number
<Sip::TermDnumber> ] [ no user-name | user-name <Sip::TermUserName> ] [ no display-name | display-name
<Sip::TermUserName> ] [ no uri | uri <Sip::TermUri> ] [ no admin-status | admin-status <Sip::TermAdminStatus>
] [ no clip-mode | clip-mode <Sip::TermETSIClipDataMode> ] [ no callwait-service | callwait-service
<Sip::TermCallwaitingService> ] [ no callhold-service | callhold-service <Sip::TermSupplementaryService> ] [ no
callconf-service | callconf-service <Sip::TermSupplementaryService> ] [ no calltras-service | calltras-service
<Sip::TermSupplementaryService> ] )
```

Command Parameters

Table 40.11-1 "Voice Sip Shared Line Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The unique internal identifier of the termination port

Table 40.11-2 "Voice Sip Shared Line Termination Configuration Commands" Command Parameters

Parameter	Type	Description
[no] directory-number	Parameter type: <Sip::TermDnumber> Format: - identify the DN of the subscriber line - length: x<=32	<i>optional parameter with default value: ""</i> identify the directory (telephone) number of the subscriber line

Parameter	Type	Description
[no] user-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> identify the user name for this termination port
[no] display-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> display name for this termination port
[no] uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> sip uri by which user agent identifies subscriber line
[no] admin-status	Parameter type: <Sip::TermAdminStatus> Format: (up down) Possible values: - up : unlock the sip termination - down : lock the sip termination	<i>optional parameter with default value: "down"</i> identify the status of this port administration
[no] clip-mode	Parameter type: <Sip::TermETSIClipDataMode> Format: (cdevalue fsk dtmf) Possible values: - cdevalue : cde configuration will be applied for etsi clip - fsk : fsk will be applied for etsi clip - dtmf : dtmf will be applied for etsi clip	<i>optional parameter with default value: "cdevalue"</i> the etsi clip data transmission protocol of this sip termination
[no] callwait-service	Parameter type: <Sip::TermCallwaitingService> Format: (disabled activated subscribed) Possible values: - disabled : Callwaiting is disabled - activated : Callwaiting is activated - subscribed : Callwaiting can be subscribed by end user	<i>optional parameter with default value: "disabled"</i> callwaiting administrative status
[no] callhold-service	Parameter type: <Sip::TermSupplementaryService> Format: (disabled activated) Possible values: - disabled : the service is disabled - activated : the service is activated	<i>optional parameter with default value: "disabled"</i> callhold administrative status
[no] callconf-service	Parameter type: <Sip::TermSupplementaryService> Format: (disabled activated) Possible values: - disabled : the service is disabled - activated : the service is activated	<i>optional parameter with default value: "disabled"</i> callconference administrative status
[no] calltras-service	Parameter type: <Sip::TermSupplementaryService> Format: (disabled activated) Possible values: - disabled : the service is disabled	<i>optional parameter with default value: "disabled"</i> calltransfer administrative status

40 Voice Configuration Commands

Parameter	Type	Description
	- activated : the service is activated	

40.12 Sip Voice Register Configuration Commands

Command Description

This command allows the operator to configure the SIP Voice Register parameters .

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip register (provider-name) [ no register-uri | register-uri <Sip::RegisterUri> ] [ no register-intv |
register-intv <Sip::RegisterIntv> ] [ no reg-retry-intv | reg-retry-intv <Sip::RegisterRetryIntv> ] [ no
reg-prev-ava-intv | reg-prev-ava-intv <Sip::RegisterPrevAvaIntv> ] [ no reg-head-start | reg-head-start
<Sip::RegisterHeadStart> ] [ no reg-start-min | reg-start-min <Sip::RegisterStartMin> ] [ no init-reg-delay |
init-reg-delay <Sip::RegisterDelayInitialRegister> ]
```

Command Parameters

Table 40.12-1 "Sip Voice Register Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(provider-name)	Format: - provider name - length: x<=32	uniquely identify register provider name

Table 40.12-2 "Sip Voice Register Configuration Commands" Command Parameters

Parameter	Type	Description
[no] register-uri	Parameter type: <Sip::RegisterUri> Format: - The registration URI to be used by all SIP terminations that have a service agreement with this SIP Voice Service Gateway - length: x<=80	<i>optional parameter with default value: ""</i> The registration URI to be used by all SIP terminations that have a service agreement with this SIP Voice Service Gateway.
[no] register-intv	Parameter type: <Sip::RegisterIntv> Format: - The registration expiration time that UA will propose in the Expires header of a REGISTER request, unless the value is 0. If the value is set to 0 the UA shall not refresh a registration even if the server specifies an expiration interval. Accept value greater than or equal to 60 [0[(60..86400)] - unit: second - range: [0,60...86400]	<i>optional parameter with default value: 3600</i> The registration expiration time that UA will propose in the Expires header of a REGISTER request, unless the value is 0. If the value is set to 0 the UA shall not refresh a registration even if the server specifies an expiration interval.
[no] reg-retry-intv	Parameter type: <Sip::RegisterRetryIntv> Format: - The interval between successive registration retries after a	<i>optional parameter with default value: 60</i> The interval between successive

Parameter	Type	Description
	failed registration. The value of 0 shall disable registration retry. The valid input would be [0,30..86400] - unit: second - range: [0,30..86400]	registration retries after a failed registration. The value of 0 shall disable registration retry.
[no] reg-prev-ava-intv	Parameter type: <Sip::RegisterPrevAvaIntv> Format: - The magnitude of time interval that must be awaited before the system is allowed to initiate another register request. - unit: millisecond - range: [30...32000]	<i>optional parameter with default value: 500</i> the magnitude of time interval that must be awaited before the system is allowed to initiate another register request.
[no] reg-head-start	Parameter type: <Sip::RegisterHeadStart> Format: - The time prior to expiration of a registration at which the UA sends a registration refresh. If the value of register_head_start is greater than (1 - start_min%) of the value for register_period, then the register_head_start value will be ignored and a timer equal to start_min% of the value for register_period will be used for this function, a value 0 means register_head_start will not be used - unit: second - range: [0...86400]	<i>optional parameter with default value: 600</i> The time prior to expiration of a registration at which the UA sends a registration refresh, if the value of register_head_start is greater than (1 - start_min%) of the value for register_period, then the register_head_start value will be ignored and a timer equal to start_min% of the value for register_period will be used for this function, a value 0 means, this value will not be used, valid input would be [0,32..86400]
[no] reg-start-min	Parameter type: <Sip::RegisterStartMin> Format: - The time prior to expiration of a registration at which a registration refresh is sent, if the value of register_head_start is greater than (1 - start_min%) of the value for the Expires value received in the 200 OK response to last REGISTER request for this line (either the Expires parameter in the Contact header or, if that is not present, in an Expires header), then the register_head_start value is ignored and a timer equal to start_min% of the value for register_period is used for this function - unit: percentage - range: [30...70]	<i>optional parameter with default value: 50</i> The time prior to expiration of a registration at which a registration refresh is sent. If the value of register_head_start is greater than (1 - start_min%) of the value for the Expires value received in the 200 OK response to last REGISTER request for this line (either the Expires parameter in the Contact header or, if that is not present, in an Expires header), then the register_head_start value is ignored and a timer equal to start_min% of the value for register_period is used for this function.
[no] init-reg-delay	Parameter type: <Sip::RegisterDelayInitialRegister> Format: - Configurable delayed initial register time for failure cases with response without Retry-After header included. range is [0,10...400] - unit: second	<i>optional parameter with default value: 180</i> Configurable delayed initial register time for failure cases with response without Retry-After header included. This object only applies to POTS. range is [0,10...400]

40.13 Voice Sip Transport Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Transport params.

IPv6 is actually not supported. All references to IPv6 must be ignored since mentioned for future usage only.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no transport (trans-protocol) provider-name <Sip::TransportProviderName> ) | ( transport
(trans-protocol) provider-name <Sip::TransportProviderName> [ no admin-status | admin-status
<Sip::TransportAdminStatus> ] [ no port-rcv | port-rcv <Sip::TransportPortRcv> ] [ no tcp-idle-time | tcp-idle-time
<Sip::TransportTCPIidleTime> ] [ no max-out-udp-size | max-out-udp-size <Sip::TransportMaxOutgUdpReqSize>
] [ no tls-port-rcv | tls-port-rcv <Sip::TransportPortTLSPrcv> ] )
```

Command Parameters

Table 40.13-1 "Voice Sip Transport Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(trans-protocol)	Format: (udp tcp udp_tcp tls_over_tcp udp_tls tcp_tls udp_tcp_tls udp_swo_tcp) Possible values: - udp : transport protocol is UDP - tcp : transport protocol is TCP - udp_tcp : transport protocol is UDP or TCP. TCP is the preferred transport protocol. If UDP would be used and the size of the message exceeds a configured threshold then a switch can be made to TCP - tls_over_tcp : transport protocol is TLSoverTCP - udp_tls : transport protocol is UDP or TLSoverTCP. TLSoverTCP is the preferred transport protocol - tcp_tls : transport protocol is TCP or TLSoverTCP. TLSoverTCP	Terminations will use this transport for establishing the calls

Resource Identifier	Type	Description
	is the preferred transport protocol - udp_tcp_tls : transport protocol is UDP, TCP or TLS over TCP. TLS over TCP is the preferred transport protocol. The next preferred transport protocol is TCP and finally UDP. If UDP would be used and the size of the message exceeds a configured threshold then a switch can be made to TCP - udp_swo_tcp : transport protocol is UDP or TCP. Basically, UDP is to be used. When size of message exceeds a configured threshold then a switch is made to TCP	
provider-name	Parameter type: <Sip::TransportProviderName> Format: - uniquely identifies the transport provider name - length: x<=32	uniquely identify transport provider name

Table 40.13-2 "Voice Sip Transport Configuration Commands" Command Parameters

Parameter	Type	Description
[no] admin-status	Parameter type: <Sip::TransportAdminStatus> Format: (up down) Possible values: - up : unlock the dns server - down : lock the dns server	<i>optional parameter with default value: "down"</i> change administrative status
[no] port-rcv	Parameter type: <Sip::TransportPortRcv> Format: - Defines transport protocol port the UserAgent has to listen to for incoming SIP requests. - range: [0...65534]	<i>optional parameter with default value: 5060</i> Defines transport protocol port the User Agent has to listen to for incoming SIP requests.
[no] tcp-idle-time	Parameter type: <Sip::TransportTCPIIdleTime> Format: - Define the max time period that a TCP shall be kept alive without exchanging any msg. - unit: second - range: [32...3600]	<i>optional parameter with default value: 64</i> Define the max time period that a tcp shall be kept alive without exchanging any msg.
[no] max-out-udp-size	Parameter type: <Sip::TransportMaxOutgUdpReqSize> Format: - Define the maximum SIP message size that can be sent over UDP. The minimum value of IPv4 is 576, the minimum value for IPv6 is 1280 - unit: bytes - range: [576...65535]	<i>optional parameter with default value: 65535</i> Define the maximum SIP message size that can be sent over udp
[no] tls-port-rcv	Parameter type: <Sip::TransportPortTLSPortRcv> Format: - Define transport protocol port to which the SIP User Agent will listen when TLS over TCP applies as underlying transport protocol for SIP. - range: [0...65534]	<i>optional parameter with default value: 5061</i> Define transport protocol port to which the SIP User Agent will listen when TLS over TCP applies as underlying transport protocol for SIP.

40.14 Voice Sip Redundancy Table Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Redundancy table.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip redundancy (admin-domain-name) [ no support-redun | support-redun
<Sip::NetwRedunSupported> ] [ no dns-purge-timer | dns-purge-timer <Sip::NetwRedunDnsPurgeTimer> ] [ no
dns-ini-retr-int | dns-ini-retr-int <Sip::NetwRedunDnsInitRetranTimer> ] [ no dns-max-retr-nbr | dns-max-retr-nbr
<Sip::NetwRedunDnsMaxRetrNbr> ] [ no fg-monitor-method | fg-monitor-method
<Sip::NetwRedunFgMonitorMethod> ] [ no fg-monitor-int | fg-monitor-int <Sip::NetwRedunFgMonitorInt> ] [ no
bg-monitor-method | bg-monitor-method <Sip::NetwRedunBgMonitorMethod> ] [ no bg-monitor-int |
bg-monitor-int <Sip::NetwRedunBgMonitorInt> ] [ no stable-obs-period | stable-obs-period
<Sip::NetwRedunStableObsPeriod> ] [ no fo-hystersis | fo-hystersis <Sip::NetwRedunFailoverHystersis> ] [ no
del-upd-threshold | del-upd-threshold <Sip::NetwRedunDeliUpdThreshold> ] [ no auto-server-fo | auto-server-fo
<Sip::NetwRedunAutoFailOver> ] [ no auto-server-fb | auto-server-fb <Sip::NetwRedunAutoFailBack> ] [ no
auto-sos-fo | auto-sos-fo <Sip::NetwRedunAutoFailOver> ] [ no auto-sos-fb | auto-sos-fb
<Sip::NetwRedunAutoSosFailback> ] [ no rtry-after-thrsh | rtry-after-thrsh <Sip::NetwRedunRetryAfterThreshold>
] [ no options-max-fwd | options-max-fwd <Sip::NetwRedunOPTIONSMaxForward> ] [ no dns-redun-mode |
dns-redun-mode <Sip::NetwRedundnsredunmode> ] [ no fail-obs-timer | fail-obs-timer
<Sip::NetwRedunFailureObservationTimer> ] [ no fg-intv-503 | fg-intv-503 <Sip::NetwRedun503FGMonitorIntv>
] [ no time-thrsh-503 | time-thrsh-503 <Sip::NetwRedun503MaxTimeThreshold> ] [ no nbr-thrsh-503 |
nbr-thrsh-503 <Sip::NetwRedun503MaxNbrThreshold> ] [ no auto-srv-fo-timer | auto-srv-fo-timer
<Sip::netwRedunAutoSIPServerFOTimer> ]
```

Command Parameters

Table 40.14-1 "Voice Sip Redundancy Table Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(admin-domain-name)	Format: - uniquely name of this element - length: x<=32	The administrative domain name of the (farm of) SIP First hop(s)

Table 40.14-2 "Voice Sip Redundancy Table Configuration Commands" Command Parameters

Parameter	Type	Description
[no] support-redun	Parameter type: <Sip::NetwRedunSupported> Format: (enable	<i>optional parameter with default value: "disable"</i> This object allows the

Parameter	Type	Description
	disable) Possible values: - enable : support Redundancy - disable : doesn't support Redundancy	administrator to define whether the Voice Service Gateway network supports redundancy or not.
[no] dns-purge-timer	Parameter type: <Sip::NetwRedunDnsPurgeTimer> Format: - Expire of the DNS Purge Timer, a value 0 means that the DNS purge timer is disabled - unit: second - range: [0...86400]	<i>optional parameter with default value: 86400</i> Expire of the DNS Purge Timer, a value 0 means that the DNS purge timer is disabled.
[no] dns-ini-retr-int	Parameter type: <Sip::NetwRedunDnsInitRetranTimer> Format: - Initial DNS retransmission Interval - unit: milliseconds - range: [200...1000]	<i>optional parameter with default value: 500</i> The initial DNS query retransmission interval(in ms).
[no] dns-max-retr-nbr	Parameter type: <Sip::NetwRedunDnsMaxRetrNbr> Format: - Maximum DNS retransmission times - range: [0...4]	<i>optional parameter with default value: 2</i> The maximum DNS query retransmission times.
[no] fg-monitor-method	Parameter type: <Sip::NetwRedunFgMonitorMethod> Format: (register-method options-method passive-heartbeat) Possible values: - register-method : Foreground Service Healthy Monitoring mode : register-method - options-method : Foreground Service Healthy Monitoring mode : options-method - passive-heartbeat : Foreground Service Healthy Monitoring mode : passive-heartbeat	<i>optional parameter with default value: "register-method"</i> The Foreground healthy monitoring method.
[no] fg-monitor-int	Parameter type: <Sip::NetwRedunFgMonitorInt> Format: - The Foreground healthy monitoring interval, range is [0,30..3600],0 means disable. - unit: second	<i>optional parameter with default value: 90</i> The Foreground healthy monitoring interval, range is [0,30..3600],0 means disable.
[no] bg-monitor-method	Parameter type: <Sip::NetwRedunBgMonitorMethod> Format: options-method Possible values: - options-method : Background Service Healthy Monitoring mode : options-method	<i>optional parameter with default value: "options-method"</i> The Background healthy monitoring method.
[no] bg-monitor-int	Parameter type: <Sip::NetwRedunBgMonitorInt> Format: - The Background healthy monitoring interval,range is [0,60..86400], 0 means disable. - unit: second	<i>optional parameter with default value: 3600</i> The Background healthy monitoring interval,range is [0,60..86400], 0 means disable.
[no] stable-obs-period	Parameter type: <Sip::NetwRedunStableObsPeriod> Format: - Configurable stable operation observation period, a value 0 means that the Stable-Operation Observation Period is disabled - unit: second - range: [0...86400]	<i>optional parameter with default value: 21600</i> Configurable stable operation observation period, a value 0 means that the Stable-Operation Observation Period is disabled.
[no] fo-hystersis	Parameter type: <Sip::NetwRedunFailoverHystersis> Format: - Fail-Over Hysteresis Threshold, a value 0 means that the	<i>optional parameter with default value: 0</i> The Fail-Over hysteresis,a value

Parameter	Type	Description
	Fail-Over Hysteresis is disabled - range: [0...5]	0 means that the Fail-Over Hysteresis is disabled.
[no] del-upd-threshold	Parameter type: <Sip::NetwRedunDeliUpdThreshold> Format: - The Deliberate Update Threshold. When set to 0, then upon a SIP server priority change or a change of the list of SIP servers. DU is immediately triggered for idle SIP terminations. DU is triggered upon call completion for SIP terminations involved in a call, with a maximum time limit of 60 sec. i.e. if after 60 sec the call is still not finished, then the call is aborted and DU is performed for that SIP termination. - unit: second - range: [0...86400]	<i>optional parameter with default value: 0</i> The Deliberate Update Threshold. When set to 0, then upon a SIP server priority change or a change of the list of SIP servers. DU is immediately triggered for idle SIP terminations. DU is triggered upon call completion for SIP terminations involved in a call, with a maximum time limit of 60 sec. i.e. if after 60 sec the call is still not finished, then the call is aborted and DU is performed for that SIP termination.
[no] auto-server-fo	Parameter type: <Sip::NetwRedunAutoFailOver> Format: (enable disable) Possible values: - enable : Support autonomous Fail-Over - disable : Not support autonomous Fail-Over	<i>optional parameter with default value: "disable"</i> This object allows to enable/disable autonomous SIP Server Fail-Over.
[no] auto-server-fb	Parameter type: <Sip::NetwRedunAutoFailBack> Format: - support/unsupported Autonomous SIP server Fail-Back, a value 0 means disable this functionality, not 0 means that SIP server Fail-Back is enabled. The value indicates the time period by which the SIP server Fail-Back must be done - unit: second - range: [0...86400]	<i>optional parameter with default value: 0</i> This object allows to enable/disable autonomous SIP Server Fail-Back.If value != 0, the value indicates the time period by which the SIP server Fail-Back must be completed, a value 0 means disable
[no] auto-sos-fo	Parameter type: <Sip::NetwRedunAutoFailOver> Format: (enable disable) Possible values: - enable : Support autonomous Fail-Over - disable : Not support autonomous Fail-Over	<i>optional parameter with default value: "disable"</i> This object allows to enable/disable autonomous SOS Fail-Over.
[no] auto-sos-fb	Parameter type: <Sip::NetwRedunAutoSosFailback> Format: - support/unsupported Autonomous SOS Fail-Back, a value 0 means disable this functionality,not 0 means that SIP SOS Fail-Back is enabled. The value indicates the time period by which the SIP SOS Fail-Back must be done - unit: second - range: [0...86400]	<i>optional parameter with default value: 0</i> This object allows to enable/disable autonomous SOS Fail-Back.If value != 0, the value indicates the time period by which the SOS Fail-Back must be completed,a value 0 means disable
[no] rtry-after-thrsh	Parameter type: <Sip::NetwRedunRetryAfterThreshold> Format: - Retry-after threshold. - unit: milliseconds - range: [0...30000]	<i>optional parameter with default value: 0</i> The retry after Threshold.
[no] options-max-fwd	Parameter type: <Sip::NetwRedunOPTIONSMaxForward> Format:	<i>optional parameter with default value: 0</i>

Parameter	Type	Description
	- Max-Forward of OPTION, Value - 0: Must not forward this OPTIONS, Value - 1: Allow to forward once. - range: [0...1]	Max-forwarding is used to configure max-forward attribute for the forwarding property of the SIP OPTIONS message.
[no] dns-redun-mode	Parameter type: <Sip::NetwRedundnsredunmode> Format: (dns-redun-primary dns-redun-success) Possible values: - dns-redun-primary : dns redun mode is dns-redun-primary - dns-redun-success : dns redun mode is dns-redun-success	<i>optional parameter with default value: "dns-redun-primary"</i> DNS Redundancy Mode, dns-redun-primary means the DNS query will be sent to primary DNS server always firstly, dns-redun-success Means the DNS query will be sent to the DNS server where the previous request was successfully respond.
[no] fail-obs-timer	Parameter type: <Sip::NetwRedunFailureObservationTimer> Format: - The failure observation timer, range is [0,60..480]. - unit: second	<i>optional parameter with default value: 240</i> Configurable the failure observation timer for failure cases, The failure observation timer allowing to verify whether after the receipt of a recoverable error, a SIP register is still successfully replied. This object only applies to POTS. range is [0,60..480].
[no] fg-intv-503	Parameter type: <Sip::NetwRedun503FGMonitorIntv> Format: - The 503-restoration-mode FGHM interval, range is [0,2..3600]. - unit: second	<i>optional parameter with default value: 2</i> The configurable 503-restoration-mode FGHM interval that applies from the moment a 503 error response is received to the FGHM re-register request. This object has only relevance in case the overall restoration behaviour regarding a 503 response to a SIP register request is enabled in the SIP service Profile. This object only applies to POTS. range is [0,2..3600].
[no] time-thrsh-503	Parameter type: <Sip::NetwRedun503MaxTimeThreshold> Format: - The maximum elapse time during which a consecutive series of 503 responses to initial/re-register requests is allowed, range is [0,180..7200]. - unit: second	<i>optional parameter with default value: 0</i> The maximum elapse time during which a consecutive series of 503 responses to initial/re-register requests is allowed. The system will trigger a fail-over when EITHER the 503MaxTimeThreshold OR the 503MaxNbrThreshold is reached i.e. only one of the conditions must be fulfilled to trigger a fail-over. This object only applies to POTS. range is [0,180..7200].
[no] nbr-thrsh-503	Parameter type: <Sip::NetwRedun503MaxNbrThreshold> Format: - The maximum number of consecutive 503 responses to	<i>optional parameter with default value: 1</i> The maximum number of

Parameter	Type	Description
	initial/re-register requests that is allowed, range is [0,1,2..144].	consecutive 503 responses to initial/re-register requests that is allowed. The system will trigger a fail-over when EITHER the 503MaxTimeThreshold OR the 503MaxNbrThreshold is reached i.e. only one of the conditions must be fulfilled to trigger a fail-over. This object only applies to POTS. range is [0,1,2..144]. A value 1 means that the 503 Max Number Threshold equals [the number of configured and administratively enabled SIP terminations at the voice LT board * 2].
[no] auto-srv-fo-timer	Parameter type: <Sip::netwRedunAutoSIPServerFOTimer> Format: - The configured elapse time by which a graceful autonomous SIP Server Fail-Over/SOS Fail-Over must be completed for all involved SIP terminations. When set to the default value '86400': The netwRedunAutoSIPServerFOTimer is considered as 'disabled'. For those SIP terminations that are involved in an ongoing call, the fail-over is postponed till the ongoing call has terminated. (backward compatible behaviour.) When set to the value '0': The fail-over (for POTS as well as ISDN PRI and CAS R2 SIP terminations) is immediately triggered. Calls that are ongoing at the moment the fail-over is triggered are immediately dropped. When set to a value [1..86399]: For those POTS SIP terminations that are involved in an ongoing call at the moment the Fail-Over is triggered, the Fail-Over will be postponed until either the call is released (while the FO timer is still running) or the FO timer has expired or session-refresh failure or SIP in-dialog communication failure. Ongoing calls are immediately dropped upon the expiry of the FO timer. For ISDN PRA and CAS R2 terminations, the Fail-Over is immediately triggered, however ongoing calls are kept until either the call is released (while the FO timer is still running) or the FO timer has expired or session-refresh failure or SIP in-dialog communication failure. Ongoing calls are immediately dropped upon the expiry of the FO timer. New calls are established via E1 interface/B-channels that already made a fail-over. - unit: second - range: [0...86400]	<i>optional parameter with default value: 86400</i> The configured elapse time by which a graceful autonomous SIP Server Fail-Over/SOS Fail-Over must be completed for all involved SIP terminations. When set to the default value '86400': The netwRedunAutoSIPServerFOTimer is considered as 'disabled'. For those SIP terminations that are involved in an ongoing call, the fail-over is postponed till the ongoing call has terminated. (backward compatible behaviour.) When set to the value '0': The fail-over (for POTS as well as ISDN PRI and CAS R2 SIP terminations) is immediately triggered. Calls that are ongoing at the moment the fail-over is triggered are immediately dropped. When set to a value [1..86399]: For those POTS SIP terminations that are involved in an ongoing call at the moment the Fail-Over is triggered, the Fail-Over will be postponed until either the call is released (while the FO timer is still running) or the FO timer has expired or session-refresh failure or SIP in-dialog communication failure. Ongoing calls are immediately dropped upon the expiry of the FO timer. For ISDN PRA and CAS R2 terminations, the Fail-Over is immediately triggered, however ongoing calls are kept until either the call is

40 Voice Configuration Commands

Parameter	Type	Description
		released (while the FO timer is still running) or the FO timer has expired or session-refresh failure or SIP in-dialog communication failure. Ongoing calls are immediately dropped upon the expiry of the FO timer. New calls are established via E1 interface/B-channels that already made a fail-over.

40.15 Voice Sip System Session Timer Configuration Commands

Command Description

this command allows the operator to manage the voice sip session timer profile. The timer is used to consult with remote, and at last, if session timer was enabled, the refresh timer will be started by IPTK. The SIP Session Timer feature adds the capability to periodically refresh SIP sessions by sending repeated INVITE requests. The repeated INVITE requests, or re-INVITES, are sent during an active call leg to allow user agents (UA) or SIP proxies to determine the status of a SIP session. Without this keep alive mechanism, proxies that remember incoming and outgoing requests (stateful proxies) may continue to retain call state needlessly. If a UA fails to send a BYE message at the end of a session or if the BYE message is lost because of network problems, a stateful proxy does not know that the session has ended. The re-INVITES ensure that active sessions stay active and completed sessions are terminated.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip system session-timer [ [ no ] enable ] [ no status | status <Sip::SessionTimerAdminState> ] [
no min-se-time | min-se-time <Sip::SessionTimerMinSE> ] [ no se-time | se-time
<Sip::SessionTimerSessionExpire> ] [ no admin-status | admin-status <Sip::SysObjectsAdminStatus> ]
```

Command Parameters

Table 40.15-2 "Voice Sip System Session Timer Configuration Commands" Command Parameters

Parameter	Type	Description
[no] enable	Parameter type: boolean	<i>obsolete parameter replaced by parameter "status"</i> Prefix activated of session timer is enable
[no] status	Parameter type: <Sip::SessionTimerAdminState> Format: (enable disable enable-uas) Possible values: - enable : Prefix activated of session timer is enable - disable : Prefix activated of session timer is disable - enable-uas : Prefix activated of session timer is enableAsUas	<i>optional parameter with default value: "disable"</i> To configure the SIP Session Timer feature capability. If it's disable, shall not request session expiration in initial INVITE requests and 200 OK responses If it's enable, shall request session expiration in initial INVITE requests and 200 OK responses, and in both cases, if an incoming initial INVITE request contains a

Parameter	Type	Description
		session expiration header, but does not include the refresher value, then shall use uac for the refresher parameter. If it's enable-uas, shall request session expiration in initial INVITE requests and 200 OK responses, and in both cases, if an incoming initial INVITE request contains a session header, but does not include the refresher value, then shall use uas for the refresher parameter.
[no] min-se-time	Parameter type: <Sip::SessionTimerMinSE> Format: - value of min-se when use session time - unit: second - range: [90...65535]	<i>optional parameter with default value: "90"</i> Minimum Session Expires time. The lower bound for the session refresh interval. Because of the processing load of INVITE requests, the SIP proxy, User Agent Client and User Agent Server can have a configured minimum refresh timer value that they can accept. It is conveyed in the Min-SE header in the initial INVITE request. When making a call, the presence of the Min-SE header informs the UAS and any proxy of the minimum value that the UAC accepts for the session timer duration, in units of delta-seconds.
[no] se-time	Parameter type: <Sip::SessionTimerSessionExpire> Format: - value of session-expires when use sessiontime - unit: second - range: [90...65535]	<i>optional parameter with default value: "1800"</i> Session Expires Time. The upper bound for the session refresh interval. It is conveyed in the Session-Expires header in the initial INVITE request. If a session refresh request is not received before the interval passes, the session is considered terminated.
[no] admin-status	Parameter type: <Sip::SysObjectsAdminStatus> Format: (up down) Possible values: - up : unlock the sipSysObjects - down : lock the sipSysObjects	<i>optional parameter with default value: "down"</i> The administrative status of this sipSysObjects

40.16 Voice Sip DNS Server Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip DNS Server profile.

IPv6 is actually not supported. All references to IPv6 must be ignored since mentioned for future usage only.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no dnsserver (name) ) | ( dnsserver (name) [ no admin-status | admin-status
<Sip::sipDNSServerAdminStatus> ] address <Sip::sipDNSServerAddr> [ no priority | priority
<Sip::sipDNSServerPriority> ] [ no site | site <Sip::sipDNSServerSite> ] admin-domain-name
<Sip::AdminDomName> [ no port | port <Sip::sipDNSServerPort> ] )
```

Command Parameters

Table 40.16-1 "Voice Sip DNS Server Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identifies this voice dns server - length: 1<=x<=32	uniquely identify of this sip DNS server

Table 40.16-2 "Voice Sip DNS Server Configuration Commands" Command Parameters

Parameter	Type	Description
[no] admin-status	Parameter type: <Sip::sipDNSServerAdminStatus> Format: (up down) Possible values: - up : unlock the dns server - down : lock the dns server	<i>optional parameter with default value: "down"</i> administrative status of this DNS server
address	Parameter type: <Sip::sipDNSServerAddr> Format: (ipv4 : <Ip::V4Address> ipv6 : <Ip::V6Address>) Possible values: - ipv4 : the address type of the server is IPv4 - ipv6 : the address type of the server is IPv6 Field type <Ip::V4Address>	<i>mandatory parameter</i> The address(IPv4 or IPv6) of this DNS server

40 Voice Configuration Commands

Parameter	Type	Description
	- IPv4-address Field type <Ip::V6Address> - IPv6-address	
[no] priority	Parameter type: <Sip::sipDNSServerPriority> Format: - the SIP dns server priority, lower value with higher priority - range: [0...65535]	<i>optional parameter with default value: 100</i> The priority of sip DNS server, lower value with higher priority
[no] site	Parameter type: <Sip::sipDNSServerSite> Format: (primary-site geo-backup-site) Possible values: - primary-site : the server belongs to the GEO primary site - geo-backup-site : the server belongs to the GEO secondary site	<i>optional parameter with default value: "primary-site"</i> The site which the sip DNS server is belonged to
admin-domain-name	Parameter type: <Sip::AdminDomName> Format: - uniquely name of this element - length: x<=32	<i>mandatory parameter</i> The administrative domain name of the DNS server. The administrative domain might be the VoIP Access Seeker Network or the Connectivity Serving Network.
[no] port	Parameter type: <Sip::sipDNSServerPort> Format: - - range: [1...65534]	<i>optional parameter with default value: 53</i> The remote port of sip DNS server, a value 0 means use default value 53

40.17 Voice Sip DHCP Authentication Params Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip DHCP authentication params.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no dhcp-authent-para (ua-name) secret-id <Sip::DHCPAuthentParaSecretId> ) | (
dhcp-authent-para (ua-name) secret-id <Sip::DHCPAuthentParaSecretId> [ no key | key
<Sip::DHCPAuthentParaKey> ] [ no action-type | action-type <Sip::DHCPAuthentParaActionType> ] )
```

Command Parameters

Table 40.17-1 "Voice Sip DHCP Authentication Params Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(ua-name)	Format: - uniquely identifies the User Agent - length: 1<=x<=32	uniquely identify of the user agent
secret-id	Parameter type: <Sip::DHCPAuthentParaSecretId> Format: - Unique identifier of the DHCP message authentication parameter record - range: [1...4294967295]	A unique identifier of the DHCP message authentication parameter record

Table 40.17-2 "Voice Sip DHCP Authentication Params Configuration Commands" Command Parameters

Parameter	Type	Description
[no] key	Parameter type: <Sip::DHCPAuthentParaKey> Format: - DHCP secret key used for DHCP message authentication. Every letter in key must be in '0'~'9', 'a'~'f', 'A'~'F' and the string length must be even. - length: x<=32	<i>optional parameter with default value: ""</i> DHCP secret key used for DHCP message authentication. Every letter in key must be in '0'~'9', 'a'~'f', 'A'~'F' and the string length must be even.
[no] action-type	Parameter type: <Sip::DHCPAuthentParaActionType> Format: (normal-req-key force-discover	<i>optional parameter with default value: "normal-send-req"</i> the action type for the configured DHCP secret keys

40 Voice Configuration Commands

Parameter	Type	Description
	force-request normal-force-dis normal-force-req) Possible values: - normal-req-key : used when send DHCP request, not used for response - force-discover : used when force renew received with this key, will send DHCP discover - force-request : used when force renew received with this key, will send DHCP renew request - normal-force-dis : used when send DHCP request, not used for response, and when force renew received with this key, will send DHCP discover - normal-force-req : used when send DHCP request, not used for response, and when force renew received with this key, will send DHCP renew request	

40.18 Voice Sip Restoration Failover/Failback Type/Mode Configuration Commands

Command Description

This command allows the operator to change the Failover/Failback type or mode.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip redundancy-cmd (domain-name) [ no start-time | start-time <Sip::FailXStartTime> ] [ no
end-time | end-time <Sip::FailXEndTime> ] [ fail-x-type <Sip::FailXType> ]
```

Command Parameters

Table 40.18-1 "Voice Sip Restoration Failover/Failback Type/Mode Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(domain-name)	Format: - uniquely identifies the transport provider name - length: x<=32	uniquely identify of admin domain name

Table 40.18-2 "Voice Sip Restoration Failover/Failback Type/Mode Configuration Commands" Command Parameters

Parameter	Type	Description
[no] start-time	Parameter type: <Sip::FailXStartTime> Format: - The absolute time when the manually triggered GEO Fail-Over / Fail-Back needs to start. The unit is in seconds. - unit: second - range: [0...4294967295]	<i>optional parameter with default value: 0</i> The absolute time when the manually triggered GEO Fail-Over / Fail-Back needs to start. The unit is in seconds.
[no] end-time	Parameter type: <Sip::FailXEndTime> Format: - The absolute time when the manually triggered graceful GEO Fail-Over / Fail-Back needs to be completed. The unit is in seconds. - unit: second - range: [0...4294967295]	<i>optional parameter with default value: 0</i> The absolute time when the manually triggered graceful GEO Fail-Over / Fail-Back needs to be completed. The unit is in seconds.
fail-x-type	Parameter type: <Sip::FailXType> Format: (geo-fail-over geo-fail-back)	<i>optional parameter</i> Fail X type, failover or failback.

40 Voice Configuration Commands

Parameter	Type	Description
	Possible values: - geo-fail-over : geo fail over - geo-fail-back : geo fail back	

40.19 Voice Statistics Configure Command

Command Description

Set statistics configuration.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip statistics [ no stats-5min-config | stats-5min-config <Sip::FiveMStats> ] [ no cdr-config |
cdr-config <Sip::CallRecord> ]
```

Command Parameters

Table 40.19-2 "Voice Statistics Configure Command" Command Parameters

Parameter	Type	Description
[no] stats-5min-config	Parameter type: <Sip::FiveMStats> Format: (disable enable) Possible values: - disable : disable 5m stats function - enable : enable 5m stats function	<i>optional parameter with default value: "disable"</i> enable/disable the 5-Min Statistics
[no] cdr-config	Parameter type: <Sip::CallRecord> Format: (disable enable) Possible values: - disable : disable call record function - enable : enable call record function	<i>optional parameter with default value: "disable"</i> enable/disable the call record

40.20 Voice Statistics Mode Configuration

Command

Command Description

Change voice statistics Mode.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip statistics stats-config [ [ no ] per-line ] [ [ no ] per-board ] [ [ no ] per-system ] [ [ no ] per-call ] [ [ no ] out-any-rsp ] [ [ no ] out-180-rsp ] [ [ no ] out-200-rsp ] [ [ no ] in-any-rsp ] [ [ no ] in-180-rsp ] [ [ no ] in-200-rsp ]
```

Command Parameters

Table 40.20-2 "Voice Statistics Mode Configuration Command" Command Parameters

Parameter	Type	Description
[no] per-line	Parameter type: boolean	<i>optional parameter</i> enable per line statistics function
[no] per-board	Parameter type: boolean	<i>optional parameter</i> enable per board statistics function
[no] per-system	Parameter type: boolean	<i>optional parameter</i> enable per system statistics function
[no] per-call	Parameter type: boolean	<i>optional parameter</i> enable per call statistics function
[no] out-any-rsp	Parameter type: boolean	<i>optional parameter</i> enable Arbitrary Response Mode for out-going call answered
[no] out-180-rsp	Parameter type: boolean	<i>optional parameter</i> enable 180 Response Mode for out-going call answered
[no] out-200-rsp	Parameter type: boolean	<i>optional parameter</i> enable 200 Response Mode for out-going call answered
[no] in-any-rsp	Parameter type: boolean	<i>optional parameter</i> enable Arbitrary Response Mode for in-coming call answered
[no] in-180-rsp	Parameter type: boolean	<i>optional parameter</i> enable 180 Response Mode for

Parameter	Type	Description
		in-coming call answered
[no] in-200-rsp	Parameter type: boolean	<i>optional parameter</i> enable 200 Response Mode for in-coming call answered

40.21 Voice Sip Isdn/Cas Termination Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Isdn/Cas termination profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no isdn-cas-term (if-index) ) | ( isdn-cas-term (if-index) [ no directory-number |
directory-number <Sip::TermDnumber> ] [ no user-name | user-name <Sip::TermUserName> ] [ no display-name |
display-name <Sip::TermUserName> ] [ no uri | uri <Sip::TermUri> ] [ no md5-realm | md5-realm
<Sip::MD5Realm> ] [ no md5-password | md5-password <Security::Password4> ] [ no aka-secret-key |
aka-secret-key <Security::Password8> ] [ no admin-status | admin-status <Sip::IsdnTermAdminStatus> ] [ no
line-id | line-id <Sip::ISDNTermLineId> ] [ no testaccessstate | testaccessstate <Sip::TestAccessState> ] [ no
busyoverwrite | busyoverwrite <Sip::TestAccessBusyOverWrite> ] [ no accessontimeout | accessontimeout
<Sip::TestAccessonTimeout> ] [ no provider-name | provider-name <Sip::TermUserProviderName> ] [ no
signalling-type | signalling-type <Sip::TermSignallingType> ] [ no cpn-screen | cpn-screen
<Sip::TermCallingScreen> ] [ no default-cpc | default-cpc <Sip::TermDefaultCPC> ] [ no restrict-acc | restrict-acc
<Sip::TermRestrictACC> ] [ no hunting-way | hunting-way <Sip::TermHuntingWay> ] [ no sip-rule-set |
sip-rule-set <Sip::IsdnCasManipulationRuleSet> ] [ no cas-exch-type | cas-exch-type <Sip::TermExchangeType> ]
[ no q-value | q-value <Sip::IsdnCasTerminationQValue> ] [ no reg-mode | reg-mode
<Sip::IsdnCasTerminationRegMode> ] [ no e1-hunting-way | e1-hunting-way
<Sip::IsdnCasTerminationE1HuntingWay> ] [ no e1-cluster-itf | e1-cluster-itf
<Sip::IsdnCasTerminationE1ClusterItf> ] [ no e1-cluster-name | e1-cluster-name
<Sip::IsdnCasTerminationE1ClusterName> ] [ no isdn-nsm-profile | isdn-nsm-profile <Sip::NsmProfile> ] [ no
cas-nsm-profile | cas-nsm-profile <Sip::CasNsmProfPointer> ] )
```

Command Parameters

Table 40.21-1 "Voice Sip Isdn/Cas Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	The unique internal identifier of the termination port

Resource Identifier	Type	Description
	Field type <Eqpt::PortId> - the port number	

Table 40.21-2 "Voice Sip Isdn/Cas Termination Configuration Commands" Command Parameters

Parameter	Type	Description
[no] directory-number	Parameter type: <Sip::TermDnumber> Format: - identify the DN of the subscriber line - length: x<=32	<i>optional parameter with default value: ""</i> Identify the directory (telephone) number of the subscriber line
[no] user-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> Identify the user name for this termination port
[no] display-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> Display name for this termination port
[no] uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> SIP URI by which user agent identifies subscriber line
[no] md5-realm	Parameter type: <Sip::MD5Realm> Format: - the realm identifier (Due to legacy reasons, the MD5 character string was included in the object name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication realm identifier.) - length: x<=64	<i>optional parameter with default value: ""</i> Realm identifier corresponding to voice service gateway domain
[no] md5-password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.)	<i>optional parameter with default value: "plain : "</i> The password associated with the user

Parameter	Type	Description
[no] aka-secret-key	- length: x<=64 Parameter type: <Security::Password8> Format: (prompt plain : <Security::PlainPassword8>) Possible values: - prompt : prompts the operator for AKA shared secret key - plain : the AKA shared secret key in plain text, each character should be 0-f, and the length can only be 0 or 32 Field type <Security::PlainPassword8> - the AKA shared secret key, each character should be 0-f, and the length can only be 0 or 32 - length: x<=32	<i>optional parameter with default value: "plain : "</i> The AKA shared secret key
[no] admin-status	Parameter type: <Sip::IsdnTermAdminStatus> Format: (up down) Possible values: - up : unlock the sip isdn/cas termination - down : lock the sip isdn/cas termination	<i>optional parameter with default value: "down"</i> Identify the status of this port administration
[no] line-id	Parameter type: <Sip::ISDNTermLineId> Format: - Prior to ISR6.0.01: The Line ID of this PRA ISDN or R2 CAS SIP termination. It is contained in the Pani header. The line id configuration is not bounded to any format. It is the responsibility of the customer to define the desired line ID format. There is no restriction on the character set being used to configure the line ID/line ID format. From ISR6.0.01 onwards: The object allows the configuration, together or separately, for the pani header line id and/or the E1 interface CRC4 framing mode. In case the E1 interface CRC4 framing mode is not configured, the setting in the CDE profile applies. Otherwise (the E1 interface CRC4 framing mode is configured via this object), the input must be given via the following syntax: crc4:(enabled/disabled), 'crc4' is a fixed case-sensitive key-word immediately followed by a colon which in turn is immediately followed by the case-sensitive key-words 'enabled' or 'disabled'. 'enabled' means: Transmit and receive framing mode is set to CRC-multi frame. 'disabled' means: Transmit and receive framing mode is set to double frame. In case, it is required to configure both the CRC4 framing mode and the pani header line id, the CRC4 configuration input must be given prior to the pani header configuration input. In such case the syntax of the CRC4 configuration input is as described above, immediately followed by a semicolon and the semicolon immediately followed by the pani header line id in the same free format as described above: crc4:[enabled/disabled];[pani header line id]. - length: x<=63	<i>optional parameter with default value: ""</i> Identify the line id for this termination port
[no] testaccessstate	Parameter type: <Sip::TestAccessState> Format: (on off) Possible values: - on : turn on TestAccessState - off : turn off TestAccessState	<i>optional parameter with default value: "off"</i> Test access status

Parameter	Type	Description
[no] busyoverwrite	Parameter type: <Sip::TestAccessBusyOverWrite> Format: (true false) Possible values: - true : enable TestAccessBusyOverWrite parameter - false : disable TestAccessBusyOverWrite parameter	<i>optional parameter with default value: "false"</i> Test access busyoverwrite
[no] accessontimeout	Parameter type: <Sip::TestAccessonTimeout> Format: - value of test access on expires. - unit: second - range: [0...900]	<i>optional parameter with default value: "900"</i> Time to go until test access timeout. In case test access state is off, the value will be 0. In case test access state is on, this parameter is optional with default initial value 900. The value will start counting down, until value 0 and test access state will be off again
[no] provider-name	Parameter type: <Sip::TermUserProviderName> Format: - identify the user VSG name for this port - length: x<=32	<i>optional parameter with default value: "vsp1"</i> Identify the user VSG name for this termination port
[no] signalling-type	Parameter type: <Sip::TermSignallingType> Format: (isdn-pra cas-r2) Possible values: - isdn-pra : set signalling type to ISDN PRA - cas-r2 : set signalling type to CAS R2	<i>optional parameter with default value: "isdn-pra"</i> Identify the signalling type for this termination port. It can not be modified after term created.
[no] cpn-screen	Parameter type: <Sip::TermCallingScreen> Format: (disable enable) Possible values: - disable : disable calling party number screening - enable : enable calling party number screening	<i>optional parameter with default value: "enable"</i> Identify whether to support the screening of calling party number(CPN) for outgoing call of CAS R2 termination port. When enabled, the ISAMV shall request the calling party number from PBX and screen the CPN. When disabled, the ISAMV shall not request the calling party number and the default number assigned for the given termination shall be sent
[no] default-cpc	Parameter type: <Sip::TermDefaultCPC> Format: (passthrough ordinary specchg test payphone operator data payphoneiu atme) Possible values: - passthrough : bypass the cpc from PBX - ordinary : replace the cpc from PBX by ordinary	<i>optional parameter with default value: "passthrough"</i> Identify the default calling party's category for outgoing call of CAS R2 termination port. Value of passthrough means to bypass the cpc from PBX, other value means to replace the cpc from PBX by this value

Parameter	Type	Description
	- specchg : replace the cpc from PBX by specchg - test : replace the cpc from PBX by test - payphone : replace the cpc from PBX by payphone - operator : replace the cpc from PBX by operator - data : replace the cpc from PBX by data. data is not supported right now. - payphoneiu : replace the cpc from PBX by payphoneIU - atme : replace the cpc from PBX by atme	
[no] restrict-acc	Parameter type: <Sip::TermRestrictACC> Format: (disable enable) Possible values: - disable : no restriction for terminated ACC - enable : restriction for terminated ACC	<i>optional parameter with default value: "disable"</i> Identify whether the PBX is restricted for terminated automatic collect call for incoming call of CAS R2 termination port
[no] hunting-way	Parameter type: <Sip::TermHuntingWay> Format: (cyclic-forward sequential-forward sequential-reverse random-forward cyclic-reverse random-reverse) Possible values: - cyclic-forward : Initially the lowest B-channel is selected i.e. B-channel 1; afterwards, always again the next B-channel following the one used last is selected. - sequential-forward : The selection of the B-channel is based on an increasing port number, starting with the B-channel with the lowest port number of the E1/T1 interface and the next B-channel in the ordered series of B-channels is selected if the B-channel last used is busy. Again select the B-channel with the lowest port number. - sequential-reverse : The selection of the B-channel is based on an decreasing port number, starting with the B-channel with the highest port number of the E1/T1 interface and the next B-channel in the ordered series of B-channels is selected if the B-channel last used is busy. Again select the B-channel with the highest port number. - random-forward : allocation by random order. if the randomly selected B-channel is busy, the selection of a new candidate B-channel starts at the next in the ordered series of B-channels following the one been randomly selected, and follows increasing order. - cyclic-reverse : Initially the highest B-channel is selected i.e. B-channel 30; afterwards, always again the next B-channel following the one used last is selected. - random-reverse : allocation by random order. if the randomly selected B-channel is busy, the selection of a new candidate B-channel starts at the next in the ordered series of B-channels following the one been randomly selected, and follows decreasing order.	<i>optional parameter with default value: "cyclic-forward"</i> Identify the channel allocation method. For ISDN PRA, used for both outgoing and incoming calls. For CAS R2, only used for incoming call
[no] sip-rule-set	Parameter type: <Sip::IsdnCasManipulationRuleSet> Format: - the ISDN-PRA/CAS-R2 manipulation rule set, at most 4 rule ids can be configured for ISDN-PRA term and 3 rule ids for CAS-R2 term	<i>optional parameter with default value: ""</i> Identify the rules this termination can apply

Parameter	Type	Description
	- length: x<=4	
[no] cas-exch-type	Parameter type: <Sip::TermExchangeType> Format: (normal compelled-a3-and-b1 pulsed-a3-and-b1) Possible values: - normal : the exchange type is normal - compelled-a3-and-b1 : the exchange can only handle B-1 and compelled A3 when digit completed - pulsed-a3-and-b1 : the exchange can only handle B-1 and pulsed A3 when digit completed	<i>optional parameter with default value: "normal"</i> Only used for cas termination to identify the PBX type. It is only used for special legacy PBX in special nations and should be set to normal for normal PBX, otherwise it will break
[no] q-value	Parameter type: <Sip::IsdnCasTerminationQValue> Format: - The q value is a number specified as parameter in the Contact header field, denotes an order of preference - range: [0...100]	<i>optional parameter with default value: "100"</i> The q value is a number specified as parameter in the Contact header field, denotes an order of preference
[no] reg-mode	Parameter type: <Sip::IsdnCasTerminationRegMode> Format: (explicit implicit no-reg) Possible values: - explicit : The Explicit register (ER) mode is only relevant in case a list of individual DDI-EXTs has been manually configured and associated with this SIP termination - implicit : The Implicit register (IR) mode, the list of implicit registered DDI-EXTs is returned by the register server in the 200 OK response to the SIP register request - no-reg : The no-registration mode is only relevant in case the sip UA does not have to send any sip REGISTER / re-REGISTER request to the sipserver nor for the GDN, nor for the optional manually configured DDI-EXT.	<i>optional parameter with default value: "implicit"</i> The sipIsdnCasTerminationRegMode object allows to configure whether the implicit or explicit register mode applies
[no] e1-hunting-way	Parameter type: <Sip::IsdnCasTerminationE1HuntingWay> Format: (cyclic-forward sequential-forward-fl sequential-reverse-fl random-forward cyclic-reverse random-reverse sequential-forward-ud sequential-reverse-ud) Possible values: - cyclic-forward : The selection of the E1 interfaces is a cyclic process in which the different E1 interface are alternately selected. At the first selection attempt the first E1 in the configuration input will be selected and If no free channel on this interface the selection proceeds with the succeeding interface (i.e. in forward order) in the configuration order. For any subsequent selection attempt, the selection process will start at the interface which is succeeding the one in the configuration order that was selected last for the previous attempt (i.e. starting point proceeds in forward order). - sequential-forward-fl : Each time always start from the first	<i>optional parameter with default value: "cyclic-forward"</i> The selection of the E1 interface ways upon the receipt of an incoming call attempt (received from the IMS core side)

Parameter	Type	Description
	E1 in the configuration input, will select the next E1 in the order configured only when all B channels of current E1 are busy. - sequential-reverse-fl : Each time always start from the last E1 in the configuration input, will select the preceding E1 in the order configured only when all B channels of current E1 are busy. - random-forward : The selection of the E1 interfaces happens randomly. If selected E1 interface has no idle channel, then take the next E1 interface(forward) - cyclic-reverse : The selection of the E1 interfaces is a cyclic process in which the different E1 interface are alternately selected. At the first selection attempt the last E1 in the configuration input will be selected and If no free channel on this interface the selection proceeds with the preceding interface (i.e in reverse order) in the configuration order. For any subsequent selection attempt, the selection process will start at the interface which is preceding the one in the configuration order that was selected last for the previous attempt (i.e starting point proceeds in reverse order) - random-reverse : The selection of the E1 interfaces happens randomly. If selected E1 interface has no idle channel, then take the next E1 interface(reverse) - sequential-forward-ud : Aiming at having a equal load (more or less equal number of busy B-channels for each of the E1 interfaces in the E1 cluster. MIB readiness only. Unsupport now - sequential-reverse-ud : Aiming at having a equal load (more or less equal number of busy B-channels for each of the E1 interfaces in the E1 cluster. MIB readiness only. Unsupport now	
[no] e1-cluster-itf	Parameter type: <Sip::IsdnCasTerminationE1ClusterItf> Format: - The ifindex of interfaces. At maximum 8 ifIndexes can be configured. The ifindex used as index of the ISDN PRI/CAS R2 SIP termination must be configured in IsdnCasTerminationE1ClusterItf object. The order of the E1 interface ifindices in the configuration input for the sipIsdnCasTerminationE1ClusterItf object defines the priority of the E1 interface selection.	<i>optional parameter with default value: ""</i> A SIP termination is created on top of an E1 cluster that embraces multiple E1 interfaces
[no] e1-cluster-name	Parameter type: <Sip::IsdnCasTerminationE1ClusterName> Format: - Name of the E1 cluster - length: x<=32	<i>optional parameter with default value: ""</i> Name of the E1 cluster
[no] isdn-nsm-profile	Parameter type: <Sip::NsmProfile> Format: <pre>(none <Sip::NsmProfilePointer> name : <PrintableString>)</pre> Possible values: - none : no ISDN NSM profile assigned. - name : ISDN NSM profile name Field type <Sip::NsmProfilePointer> - the index of the ISDN NSM profile. - range: [1...32] Field type <PrintableString>	<i>optional parameter with default value: "none"</i> The nsm profile which should be associated with the ISDN PRA termination. For CAS R2 termination, it must be none.

Parameter	Type	Description
[no] cas-nsm-profile	- printable string Parameter type: <Sip::CasNsmProfPointer> Format: (none <Sip::CasNsmProfPointer> name : <PrintableString>) Possible values: - none : no CAS NSM profile assigned. - name : CAS NSM profile name Field type <Sip::CasNsmProfPointer> - the index of the CAS NSM profile. - range: [1...32] Field type <PrintableString> - printable string	<i>optional parameter with default value: "none"</i> The cas nsm profile which should be associated with the CAS R2 termination. For ISDN PRA termination, it must be none.

40.22 Voice Sip Isdn/Cas Termination Configuration Commands

Command Description

This command allows the operator to manage the Isdn Pri /Cas SIP termination created on top of an E1/T1 trunk (sub-)group.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no pri-cas-tksg-term (if-index) tksg-id <Sip::TrunkSubGroupId> ) | ( pri-cas-tksg-term
(if-index) tksg-id <Sip::TrunkSubGroupId> [ no directory-number | directory-number <Sip::TermDnumber> ] [ no
user-name | user-name <Sip::TermUserName> ] [ no display-name | display-name <Sip::TermDisplayName> ] [ no
uri | uri <Sip::TermUri> ] [ no realm | realm <Sip::MD5Realm> ] [ no password | password <Security::Password4>
] [ no aka-secret-key | aka-secret-key <Security::Password8> ] [ no admin-status | admin-status
<Sip::IsdnTermAdminStatus> ] [ no line-id | line-id <Sip::PriTksgTermLineId> ] [ no provider-name |
provider-name <Sip::TermUserProviderName> ] [ no ds0-hunting-way | ds0-hunting-way
<Sip::TermHuntingWay> ] [ no itf-hunting-way | itf-hunting-way <Sip::IsdnCasTerminationItfHuntingWay> ] [ no
sip-rule-set | sip-rule-set <Sip::IsdnCasManipulationTksgRuleSet> ] [ no q-value | q-value
<Sip::IsdnCasTerminationQValue> ] [ no reg-mode | reg-mode <Sip::IsdnCasTerminationRegMode> ] [ no
extension | extension <Sip::SipPriCasTksgTermExtension> ] trunk-group-name
<Sip::SipPriCasTksgTermTrunkGroupName> [ no signalling-type | signalling-type
<Sip::TksgTermSignallingType> ] [ no cas-cpn-screen | cas-cpn-screen <Sip::TermCallingScreen> ] [ no
cas-default-cpc | cas-default-cpc <Sip::TermDefaultCPC> ] [ no cas-restrict-acc | cas-restrict-acc
<Sip::TermRestrictACC> ] [ no cas-exch-type | cas-exch-type <Sip::TermExchangeType> ] [ no isdn-nsm-profile |
isdn-nsm-profile <Sip::NsmProfile> ] [ no cas-nsm-profile | cas-nsm-profile <Sip::CasNsmProfPointer> ] [ no
uus-profile | uus-profile <Sip::UserToUserProfile> ] [ no cas-timer-profile | cas-timer-profile
<Sip::CasTimerProfPointer> ] )
```

Command Parameters

Table 40.22-1 "Voice Sip Isdn/Cas Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	The ifindex of one of E1/T1 interfaces of the trunk (sub-)group on top of which the ISDN PRI / CAS SIP termination is created

Resource Identifier	Type	Description
	- the LT slot number Field type <Eqpt::PortId> - the port number	
tksg-id	Parameter type: <Sip::TrunkSubGroupId> Format: - The index of E1/T1 interface trunk sub-group. - range: [0...256]	The E1/T1 Trunk sub-group ID.

Table 40.22-2 "Voice Sip Isdn/Cas Termination Configuration Commands" Command Parameters

Parameter	Type	Description
[no] directory-number	Parameter type: <Sip::TermDnumber> Format: - identify the DN of the subscriber line - length: x<=32	<i>optional parameter with default value: ""</i> The global directory number (GDN)
[no] user-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> The user name for this ISDN PRI / CAS SIP termination
[no] display-name	Parameter type: <Sip::TermDisplayName> Format: - identify the display name for this port - length: x<=64	<i>optional parameter with default value: ""</i> The display name for this ISDN PRI / CAS SIP termination
[no] uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> The sip uri by which the SIP user agent identifies the SIP termination
[no] realm	Parameter type: <Sip::MD5Realm> Format: - the realm identifier (Due to legacy reasons, the MD5 character string was included in the object name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication realm identifier.) - length: x<=64	<i>optional parameter with default value: ""</i> The Realm of the voice service gateway domain
[no] password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or	<i>optional parameter with default value: "plain : "</i> The password of the ISDN PRI / CAS SIP termination

Parameter	Type	Description
	equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) - length: x<=64	
[no] aka-secret-key	Parameter type: <Security::Password8> Format: (prompt plain : <Security::PlainPassword8>) Possible values: - prompt : prompts the operator for AKA shared secret key - plain : the AKA shared secret key in plain text, each character should be 0-f, and the length can only be 0 or 32 Field type <Security::PlainPassword8> - the AKA shared secret key, each character should be 0-f, and the length can only be 0 or 32 - length: x<=32	<i>optional parameter with default value: "plain : "</i> The AKA shared secret key of the ISDN PRI / CAS SIP termination
[no] admin-status	Parameter type: <Sip::IsdnTermAdminStatus> Format: (up down) Possible values: - up : unlock the sip isdn/cas termination - down : lock the sip isdn/cas termination	<i>optional parameter with default value: "down"</i> The administrative status of the ISDN PRI / CAS SIP termination.
[no] line-id	Parameter type: <Sip::PriTksgTermLineId> Format: - The line-id allows to configure the Fax Mode(fm) and/or the Voice Activity Detection(vad) and/or the processing procedure for the dtmf event tones(2833) and/or the Vbd-mode (vm) and/or the UDP port usage for T38 to voice switching (udp) and/or the Pani header line ID. Overall syntax: [fm:(value(1:3))];[vad:e vad:d];[2833:(value(1:4))];[vm:(value(1:4))];[udp:e udp:d];[(Pani header line-id value)] A semi-colon must be inserted between the configuration input strings. The configuration input must be given in lower case characters. No space allowed anywhere; no leading zero(es) allowed anywhere. In case the configuration input for one or multiple input strings must be changed, the configuration input for all other input strings must be repeated too i.e. the new configuration input for the line id parameter fully overwrites the previous configuration input. - Keyword : fm Values : range [1:3] 1 : g711vbd 2 : t.38-with-g711vbd-fallback-with-signaling 3 : t.38-with-g711vbd-fallback-without-signaling In case the keyword is not found in the configuration input of lind-id parameter, the system wide pre-provisioned value in the CDE profile file applies. - Keyword : vad Values : e d e : vad is enabled (sending comfort noise packets during silent periods) d : vad is disabled (do not send comfort noise packets during silent periods) In case the keyword is not found in the configuration input of the line-id parameter, the system wide pre-provisioned value in the CDE profile file applies. - Keyword : 2833 Values : range [1:4] 1 : the processing procedure is audio 2 : the processing	<i>optional parameter with default value: ""</i> The format of the line ID to be included in the PANI-HEADER.

Parameter	Type	Description
	procedure is rfc2833\n 3 : the processing procedure is both, audio and rfc2833\n 4 : audio has priority in the processing procedure\n In case the keyword is not found in the configuration input of the line-id parameter, the system wide configured value in the sipVspTable applies.\n - Keyword : vm\n Values : range [1:4]\n 1 : auto switch without negotiation\n 2 : renegotiation\n 3 : If V152 negotiation fails, autoswitch applies(not support now)\n 4 : If V152 negotiation fails, renegotiation applies(not support now)\n In case the keyword is not found in the configuration input of the line-id parameter, the system wide configured value in the sipVspTable applies.\n - Keyword : udp\n Values : e d\n e : the same UDP port is used for Voice and T38\n d : a different UDP port is used for Voice and T38\n In case the keyword is not found in the configuration input of the line-id parameter, the system wide configured value in the sipVspTable applies.\n - Pani header line id :\n Must always appear at the end of the configuration string.\n The configuration input is not bounded to any format i.e. It is the responsibility of the customer to define the desired line ID format; There is no restriction on the character set being used. - length: x<=63	
[no] provider-name	Parameter type: <Sip::TermUserProviderName> Format: - identify the user VSG name for this port - length: x<=32	<i>optional parameter with default value: "vsp1"</i> The name of the VSG the ISDN PRI /CAS SIP termination is associated with.
[no] ds0-hunting-way	Parameter type: <Sip::TermHuntingWay> Format: (cyclic-forward sequential-forward sequential-reverse random-forward cyclic-reverse random-reverse) Possible values: - cyclic-forward : Initially the lowest B-channel is selected i.e. B-channel 1; afterwards, always again the next B-channel following the one used last is selected. - sequential-forward : The selection of the B-channel is based on an increasing port number, starting with the B-channel with the lowest port number of the E1/T1 interface and the next B-channel in the ordered series of B-channel is selected if the B-channel last used is busy. Again select the B-channel with the lowest port number. - sequential-reverse : The selection of the B-channel is based on an decreasing port number, starting with the B-channel with the highest port number of the E1/T1 interface and the next B-channel in the ordered series of B-channels is selected if the B-channel last used is busy. Again select the B-channel with the highest port number. - random-forward : allocation by random order. if the randomly selected B-channel is busy, the selection of a new candidate B-channel starts at the next in the ordered series of B-channels following the one been randomly selected, and follows increasing order.	<i>optional parameter with default value: "cyclic-forward"</i> The channel selection method. For ISDN PRA, it applies both outgoing and incoming calls. For CAS, it applies to incoming calls only.

Parameter	Type	Description
	- cyclic-reverse : Initially the highest B-channel is selected i.e. B-channel 30; afterwards, always again the next B-channel following the one used last is selected. - random-reverse : allocation by random order. if the randomly selected B-channel is busy, the selection of a new candidate B-channel starts at the next in the ordered series of B-channels following the one been randomly selected, and follows decreasing order.	
[no] itf-hunting-way	Parameter type: <Sip::IsdnCasTerminationItfHuntingWay> Format: (cyclic-forward sequential-forward-fl sequential-reverse-fl random-forward cyclic-reverse random-reverse sequential-forward-ud sequential-reverse-ud) Possible values: - cyclic-forward : The selection of the E1/T1 interfaces is a cyclic process in which the different E1/T1 interface are alternately selected. At the first selection attempt the first E1/T1 in the configuration input will be selected and If no free channel on this interface the selection proceeds with the succeeding interface (i.e. in forward order) in the configuration order. For any subsequent selection attempt, the selection process will start at the interface which is succeeding the one in the configuration order that was selected last for the previous attempt (i.e. starting point proceeds in forward order) - sequential-forward-fl : Each time always start from the first E1/T1 in the configuration input, will select the next E1/T1 in the order configured only when all B channels of current E1/T1 are busy. - sequential-reverse-fl : Each time always start from the last E1/T1 in the configuration input, will select the preceding E1/T1 in the order configured only when all B channels of current E1/T1 are busy. - random-forward : The selection of the E1/T1 interfaces happens randomly. If selected E1/T1 interface has no idle channel, then take the next E1/T1 interface(forward) - cyclic-reverse : The selection of the E1/T1 interfaces is a cyclic process in which the different E1/T1 interface are alternately selected. At the first selection attempt the last E1/T1 in the configuration input will be selected and If no free channel on this interface the selection proceeds with the preceding interface (i.e in reverse order) in the configuration order. For any subsequent selection attempt, the selection process will start at the interface which is preceding the one in the configuration order that was selected last for the previous attempt (i.e starting point proceeds in reverse order) - random-reverse : The selection of the E1/T1 interfaces happens randomly. If selected E1/T1 interface has no idle channel, then take the next E1/T1 interface(reverse) - sequential-forward-ud : Aiming at having a equal load (more or less equal number of busy B-channels for each of	<i>optional parameter with default value: "cyclic-forward"</i> The E1/T1 interface selection method (for incoming call attempt)

Parameter	Type	Description
	the E1/T1 interfaces in the E1/T1 cluster. MIB readiness only. Unsupport now - sequential-reverse-ud : Aiming at having a equal load (more or less equal number of busy B-channels for each of the E1/T1 interfaces in the E1/T1 cluster. MIB readiness only. Unsupport now	
[no] sip-rule-set	Parameter type: <Sip::IsdnCasManipulationTksgRuleSet> Format: - the ISDN-PRA/CAS-R2 manipulation rule set, at most 32 rule ids can be configured for ISDN-PRA term and CAS-R2 term - length: x<=32	<i>optional parameter with default value: ""</i> The SIP termination specific rule set that applies to this ISDN PRI / CAS SIP termination.
[no] q-value	Parameter type: <Sip::IsdnCasTerminationQValue> Format: - The q value is a number specified as parameter in the Contact header field, denotes an order of preference - range: [0...100]	<i>optional parameter with default value: "100"</i> The q value for in case SIP Forking applies
[no] reg-mode	Parameter type: <Sip::IsdnCasTerminationRegMode> Format: (explicit implicit no-reg) Possible values: - explicit : The Explicit register (ER) mode is only relevant in case a list of individual DDI-EXTs has been manually configured and associated with this SIP termination - implicit : The Implicit register (IR) mode, the list of implicit registered DDI-EXTs is returned by the register server in the 200 OK response to the SIP register request - no-reg : The no-registration mode is only relevant in case the sip UA does not have to send any sip REGISTER / re-REGISTER request to the sipserver nor for the GDN, nor for the optional manually configured DDI-EXT.	<i>optional parameter with default value: "implicit"</i> The register mode : implicit registration, explicit registration, no-registration
[no] extension	Parameter type: <Sip::SipPriCasTksgTermExtension> Format: - The ifindex of interfaces. At maximum 32 ifIndexes can be configured. The ifindex used as index of the ISDN PRI/CAS SIP termination must be configured in SipPriCasTksgExtension object. The order of the E1/T1 interface ifindices in the configuration input for the SipPriCasTksgExtension object defines the priority of the E1/T1 interface selection.	<i>optional parameter with default value: ""</i> The list of E1/T1 interfaces that composes the Trunk (sub-)group.
trunk-group-name	Parameter type: <Sip::SipPriCasTksgTermTrunkGroupName> Format: - Name of the E1/T1 Trunk Group - length: x<=32	<i>mandatory parameter</i> The name of the E1/T1 Trunk Group
[no] signalling-type	Parameter type: <Sip::TksgTermSignallingType> Format: (isdn-pra cas-2bit-mfc-gr-fw-bw cas-2bit-dtmf cas-1bit-dtmf cas-1bit-mfc-gr-fw-bw cas-1bit-decadic cas-1bit-mfc-fw) Possible values:	<i>optional parameter with default value: "isdn-pra"</i> The signaling type for this SIP termination.

Parameter	Type	Description
	- isdn-pra : Q931/Q921 protocol based communication between the CPE side and the NIAT-A board - cas-2bit-mfc-gr-fw-bw : 2 bit line signaling and MFC register signaling in compliance with ITU-T Q.400-490 CAS R2 specification (supporting groups, forward and backward signals) - cas-2bit-dtmf : 2 bit line signaling and DTMF register signaling - cas-1bit-dtmf : 1 bit line signaling and DTMF register signaling - cas-1bit-mfc-gr-fw-bw : 1 bit line signaling and MFC register signaling (supporting groups, forward and backward signals). This ENUM value is actually NOT supported. - cas-1bit-decadic : 1 bit line signaling and DECADIC register signaling. This ENUM value is actually NOT supported. - cas-1bit-mfc-fw : 1 bit line signaling and MFC register signaling in compliance with ITU-T Q.310-Q322 CAS R1 specification (supporting only forward signals). This ENUM value is actually NOT supported.	
[no] cas-cpn-screen	Parameter type: <Sip::TermCallingScreen> Format: (disable enable) Possible values: - disable : disable calling party number screening - enable : enable calling party number screening	<i>optional parameter with default value: "enable"</i> To enable / disable the screening of the calling party number for calls originating at the CPE side. It applies to the CAS SIP termination only.
[no] cas-default-cpc	Parameter type: <Sip::TermDefaultCPC> Format: (passthrough ordinary specchg test payphone operator data payphoneiu atme) Possible values: - passthrough : bypass the cpc from PBX - ordinary : replace the cpc from PBX by ordinary - specchg : replace the cpc from PBX by specchg - test : replace the cpc from PBX by test - payphone : replace the cpc from PBX by payphone - operator : replace the cpc from PBX by operator - data : replace the cpc from PBX by data. data is not supported right now. - payphoneiu : replace the cpc from PBX by payphoneIU - atme : replace the cpc from PBX by atme	<i>optional parameter with default value: "passthrough"</i> The calling party's category for this SIP termination. In case a CAS SIP termination is expected to request the calling party number and category from the CPE, the received calling party's category shall be replaced by the configured category. It applies to the CAS SIP termination only.
[no] cas-restrict-acc	Parameter type: <Sip::TermRestrictACC> Format: (disable enable) Possible values: - disable : no restriction for terminated ACC - enable : restriction for terminated ACC	<i>optional parameter with default value: "disable"</i> To enable/disable whether the CPE is restricted for terminated Automatic Collect Call. It applies to the CAS SIP termination only.
[no] cas-exch-type	Parameter type: <Sip::TermExchangeType>	<i>optional parameter with default</i>

Parameter	Type	Description
	Format: (normal compelled-a3-and-b1 pulsed-a3-and-b1) Possible values: - normal : the exchange type is normal - compelled-a3-and-b1 : the exchange can only handle B-1 and compelled A3 when digit completed - pulsed-a3-and-b1 : the exchange can only handle B-1 and pulsed A3 when digit completed	<i>value: "normal"</i> To configure the exchange type : - the CPE supports all, the group A and the group B signals - compelled-a3-and-b1 - the CPE supports only the B-1 signal. Any other B-x signal sent to the CPE is ignored. - pulsed-a3-and-b1 - the CPE supports only the B-1 signal. A pulsed A-3 signal is sent to the CPE after DML analysis has completed and a B-1 signal is sent to the CPE after a SIP INVITE has been sent to the SIP server. It applies to the CAS SIP termination only.
[no] isdn-nsm-profile	Parameter type: <Sip::NsmProfile> Format: (none <Sip::NsmProfilePointer> name : <PrintableString>) Possible values: - none : no ISDN NSM profile assigned. - name : ISDN NSM profile name Field type <Sip::NsmProfilePointer> - the index of the ISDN NSM profile. - range: [1...32] Field type <PrintableString> - printable string	<i>optional parameter with default value: "none"</i> The nsm profile assigned to the ISDN PRI SIP termination.
[no] cas-nsm-profile	Parameter type: <Sip::CasNsmProfPointer> Format: (none <Sip::CasNsmProfPointer> name : <PrintableString>) Possible values: - none : no CAS NSM profile assigned. - name : CAS NSM profile name Field type <Sip::CasNsmProfPointer> - the index of the CAS NSM profile. - range: [1...32] Field type <PrintableString> - printable string	<i>optional parameter with default value: "none"</i> The cas nsm profile assigned to the CAS SIP termination.
[no] uus-profile	Parameter type: <Sip::UserToUserProfile> Format: (none <Sip::UserToUserProfilePointer> name : <PrintableString>) Possible values: - none : no ISDN user-to-user profile assigned. - name : ISDN user-to-user profile name Field type <Sip::UserToUserProfilePointer> - the index of the user-to-user profile. - range: [1...32] Field type <PrintableString> - printable string	<i>optional parameter with default value: "none"</i> The user-to-user service profile assigned to the ISDN PRI SIP termination.
[no] cas-timer-profile	Parameter type: <Sip::CasTimerProfPointer> Format:	<i>optional parameter with default value: "none"</i>

40 Voice Configuration Commands

Parameter	Type	Description
	(none <Sip::CasTimerProfPointer> name : <PrintableString>) Possible values: - none : no CAS timer profile assigned. - name : CAS timer profile name Field type <Sip::CasTimerProfPointer> - the index of the CAS timer profile. - range: [1...32] Field type <PrintableString> - printable string	The cas timer profile assigned to the CAS SIP termination.

40.23 Voice Sip Manipulation Rule Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip manipulation rule profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no manipulate-rule (rule-id) ) | ( manipulate-rule (rule-id) [ no admin-status | admin-status
<Sip::RuleAdminStatus> ] [ no rule-name | rule-name <Sip::RuleName> ] rule <Sip::ManipulateRule> [ no
rule-type | rule-type <Sip::ManipulateRuleType> ] )
```

Command Parameters

Table 40.23-1 "Voice Sip Manipulation Rule Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(rule-id)	Format: - the index of one manipulation rule - range: [1...255]	uniquely identify of this sip manipulation rule

Table 40.23-2 "Voice Sip Manipulation Rule Configuration Commands" Command Parameters

Parameter	Type	Description
[no] admin-status	Parameter type: <Sip::RuleAdminStatus> Format: (enabled disabled) Possible values: - enabled : the rule can be executed - disabled : the rule can't be executed	<i>optional parameter with default value: "disabled"</i> administrative status of this sip manipulation rule
[no] rule-name	Parameter type: <Sip::RuleName> Format: - The operator friendly name of the rule - length: x<=32	<i>optional parameter with default value: ""</i> The operator friendly name of the rule
rule	Parameter type: <Sip::ManipulateRule> Format: - The supported rule key phrases are listed below. Only 1 rule key phrase can be configured per rule.\n-[ISDN]outg-use-default-pbx-number:[value]\n-[ISDN]inc-add-phone-context-to-number\n-[ISDN]outg-add-country-area-code-in-phone-context:[countrycode]-[areacode]\n-	<i>mandatory parameter</i> The manipulation rule

Parameter	Type	Description
	[ISDN/CAS]inc-short-number-len:[shortnumberlength]\n- [ISDN]outg-add-domain-name-in-phone-context\n- [POTS]out-dialedprefix-outprefix:[dialedprefix]-[outprefix]\n- [POTS/ISDN/CAS]outg-call-duration-limitation:[Prefix(es)]-[MaxCallDuration]-[MaxToneDurationTimer]\n- [POTS/ISDN/CAS]inc-call-duration-limitation:[MaxCallDuration]-[MaxToneDurationTimer]\n- [POTS/ISDN]emergency-mode\n- [POTS/ISDN]priority-user\n- [CAS]outg-add-country-area-code-in-cpn:[countrycode]-[areacode]\n- [CAS]inc-del-local-country-code-in-cpn:[countrycode]\n- For further details about the value ranges and meaning of the different values, please have a look at the description of the sipRuleTable in the SIP-MIB. - length: 1<=x<=64	
[no] rule-type	Parameter type: <Sip::ManipulateRuleType> Format: (pots isdn-pra pots-all isdn-pra-all cas-r2 cas-r2-all) Possible values: - pots : this rule is applied to POTS term - isdn-pra : this rule is applied to ISDN PRA term - pots-all : this rule is applied to all POTS terms - isdn-pra-all : this rule is applied to all ISDN PRA terms - cas-r2 : this rule is applied to CAS term - cas-r2-all : this rule is applied to all CAS terms	<i>optional parameter with default value: "isdn-pra"</i> The manipulation rule type

40.24 Voice Sip Cas R2 Timer Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Cas R2 timer profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip cas-r2-timer (if-index) [ no seizure-ack | seizure-ack <Sip::CasR2TimerSeizureAck> ] [ no
disconnect-ack | disconnect-ack <Sip::CasR2TimerDisconnectAck> ] [ no force-rel-ack | force-rel-ack
<Sip::CasR2TimerForceReleaseAck> ] [ no pres-fwd-sig | pres-fwd-sig <Sip::CasR2TimerPreFwdSig> ] [ no
recept-fwd-sig | recept-fwd-sig <Sip::CasR2TimerRecpFwdSig> ] [ no re-answer | re-answer
<Sip::CasR2TimerReanswer> ] [ no call-process | call-process <Sip::CasR2TimerCallProcess> ]
```

Command Parameters

Table 40.24-1 "Voice Sip Cas R2 Timer Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The unique internal identifier of the termination port

Table 40.24-2 "Voice Sip Cas R2 Timer Configuration Commands" Command Parameters

Parameter	Type	Description
[no] seizure-ack	Parameter type: <Sip::CasR2TimerSeizureAck> Format: - Timer for the reception of the SEIZURE ACK Signal to the TDM R2 side. - unit: millisecond - range: [100...1000]	<i>optional parameter with default value: "200"</i> Timer for the reception of the SEIZURE ACK Signal to the TDM R2 side
[no] disconnect-ack	Parameter type: <Sip::CasR2TimerDisconnectAck> Format:	<i>optional parameter with default value: "90"</i>

40 Voice Configuration Commands

Parameter	Type	Description
	- Timer for the reception of the DISCONNECTION ACK Signal to the TDM R2 side. - unit: second - range: [1...360]	Timer for the reception of the DISCONNECTION ACK Signal to the TDM R2 side.
[no] force-rel-ack	Parameter type: <Sip::CasR2TimerForceReleaseAck> Format: - Timer for the reception of the FORCED RELEASE ACK / CLEAR BACK ACK Signal to the TDM R2 side. - unit: second - range: [1...360]	<i>optional parameter with default value: "90"</i> Timer for the reception of the FORCED RELEASE ACK / CLEAR BACK ACK Signal to the TDM R2 side.
[no] pres-fwd-sig	Parameter type: <Sip::CasR2TimerPreFwdSig> Format: - Timer that defines the interval for the presence of the FORWARDING Signal to the TDM R2 side. - unit: second - range: [1...36]	<i>optional parameter with default value: "15"</i> Timer that defines the interval for the presence of the FORWARDING Signal to the TDM R2 side.
[no] recept-fwd-sig	Parameter type: <Sip::CasR2TimerRecpFwdSig> Format: - Timer that defines the interval for the reception of the FORWARDING Signal to the TDM R2 side. - unit: second - range: [1...20]	<i>optional parameter with default value: "7"</i> Timer that defines the interval for the reception of the FORWARDING Signal to the TDM R2 side.
[no] re-answer	Parameter type: <Sip::CasR2TimerReanswer> Format: - The re-answer timer on terminated calls to the TDM R2 side. A value '0' configured for the re-answer timer means that the re-answer timer shall not be started. - unit: second - range: [0...360]	<i>optional parameter with default value: "90"</i> The re-answer timer on terminated calls to the TDM R2 side.
[no] call-process	Parameter type: <Sip::CasR2TimerCallProcess> Format: - Timer that defines the interval between digit collection completed and called party answering the call request. The timer is started for incoming call requests to the TDM R2 side. A value '0' configured for the call-process timer means that the call-process timer shall not be started. - unit: second - range: [0...360]	<i>optional parameter with default value: "0"</i> Timer that defines the interval between digit collection completed and called party answering the call request. The timer is started for incoming call requests to the TDM R2 side. A value '0' configured for the call-process timer means that the call-process timer shall not be started.

40.25 Voice Sip PUID Configuration Commands

Command Description

This command allows the operator to manage the PUID term.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no isdn-cas-cls-puid (name) directory-number <Sip::TermDnumber> ) | ( isdn-cas-cls-puid
(name) directory-number <Sip::TermDnumber> [ no user-name | user-name <Sip::TermUserName> ] [ no uri | uri
<Sip::TermUri> ] [ no md5-password | md5-password <Security::Password4> ] [ no aka-secret-key | aka-secret-key
<Security::Password8> ] [ no display-name | display-name <Sip::TermUserName> ] )
```

Command Parameters

Table 40.25-1 "Voice Sip PUID Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - Name of the E1 cluster - length: x<=32	Name of E1 or T1 cluster
directory-number	Parameter type: <Sip::TermDnumber> Format: - identify the DN of the subscriber line - length: x<=32	The directory number of this PUID

Table 40.25-2 "Voice Sip PUID Configuration Commands" Command Parameters

Parameter	Type	Description
[no] user-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> Identify the user name for this PUID
[no] uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> SIP URI by which user agent identifies PUID
[no] md5-password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set	<i>optional parameter with default value: "plain : "</i> The password associated with the user

Parameter	Type	Description
	and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) - length: x<=64	
[no] aka-secret-key	Parameter type: <Security::Password8> Format: <pre>(prompt plain : <Security::PlainPassword8>)</pre> Possible values: - prompt : prompts the operator for AKA shared secret key - plain : the AKA shared secret key in plain text, each character should be 0-f, and the length can only be 0 or 32 Field type <Security::PlainPassword8> - the AKA shared secret key, each character should be 0-f, and the length can only be 0 or 32 - length: x<=32	<i>optional parameter with default value: "plain : "</i> The AKA shared secret key
[no] display-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> Display name for this PUID

40.26 Voice Sip PUID Configuration Commands

Command Description

This command allows the operator to manage the DDI-EXTs of the ISDN PRI / CAS SIP termination

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no pri-cas-tksg-puid (if-index) tksg-id <Sip::TrunkSubGroupId> directory-number
<Sip::TermDnumber> ) | ( pri-cas-tksg-puid (if-index) tksg-id <Sip::TrunkSubGroupId> directory-number
<Sip::TermDnumber> [ no user-name | user-name <Sip::TermUserName> ] [ no uri | uri <Sip::TermUri> ] [ no
password | password <Security::Password4> ] [ no aka-secret-key | aka-secret-key <Security::Password8> ] [ no
display-name | display-name <Sip::TermUserName> ] )
```

Command Parameters

Table 40.26-1 "Voice Sip PUID Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The ifindex of the related ISDN PRI / CAS SIP termination
tksg-id	Parameter type: <Sip::TrunkSubGroupId> Format: - The index of E1/T1 interface trunk sub-group. - range: [0...256]	The E1/T1 Trunk sub-group ID
directory-number	Parameter type: <Sip::TermDnumber> Format: - identify the DN of the subscriber line - length: x<=32	The directory number of the DDI-EXT

Table 40.26-2 "Voice Sip PUID Configuration Commands" Command Parameters

Parameter	Type	Description
[no] user-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port	<i>optional parameter with default value: ""</i> The user name of the DDI-EXT

Parameter	Type	Description
	- length: x<=64	
[no] uri	Parameter type: <Sip::TermUri> Format: - SIP uri by which the user agent identifies subscriber line - length: x<=80	<i>optional parameter with default value: ""</i> The SIP URI by which the SIP user agent identifies the DDI-EXT
[no] password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) - length: x<=64	<i>optional parameter with default value: "plain : "</i> The password of the DDI-EXT
[no] aka-secret-key	Parameter type: <Security::Password8> Format: (prompt plain : <Security::PlainPassword8>) Possible values: - prompt : prompts the operator for AKA shared secret key - plain : the AKA shared secret key in plain text, each character should be 0-f, and the length can only be 0 or 32 Field type <Security::PlainPassword8> - the AKA shared secret key, each character should be 0-f, and the length can only be 0 or 32 - length: x<=32	<i>optional parameter with default value: "plain : "</i> The AKA shared secret key of the DDI-EXT
[no] display-name	Parameter type: <Sip::TermUserName> Format: - identify the user name for this port - length: x<=64	<i>optional parameter with default value: ""</i> Display name of this DDI-EXT

40.27 Voice Sip Isdn Nsm Profile Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Isdn nsm Profile profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no isdn-nsm-prof (prof-name) ) | ( isdn-nsm-prof (prof-name) [ no version-nbr | version-nbr
<Sip::NsmProfileVersionNbr> ] [ no outg-from-no-cgpn | outg-from-no-cgpn <Sip::NsmOutFromNoCgpn> ] [ no
outg-privacy | outg-privacy <Sip::NsmOutPricy> ] [ no outg-from-pi | outg-from-pi <Sip::NsmOutFromPi> ] [ no
inc-from-noclip | inc-from-noclip <Sip::NsmIncFromNoClip> ] [ no inc-from-clip-pri | inc-from-clip-pri
<Sip::NsmIncFromClipPri> ] [ no inc-from-clip-ua | inc-from-clip-ua <Sip::NsmIncFromClipUa> ] [ no
inc-npi-to-cpn | inc-npi-to-cpn <Sip::NsmIncNpiToCpn> ] [ no inc-ton-to-cpn | inc-ton-to-cpn
<Sip::NsmIncTonToCpn> ] international-prefix <Sip::NsmProfInPrefix> [ no national-prefix | national-prefix
<Sip::NsmProfNPrefix> ] country-code <Sip::NsmProfCC> outg-cpn-length <Sip::NsmOutCpnLength> [ no
inc-cgpn-add-ac | inc-cgpn-add-ac <Sip::NsmIncCgpnAddAC> ] [ no inc-ton-to-cdpn | inc-ton-to-cdpn
<Sip::NsmIncTonToCdPn> ] )
```

Command Parameters

Table 40.27-1 "Voice Sip Isdn Nsm Profile Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(prof-name)	Format: - the name of a nsm profile - length: x<=32	The unique name identifier of an row in the sipIsdnNsmProfileTable.

Table 40.27-2 "Voice Sip Isdn Nsm Profile Configuration Commands" Command Parameters

Parameter	Type	Description
[no] version-nbr	Parameter type: <Sip::NsmProfileVersionNbr> Format: - a version number of the profile - range: [1...65535]	<i>optional parameter with default value: 1</i> The version number to the profile.
[no] outg-from-no-cgpn	Parameter type: <Sip::NsmOutFromNoCgpn> Format: (impu-gdn unavailable) Possible values: - impu-gdn : The From header is to be sent with the default group number for outgoing call	<i>optional parameter with default value: "impu-gdn"</i> This object allows indicating whether the From-header user part of an outgoing SIP Invite request needs to be set to 'Unavailable' or to include the

Parameter	Type	Description
	- unavailable : The From header is to be sent as unavailable@unknown.invalid for outgoing call	default group number
[no] outg-privacy	Parameter type: <Sip::NsmOutPricy> Format: (privacy-id-hdr-usr privacy-none) Possible values: - privacy-id-hdr-usr : Privacy header included with value id, header, user - privacy-none : Privacy header included with value none	<i>optional parameter with default value: "privacy-id-hdr-usr"</i> this object allows to indicate whether a privacy header field with value 'id, header, user' or a privacy header with value 'none' is to be included when CgPN IE received with NPI other than 'ISDN/telephony numbering plan' or 'unknown' or CgPN IE received with NPI is 'ISDN/telephony numbering plan' or 'unknown' and PI=absent.
[no] outg-from-pi	Parameter type: <Sip::NsmOutFromPi> Format: (anonymous not-anonymous) Possible values: - anonymous : the From header shall be set to: From: Anonymous sip:anonymous@anonymous.invalid - not-anonymous : the setting of the sipIsdnNsmProfileOutFromNoInvNbr object applies.	<i>optional parameter with default value: "not-anonymous"</i> This object allows to indicate whether the 'From' header is to be anonymized or not, when PI = Presentation restricted is received.
[no] inc-from-noclip	Parameter type: <Sip::NsmIncFromNoClip> Format: - the string value that IMS will send in the 'From' header user info in case the user does not have the CLIP feature assigned - length: x<=32	<i>optional parameter with default value: "unsubscribed"</i> This object allows to configure the string value the IMS will send in the 'From' header user info in case the terminating user does not have the CLIP feature assigned.
[no] inc-from-clip-pri	Parameter type: <Sip::NsmIncFromClipPri> Format: - the string value that IMS will send in the 'From' header user info in case the CLI has to be kept private - length: x<=32	<i>optional parameter with default value: "anonymous"</i> This object allows to configure the string value the IMS will send in the 'From' header user info in case the CLI has to be kept private.
[no] inc-from-clip-ua	Parameter type: <Sip::NsmIncFromClipUa> Format: - the string value that IMS will send in the 'From' header user info in case there's no CLI that can be passed to the MSAN - length: x<=32	<i>optional parameter with default value: "unavailable"</i> This object allows to configure the string value the IMS will send in the 'From' header user info in case no CLI is available.
[no] inc-npi-to-cpn	Parameter type: <Sip::NsmIncNpiToCpn> Format: (itu-t-e164 unknown) Possible values: - itu-t-e164 : the NPI is set to ISDN/telephony numbering plan (ITU-T Recommendation E.164) for incoming call - unknown : the NPI is set to unknown for incoming call	<i>optional parameter with default value: "unknown"</i> This object allows to configure how the numbering plan identifier field must be coded towards the terminating ISDN PRI user.
[no] inc-ton-to-cpn	Parameter type: <Sip::NsmIncTonToCpn> Format: (international unknown) Possible values:	<i>optional parameter with default value: "unknown"</i> This object allows to configure the preferred value of the TON (Type Of Number) parameter of

Parameter	Type	Description
	- international : the TON is set to international for incoming call - unknown : the TON is set to unknown for incoming call	CgPN IE that is sent to the terminating ISDN PRI user.
international-prefix	Parameter type: <Sip::NsmProfInPrefix> Format: - the string value of the international prefix - length: 1<=x<=8	<i>mandatory parameter</i> The international prefix. Mandatory parameter
[no] national-prefix	Parameter type: <Sip::NsmProfNPrefix> Format: - the string value of the national prefix - length: x<=4	<i>optional parameter with default value: ""</i> The national prefix.
country-code	Parameter type: <Sip::NsmProfCC> Format: - the string value of the country code - length: 1<=x<=8	<i>mandatory parameter</i> The country code. Mandatory parameter
outg-cpn-length	Parameter type: <Sip::NsmOutCpnLength> Format: - The length of digits - range: [0...15]	<i>mandatory parameter</i> The number of digits that allows the MSAN to distinguish whether the phone number received in the CgPN is a shortened phone number (a DDI extension) or a phone number with a national or international format. Mandatory parameter.
[no] inc-cgpn-add-ac	Parameter type: <Sip::NsmIncCgpnAddAC> Format: (disable enable) Possible values: - disable : Do not add area code to CgPN when intra-area call received - enable : Add area code to CgPN when intra-area call received	<i>optional parameter with default value: "disable"</i> This object allows to configure whether to add national prefix and area code to CgPN IE when receive an intra-area call.
[no] inc-ton-to-cdpn	Parameter type: <Sip::NsmIncTonToCdPn> Format: (unknown international national) Possible values: - unknown : the TON of CdPN is set to unknown for incoming call - international : the TON of CdPN is set to international for incoming call - national : the TON of CdPN is set to national for incoming call	<i>optional parameter with default value: "unknown"</i> This object allows to configure the value of the TON (Type Of Number) parameter of CdPN IE that is sent to the terminating ISDN PRI user.

40.28 Voice Sip Cas Nsm Profile Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Cas nsm Profile profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no cas-nsm-prof (prof-name) ) | ( cas-nsm-prof (prof-name) [ no version-nbr | version-nbr
<Sip::CasNsmProfVersionNbr> ] [ no outg-from-no-cgpn | outg-from-no-cgpn
<Sip::CasNsmProfOutFromNoInvNbr> ] international-prefix <Sip::CasNsmProfInPrefix> [ no national-prefix |
national-prefix <Sip::CasNsmProfInPrefix> ] country-code <Sip::CasNsmProfCC> outg-cpn-length
<Sip::CasNsmProfCgPnNbrLength> )
```

Command Parameters

Table 40.28-1 "Voice Sip Cas Nsm Profile Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(prof-name)	Format: - the name of a nsm profile - length: 1<=x<=32	The unique name identifier of an row in the sipCasNsmProfileTable.

Table 40.28-2 "Voice Sip Cas Nsm Profile Configuration Commands" Command Parameters

Parameter	Type	Description
[no] version-nbr	Parameter type: <Sip::CasNsmProfVersionNbr> Format: - a version number of the profile - range: [1...65535]	<i>optional parameter with default value: 1</i> The version number to the profile.
[no] outg-from-no-cgpn	Parameter type: <Sip::CasNsmProfOutFromNoInvNbr> Format: (impu-gdn unavailable) Possible values: - impu-gdn : The From header is to be sent with the default group number for outgoing call - unavailable : The From header is to be sent as unavailable@unknown.invalid for outgoing call	<i>optional parameter with default value: "impu-gdn"</i> This object allows indicating whether the From-header user part of an outgoing SIP Invite request needs to be set to 'Unavailable' or to include the default group number
international-prefix	Parameter type: <Sip::CasNsmProfInPrefix> Format: - the string value of the international prefix	<i>mandatory parameter</i> The international prefix. Mandatory parameter

Parameter	Type	Description
	- length: 1<=x<=8	
[no] national-prefix	Parameter type: <Sip::CasNsmProfNPrefix> Format: - the string value of the national prefix - length: x<=4	<i>optional parameter with default value: ""</i> The national prefix.
country-code	Parameter type: <Sip::CasNsmProfCC> Format: - the string value of the country code - length: 1<=x<=8	<i>mandatory parameter</i> The country code. Mandatory parameter
outg-cpn-length	Parameter type: <Sip::CasNsmProfCgPnNbrLength> Format: - the length of digits - range: [0...15]	<i>mandatory parameter</i> The number of digits that allows the MSAN to distinguish whether the phone number received in the CgPN is a shortened phone number (a DDI extension) or a phone number with a national or international format. Mandatory parameter.

40.29 Voice Sip Pri User To User Profile Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Pri User To User Profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no user-to-user-prof (prof-name) ) | ( user-to-user-prof (prof-name) [ no version-nbr |
version-nbr <Sip::UserToUserProfVersionNbr> ] [ no service-type | service-type
<Sip::UserToUserProfServiceType> ] [ no act-estab-call | act-estab-call
<Sip::UserToUserProfActivateEstablishCall> ] [ no act-stable-call | act-stable-call
<Sip::UserToUserProfActivateStableCall> ] [ no uus3-t1-timer | uus3-t1-timer
<Sip::UserToUserProfUUS3T1Timer> ] )
```

Command Parameters

Table 40.29-1 "Voice Sip Pri User To User Profile Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(prof-name)	Format: - The unique name identifier of a row in the sipPriUserToUserProfileTable - length: 1<=x<=32	The unique name identifier of a row in the sipPriUserToUserProfileTable.

Table 40.29-2 "Voice Sip Pri User To User Profile Configuration Commands" Command Parameters

Parameter	Type	Description
[no] version-nbr	Parameter type: <Sip::UserToUserProfVersionNbr> Format: - The version number of the pri user to user profile - range: [1...65535]	<i>optional parameter with default value: 1</i> The version number of the profile.
[no] service-type	Parameter type: <Sip::UserToUserProfServiceType> Format: uus3 Possible values: - uus3 : User-to-user information exchanged while a call is in the Active state	<i>optional parameter with default value: "uus3"</i> This object allows the operator to configure the UUS service type (UUS service 1, UUS service 2, UUS service 3). Only uus3 is supported.
[no] act-estab-call	Parameter type: <Sip::UserToUserProfActivateEstablishCall>	<i>optional parameter with default value: "false"</i>

Parameter	Type	Description
	Format: (true false) Possible values: - true : the UUS service will be active during call establishment - false : the UUS service will not be active during call establishment	If this object is set as true(1), the UUS service will be active during call establishment; the SETUP message shall contain an independent UUS service request. The value true(1) can only be set when the act-stable-call is set to false(2).
[no] act-stable-call	Parameter type: <Sip::UserToUserProfActivateStableCall> Format: (true false) Possible values: - true : the UUS service will be active during the active state of a call - false : the UUS service will not be active during the active state of a call	<i>optional parameter with default value: "false"</i> If this object is set as true(1), the UUS service will be active during the active state of a call; a FACILITY message indicating the UUS service request will be sent out for UUS service activation. The value true(1) can only be set when the act-estab-call is set to false(2).
[no] uus3-t1-timer	Parameter type: <Sip::UserToUserProfUUS3T1Timer> Format: - Value of UUS3-T1 timer - unit: second - range: [1...60]	<i>optional parameter with default value: 10</i> This object allows the operator to configure the UUS3-T1 timer. The timer is started when a FACILITY message indicating a User-To-user service 3 request is sent out and will be stopped when a response FACILITY message is received.

40.30 Voice Sip Isdn/Cas trunk sub-group Configuration Commands

Command Description

This command allows the operator to manage the E1/T1 trunk sub-group.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no tksg (if-index) tksg-id <Sip::TksgId> interface <Itf::IsdnLine> ) | ( tksg (if-index) tksg-id
<Sip::TksgId> interface <Itf::IsdnLine> tksg-name <Sip::TksgName> ds0-bitmap <Sip::Ds0BitSet> [ no
admin-status | admin-status <Sip::IsdnTermAdminStatus> ] [ no ds0-hunting-way | ds0-hunting-way
<Sip::Ds0HuntingWay> ] )
```

Command Parameters

Table 40.30-1 "Voice Sip Isdn/Cas trunk sub-group Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The ifIndex of the ISDN PRI / CAS SIP termination that has been created on top of the E1/T1 trunk sub-group.
tksg-id	Parameter type: <Sip::TksgId> Format: - The index of trunk sub-group - range: [1...256]	The unique Identifier of the trunk sub-group (chosen by the operator in the range [1..256]).
interface	Parameter type: <Itf::IsdnLine> Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	The Ifindex of the E1/T1 interface at which the trunk sub-group is created.

Resource Identifier	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	

Table 40.30-2 "Voice Sip Isdn/Cas trunk sub-group Configuration Commands" Command Parameters

Parameter	Type	Description
tksg-name	Parameter type: <Sip::TksgName> Format: - The operator friendly name of the trunk sub-group. - length: 1<=x<=32	<i>mandatory parameter</i> The operator friendly name of the trunk sub-group.
ds0-bitmap	Parameter type: <Sip::Ds0BitSet> Format: - The bitmap indicating the DS0 channels that belong to the trunk sub-group.	<i>mandatory parameter</i> The bitmap indicating the DS0 channels that belong to the trunk sub-group.
[no] admin-status	Parameter type: <Sip::IsdnTermAdminStatus> Format: (up down) Possible values: - up : unlock the sip isdn/cas termination - down : lock the sip isdn/cas termination	<i>optional parameter with default value: "down"</i> The administrative status of the trunk sub-group.
[no] ds0-hunting-way	Parameter type: <Sip::Ds0HuntingWay> Format: (cyclic-forward sequential-forward sequential-reverse random-forward cyclic-reverse random-reverse inherit) Possible values: - cyclic-forward : DS0 channels are allocated cyclically. The preference is for the allocation of the subsequent idle channel in a cyclical manner. Initially the lowest DS0 channel is selected. i.e. DS0-channel 1; afterwards, always again the next DS0-channel following the one used last is selected. - sequential-forward : DS0 channels are allocated increasingly. The preference is for the allocation of the idle channel with the lowest number. - sequential-reverse : DS0 channels are allocated decreasingly. The preference is for the allocation of the idle channel with the highest number. - random-forward : DS0 channels are allocated randomly. The preference is for the allocation of the idle channel with the random number. If selected channel is busy, then Take the next free B-channel (forward) - cyclic-reverse : DS0 channels are allocated cyclically. Initially the highest DS0-channel is selected i.e. DS0-channel 30; afterwards, always again the preceding B-channel of the one used last is selected. - random-reverse : DS0 channels are allocated randomly. The preference is for the allocation of the idle channel with the random number. If selected channel is busy, then Take the	<i>optional parameter with default value: "inherit"</i> The hunting method for the DS0 channels of the trunk sub-group.

40 Voice Configuration Commands

Parameter	Type	Description
	next free B-channel (reverse) - inherit : DS0 channels are allocated as configured in the corresponding ISDN PRI/CAS R2 SIP termination entry in the sipPriCasTksgTerminationDs0HuntingWay object of the sipPriCasTksgTerminationTable.	

40.31 Voice Sip Physical Interface Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip physical interface profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no phys-itf (if-index) ) | ( phys-itf (if-index) [ no admin-status | admin-status
<Sip::PhysItfAdminStatus> ] [ no interface-type | interface-type <Sip::PhysItfType> ] [ no signalling-type |
signalling-type <Sip::PhysItfSignalingType> ] [ no e1-crc4frame | e1-crc4frame <Sip::PhysItfE1Crc4Framing> ] [
no t1-framemode | t1-framemode <Sip::PhysItfT1FrameMode> ] [ no t1-tx-linecode | t1-tx-linecode
<Sip::PhysItfT1LineCode> ] [ no t1-rx-linecode | t1-rx-linecode <Sip::PhysItfT1LineCode> ] [ no t1-lbo-value |
t1-lbo-value <Sip::PhysItfT1LBOValue> ] [ no blocking-bitmap | blocking-bitmap <Sip::PhysItfBlockingBitmap>
] [ no cap-name | cap-name <Sip::PhysItfCapName> ] [ no cas-sig-prof | cas-sig-prof <Sip::CasSignalProfPointer>
])
```

Command Parameters

Table 40.31-1 "Voice Sip Physical Interface Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The unique internal identifier of the physical E1/T1 interface

Table 40.31-2 "Voice Sip Physical Interface Configuration Commands" Command Parameters

Parameter	Type	Description
[no] admin-status	Parameter type: <Sip::PhysItfAdminStatus> Format: (up down testing)	<i>optional parameter with default value: "down"</i> The administrative status of the physical E1/T1 interface.

Parameter	Type	Description
	Possible values: - up : unlock the E1/T1 physical interface - down : lock the E1/T1 physical interface - testing : the operator is going to run or is running loop-back testing on this interface	
[no] interface-type	Parameter type: <Sip::PhysItfType> Format: (e1-itf-type t1-itf-type) Possible values: - e1-itf-type : E1 interface with 30 B channels. - t1-itf-type : T1 interface with 23 B channels.	<i>optional parameter with default value: "e1-itf-type"</i> The type of physical interface
[no] signalling-type	Parameter type: <Sip::PhysItfSignalingType> Format: (isdn-pra cas-2bit-mfc-gr-fw-bw cas-2bit-dtmf cas-1bit-dtmf cas-1bit-mfc-gr-fw-bw cas-1bit-decadic cas-1bit-mfc-fw) Possible values: - isdn-pra : Q931/Q921 protocol based communication between the CPE side and the NIAT-A board - cas-2bit-mfc-gr-fw-bw : 2 bit line signaling and MFC register signaling in compliance with ITU-T Q.400-490 CAS R2 specification (supporting groups, forward and backward signals) - cas-2bit-dtmf : 2 bit line signaling and DTMF register signaling - cas-1bit-dtmf : 1 bit line signaling and DTMF register signaling - cas-1bit-mfc-gr-fw-bw : 1 bit line signaling and MFC register signaling (supporting groups, forward and backward signals). This ENUM value is actually NOT supported. - cas-1bit-decadic : 1 bit line signaling and DECADIC register signaling. This ENUM value is actually NOT supported. - cas-1bit-mfc-fw : 1 bit line signaling and MFC register signaling in compliance with ITU-T Q.310-Q322 CAS R1 specification (supporting only forward signals). This ENUM value is actually NOT supported.	<i>optional parameter with default value: "isdn-pra"</i> The signaling type between the end-user (PBX) side and the NIAT-A board
[no] e1-crc4frame	Parameter type: <Sip::PhysItfE1Crc4Framing> Format: (cde-profile enabled disabled) Possible values: - cde-profile : default value defined in CDE. - enabled : CRC4 multiframe. - disabled : double frame.	<i>optional parameter with default value: "cde-profile"</i> The E1 interface CRC4 framing mode
[no] t1-framemode	Parameter type: <Sip::PhysItfT1FrameMode> Format: (cde-value f4 f12 f24	<i>optional parameter with default value: "cde-value"</i> The Frame Mode of the T1 interface

Parameter	Type	Description
	f72) Possible values: - cde-value : default value defined in CDE. - f4 : 4-frame multiframe. - f12 : 12-frame multiframe (D4). - f24 : 24-frame Superframe (ESF). - f72 : 72-frame multiframe (SLC96).	
[no] t1-tx-linecode	Parameter type: <Sip::PhysItfT1LineCode> Format: (cde-value ami ami-with-zcs b8zs) Possible values: - cde-value : default value defined in CDE. - ami : Alternate Mark Inversion. - ami-with-zcs : Alternate Mark Inversion with Zero-Code Suppression. - b8zs : Bipolar with 8-zero Substitution.	<i>optional parameter with default value: "cde-value"</i> The Tx line code of the T1 interface
[no] t1-rx-linecode	Parameter type: <Sip::PhysItfT1LineCode> Format: (cde-value ami ami-with-zcs b8zs) Possible values: - cde-value : default value defined in CDE. - ami : Alternate Mark Inversion. - ami-with-zcs : Alternate Mark Inversion with Zero-Code Suppression. - b8zs : Bipolar with 8-zero Substitution.	<i>optional parameter with default value: "cde-value"</i> The Rx line code of the T1 interface
[no] t1-lbo-value	Parameter type: <Sip::PhysItfT1LBOValue> Format: (lbo-0db lbo-7-5db lbo-15db) Possible values: - lbo-0db : LBO = 0dB, the resulting range of CI attenuation shall be 0 to 5.5 dB. - lbo-7-5db : LBO = 7.5dB, the resulting range of CI attenuation shall be 7.5 to 13.0 dB. - lbo-15db : LBO = 15dB, the resulting range of CI attenuation shall be 15 to 20.5 dB.	<i>optional parameter with default value: "lbo-0db"</i> The line build-out of the interface
[no] blocking-bitmap	Parameter type: <Sip::PhysItfBlockingBitmap> Format: - The bitmap indicating the TS channels that belong to the physical interface.	<i>optional parameter with default value: ""</i> The blocking/unblocking of a physical interface or TS channel (range)
[no] cap-name	Parameter type: <Sip::PhysItfCapName> Format: - The name of the Central Access Point that manages the E1/T1 interface - length: x<=31	<i>optional parameter with default value: ""</i> The name of the CAP
[no] cas-sig-prof	Parameter type: <Sip::CasSignalProfPointer> Format: (none <Sip::CasSignalProfPointer>	<i>optional parameter with default value: "none"</i> The cas timer profile assigned to the CAS SIP termination.

40 Voice Configuration Commands

Parameter	Type	Description
	name : <PrintableString>) Possible values: - none : no CAS signaling profile assigned. - name : CAS signaling profile name Field type <Sip::CasSignalProfPointer> - the index of the CAS signaling profile. - range: [1...32] Field type <PrintableString> - printable string	

40.32 Voice Sip Cas Signaling Profile Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Cas Signaling Profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no cas-sig-prof (prof-name) ) | ( cas-sig-prof (prof-name) [ no version-nbr | version-nbr
<Sip::CasSignalProfVersionNbr> ] [ no idle | idle <Sip::CasSignalProfIdle> ] [ no seize | seize
<Sip::CasSignalProfSeize> ] [ no seize-ack | seize-ack <Sip::CasSignalProfSeizeAck> ] [ no answer | answer
<Sip::CasSignalProfAnswer> ] [ no fw-disconnect | fw-disconnect <Sip::CasSignalProfForwardDisconnect> ] [ no
fw-disconnect-ack | fw-disconnect-ack <Sip::CasSignalProfForwardDisconnectAck> ] [ no bw-disconnect |
bw-disconnect <Sip::CasSignalProfBackwardDisconnect> ] [ no bw-disconnect-ack | bw-disconnect-ack
<Sip::CasSignalProfBackwardDisconnectAck> ] [ no fault | fault <Sip::CasSignalProfFault> ] [ no block | block
<Sip::CasSignalProfBlock> ] [ no meter | meter <Sip::CasSignalProfMeter> ] [ no reject-call | reject-call
<Sip::CasSignalProfRejectCall> ] [ no bw-disc-reanswer | bw-disc-reanswer
<Sip::CasSignalProfBackwardDisconnectWithReAnswer> ] )
```

Command Parameters

Table 40.32-1 "Voice Sip Cas Signaling Profile Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(prof-name)	Format: - name of the signaling profile - length: 1<=x<=32	The unique name identifier of an row in the sipCasSignalingProfileTable.

Table 40.32-2 "Voice Sip Cas Signaling Profile Configuration Commands" Command Parameters

Parameter	Type	Description
[no] version-nbr	Parameter type: <Sip::CasSignalProfVersionNbr> Format: - version number of the signaling profile - range: [1...65535]	<i>optional parameter with default value: 1</i> The version number to the profile.
[no] idle	Parameter type: <Sip::CasSignalProfIdle> Format: - four signal bits(A/B/C/D) for line signal IDLE of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "9"</i> Four signaling bits(A/B/C/D) for line signal IDLE of CAS R2 or CAS R1.
[no] seize	Parameter type: <Sip::CasSignalProfSeize> Format:	<i>optional parameter with default value: "1"</i>

40 Voice Configuration Commands

Parameter	Type	Description
	- four signal bits(A/B/C/D) for line signal Seize of CAS R2 or CAS R1 - range: [0...15]	Four signaling bits(A/B/C/D) for line signal Seizure of CAS R2 or CAS R1.
[no] seize-ack	Parameter type: <Sip::CasSignalProfSeizeAck> Format: - four signal bits(A/B/C/D) for line signal Seize Ack of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "13"</i> Four signaling bits(A/B/C/D) for line signal Seizure Ack of CAS R2 or CAS R1.
[no] answer	Parameter type: <Sip::CasSignalProfAnswer> Format: - four signal bits(A/B/C/D) for line signal Answer of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "5"</i> Four signaling bits(A/B/C/D) for line signal Answer of CAS R2 or CAS R1.
[no] fw-disconnect	Parameter type: <Sip::CasSignalProfForwardDisconnect> Format: - four signal bits(A/B/C/D) for line signal Forward disconnect of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "9"</i> Four signaling bits(A/B/C/D) for line signal Forward disconnect of CAS R2 or CAS R1.
[no] fw-disconnect-ack	Parameter type: <Sip::CasSignalProfForwardDisconnectAck> Format: - four signal bits(A/B/C/D) for line signal Forward disconnect Ack of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "9"</i> Four signaling bits(A/B/C/D) for line signal Forward disconnect Ack of CAS R2 or CAS R1.
[no] bw-disconnect	Parameter type: <Sip::CasSignalProfBackwardDisconnect> Format: - four signal bits(A/B/C/D) for line signal Backward disconnect of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "1"</i> Four signaling bits(A/B/C/D) for line signal Backward disconnect of CAS R2 or CAS R1.
[no] bw-disconnect-ack	Parameter type: <Sip::CasSignalProfBackwardDisconnectAck> Format: - four signal bits(A/B/C/D) for line signal Backward disconnect Ack of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "9"</i> Four signaling bits(A/B/C/D) for line signal Backward disconnect Ack of CAS R2 or CAS R1.
[no] fault	Parameter type: <Sip::CasSignalProfFault> Format: - four signal bits(A/B/C/D) for line signal Fault of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "13"</i> Four signaling bits(A/B/C/D) for line signal Fault of CAS R2 or CAS R1.
[no] block	Parameter type: <Sip::CasSignalProfBlock> Format: - four signal bits(A/B/C/D) for line signal Block of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "13"</i> Four signaling bits(A/B/C/D) for line signal Block of CAS R2 or CAS R1.
[no] meter	Parameter type: <Sip::CasSignalProfMeter> Format: - four signal bits(A/B/C/D) for line signal Meter of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "13"</i> Four signaling bits(A/B/C/D) for line signal Meter of CAS R2 or CAS R1.
[no] reject-call	Parameter type: <Sip::CasSignalProfRejectCall> Format: - four signal bits(A/B/C/D) for line signal Reject Call of CAS R2 or CAS R1 - range: [0...15]	<i>optional parameter with default value: "1"</i> Four signaling bits(A/B/C/D) for line signal Reject call of CAS R2 or CAS R1.
[no] bw-disc-reanswer	Parameter type: <Sip::CasSignalProfBackwardDisconnectWithReAnswer>	<i>optional parameter with default value: "13"</i>

Parameter	Type	Description
	Format: - four signal bits(A/B/C/D) for line signal backward_disconnect with_reanswer of CAS R2 or CAS R1 - range: [0...15]	Four signaling bits(A/B/C/D) for line signal backward_disconnect with_reanswer of CAS R2 or CAS R1.

40.33 Central Access Point Table Configuration Commands

Command Description

This command allows the operator to configure Central Access Point Table.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no cap (cap) ) | ( cap (cap) [ no cap-name | cap-name <Sip::CapName> ] [ no ne-name |
ne-name <Sip::NeName> ] [ no mode | mode <Sip::CapMode> ] [ no location | location <Sip::CapLocation> ] [ no
admin-status | admin-status <Sip::CapAdminStatus> ] [ no ip | ip <SIP::IpAddressAndMask> ] [ no udp-port |
udp-port <Sip::CapUDPPort> ] [ no gateway-ip | gateway-ip <Sip::CapGatewayIpAddr> ] [ no provider-name |
provider-name <Sip::CapProviderName> ] )
```

Command Parameters

Table 40.33-1 "Central Access Point Table Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cap)	Format: - the central access point id - range: [1...16]	The unique identifier of this central access point

Table 40.33-2 "Central Access Point Table Configuration Commands" Command Parameters

Parameter	Type	Description
[no] cap-name	Parameter type: <Sip::CapName> Format: - The name of the Central Access Point - length: x<=32	<i>optional parameter with default value: ""</i> The operator friendly name of this central access point
[no] ne-name	Parameter type: <Sip::NeName> Format: - the name of the network element - length: x<=32	<i>optional parameter with default value: ""</i> The operator friendly name of NE that hosts the central access point
[no] mode	Parameter type: <Sip::CapMode> Format: (enabled disabled) Possible values: - enabled : cap mode enable for the ISDN PRI/CAS VoIP service	<i>optional parameter with default value: "disabled"</i> allows to configure whether the central access point mode is enabled or disabled

Parameter	Type	Description
	- disabled : cap mode disable for the ISDN PRI/CAS VoIP service	
[no] location	Parameter type: <Sip::CapLocation> Format: (local remote) Possible values: - local : the value is set to local in cap ne - remote : the value is set to remote in remote ne	<i>optional parameter with default value: "local"</i> allows to configure whether the central access point is hosted in the local NE or hosted
[no] admin-status	Parameter type: <Sip::CapAdminStatus> Format: (up down) Possible values: - up : the cap mode as configured becomes effective - down : the cap mode becomes not effective when cap mode enabled;non cap mode run in ISAMV NE when cap mode disabled	<i>optional parameter with default value: "down"</i> administrative status of this central access point
[no] ip	Parameter type: <SIP::IpAddressAndMask> Format: <Ip::V4Address> / <Sip::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <Sip::PrefixLength> - prefix length of the subnet - range: [0...128]	<i>optional parameter with default value: "0.0.0.0/0"</i> the IPv4 address and prefix length of the Central Access Point
[no] udp-port	Parameter type: <Sip::CapUDPPort> Format: - The UDP port by which the cap can be addressed at the NVPS-C - range: [49152...65534]	<i>optional parameter with default value: "49152"</i> the UDP port by which the Central Access Point can be addressed via the proprietary communication protocol
[no] gateway-ip	Parameter type: <Sip::CapGatewayIpAddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the Gateway IP address that allows the CAP to send internal communication packets to the remote NE
[no] provider-name	Parameter type: <Sip::CapProviderName> Format: - provider name - length: x<=32	<i>optional parameter with default value: "common"</i> The operator friendly name of the Voice Service Provider

40.34 Central Access Point Table Configuration Commands

Command Description

This command allows the operator to configure Central Access Point Table.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no ne-board cap-id <Sip::CapId> ne-id <Sip::NeId> board <Equipm::LtSlotIndex> ) | (
ne-board cap-id <Sip::CapId> ne-id <Sip::NeId> board <Equipm::LtSlotIndex> [ no admin-status | admin-status
<Sip::NeBoardAdminStatus> ] xhub-port <Sip::xHubPort> )
```

Command Parameters

Table 40.34-1 "Central Access Point Table Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
cap-id	Parameter type: <Sip::CapId> Format: - the central access point id - range: [1...16]	The unique identifier of this central access point
ne-id	Parameter type: <Sip::NeId> Format: - the network element id - range: [1...8]	The unique identifier of the Network element.
board	Parameter type: <Equipm::LtSlotIndex> Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	The slot identifier of the NIAT-A LT board.

Table 40.34-2 "Central Access Point Table Configuration Commands" Command Parameters

Parameter	Type	Description
[no] admin-status	Parameter type: <Sip::NeBoardAdminStatus> Format: (up	<i>optional parameter with default value: "down"</i> administrative status of this

Parameter	Type	Description
	down) Possible values: - up : the NIAT-A LT board has been planned and has been physically pulled in - down : the NIAT-A LT board has not been planned yet or the NIAT-A LT board has been planned but is not physical plugged in.	NIAT-A LT board.
xhub-port	Parameter type: <Sip::xHubPort> Format: - The xHUB port to which the NIAT-A LT board is connected. - range: [1...32]	<i>mandatory parameter</i> The xHUB port to which the NIAT-A LT board is connected

40.35 Voice Sip Cas Timer Profile Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip Cas Timer Profile profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no cas-timer-prof (prof-name) ) | ( cas-timer-prof (prof-name) [ no version-nbr | version-nbr
<Sip::CasTimerProfVersionNbr> ] appl-bitmap <Sip::CasTimerProfAppliBitmap> [ no seize-ack | seize-ack
<Sip::CasTimerProfSeizeAck> ] [ no clear-back-ack | clear-back-ack <Sip::CasTimerProfClearBwAck> ] [ no
clear-fw-ack | clear-fw-ack <Sip::CasTimerProfClearFwAck> ] [ no presence-fw-sig | presence-fw-sig
<Sip::CasTimerProfPresenceFwSig> ] [ no receipt-fw-sig | receipt-fw-sig <Sip::CasTimerProfReceiptFwSig> ] [
no re-answer | re-answer <Sip::CasTimerProfReAnswer> ] [ no call-process | call-process
<Sip::CasTimerProfCallProcess> ] [ no delay-dial-min | delay-dial-min <Sip::CasTimerProfDelayDialingMinDur>
] [ no delay-dial-max | delay-dial-max <Sip::CasTimerProfDelayDialingMaxDur> ] [ no seize-state-time |
seize-state-time <Sip::CasTimerProfSeizeStateTime> ] [ no reg-recall-min | reg-recall-min
<Sip::CasTimerProfRegRecallMinDur> ] [ no reg-recall-max | reg-recall-max
<Sip::CasTimerProfRegRecallMaxDur> ] [ no decadic-pulse-dur | decadic-pulse-dur <Sip::CasTimerProfDpDur> ]
[ no decadic-break-dur | decadic-break-dur <Sip::CasTimerProfDpBreakDur> ] [ no inter-digit-peri | inter-digit-peri
<Sip::CasTimerProfInterDigitPeriod> ] [ no ring-fw | ring-fw <Sip::CasTimerProfRingForward> ] [ no
receipt-nbr-rcvd | receipt-nbr-rcvd <Sip::CasTimerProfReceipNbrRecv> ] [ no meter-pulse-dur | meter-pulse-dur
<Sip::CasTimerProfMeterPulseDur> ] )
```

Command Parameters

Table 40.35-1 "Voice Sip Cas Timer Profile Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(prof-name)	Format: - the name of a timer profile - length: 1<=x<=32	The unique name identifier of an row in the sipCasTimerProfileTable.

Table 40.35-2 "Voice Sip Cas Timer Profile Configuration Commands" Command Parameters

Parameter	Type	Description
[no] version-nbr	Parameter type: <Sip::CasTimerProfVersionNbr> Format: - a version number of the profile - range: [1...65535]	<i>optional parameter with default value: 1</i> The version number to the profile.
appl-bitmap	Parameter type: <Sip::CasTimerProfAppliBitmap> Format:	<i>mandatory parameter</i> A bitmap that allows to indicate

Parameter	Type	Description
	(cas-2bit-dtmf cas-1bit-dtmf cas-1bit-decade cas-1bit-mfc-fw cas-1bit-mfc-gr-fw-bw cas-2bit-mfc-gr-fw-bw) Possible values: - cas-2bit-dtmf : Indicate the timer objects of sipCasTimerProfileSeizeAck, sipCasTimerProfileClearBackAck, sipCasTimerProfileClearForwardAck, sipCasTimerProfileCallProcess, sipCasTimerProfileSeizureStateTime - cas-1bit-dtmf : Indicate the timer objects of sipCasTimerProfileClearBackAck, sipCasTimerProfileClearForwardAck, sipCasTimerProfileCallProcess, sipCasTimerProfileDelayDialingMinDuration, sipcasTimerProfileDelayDialingMaxDuration, sipCasTimerProfileSeizureStateTime - cas-1bit-decade : Indicate the timer objects of sipCasTimerProfileClearBackAck, sipCasTimerProfileClearForwardAck, sipCasTimerProfileCallProcess, sipCasTimerProfileDelayDialingMinDuration, sipCasTimerProfileDelayDialingMaxDuration, sipCasTimerProfileSeizureStateTime, sipCasTimerProfileDecadicAFPulseDuration, sipCasTimerProfileDecadicAFBreakDuration, sipCasTimerProfileDpInterdigitPeriod - cas-1bit-mfc-fw : Indicate the timer objects of sipCasTimerProfileClearBackAck, sipCasTimerProfileClearForwardAck, sipCasTimerProfileCallProcess, sipCasTimerProfileDelayDialingMinDuration, sipcasTimerProfileDelayDialingMaxDuration, sipCasTimerProfileRingForward - cas-1bit-mfc-gr-fw-bw : Indicate the timer objects of sipCasTimerProfileClearBackAck, sipCasTimerProfileClearForwardAck, sipCasTimerProfilePresenceForwardSig, sipCasTimerProfileReceiptForwardSig, sipCasTimerProfileCallProcess, sipCasTimerProfileSeizureStateTime, sipCasTimerProfileRegisterRecallMinDuration, sipCasTimerProfileRegisterRecallMaxDuration, sipCasTimerProfileReceiptNumberReceived - cas-2bit-mfc-gr-fw-bw : Indicate the timer objects of sipCasTimerProfileSeizeAck, sipCasTimerProfileClearBackAck, sipCasTimerProfileClearForwardAck, sipCasTimerProfilePresenceForwardSig, sipCasTimerProfileReceiptForwardSig, sipCasTimerProfileReanswer, sipCasTimerProfileCallProcess, sipCasTimerProfileRegisterRecallMinDuration, sipCasTimerProfileRegisterRecallMaxDuration,	the timer objects that are applicable to the profile.

40 Voice Configuration Commands

Parameter	Type	Description
	sipCasTimerProfileMeteringPulseDuration	
[no] seize-ack	Parameter type: <Sip::CasTimerProfSeizeAck> Format: - Timer for the receipt of the SEIZURE ACK Signal. - unit: millisecond - range: [100...1000]	<i>optional parameter with default value: "200"</i> Timer for the receipt of the SEIZURE ACK Signal. The unit is millisecond.
[no] clear-back-ack	Parameter type: <Sip::CasTimerProfClearBwAck> Format: - Timer for the receipt of the CLEAR BACK ACK Signal. - unit: second - range: [1...360]	<i>optional parameter with default value: "90"</i> Timer for the receipt of the CLEAR BACK ACK Signal. The unit is second.
[no] clear-fw-ack	Parameter type: <Sip::CasTimerProfClearFwAck> Format: - Timer for the receipt of the CLEAR FORWARD ACK Signal. - unit: second - range: [1...360]	<i>optional parameter with default value: "90"</i> Timer for the receipt of the CLEAR FORWARD ACK Signal. The unit is second.
[no] presence-fw-sig	Parameter type: <Sip::CasTimerProfPresenceFwSig> Format: - Timer that defines the interval for the presence of the FORWARDING Signal. - unit: second - range: [1...36]	<i>optional parameter with default value: "15"</i> Timer that defines the interval for the presence of the FORWARDING Signal. The unit is second.
[no] receipt-fw-sig	Parameter type: <Sip::CasTimerProfReceiptFwSig> Format: - Timer that defines the interval for the receipt of the FORWARDING Signal. - unit: second - range: [1...20]	<i>optional parameter with default value: "7"</i> Timer that defines the interval for the receipt of the FORWARDING Signal. The unit is second.
[no] re-answer	Parameter type: <Sip::CasTimerProfReAnswer> Format: - The re-answer timer on terminated calls to the TDM R2 side. - unit: second - range: [0...360]	<i>optional parameter with default value: "90"</i> The re-answer timer on terminated calls to the TDM R2 side. The unit is second.
[no] call-process	Parameter type: <Sip::CasTimerProfCallProcess> Format: - Timer for the call process. The timer is started after digit collection completed. - unit: second - range: [0...360]	<i>optional parameter with default value: "0"</i> Timer for the call process. The timer is started after digit collection completed. The unit is second.
[no] delay-dial-min	Parameter type: <Sip::CasTimerProfDelayDialingMinDur> Format: - Minimum time of the signal duration to recognize the delay-dialing signal (defined by ITU Q.311). - unit: millisecond - range: [140...500]	<i>optional parameter with default value: "220"</i> Minimum time of the signal duration to recognize the delay-dialing signal (defined by ITU Q.311). The unit is millisecond.
[no] delay-dial-max	Parameter type: <Sip::CasTimerProfDelayDialingMaxDur> Format: - Maximum time of the signal duration to recognize the delay-dialing signal (defined by ITU Q.311). - unit: millisecond - range: [140...500]	<i>optional parameter with default value: "250"</i> Maximum time of the signal duration to recognize the delay-dialing signal (defined by ITU Q.311). The unit is millisecond.
[no] seize-state-time	Parameter type: <Sip::CasTimerProfSeizeStateTime> Format:	<i>optional parameter with default value: "600"</i>

Parameter	Type	Description
	- The timer is used to indicate how long after the seizure signal. The value is set as 0 means that SVG will not start this timer and value 0 only apply to cas-2bit-dtmf signalling type termination. The actual valid range is from 200 ms to 1500 ms. - unit: millisecond - range: [0,200...1500]	The timer is used to indicate how long after the seizure signal, the originating side will start sending the CdPN, for those cases where the line signaling has no indication from the calling side that seizure is accepted. The value is set as 0 means that SVG will not start this timer and value 0 only apply to cas-2bit-dtmf signalling type termination. The actual valid range is from 200 ms to 1500 ms. The unit is millisecond.
[no] reg-recall-min	Parameter type: <Sip::CasTimerProfRegRecallMinDur> Format: - Minimum time of the signal duration to recognize the Register-recall signal. - unit: millisecond - range: [30...2000]	<i>optional parameter with default value: "40"</i> Minimum time of the signal duration to recognize the Register-recall signal. The unit is millisecond.
[no] reg-recall-max	Parameter type: <Sip::CasTimerProfRegRecallMaxDur> Format: - Maximum time of the signal duration to recognize the Register-recall signal. - unit: millisecond - range: [30...2000]	<i>optional parameter with default value: "890"</i> Maximum time of the signal duration to recognize the Register-recall signal. The unit is millisecond.
[no] decadic-pulse-dur	Parameter type: <Sip::CasTimerProfDpDur> Format: - Length of time for the generation of the Decadic Pulse signal. - unit: millisecond - range: [20...100]	<i>optional parameter with default value: "60"</i> Length of time for the generation of the Decadic Pulse signal. The unit is millisecond.
[no] decadic-break-dur	Parameter type: <Sip::CasTimerProfDpBreakDur> Format: - Length of time for the generation of the Decadic Pulse signal. - unit: millisecond - range: [20...100]	<i>optional parameter with default value: "40"</i> Length of time for the generation of the Decadic Pulse break. The unit is millisecond.
[no] inter-digit-peri	Parameter type: <Sip::CasTimerProfInterDigitPeriod> Format: - Timer for the inter-digit pauses. - unit: millisecond - range: [200...2000]	<i>optional parameter with default value: "600"</i> Timer for the inter-digit pauses. The unit is millisecond.
[no] ring-fw	Parameter type: <Sip::CasTimerProfRingForward> Format: - Length of time for the generation of the ring-forward signal (Q.311). - unit: second - range: [65...135]	<i>optional parameter with default value: "100"</i> Length of time for the generation of the ring-forward signal (Q.311). The unit is second.
[no] receipt-nbr-rcvd	Parameter type: <Sip::CasTimerProfReceipNbrRecv> Format: - Timer for the receipt of the Number-received signal. - unit: second - range: [15...100]	<i>optional parameter with default value: "30"</i> Timer for the receipt of the Number-received signal. The unit is second.
[no] meter-pulse-dur	Parameter type: <Sip::CasTimerProfMeterPulseDur> Format: - Length of time for the generation of the metering pulse.	<i>optional parameter with default value: "150"</i> Length of time for the generation

40 Voice Configuration Commands

Parameter	Type	Description
	- unit: millisecond - range: [50...500]	of the metering pulse. The unit is millisecond.

40.36 Network Element Table Configuration Commands

Command Description

This command allows the operator to configure Network Element Table.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no network-element cap-id <Sip::CapId> ne-id <Sip::NeId> ) | ( network-element cap-id
<Sip::CapId> ne-id <Sip::NeId> ne-name <Sip::NeName> [ no role | role <Sip::NeRole> ] [ no admin-status |
admin-status <Sip::NeAdminStatus> ] [ no ip | ip <SIP::IpAddressAndMask> ] [ no vlan-id | vlan-id
<Sip::NeVlanId> ] )
```

Command Parameters

Table 40.36-1 "Network Element Table Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
cap-id	Parameter type: <Sip::CapId> Format: - the central access point id - range: [1...16]	The unique identifier of this central access point
ne-id	Parameter type: <Sip::NeId> Format: - the network element id - range: [1...8]	The unique identifier of this network element

Table 40.36-2 "Network Element Table Configuration Commands" Command Parameters

Parameter	Type	Description
ne-name	Parameter type: <Sip::NeName> Format: - the name of the network element - length: x<=32	<i>mandatory parameter</i> The operator friendly name of this network element
[no] role	Parameter type: <Sip::NeRole> Format: (local-ne remote-ne cap-ne) Possible values: - local-ne : the entry of a REMOTE NE is configured in that same REMOTE NE	<i>optional parameter with default value: "cap-ne"</i> The CAP related role of the network element

40 Voice Configuration Commands

Parameter	Type	Description
	- remote-ne : the entry of a REMOTE NE is configured in the CAP NE or another REMOTE NE - cap-ne : the entry of the CAP NE is configured in the CAP NE or a remote NE	
[no] admin-status	Parameter type: <Sip::NeAdminStatus> Format: (up down) Possible values: - up : the ISAMv NE can be addressed - down : the ISAMv NE cannot be addressed	<i>optional parameter with default value: "down"</i> administrative status of this network element
[no] ip	Parameter type: <SIP::IpAddressAndMask> Format: <Ip::V4Address> / <Sip::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <Sip::PrefixLength> - prefix length of the subnet - range: [0...128]	<i>optional parameter with default value: "0.0.0.0/0"</i> The internal communication IP address that applies to the NIAT-A LT boards
[no] vlan-id	Parameter type: <Sip::NeVlanId> Format: - The VLAN ID used by the internal communication between the CAP and the NIAT-A LT board - range: [0...4093]	<i>optional parameter with default value: "0"</i> The VLAN ID used by the internal communication between the CAP and the NIAT-A LT board

40.37 Voice Sip Call Query Configuration Commands

Command Description

This command allows the operator to create and start a call query for active call.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice sip ( no call-query (id) ) | ( call-query (id) [ no timeout-period | timeout-period
<Sip::TimeoutPeriod> ] target-dn <Sip::CallQueryTargetDN> [ no remote-dn | remote-dn
<Sip::CallQueryRemoteDN> ] [ no type | type <Sip::CallQueryType> ] )
```

Command Parameters

Table 40.37-1 "Voice Sip Call Query Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(id)	Format: - the index of call query session - range: [1]	The unique identifier of this call query session

Table 40.37-2 "Voice Sip Call Query Configuration Commands" Command Parameters

Parameter	Type	Description
[no] timeout-period	Parameter type: <Sip::TimeoutPeriod> Format: - Allows to set the whole timer of sending call query request to all configured LTs and receiving query results of these LTs. - unit: second - range: [1...255]	<i>optional parameter with default value: 10</i> Allows to set the whole timer of sending call query request to all configured LTs and receiving query results of these LTs.
target-dn	Parameter type: <Sip::CallQueryTargetDN> Format: - The Target DN is a number that is registered on that specific SVG shelf. It can be a GDN number or Puid number (for ISDN and CAS), and it can be either the calling or called number. If uri is configured, the Target DN should be consistent with user part in configured uri. If uri is not configured, the Target DN should be consistent with directory number. - length: 1<=x<=32	<i>mandatory parameter</i> The Target DN is a number that is registered on that specific SVG shelf. It can be a GDN number or Puid number (for ISDN and CAS), and it can be either the calling or called number. If uri is configured, the Target DN should be consistent with user part in configured uri. If uri is not configured, the Target DN should

40 Voice Configuration Commands

Parameter	Type	Description
		be consistent with directory number.
[no] remote-dn	Parameter type: <Sip::CallQueryRemoteDN> Format: - The Remote DN can be any number, this is the number with which the Target DN is expected to be in a call. - length: x<=32	<i>optional parameter with default value: ""</i> The Remote DN can be any number, this is the number with which the Target DN is expected to be in a call.
[no] type	Parameter type: <Sip::CallQueryType> Format: (pots isdn-pri cas) Possible values: - pots : only transfer request data to NPOT-B/NPOT-C and receive POTS call query results from them. - isdn-pri : only transfer request data to NIAT-A and receive ISDN-PRI call query results from them. - cas : only transfer request data to NIAT-A and receive CAS call query results from them.	<i>optional parameter with default value: "pots"</i> Allows to configure which type of call will be queried on Target DN.

40.38 Voice Cluster Configuration Commands

Command Description

This command allows the operator to manage the Voice Cluster.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

> configure voice cluster (cluster-id)

Command Parameters

Table 40.38-1 "Voice Cluster Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster

40.39 Voice Megaco IP Configuration Commands

Command Description

This command allows the operator to manage the Voice Megaco xvps ip.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) ip [ no ivps-ip | ivps-ip <Ip::V4Address> ] [ no netmask | netmask
<Ip::V4Address> ] [ no router-ip | router-ip <Ip::V4Address> ] [ vlan-id <MEGACO::ivpsXLESVLAN> ] [ no
ip-mode | ip-mode <MEGACO::voiceIPConfigMode> ] [ no dhcption60 | dhcption60
<MEGACO::voiceIPDhcpv4Option60> ] [ no private-ip | private-ip <Ip::V4Address> ] [ no private-netmask |
private-netmask <Ip::V4Address> ] [ no private-vlan-id | private-vlan-id <MEGACO::ivpsPrivateVLAN> ]
```

Command Parameters

Table 40.39-1 "Voice Megaco IP Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster

Table 40.39-2 "Voice Megaco IP Configuration Commands" Command Parameters

Parameter	Type	Description
[no] ivps-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> xles ip address of this xvps cluster.When operator configure Ip parameters first time ,operator should provide ivps-ip,netmask and vlan-id at the same time.
[no] netmask	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> xles ip subnet mask address of this xvps cluster.When operator configure Ip parameters first time ,operator should provide ivps-ip,netmask and vlan-id at the same time.
[no] router-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the next hop ip address of this

Parameter	Type	Description
		xvps cluster. When operator configure Ip parameters first time ,operator should provide ivps-ip,netmask and vlan-id at the same time.
vlan-id	Parameter type: <MEGACO::ivpsXLESVLAN> Format: - the vlan id of xvps - range: [0...4093]	<i>optional parameter</i> vlan id of voice xvps cluster
[no] ip-mode	Parameter type: <MEGACO::voiceIPConfigMode> Format: (dhcp manual) Possible values: - dhcp : The ip mode is dhcp - manual : The ip mode is manual	<i>optional parameter with default value: "manual"</i> the configure mode of the IP addresses
[no] dhcption60	Parameter type: <MEGACO::voiceIPDhcpv4Option60> Format: - DHCP option 60 for the DHCP client - length: x<=64	<i>optional parameter with default value: ""</i> the DHCP option 60 for the DHCP client
[no] private-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the private ip address of voice xvps cluster. When operator configure Ip parameters first time ,operator should provide ivps-ip,netmask and vlan-id at the same time.
[no] private-netmask	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the private ip subnet mask address of voice xvps cluster. When operator configure Ip parameters first time ,operator should provide ivps-ip,netmask and vlan-id at the same time.
[no] private-vlan-id	Parameter type: <MEGACO::ivpsPrivateVLAN> Format: - the private vlan id of xvps - range: [0...4093]	<i>optional parameter with default value: 0</i> the private vlan of voice xvps cluster. When operator configure Ip parameters first time ,operator should provide ivps-ip,netmask and vlan-id at the same time.

40.40 Voice Megaco Equipment Configuration Commands

Command Description

This command allows the operator to manage the Voice equipment. One ivps can manage at most 256 equipments, so the id of equipment is from 1 to 256.

If you want to configure a board or a termination, you must configure a equipment first.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) ( no equipment (equip-id) ) | ( equipment (equip-id) asam-id
<MEGACO::accessEquipmentAsamId> ip-address <Ip::V4Address> [ no next-hop | next-hop <Ip::V4Address> ] )
```

Command Parameters

Table 40.40-1 "Voice Megaco Equipment Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(equip-id)	Format: - id of equipment - range: [1...32]	uniquely identify of this equipment

Table 40.40-2 "Voice Megaco Equipment Configuration Commands" Command Parameters

Parameter	Type	Description
asam-id	Parameter type: <MEGACO::accessEquipmentAsamId> Format: - the equipment asam id of ne - range: [a-zA-Z0-9-_.] - length: x<=64	<i>mandatory parameter</i> asam identify of this ne
ip-address	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> the voice ip address of this isam-v ne.
[no] next-hop	Parameter type: <Ip::V4Address> Format:	<i>optional parameter with default value: "0.0.0.0"</i>

Parameter	Type	Description
	- IPv4-address	the ip address of the next hop for this isam-v ne

40.41 Voice Megaco Equipment Board Configuration Commands

Command Description

This command allows the operator to manage the Voice board. Before you configure a board, you must configure a equipment first.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) equipment (equip-id) ( no board (board-id) ) | ( board (board-id) planned-type
<Equipm::BoardFuncType> lanx-port <MEGACO::accessBoardLanxPort> )
```

Command Parameters

Table 40.41-1 "Voice Megaco Equipment Board Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(equip-id)	Format: - id of equipment - range: [1...32]	uniquely identify of this equipment
(board-id)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number	uniquely identify of this board. the CLI slot numbering method is based on logical concept. for XD shelf, CLI logic slot-id(1 to 16) is mapped to physical slot-id from 4 to 19. for FD shelf, CLI logic slot-id(1 to 16) is mapped to physical slot-id from 1 to 8 and 12 to 19. In extend-lt mode, the slot-id range shall be 1 to 18. For XD shelf, CLI logic slot-id(17 to 18) is mapped to physical slot-id from 2 to 3. for FD shelf, CLI logic slot-id(17 to 18) is mapped to physical slot-id from 10 to 11

Table 40.41-2 "Voice Megaco Equipment Board Configuration Commands" Command Parameters

Parameter	Type	Description
planned-type	Parameter type: <Equipm::BoardFuncType> Format: (nbat-b nbat-a npot-a nvps-a nvps-c polt-b npot-b npot-c ivps-b balt-a ivps-a polt-a isdn-24l pots-48l) Possible values: - nbat-b : ISDN Basic Access line termination board for FD (4B3T) - nbat-a : ISDN Basic Access line termination board for FD - npot-a : 48 Pots Only LT board for FD - nvps-a : Isam Voice Packet Server for FD - nvps-c : Isam Voice Packet Server for FD - polt-b : 48 Pots Only LT board for XD - npot-b : 72 Pots Only LT board for FD - npot-c : 48 Pots Only LT board for FD - ivps-b : Isam Voice Packet Server for XD - balt-a : 48 ISDN Only LT board for XD - ivps-a : Isam Voice Packet Server for XD - polt-a : 48 Pots Only LT board for XD - isdn-24l : 24 ISDN LT board for XD/FD, only for migration, can not be configured - pots-48l : 48 Pots LT board for XD/FD, only for migration, can not be configured	<i>mandatory parameter</i> the type of user board
lanx-port	Parameter type: <MEGACO::accessBoardLanxPort> Format: - the logic slot of board - range: [1...32]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> the logic slot of this board

40.42 Voice Megaco Equipment Termination Configuration Commands

Command Description

This command allows the operator to manage the Voice termination. Before you configure a termination, you must configure a equipment first.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) equipment (equip-id) ( no termination (port-id) ) | ( termination (port-id) [ no
type | type <MEGACO::accTerminationUserPortType> ] [ no isdn-codec | isdn-codec
<MEGACO::IsdnCodecType> ] [ no switch-type | switch-type <MEGACO::accTerminationPacketSwitchType> ] [
no activate-type | activate-type <MEGACO::accTerminationL1ActivateType> ] [ termination-id
<MEGACO::accessTerminationId> ] media-gateway-id <MEGACO::MediaGatewayId> [ no admin-status |
admin-status <MEGACO::accTerminationAdminStatus> ] [ no line-feed | line-feed
<MEGACO::accTerminationLineCharact> ] [ no rx-gain | rx-gain <MEGACO::accTerminationRxGain> ] [ no
tx-gain | tx-gain <MEGACO::accTerminationTxGain> ] [ no impedance | impedance
<MEGACO::accTerminationImpedance> ] [ no rtp-dscp | rtp-dscp <MEGACO::accTerminationVoiceDscp> ] [ no
rtp-pbits | rtp-pbits <MEGACO::accTerminationVoiceDot1P> ] [ no clip-mode | clip-mode
<MEGACO::accTerminationETSIClipDataMode> ] [ no metering-type | metering-type
<MEGACO::accTerminationMeteringPulseType> ] [ no directory-number | directory-number
<MEGACO::accTerminationDirectoryNumber> ] [ no voice-service | voice-service
<MEGACO::accTermVoiceServAtMgc> ] [ no reserved | reserved <MEGACO::accTerminationReserved> ] )
```

Command Parameters

Table 40.42-1 "Voice Megaco Equipment Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(equip-id)	Format: - id of equipment - range: [1...32]	uniquely identify of this equipment
(port-id)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId>	unique identifier of this termination port

Resource Identifier	Type	Description
	- the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	

Table 40.42-2 "Voice Megaco Equipment Termination Configuration Commands" Command Parameters

Parameter	Type	Description
[no] type	Parameter type: <MEGACO::accTerminationUserPortType> Format: (pstn isdn) Possible values: - pstn : the termination type is pstn - isdn : the termination type is isdn	<i>optional parameter with default value: "pstn"</i> The type of termination user port
[no] isdn-codec	Parameter type: <MEGACO::IsdnCodecType> Format: (alaw ulaw) Possible values: - alaw : the codec type on TDM side of isdn is a_law - ulaw : the codec type on TDM side of isdn is u_law	<i>optional parameter with default value: "alaw"</i> the type of isdn codec on TDM side
[no] switch-type	Parameter type: <MEGACO::accTerminationPacketSwitchType> Format: (enable disable) Possible values: - enable : the packet switch type is enable - disable : the packet switch type is disable	<i>optional parameter with default value: "disable"</i> The type of the packet switch type, only for type isdn
[no] activate-type	Parameter type: <MEGACO::accTerminationL1ActivateType> Format: (permanent percall) Possible values: - permanent : the layer1 activate type is permanent - percall : the layer1 activate type is percall	<i>optional parameter with default value: "permanent"</i> The type of the layer1 activate type, only for type isdn
termination-id	Parameter type: <MEGACO::accessTerminationId> Format: - the termination id, if it is not specified, system will automatically assign a free one in range - range: [0...32767]	<i>optional parameter</i> The id of termination, if not entered during creating, it will be assigned by system
media-gateway-id	Parameter type: <MEGACO::MediaGatewayId> Format: - the media gateway table index - range: [1]	<i>mandatory parameter</i> The id of media gateway
[no] admin-status	Parameter type: <MEGACO::accTerminationAdminStatus> Format: (locked unlocked) Possible values: - locked : the admin status of termination is locked	<i>optional parameter with default value: "locked"</i> The administrative status of termination

40 Voice Configuration Commands

Parameter	Type	Description
	- unlocked : the admin status of termination is unlocked	
[no] line-feed	Parameter type: <MEGACO::accTerminationLineCharact> Format: (25 40) Possible values: - 25 : the line character is 25 mA - 40 : the line character is 40 mA	<i>optional parameter with default value: "25"</i> The line character of this termination, only for type pstn
[no] rx-gain	Parameter type: <MEGACO::accTerminationRxGain> Format: - the termination rx-gain - range: [-14...6]	<i>optional parameter with default value: "0"</i> The rx-gain of this termination, only for type pstn
[no] tx-gain	Parameter type: <MEGACO::accTerminationTxGain> Format: - the termination tx-gain - range: [-14...6]	<i>optional parameter with default value: "0"</i> The tx-gain of this termination, only for type pstn
[no] impedance	Parameter type: <MEGACO::accTerminationImpedance> Format: (default 200 220 220minisplitter 270 300 370 600 900 370minisplitter 600splitter 370nvlsasplitter 370skinnysplitter 270duratelsplitter 2703msplitter 100 150 220splitter reserv19 reserv20 reserv21) Possible values: - default : the impedance is default vaule - 200 : the line impedance is 200 ohm - 220 : the line impedance is 220 ohm - 220minisplitter : the line impedance is 220 ohm+ miniSplitter - 270 : the line impedance is 270 ohm - 300 : the line impedance is 300 ohm - 370 : the line impedance is 370 ohm - 600 : the line impedance is 600 ohm - 900 : the line impedance is 900 ohm - 370minisplitter : the line impedance is 370 ohm+ miniSplitter - 600splitter : the line impedance is 600 ohm+ Splitter - 370nvlsasplitter : the line impedance is 370 ohm+ NVLSASplitter - 370skinnysplitter : the line impedance is 370 ohm+ SkinnySplitter	<i>optional parameter with default value: "default"</i> The impedance of this termination, only for type pstn

Parameter	Type	Description
	- 270duratelsplitter : the line impedance is 270 ohm+ DuratelSplitter - 2703msplitter : the line impedance is 270 ohm+ 3MDplitter - 100 : the line impedance is 100 ohm - 150 : the line impedance is 150 ohm - 220splitter : the line impedance is 220 ohm+ Splitter - reserv19 : reserved for future use 19 - reserv20 : reserved for future use 20 - reserv21 : reserved for future use 21	
[no] rtp-dscp	Parameter type: <MEGACO::accTerminationVoiceDscp> Format: - the termination voice dscp - range: [-1...63]	<i>optional parameter with default value: "-1"</i> the voice dscp of termination
[no] rtp-pbits	Parameter type: <MEGACO::accTerminationVoiceDot1P> Format: - the termination voice p-bit - range: [-1...7]	<i>optional parameter with default value: "-1"</i> the voice p-bit of termination
[no] clip-mode	Parameter type: <MEGACO::accTerminationETSIClipDataMode> Format: (cdevalue fsk dtmf) Possible values: - cdevalue : cde configuration will be applied for etsi clip - fsk : fsk will be applied for etsi clip - dtmf : dtmf will be applied for etsi clip	<i>optional parameter with default value: "cdevalue"</i> the etsi clip data transmission protocol of this access termination, it can only be configured in pstn line cards
[no] metering-type	Parameter type: <MEGACO::accTerminationMeteringPulseType> Format: (pulse polarityreverse) Possible values: - pulse : 12/16 KHz sine waveform pulse will be applied for metering pulse - polarityreverse : line polarity reverse pulse will be applied for metering pulse	<i>optional parameter with default value: "pulse"</i> the metering pulse type of this access termination, it can only be configured on pstn line
[no] directory-number	Parameter type: <MEGACO::accTerminationDirectoryNumber> Format: - the termination directory number. '#' is invalid character - length: 1<=x<=16	<i>optional parameter with default value: ""</i> the directory number of this access termination, it can be configured on pstn and ISDN BA line
[no] voice-service	Parameter type: <MEGACO::accTermVoiceServAtMgc> Format: (enabled disabled) Possible values: - enabled : The voice service of termination is enabled - disabled : The voice service of termination is disabled	<i>optional parameter with default value: "enabled"</i> voice service provision of termination
[no] reserved	Parameter type: <MEGACO::accTerminationReserved> Format: - reserved for future usage - length: x<=32	<i>optional parameter with default value: ""</i> reserved for future usage

40.43 Voice Megaco Termination Configuration Commands

Command Description

This command allows the operator to enable/disable tca or configure the threshold for rtp packetloss, jitter and delay of the Voice termination.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) equipment (equip-id) termination (port-id) tca [ no tca-enable | tca-enable
<MEGACO::accTerminationTCAEnable> ] [ no rtp-pktloss-thres | rtp-pktloss-thres
<MEGACO::accTerminationRtpPacketLossTCAThreshold> ] [ no rtp-jitter-thres | rtp-jitter-thres
<MEGACO::accTerminationRtpJitterTCAThreshold> ] [ no rtp-delay-thres | rtp-delay-thres
<MEGACO::accTerminationRtpDelayTCAThreshold> ]
```

Command Parameters

Table 40.43-1 "Voice Megaco Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(equip-id)	Format: - id of equipment - range: [1...32]	uniquely identify of this equipment
(port-id)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	unique identifier of this termination port

Table 40.43-2 "Voice Megaco Termination Configuration Commands" Command Parameters

Parameter	Type	Description
[no] tca-enable	Parameter type: <MEGACO::accTerminationTCAEnable> Format: (enabled disabled) Possible values: - enabled : enable tca alarm report - disabled : disable tca alarm report	<i>optional parameter with default value: "disabled"</i> Allows to enable/disable the Threshold Crossing Alarm feature for this termination
[no] rtp-pktloss-thres	Parameter type: <MEGACO::accTerminationRtpPacketLossTCAThreshold> Format: - the packet loss threshold for the termination - range: [0...100]	<i>optional parameter with default value: 1</i> the rtp packet loss threshold of this megaco termination,a value 0 means TCA_packetloss will be disabled
[no] rtp-jitter-thres	Parameter type: <MEGACO::accTerminationRtpJitterTCAThreshold> Format: - the interarrival jitter threshold for the termination - unit: millisec - range: [0...2147483647]	<i>optional parameter with default value: 60</i> the rtp interarrival jitter threshold of this megaco termination,a value 0 means TCA_jitter will be disabled
[no] rtp-delay-thres	Parameter type: <MEGACO::accTerminationRtpDelayTCAThreshold> Format: - the round trip delay threshold for the termination - unit: millisec - range: [0...2147483647]	<i>optional parameter with default value: 400</i> the rtp round trip delay threshold of this megaco termination,a value 0 means TCA_delay will be disabled

40.44 Voice Megaco Termination Lawful Intercept Configuration Commands

Command Description

This command allows the operator to enable/disable lawful intercept and configure the src-port,dest-ip,dest-port for li stream. the src ip is same as rtp ip.

User Level

The command can be accessed by operators with li_voice privileges, and executed by operators with li_voice privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) equipment (equip-id) termination (port-id) ( no li ) | ( li [ no state | state
<MEGACO::accTerminationLI> ] src-port <MEGACO::accTerminationLISrcUdpPort> dest-ip <Ip::V4Address>
dest-port <MEGACO::accTerminationLIDestUdpPort> )
```

Command Parameters

Table 40.44-1 "Voice Megaco Termination Lawful Intercept Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(equip-id)	Format: - id of equipment - range: [1...32]	uniquely identify of this equipment
(port-id)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	unique identifier of this termination port

Table 40.44-2 "Voice Megaco Termination Lawful Intercept Configuration Commands" Command Parameters

Parameter	Type	Description
[no] state	Parameter type: <MEGACO::accTerminationLI> Format: (enabled disabled) Possible values: - enabled : enable lawful intercept - disabled : disable lawful intercept	<i>optional parameter with default value: "disabled"</i> allows to enable/disable the lawful intercept feature for this termination
src-port	Parameter type: <MEGACO::accTerminationLISrcUdpPort> Format: - the source udp port for lawful intercept - range: [49153...65535]	<i>mandatory parameter</i> the source udp port for lawful intercept. source ip address is same as voice ip
dest-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>mandatory parameter</i> the destination ip address for lawful intercept
dest-port	Parameter type: <MEGACO::accTerminationLIDestUdpPort> Format: - the destination udp port for lawful intercept - range: [0...65535]	<i>mandatory parameter</i> the destination udp port for lawful intercept

40.45 Voice Megaco Equipment Secondary Termination Configuration Commands

Command Description

This command allows the operator to manage the Voice secondary termination. Before you configure the secondary termination, you must configure an equipment and prime termination first.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) equipment (equip-id) ( no sharedlineterm (port-id) ) | ( sharedlineterm
(port-id) [ sharedlineterm-id <MEGACO::accessTerminationId> ] [ no admin-status | admin-status
<MEGACO::accTerminationAdminStatus> ] [ no directory-number | directory-number
<MEGACO::accTerminationDirectoryNumber> ] [ no voice-service | voice-service
<MEGACO::accTermVoiceServAtMgc> ] )
```

Command Parameters

Table 40.45-1 "Voice Megaco Equipment Secondary Termination Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(equip-id)	Format: - id of equipment - range: [1...32]	uniquely identify of this equipment
(port-id)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	unique identifier of the secondary termination port

Table 40.45-2 "Voice Megaco Equipment Secondary Termination Configuration Commands"

Command Parameters

Parameter	Type	Description
sharedlineterm-id	Parameter type: <MEGACO::accessTerminationId> Format: - the termination id, if it is not specified, system will automatically assign a free one in range - range: [0...32767]	<i>optional parameter</i> The id of the secondary termination, if not set manually during creating, it will be assigned by system
[no] admin-status	Parameter type: <MEGACO::accTerminationAdminStatus> Format: (locked unlocked) Possible values: - locked : the admin status of termination is locked - unlocked : the admin status of termination is unlocked	<i>optional parameter with default value: "locked"</i> The administrative status of the secondary termination
[no] directory-number	Parameter type: <MEGACO::accTerminationDirectoryNumber> Format: - the termination directory number. '#' is invalid character - length: 1<=x<=16	<i>optional parameter with default value: ""</i> the directory number of this access secondary termination
[no] voice-service	Parameter type: <MEGACO::accTermVoiceServAtMgc> Format: (enabled disabled) Possible values: - enabled : The voice service of termination is enabled - disabled : The voice service of termination is disabled	<i>optional parameter with default value: "enabled"</i> voice service provision of the secondary termination

40.46 Voice Megaco Media Gateway Configuration Commands

Command Description

This command allows the operator to manage the Voice Megaco media gateway.

- pstn-term-format: the termination id format pattern of pstn user.

If termid-type is hierarchy, It should be a string constructed according to the following rule:

[prefix][['Dslam_Id']][deli1]][['rack']][formater][deli2]]'shelf'[formater][deli3]'slot'[formater][deli4]'port'[formater] and thereinto:

'Dslam_Id' is key to indicate whether the Dslam id should be filled into hierarchy termination id. It is optional.

'rack' is key to indicate whether the rack id should be filled into hierarchy termination id. It is optional.

'shelf' is key to indicate the shelf id. It is mandatory.

'slot' is key to indicate the slot id. It is mandatory.

'port' is key to indicate the port id. It is mandatory.

Each key should present only once and the order of the keys should keep as in the rule.

deli can be zero or several characters, be note that the char must be valid for MEGACO termination id.

formater is a format string to indicate how ISAMV should format the id right before it. It must be constructed by zero or at most five digits. The number of digits indicate the minimum width of the id in the termination id, so if the width of the id is less than number of digits in formater, '0' is filling at the beginning. The value that converted by the digits into a integer indicates the value of the first device NO. in the termination id. If the no digit existing, it indicates that no format need to be applied.

prefix is a string constructed by any character that is valid for MEGACO termination id.

At least one of the deli and the formater must be presenting after the key(exclude 'Dslam_Id').

for example:

format string port position termination id

(dslamid/rack/shelf/slot/port)

AL/Dslam_Id/rack/shelf/slot/port nod01/1/1/1/1 AL/nod01/1/1/1/1

AL/Dslam_Id/shelf/slot/port nod01/1/1/1/1 AL/nod01/1/1/1

AL/rack/shelf/slot/port nod01/1/1/1/1 AL/1/1/1/1

AL/rack0/shelf0/slot0/port00 nod01/1/1/1/1 AL/0/0/0/00

ALDslam_Idrack0shelf0slot0port00 nod01/1/1/1/1 ALnod0100000

ALDslam_Idrack0shelf0slot0port0 nod01/1/1/1/12 ALnod0100012

 If the termid-type is flat, It should be a string constructed according to the following rule:

`[prefix]['<tid'[formater]']>'`

and thereinto:

prefix is a string construct by any character that is valid for MEGACO termination id.

formater is a format string to indicate how ISAMV should format the id right before it.

It must be constructed by zero or at most five digits. The number of digits indicate the minimum width of the id in the termination id. If it contains no digit, it indicates that no format need to be applied. for example:

format string port position termination id

(termination-id)

`AL/ 0 AL/0`

`AL 0 AL0`

`AL<tid000> 0 AL000`

`AL<tid000> 888 AL888`

 - *isdn-term-format*: the termination id format pattern of isdn user.

If termid-type is hierarchy, It should be a string constructed according to the following rule:

`[prefix][['Dslam_Id']][deli1]][['rack']][formater][deli2]]'shelf'[formater][deli3]'slot'[formater][deli4]'port'[formater]][deli4]'channel'`

and thereinto:

'Dslam_Id' is key to indicate whether the Dslam id should be filled into hierarchy termination id.

It is optional.

'rack' is key to indicate whether the rack id should be filled into hierarchy termination id.

It is optional.

'shelf' is key to indicate the shelf id. It is mandatory.

'slot' is key to indicate the slot id. It is mandatory.

'port' is key to indicate the port id. It is mandatory.

'channel' is key to indicate channel id. It is mandatory.

Each key should present only once and the order of the keys should keep as in the rule.

deli can be zero or several characters, be note that the char must be valid for MEGACO termination id.

formater is a format string to indicate how ISAMV should format the id right before it. It must be constructed by zero or at most five digits. The number of digits indicate the minimum width of the id in the termination id, so if the width of the id is less than number of digits in *formater*, '0' is filling at the beginning. The value that converted by the digits into a integer indicates the value of the first device NO. in the termination id. If the no digit existing, it indicates that no format need to be applied. suffix already includes delimiter, so *deli4* is will be replaced by suffix.

prefix is a string constructed by any character that is valid for MEGACO termination id.

At least one of the *deli* and the *formater* must be presenting after the key(exclude 'Dslam_Id').

for example:

format string port position termination id

(*dslamid/rack/shelf/slot/port suffix*)

BA/Dslam_Id/rack/shelf/slot/port/channel nod01/1/1/1/1 /B1 BA/nod01/1/1/1/1/B1

BA/Dslam_Id/shelf/slot/port/channel nod01/1/1/1/1 /B1 BA/nod01/1/1/1/B1

BA/rack/shelf/slot/port/channel nod01/1/1/1/1 /B1 BA/1/1/1/1/B1

BA/rack0/shelf0/slot0/port00/channel/channel nod01/1/1/1/1 /B1 BA/0/0/0/00/B1

BADslam_Idrack0shelf0slot0port00 nod01/1/1/1/1 /B1 BAnod0100000/B1

BADslam_Idrack0shelf0slot0port0/channel nod01/1/1/1/12 B1 BAnod0100012B1

If the *termid-type* is *flat*,It should be a string constructed according to the following rule:

[*prefix*]['<*tid*'[*formater*]'>']

and thereinto:

prefix is a string construct by any character that is valid for MEGACO termination id.

formater is a format string to indicate how ISAMV should format the id right before it.It must be constructed by zero or at most five digits. The number of digits indicat the minimum width of the id in the termination id,If contains no digit, it indicat that no format need to be applied. ISDN termination id should not be zero because zero is reserved for special use of IID.

for example:

format string port position termination id

(*termination-id suffix*)

BA/ 1 /B1 BA/1/B1

BA 1 /B1 BA1/B1

BA<tid000> 1 /B1 BA001/B1

BA<tid000> 888 /B1 BA888/B1

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

> configure voice cluster (cluster-id) (no media-gateway (media-gateway-id)) | (media-gateway

```

(media-gateway-id) [ no name | name <MEGACO::mediaGatewayName> ] [ no ip-mode | ip-mode

```

Command Parameters

Table 40.46-1 "Voice Megaco Media Gateway Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(media-gateway-id)	Format: - the media gateway table index - range: [1]	uniquely identify of this media gateway

Table 40.46-2 "Voice Megaco Media Gateway Configuration Commands" Command Parameters

Parameter	Type	Description
[no] name	Parameter type: <MEGACO::mediaGatewayName> Format: - uniquely name of this media gateway - length: 1<=x<=64	<i>optional parameter with default value: "AG"</i> device name of media gateway, can be modified when mgi is locked, this parameter will be used for mg mid when mg-mid-type select device-name. only '*', '/', '_', '\$', '@', 'ALPHA', 'DIGIT', '-', '.' are valid for device-name.
[no] ip-mode	Parameter type: <MEGACO::voiceIPConfigMode> Format: (dhcp manual) Possible values: - dhcp : The ip mode is dhcp - manual : The ip mode is manual	<i>optional parameter with default value: "manual"</i> the ip mode of this media gateway
[no] dhcption60	Parameter type: <MEGACO::voiceIPDhcpv4Option60> Format: - DHCP option 60 for the DHCP client - length: x<=64	<i>optional parameter with default value: ""</i> the DHCP option 60 for the DHCP client
[no] ip-address	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the ip address of this media gateway
[no] netmask	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the netmask of this media gateway
[no] udp-port	Parameter type: <MEGACO::mediaGatewayUDPPort> Format: - the udp port of media gateway - range: [1025...65534]	<i>optional parameter with default value: 2944</i> the udp port of mgi
[no] router-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the next hop ip address of media gateway
vlan-id	Parameter type: <MEGACO::mediaGatewayVLAN> Format: - the vlan id of media gateway - range: [1...4093]	<i>mandatory parameter</i> the vlan id of this xvps cluster
[no] mgc-type	Parameter type: <MEGACO::mediaGatewayMgcType> Format: (general lucent-fs5000 alcatel-a5020 alcatel-e10 zte-zxss hw-soft3000 siemens nortel ericsson meta-softswitch italtel comverse	<i>optional parameter with default value: "general"</i> the type of media gateway controller

Parameter	Type	Description
	g6-gr303 other-vendor3 other-vendor4 other-vendor16 other-vendor17) Possible values: - general : The type of mgc is general - lucent-fs5000 : The type of mgc is lucent-fs5000 - alcatel-a5020 : The type of mgc is alcatel-a5020 - alcatel-e10 : The type of mgc is alcatel-e10 - zte-zxss : The type of mgc is zte-zxss - hw-soft3000 : The type of mgc is hw-soft3000 - siemens : The type of mgc is siemens - nortel : The type of mgc is nortel - ericsson : The type of mgc is ericsson - meta-softswitch : The type of mgc is meta-softswitch - italtel : The type of mgc is italtel - comverse : The type of mgc is comverse - g6-gr303 : The type of mgc is g6-gr303 - other-vendor3 : The type of mgc is other-vendor3 - other-vendor4 : The type of mgc is other-vendor4 - other-vendor16 : The type of mgc is other-vendor16 - other-vendor17 : The type of mgc is other-vendor17	
prim-mgc-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>mandatory parameter</i> the ip address of the primary media gateway controller
[no] mgc-id	Parameter type: <MEGACO::medGwyCtrlrCallServerId> Format: - a signed integer	<i>optional parameter with default value: 0</i> the identifier of the peer call server
[no] prim-mgc-udp	Parameter type: <MEGACO::medGwyCtrlrPrimaryUDPPort> Format: - the primary udp port of media gateway controller - range: [1...65534]	<i>optional parameter with default value: 2944</i> the udp port of primary mgc
[no] sec-mgc-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the ip address of the secondary media gateway controller
[no] sec-mgc-udp	Parameter type: <MEGACO::medGwyCtrlrSecondaryUDPPort> Format: - the secondary udp port of media gateway controller - range: [1...65534]	<i>optional parameter with default value: 2944</i> the udp port of secondary mgc
[no] tert-mgc-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the ip address of the tertiary media gateway controller
[no] tert-mgc-udp	Parameter type: <MEGACO::medGwyCtrlrTertiaryUDPPort> Format: - the tertiary udp port of media gateway controller - range: [1...65534]	<i>optional parameter with default value: 2944</i> the udp port of tertiary mgc
[no] quat-mgc-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the ip address of the quaternary media gateway controller

40 Voice Configuration Commands

Parameter	Type	Description
[no] quat-mgc-udp	Parameter <MEGACO::medGwyCtrlrQuaternaryUDPPort> Format: - the quaternary udp port of media gateway controller - range: [1...65534]	type: optional parameter with default value: 2944 the udp port of quaternary mgc
[no] esa-mgc-service	Parameter <MEGACO::mediaGatewayESAMgcService> Format: (enable disable) Possible values: - enable : enable local ESA mgc service - disable : disable local ESA mgc service	type: optional parameter with default value: "disable" the state of local ESA mgc service
[no] mg-mid-type	Parameter type: <MEGACO::mediaGatewayMidType> Format: (ipv4 ipv4-port domain-name domain-name-port device-name) Possible values: - ipv4 : The mg mid type is ipv4 - ipv4-port : The mg mid type is ipv4+port - domain-name : The mg mid type is domain-name - domain-name-port : The mg mid type is domain-name+port - device-name : The mg mid type is device-name	optional parameter with default value: "ipv4-port" the mid type of this media gateway: if ipv4 is selected, the MG ip-address will be used; if ipv4-port is selected, the MG ip-address + udp-port will be used; if domain-name is selected, the mg-domain-name will be used; if domain-name-port is selected, the mg-domain-name + udp-port will be used; if device-name is selected, the mg name will be used for mg mid.
[no] mg-domain-name	Parameter type: <MEGACO::mediaGatewayDomainName> Format: - domain name of this media gateway - length: 1<=x<=255	optional parameter with default value: "isamv.alcatel-lucent.com" the domain name of media gateway, used when mg-addr-type is domain-name or domain-name-port. only 'ALPHA','DIGIT', '-', ' ', '@' are valid for domainName; max length is 255.
[no] svcreason-format	Parameter <MEGACO::mediaGatewaySVCReasonFormat> Format: (with-quotation without-quotation) Possible values: - with-quotation : the mg service change reason format is with-quotation - without-quotation : the mg service change reason format is without-quotation	type: optional parameter with default value: "with-quotation" The format of service change reason, which used in H248 service change.
[no] mg-profile-name	Parameter type: <MEGACO::mediaGatewayProfileName> Format: - profile name of this media gateway - length: 1<=x<=64	optional parameter with default value: "AGW" profile name of this media gateway. which used in h248 message service change. the max number of the string is 64.
[no] admin-status	Parameter type: <MEGACO::mediaGatewayadminStatus> Format: (locked unlocked) Possible values:	optional parameter with default value: "locked" the administrative status of this media gateway

Parameter	Type	Description
	- locked : The admin status is locked - unlocked : The admin status is unlocked	
[no] termid-type	Parameter type: <MEGACO::mediaGwyTermFormat> Format: (hierarchy flat) Possible values: - hierarchy : The termination id format is hierarchy - flat : The termination id format is flat	<i>optional parameter with default value: "flat"</i> termination id format
[no] pstn-term-format	Parameter type: <MEGACO::mediaGwyPstnTermFormat> Format: - the termination id format pattern of pstn user, the termination id format type has two types:flat and hierarchy.Flat type: example AL; AALN;length: [1...10].Hierarchy type: example AL/Dslam_Id/rack/shelf/slot/port (Dslam_Id/rack optional) length: [1...72]. - length: 1<=x<=72	<i>optional parameter with default value: "AL"</i> the termination id format pattern of pstn user
isdn-term-format	Parameter type: <MEGACO::mediaGwyIsdnTermFormat> Format: - the termination id format pattern of isdn user, the termination id format type has two types:flat and hierarchy.Flat type: example BA;length: [1...10]. Hierarchy type: example BA/Dslam_Id/rack/shelf/slot/port/channel(Dslam_Id/rack optional) length:[1...72]. - length: 1<=x<=72	<i>optional parameter</i> the termination id format pattern of isdn user
isdn-suffix1	Parameter type: <MEGACO::mediaGwyIsdnSuffix> Format: - the suffix1 of the isdn user termination format - length: 1<=x<=8	<i>optional parameter</i> the suffix1 of the isdn user termination format
isdn-suffix2	Parameter type: <MEGACO::mediaGwyIsdnSuffix> Format: - the suffix1 of the isdn user termination format - length: 1<=x<=8	<i>optional parameter</i> the suffix2 of the isdn user termination format
[no] max-transhandling	Parameter type: <MEGACO::mediaGwyTMax> Format: - the max time of mgc handling the transaction - range: [1000...30000]	<i>optional parameter with default value: 16000</i> the max time of mgc handling the transaction, the unit is millisecond
[no] max-network-delay	Parameter type: <MEGACO::mediaGwyMaxNetworkDelay> Format: - the max network delay time, the unit is millisecond - range: [100...1000]	<i>optional parameter with default value: 500</i> the max network delay time, the unit is millisecond
[no] max-retrans	Parameter type: <MEGACO::mediaGwyMaxRetrans> Format: - the max retransmit times of the transaction, the unit is times - range: [7...11]	<i>optional parameter with default value: 7</i> the max retransmit times of the transaction
[no] red-bat-delay	Parameter type: <MEGACO::mediaGwyRedBatteryDelay> Format: - the delay before MGI coming into reduced battery state - range: [0...120000]	<i>optional parameter with default value: 70000</i> the delay before mgi coming into reduced battery state
[no] release-delay	Parameter type: <MEGACO::mediaGwyReleaseDelay> Format: - the delay before mgi releasing all sessions	<i>optional parameter with default value: 600000</i> the delay before mgi releasing all

40 Voice Configuration Commands

Parameter	Type	Description
	- unit: millisecond - range: [0...900000]	sessions
[no] release-type	Parameter type: <MEGACO::mediaGwyReleaseType> Format: (normal never) Possible values: - normal : release type is normal - never : release type is never	<i>optional parameter with default value: "normal"</i> the type of releasing the active call
[no] wt-rls-delay	Parameter type: <MEGACO::mediaGwyWaitingReleaseDelay> Format: - the delay after the graceful lock delay timer expired - range: [0...3600000]	<i>optional parameter with default value: 0</i> the delay after the graceful lock delay timer expired
[no] active-heartbeat	Parameter type: <MEGACO::mediaGwyHeartBeat> Format: (fix : <MEGACO::mediaGwyHeartBeatInterval> dynamic) Possible values: - fix : The heart beat mode is fixed - dynamic : The heart beat mode is dynamic Field type <MEGACO::mediaGwyHeartBeatInterval> - the heart beat interval value, if input less than 1s, it will be set to 1s - unit: 10 msec - range: [0...65535]	<i>optional parameter with default value: "fix : 0"</i> the active heart beat mode and interval
[no] passive-heartbeat	Parameter type: <MEGACO::mediaGwyHeartBeat> Format: (fix : <MEGACO::mediaGwyHeartBeatInterval> dynamic) Possible values: - fix : The heart beat mode is fixed - dynamic : The heart beat mode is dynamic Field type <MEGACO::mediaGwyHeartBeatInterval> - the heart beat interval value, if input less than 1s, it will be set to 1s - unit: 10 msec - range: [0...65535]	<i>optional parameter with default value: "dynamic"</i> the passive heart beat mode and interval
[no] retrans	Parameter type: <MEGACO::mediaGwyRetrans> Format: (fix : <MEGACO::mediaGwyRetransInterval> dynamic) Possible values: - fix : The re-transmission mode is fixed - dynamic : The re-transmission mode is dynamic Field type <MEGACO::mediaGwyRetransInterval> - the heart beat interval value - range: [100...4000]	<i>optional parameter with default value: "fix : 4000"</i> the retransmission mode and interval
[no] max-waiting-delay	Parameter type: <MEGACO::mediaGwyMaxWaitingDelay> Format: - max time to wait after a restart before contacting to the call server. - range: [0...120]	<i>optional parameter with default value: 5</i> max time to wait after a restart before contacting to the call server
[no] prov-rpl-time	Parameter type: <MEGACO::mediaGwyProvResp> Format: - the time need to send a transaction pending - range: [0...10000]	<i>optional parameter with default value: 1000</i> the time need to send a transaction pending since the

Parameter	Type	Description
		reception of the transaction
[no] signal-dscp	Parameter type: <MEGACO::mediaGatewaySignDscp> Format: - the signaling dscp of media gateway - range: [0...63]	<i>optional parameter with default value: "0"</i> the signaling dscp of this media gateway
[no] signal-pbits	Parameter type: <MEGACO::mediaGatewaySignDot1P> Format: - the signaling p-bit of media gateway - range: [0...7]	<i>optional parameter with default value: "0"</i> the signaling p-bit of this media gateway
[no] rtp-dscp	Parameter type: <MEGACO::mediaGatewayVoiceDscp> Format: - the voice dscp of media gateway - range: [0...63]	<i>optional parameter with default value: "0"</i> the voice dscp of this media gateway
[no] rtp-pbits	Parameter type: <MEGACO::mediaGatewayVoiceDot1P> Format: - the voice p-bit of media gateway - range: [0...7]	<i>optional parameter with default value: "0"</i> the voice p-bit of this media gateway
[no] event-req-id	Parameter type: <MEGACO::medGwyEventRequestId> Format: - the event request id of this media gateway - range: [0...65535]	<i>optional parameter with default value: 0</i> the event request id of this media gateway
[no] stml-stdsg-evt	Parameter type: boolean	<i>optional parameter</i> permit notify of stimal/stedsig event
[no] al-of-evt	Parameter type: boolean	<i>optional parameter</i> permit notify of al/of event
[no] al-on-evt	Parameter type: boolean	<i>optional parameter</i> permit notify of al/on event
[no] al-of-strict-evt	Parameter type: boolean	<i>optional parameter</i> permit notify of al/of strict=state event
[no] al-on-strict-evt	Parameter type: boolean	<i>optional parameter</i> permit notify of al/on strict=state event
[no] mg-overload-evt	Parameter type: boolean	<i>optional parameter</i> permit notify of ocp/mg_overload event
[no] mg-dummy-evt	Parameter type: boolean	<i>optional parameter</i> dummy parameter for reserved bit
[no] rfc2833-pl-type	Parameter type: <MEGACO::mediaGatewayRfc2833PayloadType> Format: - payload type according to rfc2833 - range: [96...127]	<i>optional parameter with default value: 96</i> payload type according to rfc2833
[no] rfc2833-process	Parameter type: <MEGACO::mediaGatewayRfc2833Process> Format: (audio rfc2833 both) Possible values: - audio : processing procedure is audio - rfc2833 : processing procedure is rfc2833 - both : processing procedure is both	<i>optional parameter with default value: "audio"</i> processing procedure for the dtmf event tones
[no] dial-start-timer	Parameter type: <MEGACO::mediaGatewayDialStartTimer>	<i>optional parameter with default value: 10</i>

40 Voice Configuration Commands

Parameter	Type	Description
	Format: - dialing start timer in second - unit: second - range: [0...99]	maximum waiting time for dialing the first digit
[no] dial-long-timer	Parameter <MEGACO::mediaGatewayDialLongTimer> Format: - dialing start long in second - unit: second - range: [1...60]	type: <i>optional parameter with default value: 20</i> maximum waiting time for dialing when no matching found in the digitmap
[no] dial-short-timer	Parameter <MEGACO::mediaGatewayDialShortTimer> Format: - dialing short timer in second - unit: second - range: [1...60]	type: <i>optional parameter with default value: 5</i> maximum waiting time for dialing when matching found in the digitmap
[no] min-data-jitter	Parameter type: <MEGACO::mediaGatewayDataJitter> Format: - jitter buffer for data calls working in rtp mode - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> minimum jitter buffer for data calls working in rtp mode
[no] init-data-jitter	Parameter type: <MEGACO::mediaGatewayDataJitter> Format: - jitter buffer for data calls working in rtp mode - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> initial jitter buffer for data calls working in rtp mode
[no] max-data-jitter	Parameter type: <MEGACO::mediaGatewayDataJitter> Format: - jitter buffer for data calls working in rtp mode - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> maximum jitter buffer for data calls working in rtp mode
[no] ephe-term-prefix	Parameter <MEGACO::mediaGatewayEpheTermPrefix> Format: - prefix to compose the ephemeral termination id - length: 1<=x<=10	type: <i>optional parameter with default value: "E"</i> prefix to compose the ephemeral termination id
[no] ephe-term-min	Parameter type: <MEGACO::mediaGatewayEpheTerm> Format: - ephemeral termination id - range: [0...4294967295]	<i>optional parameter with default value: 65536</i> minimum ephemeral termination id
[no] ephe-term-max	Parameter type: <MEGACO::mediaGatewayEpheTerm> Format: - ephemeral termination id - range: [0...4294967295]	<i>optional parameter with default value: 72366</i> maximum ephemeral termination id

40.47 Voice Megaco Signal Gateway Configuration Commands

Command Description

This command allows the operator to manage the Voice Megaco signal gateway.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice cluster (cluster-id) ( no signal-gateway (signal-gateway-id) ) | ( signal-gateway
(signal-gateway-id) prim-asp-ip <Ip::V4Address> prim-sctp-port
<MEGACO::signallingGatewayInterfacePrimarySCTPPort> [ no sec-asp-ip | sec-asp-ip <Ip::V4Address> ] [ no
sec-sctp-port | sec-sctp-port <MEGACO::signallingGatewayInterfaceSecondarySCTPPort> ] [ no tert-asp-ip |
tert-asp-ip <Ip::V4Address> ] [ no tert-sctp-port | tert-sctp-port
<MEGACO::signallingGatewayInterfaceTertiarySCTPPort> ] [ no quat-asp-ip | quat-asp-ip <Ip::V4Address> ] [ no
quat-sctp-port | quat-sctp-port <MEGACO::signallingGatewayInterfaceQuaternarySCTPPort> ] ip-address
<Ip::V4Address> sgi-user-label <MEGACO::signallingGatewayInterfaceUserLabel> sgi-mgi
<MEGACO::MediaGatewayId> [ no admin-status | admin-status
<MEGACO::signallingGatewayInterfaceAdminStatus> ] )
```

Command Parameters

Table 40.47-1 "Voice Megaco Signal Gateway Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(signal-gateway-id)	Format: - the signal gateway table index - range: [1]	uniquely identify of this signal gateway

Table 40.47-2 "Voice Megaco Signal Gateway Configuration Commands" Command Parameters

Parameter	Type	Description
prim-asp-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>mandatory parameter</i> the primary asp ip
prim-sctp-port	Parameter type: <MEGACO::signallingGatewayInterfacePrimarySCTPPort> Format: - the sctp port of the primary asp	<i>mandatory parameter</i> the sctp port of the primary asp

Parameter	Type	Description
	- range: [1...65534]	
[no] sec-asp-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the secondary asp ip
[no] sec-sctp-port	Parameter type: <MEGACO::signallingGatewayInterfaceSecondarySCTPPort> Format: - the sctp port of the secondary asp - range: [1...65534]	<i>optional parameter with default value: 9900</i> the sctp port of the secondary asp
[no] tert-asp-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the tertiary asp ip
[no] tert-sctp-port	Parameter type: <MEGACO::signallingGatewayInterfaceTertiarySCTPPort> Format: - the sctp port of the tertiary asp - range: [1...65534]	<i>optional parameter with default value: 9900</i> the sctp port of the tertiary asp
[no] quat-asp-ip	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> the quaternary asp ip
[no] quat-sctp-port	Parameter type: <MEGACO::signallingGatewayInterfaceQuaternarySCTPPort> Format: - the sctp port of the quaternary asp - range: [1...65534]	<i>optional parameter with default value: 9900</i> the sctp port of the quaternary asp
ip-address	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> the ip address of this signal gateway
sgi-user-label	Parameter type: <MEGACO::signallingGatewayInterfaceUserLabel> Format: - the user label of the signal gateway interface - length: 1<=x<=64	<i>mandatory parameter</i> the user label of the signal gateway interface
sgi-mgi	Parameter type: <MEGACO::MediaGatewayId> Format: - the media gateway table index - range: [1]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> The id of media gateway associated with signal gateway
[no] admin-status	Parameter type: <MEGACO::signallingGatewayInterfaceAdminStatus> Format: (locked unlocked) Possible values: - locked : the admin status of signal gateway is locked - unlocked : the admin status of signal gateway is unlocked	<i>optional parameter with default value: "locked"</i> The administrative status of signal gateway

40.48 Epon Ont Voice SIP UserAgent Configuration

Command Description

This command allows the operator to configure EPON ONT voice sip user agent parameters

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice eont ( no sip-useragent (ont-idx) ) | ( sip-useragent (ont-idx) [ no udp-port | udp-port
<Epon::UdpPort> ] proxy-pri-ip <Epon::PxyPrimaryIp> [ no proxy-pri-port | proxy-pri-port
<Epon::PxyPrimaryPort> ] [ proxy-sec-ip <Epon::PxySecondaryIp> ] [ no proxy-sec-port | proxy-sec-port
<Epon::PxySecondaryPort> ] reg-pri-ip <Epon::RegPrimaryIp> [ no reg-pri-port | reg-pri-port
<Epon::RegPrimaryPort> ] [ reg-sec-ip <Epon::RegSecondaryIp> ] [ no reg-sec-port | reg-sec-port
<Epon::RegSecondaryPort> ] [ outbound-ip <Epon::OutboundIp> ] [ no outbound-port | outbound-port
<Epon::OutboundPort> ] [ no reg-intval | reg-intval <Epon::RegInterval> ] [ no heartbeat-mode | heartbeat-mode
<Epon::HeartBeatMode> ] [ no heartbeat-cycle | heartbeat-cycle <Epon::HeartBeatCycle> ] [ no heartbeat-count |
heartbeat-count <Epon::HeartBeatCount> ] digit-map-prof <Epon::DigitMapProfile> )
```

Command Parameters

Table 40.48-1 "Epon Ont Voice SIP UserAgent Configuration" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	ONT index

Table 40.48-2 "Epon Ont Voice SIP UserAgent Configuration" Command Parameters

Parameter	Type	Description
[no] udp-port	Parameter type: <Epon::UdpPort> Format: - sip udp port number - range: [0...65535]	<i>optional parameter with default value: "5060"</i> signal udp port of sip user agent

40 Voice Configuration Commands

Parameter	Type	Description
proxy-pri-ip	Parameter type: <Epon::PxyPrimaryIp> Format: - IPv4-address	<i>mandatory parameter</i> sip proxy primary ip address
[no] proxy-pri-port	Parameter type: <Epon::PxyPrimaryPort> Format: - sip udp port number - range: [0...65535]	<i>optional parameter with default value: "5060"</i> sip proxy primary udp port
proxy-sec-ip	Parameter type: <Epon::PxySecondaryIp> Format: - IPv4-address	<i>optional parameter</i> sip proxy secondary ip address
[no] proxy-sec-port	Parameter type: <Epon::PxySecondaryPort> Format: - sip udp port number - range: [0...65535]	<i>optional parameter with default value: "5060"</i> sip proxy secondary udp port
reg-pri-ip	Parameter type: <Epon::RegPrimaryIp> Format: - IPv4-address	<i>mandatory parameter</i> sip register server primary ip address
[no] reg-pri-port	Parameter type: <Epon::RegPrimaryPort> Format: - sip udp port number - range: [0...65535]	<i>optional parameter with default value: "5060"</i> sip register primary udp port
reg-sec-ip	Parameter type: <Epon::RegSecondaryIp> Format: - IPv4-address	<i>optional parameter</i> sip register server secondary ip address
[no] reg-sec-port	Parameter type: <Epon::RegSecondaryPort> Format: - sip udp port number - range: [0...65535]	<i>optional parameter with default value: "5060"</i> sip register secondary udp port
outbound-ip	Parameter type: <Epon::OutboundIp> Format: - IPv4-address	<i>optional parameter</i> sip out bound proxy ip address
[no] outbound-port	Parameter type: <Epon::OutboundPort> Format: - sip udp port number - range: [0...65535]	<i>optional parameter with default value: "5060"</i> sip out bound proxy udp port
[no] reg-intval	Parameter type: <Epon::RegInterval> Format: - reg refresh period - range: [0...4294967295]	<i>optional parameter with default value: "3600"</i> registering refresh period
[no] heartbeat-mode	Parameter type: <Epon::HeartBeatMode> Format: (enable disable) Possible values: - enable : enable heart beat mode - disable : disable heart beat mode	<i>optional parameter with default value: "enable"</i> heart beat mode
[no] heartbeat-cycle	Parameter type: <Epon::HeartBeatCycle> Format: - heartbeat count - range: [0...65535]	<i>optional parameter with default value: "60"</i> heart beat cycle
[no] heartbeat-count	Parameter type: <Epon::HeartBeatCount> Format: - heartbeat count - range: [0...65535]	<i>optional parameter with default value: "3"</i> heart beat times
digit-map-prof	Parameter type: <Epon::DigitMapProfile> Format: - digitmap profile id	<i>mandatory parameter</i> digitmap profile id

Parameter	Type	Description
	- range: [1...32]	

40.49 Epon Ont Pots Configuration Command

Command Description

This command configures provisioning data associated with an ONT Pots Port.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice eont ( no pots (uni-idx) ) | ( pots (uni-idx) [ [ no ] admin-up ] [ no user-account | user-account
<Epon::UserAcc> ] [ no user-name | user-name <Epon::UserName> ] [ no user-pwd | user-pwd <Epon::UserPwd> ]
[ tid-name <Epon::TidName> ] )
```

Command Parameters

Table 40.49-1 "Epon Ont Pots Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::EontSlot> / <Epon::EontPort> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::EontSlot> - Epon Ont Slot - range: [1...16] Field type <Epon::EontPort> - Epon Ont Port - range: [1...64]	ONT UNI interface

Table 40.49-2 "Epon Ont Pots Configuration Command" Command Parameters

Parameter	Type	Description
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> admin status is up (read-only for voicefxs interface)

Parameter	Type	Description
[no] user-account	Parameter type: <Epon::UserAcc> Format: - sip user account - length: x<=16	<i>optional parameter with default value: ""</i> sip user account
[no] user-name	Parameter type: <Epon::UserName> Format: - user name - length: 1<=x<=32	<i>optional parameter with default value: ""</i> sip user name
[no] user-pwd	Parameter type: <Epon::UserPwd> Format: - sip user password hidden from users - length: x<=16	<i>optional parameter with default value: ""</i> sip user password
tid-name	Parameter type: <Epon::TidName> Format: - tid name - length: 1<=x<=32	<i>optional parameter</i> h248 tid name

40.50 Epon Ont Voice Common Configuration Command

Command Description

This command configures EPON ONT voice common parameters.

ip /mask /gateway - If ip-mode is not static IP, this parameter has no meaning. When ip-mode is static, this parameter should be configured.

svlan - If tag- mode is not stack, this parameter has no meaning.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice eont ( no comm-para (ont-idx) ) | ( comm-para (ont-idx) [ no ip-mode | ip-mode <Epon::IpMode>
] [ ip <Epon::IpAddr> ] [ mask <Epon::IpAddr> ] [ gateway <Epon::IpAddr> ] [ no pppoe-mode | pppoe-mode
<Epon::pppoeMode> ] [ no pppoe-username | pppoe-username <Epon::pppoeUsrName> ] [ no pppoe-pwd |
pppoe-pwd <Epon::pppoePwd> ] [ no tagged-mode | tagged-mode <Epon::TagMode> ] cvlan <Epon::cvlan> [ no
svlan | svlan <Epon::svlan> ] [ no pbit | pbit <Epon::pbit> ] [ no t38-admin | t38-admin <Epon::faxMode> ] [ no fax
| fax <Epon::ctrlMode> ] )
```

Command Parameters

Table 40.50-1 "Epon Ont Voice Common Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont Index

Table 40.50-2 "Epon Ont Voice Common Configuration Command" Command Parameters

Parameter	Type	Description
[no] ip-mode	Parameter type: <Epon::IpMode> Format: (static dhcp pppoe) Possible values: - static : static mode - dhcp : dhcp mode - pppoe : PPPoE mode	<i>optional parameter with default value: "static"</i> mode to get the voice ip address
ip	Parameter type: <Epon::IpAddr> Format: - IPv4-address	<i>optional parameter</i> static voice ip address
mask	Parameter type: <Epon::IpAddr> Format: - IPv4-address	<i>optional parameter</i> subnet of the voice ip
gateway	Parameter type: <Epon::IpAddr> Format: - IPv4-address	<i>optional parameter</i> default gateway of the voice ip
[no] pppoe-mode	Parameter type: <Epon::pppoeMode> Format: (auto chap pap) Possible values: - auto : AUTO mode - chap : CHAP mode - pap : PAP mode	<i>optional parameter with default value: "auto"</i> PPPoE configure mode
[no] pppoe-username	Parameter type: <Epon::pppoeUsrName> Format: - user name - length: 1<=x<=32	<i>optional parameter with default value: ""</i> PPPoE user name
[no] pppoe-pwd	Parameter type: <Epon::pppoePwd> Format: - PPPoE password hidden from users - length: 1<=x<=32	<i>optional parameter with default value: ""</i> PPPoE password
[no] tagged-mode	Parameter type: <Epon::TagMode> Format: (transparent tag stacking) Possible values: - transparent : transparent mode - tag : tagged mode - stacking : stacking mode	<i>optional parameter with default value: "tag"</i> vlan tag mode
cvlan	Parameter type: <Epon::cvlan> Format: - Vlan id - range: [0...4093]	<i>mandatory parameter</i> customer vlan for voice
[no] svlan	Parameter type: <Epon::svlan> Format: - Vlan id - range: [2...4093,0]	<i>optional parameter with default value: 0L</i> Service vlan for voice
[no] pbit	Parameter type: <Epon::pbit> Format: - DBA polling level - range: [0...7]	<i>optional parameter with default value: 5L</i> dot1p of voice flow
[no] t38-admin	Parameter type: <Epon::faxMode>	<i>optional parameter with default</i>

40 Voice Configuration Commands

Parameter	Type	Description
	Format: (t30 t38) Possible values: - t30 : t30 mode - t38 : t38 mode	<i>value: "t30"</i> choose fax mode
[no] fax	Parameter type: <Epon::ctrlMode> Format: (negotiation autovbd) Possible values: - negotiation : Negotiation mode - autovbd : auto VBD mode	<i>optional parameter with default value: "negotiation"</i> fax or modem control mode

40.51 Epon Ont Voice media gateway Configuration Command

Command Description

This command configures EPON ONT voice media gateway parameters.

gw-id - Identifier of media gateway. It is only valid if reg-mode is domain or equip.

tid-digit-len - tid digit length. Tid digit length + prefix length should be less than or equal to 32

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice eont ( no media-gateway (ont-idx) ) | ( media-gateway (ont-idx) [ no udp-port | udp-port
<Epon::udp> ] mgc-pri-ip <Epon::IpAddr> [ no mgc-pri-port | mgc-pri-port <Epon::udp> ] [ no mgc-sec-ip |
mgc-sec-ip <Epon::IpAddr> ] [ no mgc-sec-port | mgc-sec-port <Epon::udp> ] [ no reg-mode | reg-mode
<Epon::regMode> ] [ gw-id <Epon::gwid> ] [ no heartbeat-mode | heartbeat-mode <Epon::HBMode> ] [ no
heartbeat-cycle | heartbeat-cycle <Epon::HBCycle> ] [ no heartbeat-count | heartbeat-count <Epon::HBVal> ]
tid-num <Epon::TidNum> tid-prefix <Epon::TidPrefix> tid-digit-begin <Epon::TidDigit> tid-mode
<Epon::TidMode> tid-digit-len <Epon::TidLen> )
```

Command Parameters

Table 40.51-1 "Epon Ont Voice media gateway Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont Index

Table 40.51-2 "Epon Ont Voice media gateway Configuration Command" Command Parameters

40 Voice Configuration Commands

Parameter	Type	Description
[no] udp-port	Parameter type: <Epon::udp> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 2944</i> signal udp port of media gateway
mgc-pri-ip	Parameter type: <Epon::IpAddr> Format: - IPv4-address	<i>mandatory parameter</i> primary ip address of MGC
[no] mgc-pri-port	Parameter type: <Epon::udp> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 2944</i> udp port of the primary MGC
[no] mgc-sec-ip	Parameter type: <Epon::IpAddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> secondary ip address of MGC
[no] mgc-sec-port	Parameter type: <Epon::udp> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 2944</i> udp port of the secondary MGC
[no] reg-mode	Parameter type: <Epon::regMode> Format: (ip domain equip) Possible values: - ip : - domain : - equip :	<i>optional parameter with default value: "ip"</i> register mode of media gateway
gw-id	Parameter type: <Epon::gwid> Format: - media gateway identifier - length: x<=64	<i>optional parameter</i> corresponding ID for a given Media Gw
[no] heartbeat-mode	Parameter type: <Epon::HBMode> Format: (enabled disabled) Possible values: - enabled : heartbeat function enabled - disabled : heartbeat function disabled	<i>optional parameter with default value: "enabled"</i> link checking mode
[no] heartbeat-cycle	Parameter type: <Epon::HBCycle> Format: - Heart Beat cycle - unit: secs - range: [0...65535]	<i>optional parameter with default value: 60L</i> heart beat cycle
[no] heartbeat-count	Parameter type: <Epon::HBVal> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 3L</i> The heart beat times
tid-num	Parameter type: <Epon::TidNum> Format: - Number of rtp tid - range: [0...255]	<i>mandatory parameter</i> Number of rtp tid
tid-prefix	Parameter type: <Epon::TidPrefix> Format: - an octet string defining mnemonic of EPON - length: 1<=x<=16	<i>mandatory parameter</i> prefix of rtp tid
tid-digit-begin	Parameter type: <Epon::TidDigit> Format:	<i>mandatory parameter</i> begin number of tid digit

Parameter	Type	Description
	- DBA polling interval per pon interface - range: [0...65535]	
tid-mode	Parameter type: <Epon::TidMode> Format: (inline notinline) Possible values: - inline : - notinline :	<i>mandatory parameter</i> tid digit line up mode
tid-digit-len	Parameter type: <Epon::TidLen> Format: - - range: [1...31]	<i>mandatory parameter</i> tid digit length

40.52 Voice Sip LSA Server Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip LSA Server profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice lsa-server ( no system (name) ) | ( system (name) slot-id <LSA::SlotIndex> country-code
<LSA::CountryCode> area-code <LSA::AreaCode> [ no admin-status | admin-status <LSA::SystemAdminStatus>
])
```

Command Parameters

Table 40.52-1 "Voice Sip LSA Server Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identify this LSA server system - length: 1<=x<=32	uniquely identify this voice LSA server system

Table 40.52-2 "Voice Sip LSA Server Configuration Commands" Command Parameters

Parameter	Type	Description
slot-id	Parameter type: <LSA::SlotIndex> Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> vvps-a) Possible values: - lt : 7302/7330/7360 ISAM FTTN : slot id of the NVPS-C board at which LSA server is hosted - nt : 7363 MX : slot id of NT board - vvps-a : 7302/7330/7360: slot id of the VVPS-A at which the LSA server is hosted Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	<i>mandatory parameter</i> 7302/7330/7360 ISAM FTTN : slot-id of the physical NVPS-C board while LSA server is hosted at physical NVPS-C board; slot id of the VVPS-A if LSA server is hosted at VVPS-A board (only applicable on NANT-E/FANT-F). 7363 MX : slot id of NT board

Parameter	Type	Description
	Field type <Eqpt::EqSlotId> - the equipment slot number	
country-code	Parameter type: <LSA::CountryCode> Format: - country code of the LSA server system - length: 1<=x<=32	<i>mandatory parameter</i> country code used by this LSA server to complete the DN received in an incoming sip invite request
area-code	Parameter type: <LSA::AreaCode> Format: - area code of the LSA server system - length: 1<=x<=32	<i>mandatory parameter</i> area code used by this LSA server to complete the DN received in an incoming sip invite request
[no] admin-status	Parameter type: <LSA::SystemAdminStatus> Format: (up down) Possible values: - up : unlock the LSA server system - down : lock the LSA server system	<i>optional parameter with default value: "down"</i> administrative status of the LSA server

40.53 Voice Sip LSA Server Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip LSA Server profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice lsa-server ( no instance (name) ) | ( instance (name) slot-id <LSA::SlotIndex> sign-ip
<LSA::IpAddressAndMask> [ no sign-port | sign-port <LSA::InstanceSignPort> ] sign-vlan
<LSA::InstanceSignVlan> [ no sign-gw-ip | sign-gw-ip <LSA::IpAddress> ] [ no admin-status | admin-status
<LSA::InstanceAdminStatus> ] [ no sg-name | sg-name <LSA::InstanceSGDomName> ] [ no lsa-md5-realm |
lsa-md5-realm <LSA::MD5Realm> ] [ no lsa-md5-password | lsa-md5-password <Security::Password4> ] )
```

Command Parameters

Table 40.53-1 "Voice Sip LSA Server Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - uniquely identify this LSA server instance - length: 1<=x<=32	uniquely identify this LSA server instance

Table 40.53-2 "Voice Sip LSA Server Configuration Commands" Command Parameters

Parameter	Type	Description
slot-id	Parameter type: <LSA::SlotIndex> Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> vvps-a) Possible values: - lt : 7302/7330/7360 ISAM FTTN : slot id of the NVPS-C board at which LSA server is hosted - nt : 7363 MX : slot id of NT board - vvps-a : 7302/7330/7360: slot id of the VVPS-A at which the LSA server is hosted Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	<i>mandatory parameter</i> 7302/7330/7360 ISAM FTTN : slot-id of the physical NVPS-C board while LSA server is hosted at physical NVPS-C board; slot id of the VVPS-A if LSA server is hosted at VVPS-A board (only applicable on NANT-E/FANT-F). 7363 MX : slot id of the NT board

Parameter	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
sign-ip	Parameter type: <LSA::IpAddressAndMask> Format: ipv4 : <Ip::V4Address> / <LSA::PrefixLength> Possible values: - ipv4 : the address type of the LSA server instance is ipv4 Field type <Ip::V4Address> - IPv4-address Field type <LSA::PrefixLength> - prefix length of the subnet - range: [0...32]	<i>mandatory parameter</i> signaling IP address + prefix length used by this LSA server instance
[no] sign-port	Parameter type: <LSA::InstanceSignPort> Format: - the SIP LSA server Instance port - range: [1...65534]	<i>optional parameter with default value: 5060</i> signaling port used by this LSA server instance
sign-vlan	Parameter type: <LSA::InstanceSignVlan> Format: - vlan id of LSA server instance - range: [1...4093]	<i>mandatory parameter</i> signaling vlan ID used by this LSA server instance
[no] sign-gw-ip	Parameter type: <LSA::IpAddress> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> default signaling gateway IP address used by this LSA server instance
[no] admin-status	Parameter type: <LSA::InstanceAdminStatus> Format: (up down) Possible values: - up : unlock the LSA server instance - down : lock the LSA server instance	<i>optional parameter with default value: "down"</i> administrative status of this LSA server instance
[no] sg-name	Parameter type: <LSA::InstanceSGDomName> Format: - uniquely name of this element - length: x<=32	<i>optional parameter with default value: "vsp1"</i> name of the service gateway associated with this LSA server instance
[no] lsa-md5-realm	Parameter type: <LSA::MD5Realm> Format: - the string for MD5 - length: x<=64	<i>optional parameter with default value: ""</i> realm used by this LSA server instance to authenticate an incoming SIP register request
[no] lsa-md5-password	Parameter type: <Security::Password4> Format: (prompt plain : <Security::PlainPassword4>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a	<i>optional parameter with default value: "plain : "</i> password used by this LSA server instance to authenticate an incoming SIP register request

40 Voice Configuration Commands

Parameter	Type	Description
	common configuration object for all authentication types that might require the configuration of an authentication password.) Field type <Security::PlainPassword4> - the password, may contain any printable character defined by the US-ASCII character set and that has a decimal code in the range 33 to 126, and the length should be less than or equal to 64 (Due to legacy reasons, the MD5 character string was included in the parameter name. Nevertheless, despite the MD5 string in the name of this object, from R5.8.x it is to be considered as a common configuration object for all authentication types that might require the configuration of an authentication password.) - length: x<=64	

40.54 Voice Sip LSA Server Emergency Service Configuration Commands

Command Description

This command allows the operator to manage the Voice Sip LSA Server Emergency Service profile.

User Level

The command can be accessed by operators with sip privileges, and executed by operators with sip privileges.

Command Syntax

The command has the following syntax:

```
> configure voice lsa-server ( no emergency-service dn <LSA::Dn> gateway-dn <LSA::GtwyDn> ) | (
emergency-service dn <LSA::Dn> gateway-dn <LSA::GtwyDn> slot-id <LSA::SlotIndex> [ no name | name
<LSA::EmergServiceName> ] [ no sg-name | sg-name <LSA::EmergVsgName> ] [ no gateway-ddidn |
gateway-ddidn <LSA::GtwyDDIDn> ] [ no gateway-dn-type | gateway-dn-type <LSA::GtwyDnType> ] )
```

Command Parameters

Table 40.54-1 "Voice Sip LSA Server Emergency Service Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
dn	Parameter type: <LSA::Dn> Format: - emergency service directory number - length: 1<=x<=8	emergency service directory number
gateway-dn	Parameter type: <LSA::GtwyDn> Format: - directory number only includes the subscriber number to which the emergency call is to be addressed. - length: 1<=x<=32	directory number only includes the subscriber number to which the emergency call is to be addressed

Table 40.54-2 "Voice Sip LSA Server Emergency Service Configuration Commands" Command Parameters

Parameter	Type	Description
slot-id	Parameter type: <LSA::SlotIndex> Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> vvps-a) Possible values: - lt : 7302/7330/7360 ISAM FTTN : slot id of the NVPS-C board at which LSA server is hosted	<i>mandatory parameter</i> 7302/7330/7360 ISAM FTTN : slot-id of the physical NVPS-C board while LSA server is hosted at physical NVPS-C board; slot id of the VVPS-A if LSA server is hosted at VVPS-A board (only applicable on NANT-E/FANT-F). 7363 MX :

40 Voice Configuration Commands

Parameter	Type	Description
	- nt : 7363 MX : slot id of NT board - vvps-a : 7302/7330/7360: slot id of the VVPS-A at which the LSA server is hosted - Field type <Eqpt::RackId> - the rack number - Field type <Eqpt::ShelfId> - the shelf number - Field type <Eqpt::SlotId> - the LT slot number - Field type <Eqpt::EqSlotId> - the equipment slot number	slot id of NT board
[no] name	Parameter type: <LSA::EmergServiceName> Format: - the name of LSA emergency service - length: x<=32	<i>optional parameter with default value: ""</i> name of this LSA emergency service
[no] sg-name	Parameter type: <LSA::EmergVsgName> Format: - uniquely name of this element - length: x<=32	<i>optional parameter with default value: "vsp1"</i> name of the Voice SERVICE GATEWAY associated with this LSA emergency service
[no] gateway-ddidn	Parameter type: <LSA::GtwyDDIDn> Format: - the ISDN DDI number which the emergency call is to be addressed. - length: x<=32	<i>optional parameter with default value: ""</i> the ISDN DDI number which the emergency call is to be addressed
[no] gateway-dn-type	Parameter type: <LSA::GtwyDnType> Format: (pots isdn-pra) Possible values: - pots : the gateway-dn is a POTS number. - isdn-pra : the gateway-dn is an ISDN PRA number	<i>optional parameter with default value: "pots"</i> the type of the gateway-dn

40.55 Voice extline Configuration Commands

Command Description

This command allows the operator to manage the Voice extline profile.

User Level

The command can be accessed by operators with all privileges, and executed by operators with all privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ( no extline (if-index) ) | ( extline (if-index) local-ip <ExtLine::IpAddressAndMask> [ no
gateway-ip | gateway-ip <ExtLine::ExtLineIpAddr> ] [ no ip-addr-policy | ip-addr-policy <ExtLine::IpAddrPolicy>
] vlan-id <ExtLine::ExtLineVlanId> fxo-ip <ExtLine::FxoIpAddr> fxo-port <ExtLine::ExtLinePort> [ no
admin-status | admin-status <ExtLine::ExtLineAdminStatus> ] [ no codec | codec <ExtLine::ExtLineCodec> ] [ no
ptime | ptime <ExtLine::ExtLinePtime> ] [ no echo-cancel | echo-cancel <ExtLine::ExtLineEc> ] [ no silence-suppr
| silence-suppr <ExtLine::ExtLineSilence> ] [ no impedance | impedance <ExtLine::ExtLineImpedance> ] [ no
rx-gain | rx-gain <ExtLine::ExtLineRxGain> ] [ no tx-gain | tx-gain <ExtLine::ExtLineTxGain> ] [ no dscp | dscp
<ExtLine::ExtLineDscp> ] [ no pbits | pbits <ExtLine::ExtLinePbits> ] )
```

Command Parameters

Table 40.55-1 "Voice extline Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The unique internal identifier of the extension line port

Table 40.55-2 "Voice extline Configuration Commands" Command Parameters

Parameter	Type	Description
local-ip	Parameter type: <ExtLine::IpAddressAndMask> Format: <Ip::V4Address> / <ExtLine::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <ExtLine::PrefixLength> - prefix length of the subnet - range: [0...32]	<i>mandatory parameter</i> identify the IP address of this extension line

40 Voice Configuration Commands

Parameter	Type	Description
[no] gateway-ip	Parameter type: <ExtLine::ExtLineIpAddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> IP address of the gateway, must be set when manual mode and ip-address-policy is distributed, otherwise it is optional
[no] ip-addr-policy	Parameter type: <ExtLine::IpAddrPolicy> Format: (distributed centralized) Possible values: - distributed : the ip address policy of the user agent operation is to use an IP address per Voice LT, not applicable for NGVR and ANSI MDU - centralized : the ip address policy of the user agent operation is to use a single IP address for the ISAM Voice, NGVR and ANSI MDU	<i>optional parameter with default value: "distributed"</i> The ip address policy of the extension line
vlan-id	Parameter type: <ExtLine::ExtLineVlanId> Format: - vlan id - range: [1...4093]	<i>mandatory parameter</i> vlan id for rtp packet
fxo-ip	Parameter type: <ExtLine::FxoIpAddr> Format: - IPv4-address	<i>mandatory parameter</i> identify the IP address of this fxo
fxo-port	Parameter type: <ExtLine::ExtLinePort> Format: - the extension line local port - range: [1...65534]	<i>mandatory parameter</i> port of the fxo
[no] admin-status	Parameter type: <ExtLine::ExtLineAdminStatus> Format: (up down) Possible values: - up : the status of the user agent operation is up - down : the status of the user agent operation is down	<i>optional parameter with default value: "down"</i> identify the status of this line administration
[no] codec	Parameter type: <ExtLine::ExtLineCodec> Format: (g711-a-law g711-u-law g723 g729) Possible values: - g711-a-law : the extension line codec is g711-a-law - g711-u-law : the extension line codec is g711-u-law - g723 : the extension line codec is g723 - g729 : the extension line codec is g729	<i>optional parameter with default value: "g711-a-law"</i> configure the line codec of this extension line
[no] ptime	Parameter type: <ExtLine::ExtLinePtime> Format: - value of the extension line package time - unit: milliseconds - range: [10...60]	<i>optional parameter with default value: "20"</i> configure the line ptime of this extension line,ptime accepts values only in multiples of 10.if codec is configuread as g723,the ptime accepts only 30 and 60.if codec is configuread as g711-a-law,g711-u-law,g729,the ptime can accept:10,20,30,40,50,60

Parameter	Type	Description
[no] echo-cancel	Parameter type: <ExtLine::ExtLineEc> Format: (on off) Possible values: - on : the extension line echo canceller is on - off : the extension line echo canceller is off	<i>optional parameter with default value: "off"</i> configure the line EC of this extension line
[no] silence-suppr	Parameter type: <ExtLine::ExtLineSilence> Format: (on off) Possible values: - on : the extension line echo canceller is on - off : the extension line echo canceller is off	<i>optional parameter with default value: "on"</i> configure the line silence support of this extension line
[no] impedance	Parameter type: <ExtLine::ExtLineImpedance> Format: (cdeprofile 200 220 220minisplitter 270 300 370 600 900 370minisplitter 600splitter 370nvlsasplitter 370skinnysplitter 270duratelsplitter 2703msplitter 100 150 220splitter reserv19 reserv20 reserv21) Possible values: - cdeprofile : the impedance is default value - 200 : the line impedance is 200 ohm - 220 : the line impedance is 220 ohm - 220minisplitter : the line impedance is 220 ohm+ miniSplitter - 270 : the line impedance is 270 ohm - 300 : the line impedance is 300 ohm - 370 : the line impedance is 370 ohm - 600 : the line impedance is 600 ohm - 900 : the line impedance is 900 ohm - 370minisplitter : the line impedance is 370 ohm+ miniSplitter - 600splitter : the line impedance is 600 ohm+splitter - 370nvlsasplitter : the line impedance is 370 ohm+ NVLSASplitter - 370skinnysplitter : the line impedance is 370 ohm+ SkinnySplitter - 270duratelsplitter : the line impedance is 270 ohm+ DuratelSplitter	<i>optional parameter with default value: "cdeprofile"</i> configure the line impedance of this extension line

40 Voice Configuration Commands

Parameter	Type	Description
	- 270msplitter : the line impedance is 270 ohm+ 3MDsplitter - 100 : the line impedance is 100 ohm - 150 : the line impedance is 150 ohm - 220splitter : the line impedance is 220 ohm+ splitter - reserv19 : reserved for future use 19 - reserv20 : reserved for future use 20 - reserv21 : reserved for future use 21	
[no] rx-gain	Parameter type: <ExtLine::ExtLineRxGain> Format: - the line rx_gain range -14...6 - range: [-14...6]	<i>optional parameter with default value: "0"</i> configure the line rx_gain of this extension line
[no] tx-gain	Parameter type: <ExtLine::ExtLineTxGain> Format: - the line tx_gain range -14...6 - range: [-14...6]	<i>optional parameter with default value: "0"</i> configure the line tx_gain of this extension line
[no] dscp	Parameter type: <ExtLine::ExtLineDscp> Format: - dscp mark for rtp or rtcp packets - range: [0...63]	<i>optional parameter with default value: 46</i> dscp mark for extension line packets
[no] pbits	Parameter type: <ExtLine::ExtLinePbits> Format: - the dot-1p bit value - range: [0...7]	<i>optional parameter with default value: 6</i> 802.1p bits for extension line packets.

40.56 Voice Pseudo Wire Configuration Commands

Command Description

This command allows the operator to manage the Voice pseudo wire profile.

User Level

The command can be accessed by operators with all privileges, and executed by operators with all privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ( no pseudo-wire (if-index) ) | ( pseudo-wire (if-index) channelset <PwEncapTdm::ChannelSet> [
no ip-addr-policy | ip-addr-policy <PwEncapTdm::IpAddrPolicy> ] local-ip <PwEncapTdm::IpAddressAndMask>
dest-ip <PwEncapTdm::IpAddress> dest-udp-port <PwEncapTdm::UDPPort> [ no gateway-ip | gateway-ip
<PwEncapTdm::IpAddress> ] vlan-id <PwEncapTdm::VlanId> [ no p-bits | p-bits <PwEncapTdm::Pbits> ] [ no
dscp | dscp <PwEncapTdm::Dscp> ] [ no admin-status | admin-status <PwEncapTdm::AdminStatus> ] [ no
data-jitter | data-jitter <PwEncapTdm::DataJitter> ] p-time <PwEncapTdm::PacketInterval> [ no payload-type |
payload-type <PwEncapTdm::PayloadType> ] )
```

Command Parameters

Table 40.56-1 "Voice Pseudo Wire Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	The unique internal identifier of the pseudo wire port

Table 40.56-2 "Voice Pseudo Wire Configuration Commands" Command Parameters

Parameter	Type	Description
channelset	Parameter type: <PwEncapTdm::ChannelSet> Format: - channels for pseudo wire - length: 1<=x<=31	<i>mandatory parameter</i> assign channels for pseudo wire. master DS0 Channel must appear as the first one in the DS0 channel list. Total pseudo wire DS0 should be less than 193 on every NIAT-A pack
[no] ip-addr-policy	Parameter type: <PwEncapTdm::IpAddrPolicy> Format:	<i>optional parameter with default value: "pw-distinct-ip-mode"</i>

Parameter	Type	Description
	(pw-distinct-ip-mode pw-shared-ip-mode) Possible values: - pw-distinct-ip-mode : the ip address policy of the pseudo wire, operation is to use an IP address per NIAT-A board - pw-shared-ip-mode : the ip address policy of the pseudo wire, operation is to use a single IP address for the PW traffic	The ip address policy of the pseudo wire
local-ip	Parameter type: <PwEncapTdm::IpAddressAndMask> Format: <Ip::V4Address> / <PwEncapTdm::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <PwEncapTdm::PrefixLength> - prefix length of the subnet - range: [0...32]	<i>mandatory parameter</i> identify the IP address and prefix length of this pseudo wire
dest-ip	Parameter type: <PwEncapTdm::IpAddress> Format: - IPv4-address	<i>mandatory parameter</i> the destination IP address of this pseudo wire
dest-udp-port	Parameter type: <PwEncapTdm::UDPPort> Format: - the udp port of pseudo wire - range: [1...65535]	<i>mandatory parameter</i> the destination udp port of pseudo wire
[no] gateway-ip	Parameter type: <PwEncapTdm::IpAddress> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> IP address of the gateway, must be set when manual mode and ip-address-policy is pw-distinct-ip-mode, otherwise it is optional
vlan-id	Parameter type: <PwEncapTdm::VlanId> Format: - vlan id - range: [1...4093]	<i>mandatory parameter</i> vlan id for pseudo wire packet
[no] p-bits	Parameter type: <PwEncapTdm::Pbits> Format: - the dot-1p bit value - range: [0...7]	<i>optional parameter with default value: 6</i> 802.1p bits for pseudo wire packets
[no] dscp	Parameter type: <PwEncapTdm::Dscp> Format: - dscp mark for rtp or rtcp packets - range: [0...63]	<i>optional parameter with default value: 46</i> dscp mark for pseudo wire packets
[no] admin-status	Parameter type: <PwEncapTdm::AdminStatus> Format: (up down) Possible values: - up : unlock the pseudo wire - down : lock the pseudo wire	<i>optional parameter with default value: "down"</i> identify the status of this pseudo wire administration
[no] data-jitter	Parameter type: <PwEncapTdm::DataJitter> Format: - jitter buffer for PW channel in millisecond - unit: millisecond - range: [0...200]	<i>optional parameter with default value: 50</i> data jitter buffer for pseudo wire.\nwhen p-time = 1, the range is [0...100]
p-time	Parameter type: <PwEncapTdm::PacketInterval> Format: - packetization interval for pseudo wire in millisecond	<i>mandatory parameter</i> packetization interval for pseudo wire packets.\nThe valid value is

Parameter	Type	Description
	- unit: millisecond - range: [1...10]	linked with the number of DS0(N) by the following relationship: $N * p\text{-time} \leq 31$. The package size is $8 * N * \text{packetization interval}$
[no] payload-type	Parameter type: <PwEncapTdm::PayloadType> Format: - payload type for pseudo wire packets - range: [96...127]	<i>optional parameter with default value: 96</i> payload type for pseudo wire packets

41- Voice Ont Configuration Commands

41.1 Voice Ont Configuration Command Tree	41-1362
41.2 Voice ONT Service Configuration Command	41-1369
41.3 Performance Monitoring configuration command for VOIP service	41-1374

41.2 Voice ONT Service Configuration Command

Command Description

This command is to configure the service related parameters for ONT.

NOTE: OLT prohibits the entry of the following range of well-known IP addresses:

224.0.0.0 to 239.255.255.255 (multicast)

127.0.0.0 to 127.255.255.255 (loopback)

User Level

The command can be accessed by operators with sip, megaco privileges, and executed by operators with sip, megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no service (voip-index) ) | ( service (voip-index) [ no label | label <Gpon::Label> ] [ no ip-address | ip-address <Gpon::Ipaddr> ] [ no net-mask | net-mask <Gpon::Ipaddr> ] [ no default-router | default-router <Gpon::Ipaddr> ] [ no mgc-ip-addr | mgc-ip-addr <Gpon::Ipaddr> ] [ no sec-mgc-ip-addr | sec-mgc-ip-addr <Gpon::Ipaddr> ] [ no ftp-serv-ip-addr | ftp-serv-ip-addr <Gpon::Ipaddr> ] [ no dhcp | dhcp <Gpon::Dhcp> ] [ no mgc-udp-port | mgc-udp-port <Gpon::PortSignalling> ] [ no voip-dscp | voip-dscp <Gpon::DscpSetting> ] [ no voip-mode | voip-mode <Gpon::GWMode> ] conf-file-name <Gpon::ConfName> [ no client-id | client-id <Gpon::ClientID> ] [ no secret-id | secret-id <Gpon::SecretID> ] [ no secret-k | secret-k <Gpon::SecretK> ] [ no ipsec-enable | ipsec-enable <Gpon::IpSec> ] [ no conf-method | conf-method <Gpon::SrvConfMethod> ] [ no spg-prof | spg-prof <Gpon::UriProfileName> ] [ no spg-user-name | spg-user-name <Gpon::SippingAuthUserName> ] [ no spg-passwd | spg-passwd <Gpon::AuthPasswd> ] [ no spg-realm | spg-realm <Gpon::Realm> ] [ no ftp-user-name | ftp-user-name <Gpon::FtpAuth> ] [ no ftp-passwd | ftp-passwd <Security::Password5> ] vlan <Vlan::Index> [ no admin-state | admin-state <Gpon::AdminState> ] [ [ no ] uncond-omci-dnld ] )
```

Command Parameters

Table 41.2-1 "Voice ONT Service Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(voip-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / 1 ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / 1) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	a unique interface index

Resource Identifier	Type	Description
	Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port	

Table 41.2-2 "Voice ONT Service Configuration Command" Command Parameters

Parameter	Type	Description
[no] label	Parameter type: <Gpon::Label> Format: - char string - length: x<=80	<i>optional parameter with default value: ""</i> label used to identify service
[no] ip-address	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> <i>The parameter is not visible during modification.</i> ip Address of the ONT VoIP Client
[no] net-mask	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> <i>The parameter is not visible during modification.</i> subnet mask for the VoIP client's subnet
[no] default-router	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> <i>The parameter is not visible during modification.</i> default next hop IP Address used by the VoIP Client
[no] mgc-ip-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> <i>The parameter is not visible during modification.</i> IP Address of the Network Media Gateway
[no] sec-mgc-ip-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> <i>The parameter is not visible during modification.</i> IP Address of the secondary Network Media Gateway
[no] ftp-serv-ip-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> <i>The parameter is not visible during modification.</i>

Parameter	Type	Description
		IP Address of the FTP Server that contains the VoIP configuration files that the ONT needs to download
[no] dhcp	Parameter type: <Gpon::Dhcp> Format: (enabled disabled) Possible values: - enabled : DHCP is enabled - disabled : DHCP is disabled	<i>optional parameter with default value: "disabled"</i> The parameter is not visible during modification. designate whether DHCP is enabled
[no] mgc-udp-port	Parameter type: <Gpon::PortSignalling> Format: - TCP or UDP port used for signalling (L2 only) - range: [0...65535]	<i>optional parameter with default value: 2944L</i> The parameter is not visible during modification. UDP port of the Media Gateway Controller used for signaling
[no] voip-dscp	Parameter type: <Gpon::DscpSetting> Format: - to set the DSCP value that the Voip Client will use - range: [0...63]	<i>optional parameter with default value: 24L</i> The parameter is not visible during modification. to set the DSCP value that the Voip Client will use
[no] voip-mode	Parameter type: <Gpon::GWMode> Format: (gr303-h248 v5.x-h248 softswitch-h248 sip1 sip2) Possible values: - gr303-h248 : GR303-H248 - v5.x-h248 : V5.x-H248 - softswitch-h248 : Softswitch-H248 - sip1 : Mode 1 SIP - sip2 : Mode 2 SIP	<i>optional parameter with default value: "sip1"</i> The parameter is not visible during modification. Used to set Voice Gateway signalling mode.
conf-file-name	Parameter type: <Gpon::ConfName> Format: - name of the Planned Configuration File that the VoIP Client must use for VoIP configuration. - length: x<=49	<i>mandatory parameter</i> name of the Planned Configuration File that the VoIP Client must use for VoIP configuration.
[no] client-id	Parameter type: <Gpon::ClientID> Format: - to uniquely identify the VoIP Client. - length: x<=25	<i>optional parameter with default value: ""</i> DHCP option 61 clientid associated with the VoIP service.
[no] secret-id	Parameter type: <Gpon::SecretID> Format: - DHCP Option 90 Secret ID for VoIP Service. Up to 8 hexadecimal characters (example 01:02:03:04). - length: x<=4	<i>optional parameter with default value: ""</i> The parameter is not visible during modification. DHCP Option 90 Secret ID for VoIP Service. Up to 8 hexadecimal characters.
[no] secret-k	Parameter type: <Gpon::SecretK> Format: - DHCP Option 90 Secret-K for VoIP Service. Up to 32 hexadecimal characters (example 01:02:03:04:05:06:07:08:09:10:11:12:13:14:15:16).	<i>optional parameter with default value: ""</i> The parameter is not visible during modification. DHCP Option 90 Secret-K for

41 Voice Ont Configuration Commands

Parameter	Type	Description
	- length: x<=16	VoIP Service. Up to 32 hexadecimal characters.
[no] ipsec-enable	Parameter type: <Gpon::IpSec> Format: (enabled disabled) Possible values: - enabled : IPSEC is enabled - disabled : IPSEC is disabled	<i>optional parameter with default value: "disabled"</i> The parameter is not visible during modification. Used to designate whether IPSEC is enabled or disabled.
[no] conf-method	Parameter type: <Gpon::SrvConfMethod> Format: (ftp sipping omci) Possible values: - ftp : FTP Server - sipping : Sipping Server, editing to and from sipping is not allowed - omci : Omci ftp	<i>optional parameter with default value: "ftp"</i> Used to determine the primary method the ONT uses to obtain VoIP configuration information.
[no] spg-prof	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: ""</i> URI profile that contains the address for acquiring the SIPPING Server.
[no] spg-user-name	Parameter type: <Gpon::SippingAuthUserName> Format: - user name required for sipping authentication - length: x<=25	<i>optional parameter with default value: ""</i> Username required for authentication with the SIPPING Server OR for PPPoE authentication.
[no] spg-passwd	Parameter type: <Gpon::AuthPasswd> Format: - password required for authentication - length: x<=25	<i>optional parameter with default value: ""</i> Password required for authentication with the SIPPING Server OR for PPPoE authentication.
[no] spg-realm	Parameter type: <Gpon::Realm> Format: - realm required for authentication - length: x<=25	<i>optional parameter with default value: ""</i> Realm for authentication with the SIPPING Server OR for the PPPoE access concentrator name.
[no] ftp-user-name	Parameter type: <Gpon::FtpAuth> Format: - authentication string - length: x<=25	<i>optional parameter with default value: ""</i> the Username required for authentication with the FTP Server.

Parameter	Type	Description
[no] ftp-passwd	Parameter type: <Security::Password5> Format: (prompt plain : <Security::PlainPassword5>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text Field type <Security::PlainPassword5> - authentication string - length: x<=25	<i>optional parameter with default value: "plain : "</i> password required for authentication with the FTP Server.
vlan	Parameter type: <Vlan::Index> Format: (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndexStacked> : <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndexStacked> - service vlan identity - range: [1...4093] Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> vlan id
[no] admin-state	Parameter type: <Gpon::AdminState> Format: (locked unlocked) Possible values: - locked : Setting it to 'locked' causes OLT to block upstream traffic on this service - unlocked : Setting it to 'unlocked' causes OLT to allow upstream traffic on this service	<i>optional parameter with default value: "unlocked"</i> Setting it to 'locked' causes OLT to block upstream traffic on this service
[no] uncond-omci-dnld	Parameter type: boolean	<i>optional parameter</i> <i>The parameter is not visible during creation.</i> download Voip XML unconditionally

41.3 Performance Monitoring configuration command for VOIP service

Command Description

configures the PM Mode of ONT-side TC-layer counters.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont service (voip-index) tc-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 41.3-1 "Performance Monitoring configuration command for VOIP service" Resource Parameters

Resource Identifier	Type	Description
(voip-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / 1 ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / 1) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId>	a unique interface index

Resource Identifier	Type	Description
	- the ONT identifier Possible values: - 1 : Gpon voip Port	

Table 41.3-2 "Performance Monitoring configuration command for VOIP service" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i> indicates whether tc layer counter Performance Monitors should be collected for this VOIP Service

41.4 Voice ONT POTS Configuration Command

Command Description

This command allows the operator to configure pots specific data associated with an ont.

Parameter Termination ID is a case insensitive string up to 25 characters long. Only the following characters are allowed:

['a'..'z', 'A'..'Z', '0'..'9', '*', '/', '-', '_', '\$', '@', or ' '].

The first character must be alphabetic. The string 'ROOT' is not allowed.

User Level

The command can be accessed by operators with sip, megaco privileges, and executed by operators with sip, megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont pots (uni-idx) [ no custinfo | custinfo <Gpon::CustInfo> ] [ no voip-serv | voip-serv
<Gpon::VoipSrvIndex> ] [ no termination-id | termination-id <Gpon::TerminationId> ] [ no pots-pwr-timer |
pots-pwr-timer <Gpon::PotsPwrTimer> ] [ no call-hist | call-hist <Gpon::CallHist> ] [ no pwr-override |
pwr-override <Gpon::PotsPwrShedOverride> ] [ no sip-msg-tot-th | sip-msg-tot-th
<Gpon::SipMsgTimeOutThreshold> ] [ no brr-pkt-loss-th | brr-pkt-loss-th <Gpon::BrrPktLossThreshold> ] [ no
excess-jitter-th | excess-jitter-th <Gpon::ExcessJitterThreshold> ] [ no rx-gain | rx-gain <Gpon::RxGain> ] [ no
tx-gain | tx-gain <Gpon::TxGain> ] [ no pots-dscp | pots-dscp <Gpon::PotsDscpSetting> ] [ no veip-ptr | veip-ptr
<Gpon::OntSpIndexOrZero> ] [ no admin-state | admin-state <Gpon::PotsAdminState> ] [ no transmit-path |
transmit-path <Gpon::Transmission> ] [ no nominal-feed-vol | nominal-feed-vol <Gpon::NominalFeedVoltage> ]
```

Command Parameters

Table 41.4-1 "Voice ONT POTS Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	interface index of the pots uni

Resource Identifier	Type	Description
	Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Table 41.4-2 "Voice ONT POTS Configuration Command" Command Parameters

Parameter	Type	Description
[no] custinfo	Parameter type: <Gpon::CustInfo> Format: - a printable string - length: x<=80	<i>optional parameter with default value: ""</i> information about pots port
[no] voip-serv	Parameter type: <Gpon::VoipSrvIndex> Format: - service number of the voip client service - range: [1]	<i>optional parameter with default value: "1"</i> service number of the voip client service
[no] termination-id	Parameter type: <Gpon::TerminationId> Format: - identifies the POTS port in H248 VoIP signalling messages. The first character must be alphabetic. The string 'ROOT' is not allowed. - range: [a-zA-Z0-9*/-_\$.@.] - length: x<=25	<i>optional parameter with default value: ""</i> identifies the POTS port in H248 VoIP signalling messages
[no] pots-pwr-timer	Parameter type: <Gpon::PotsPwrTimer> Format: - time during which pots loop voltage is held up - range: [0...65535]	<i>optional parameter with default value: "0"</i> time during which pots loop voltage is held up
[no] call-hist	Parameter type: <Gpon::CallHist> Format: (enable disable) Possible values: - enable : enable PM collection - disable : disable PM collection	<i>optional parameter with default value: "disable"</i> indicates whether or not a call history to be maintained for this line.
[no] pwr-override	Parameter type: <Gpon::PotsPwrShedOverride> Format: (true false) Possible values: - true : port excluded from voice class power shedding - false : port included in voice class power shedding	<i>optional parameter with default value: "false"</i> voice class power shedding
[no] sip-msg-tot-th	Parameter type: <Gpon::SipMsgTimeOutThreshold> Format: - threshold for raising the SIP message timeout tca alarm - range: [0...65535]	<i>optional parameter with default value: "0"</i> threshold for raising the SIP message timeout tca alarm
[no] brr-pkt-loss-th	Parameter type: <Gpon::BrrPktLossThreshold>	<i>optional parameter with default</i>

41 Voice Ont Configuration Commands

Parameter	Type	Description
	Format: - threshold for raising the bearer packet loss tca alarm - unit: 1/256ths - range: [0...255]	<i>value: "0"</i> threshold for raising the bearer packet loss tca alarm
[no] excess-jitter-th	Parameter type: <Gpon::ExcessJitterThreshold> Format: - threshold for raising the jitter tca alarm in milliseconds - unit: milliseconds - range: [0...65535]	<i>optional parameter with default value: "0"</i> excessive jitter threshold in milliseconds
[no] rx-gain	Parameter type: <Gpon::RxGain> Format: - gain value for the received signal in 0.1db increments - unit: db - range: [-12...6]	<i>optional parameter with default value: 0</i> gain value for the received signal in 0.1db increments
[no] tx-gain	Parameter type: <Gpon::TxGain> Format: - gain value for the transmit signal in 0.1db increments - unit: db - range: [-12...6]	<i>optional parameter with default value: 0</i> gain value for the transmit signal in 0.1db increments
[no] pots-dscp	Parameter type: <Gpon::PotsDscpSetting> Format: - dscp value for use in outgoing voip bearer packets (L3 only) - range: [0...63]	<i>optional parameter with default value: 46</i> dscp value for use in outgoing voip bearer packets
[no] veip-ptr	Parameter type: <Gpon::OntSpIndexOrZero> Format: (<Gpon::OntSlotId2> / <Gpon::OntPortId2> none) Possible values: - none : default value Field type <Gpon::OntSlotId2> - Gpon Ont Slot - range: [0...14] Field type <Gpon::OntPortId2> - Gpon Ont Port - range: [0...16]	<i>optional parameter with default value: "none"</i> interface index of the veip uni
[no] admin-state	Parameter type: <Gpon::PotsAdminState> Format: (unlocked locked) Possible values: - unlocked : activates the pots port - locked : deactivates the pots port	<i>optional parameter with default value: "locked"</i> administrative state of ptp pots uni
[no] transmit-path	Parameter type: <Gpon::Transmission> Format: (full-time part-time not-supported) Possible values: - full-time : full-time on-hook transmission - part-time : part-time on-hook transmission - not-supported : do not care and do not send any OMCI	<i>optional parameter with default value: "not-supported"</i> allows setting the POTS UNI either to full-time onhook transmission
[no] nominal-feed-vol	Parameter type: <Gpon::NominalFeedVoltage> Format: (not-supported <Gpon::NominalFeedVoltage>) Possible values:	<i>optional parameter with default value: "not-supported"</i> indicates the designed nominal feed voltage of the POTS loop

Parameter	Type	Description
	- not-supported : do not care and do not send any OMCI - Field type <Gpon::NominalFeedVoltage> - indicates the designed nominal feed voltage of the POTS loop - unit: Volts - range: [1...255,65535]	

Command Output

Table 41.4-3 "Voice ONT POTS Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Gpon::PotsOperState> (enabled disabled unknown) Possible values: - enabled : enable the service - disabled : disable the service - unknown : unknown state	operational state of the service <i>This element is always shown.</i>

41.5 Voice ONT Voice-Port Configuration Command

Command Description

This command allows the operator to configure the voice port specific data associated with an ont.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont voice-port (uni-idx) [ no custinfo | custinfo <Gpon::CustInfo> ] [ no voipconfig | voipconfig
<Gpon::VoipConfig> ] [ no pots-pwr-timer | pots-pwr-timer <Gpon::PotsPwrTimer> ] [ no call-hist | call-hist
<Gpon::CallHist> ] [ no pwr-override | pwr-override <Gpon::PotsPwrShedOverride> ] [ no rx-gain | rx-gain
<Gpon::RxGain> ] [ no tx-gain | tx-gain <Gpon::TxGain> ] [ no impedance | impedance <Gpon::Impedance> ] [ no
voip-media-prof | voip-media-prof <Gpon::VoipMediaProfilePointer> ] [ no ne-file-name | ne-file-name
<Gpon::NEFileName> ] [ no admin-state | admin-state <Gpon::PotsAdminState> ]
```

Command Parameters

Table 41.5-1 "Voice ONT Voice-Port Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::ChannelGroup>	interface index of the pots uni

Resource Identifier	Type	Description
	- channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Table 41.5-2 "Voice ONT Voice-Port Configuration Command" Command Parameters

Parameter	Type	Description
[no] custinfo	Parameter type: <Gpon::CustInfo> Format: - a printable string - length: x<=80	<i>optional parameter with default value: ""</i> information about pots port
[no] voipconfig	Parameter type: <Gpon::VoipConfig> Format: (none mgc sip) Possible values: - none : no association with sip or megaco - mgc : associates with mgc agent - sip : associates with sip agent	<i>optional parameter with default value: "none"</i> associates pots port with sip or mgc agent
[no] pots-pwr-timer	Parameter type: <Gpon::PotsPwrTimer> Format: - time during which pots loop voltage is held up - range: [0...65535]	<i>optional parameter with default value: "0"</i> time during which pots loop voltage is held up
[no] call-hist	Parameter type: <Gpon::CallHist> Format: (enable disable) Possible values: - enable : enable PM collection - disable : disable PM collection	<i>optional parameter with default value: "disable"</i> indicates whether or not a call history to be maintained for this line.
[no] pwr-override	Parameter type: <Gpon::PotsPwrShedOverride> Format: (true false) Possible values: - true : port excluded from voice class power shedding - false : port included in voice class power shedding	<i>optional parameter with default value: "false"</i> voice class power shedding
[no] rx-gain	Parameter type: <Gpon::RxGain> Format: - gain value for the received signal in 0.1db increments - unit: db - range: [-12...6]	<i>optional parameter with default value: 0</i> gain value for the received signal in 0.1db increments
[no] tx-gain	Parameter type: <Gpon::TxGain> Format: - gain value for the transmit signal in 0.1db increments - unit: db - range: [-12...6]	<i>optional parameter with default value: 0</i> gain value for the transmit signal in 0.1db increments
[no] impedance	Parameter type: <Gpon::Impedance> Format:	<i>optional parameter with default value: "unspecified"</i>

41 Voice Ont Configuration Commands

Parameter	Type	Description
	(600 900 750 820 1050 unspecified) Possible values: - 600 : 600 Ohms - 900 : 900 Ohms - 750 : 750 Ohms + 150 nF + 270 ohms - 820 : 820 Ohms + 115 nF + 220 ohms - 1050 : 1050 ohms + 230 nF + 320 ohms - unspecified : the impedance of the line will be handled by the ont internally	standard impedance settings for the pots line
[no] voip-media-prof	Parameter type: <Gpon::VoipMediaProfilePointer> Format: (none <Gpon::VoipMediaProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::VoipMediaProfilePointer> - profile index - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> voip media profile
[no] ne-file-name	Parameter type: <Gpon::NEFileName> Format: - file name used to supplement the network extension file pointer in voice service profile - length: x<=50	<i>optional parameter with default value: ""</i> file name used to supplement the network extension file pointer in voice service profile
[no] admin-state	Parameter type: <Gpon::PotsAdminState> Format: (unlocked locked) Possible values: - unlocked : activates the pots port - locked : deactivates the pots port	<i>optional parameter with default value: "locked"</i> administrative state of pptp pots uni

Command Output

Table 41.5-3 "Voice ONT Voice-Port Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Gpon::PotsOperState> (enabled disabled unknown) Possible values: - enabled : enable the service - disabled : disable the service - unknown : unknown state	operational state of the service <i>This element is always shown.</i>

41.6 GPON Authentication Security Profile Configuration Command

Command Description

This command creates the profile for accessing the server storing authentication security information for contacting network addresses. These profiles are normally associated with Voip Services that must reference common authentication information.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no auth-sec-prof (index) ) | ( auth-sec-prof (index) name <AsamProfileName> [ no
validation-scheme | validation-scheme <Gpon::AuthSecValScheme> ] [ no user-name | user-name
<Gpon::AuthUserName> ] [ no password | password <Security::Password5> ] [ no realm | realm <Gpon::Realm> ]
)
```

Command Parameters

Table 41.6-1 "GPON Authentication Security Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...20]	profile index

Table 41.6-2 "GPON Authentication Security Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> profile name
[no] validation-scheme	Parameter type: <Gpon::AuthSecValScheme> Format: (disabled md5-digest basic-authentic) Possible values: - disabled : Validation disabled	<i>optional parameter with default value: "md5-digest"</i> <i>The parameter is not visible during modification.</i> validation scheme required for authentication

Parameter	Type	Description
	- md5-digest : validate using md5 digest authentication - basic-authentic : Validate using basic authentication	
[no] user-name	Parameter type: <Gpon::AuthUserName> Format: - user name required for authentication - length: x<=50	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> user name required for authentication
[no] password	Parameter type: <Security::Password5> Format: (prompt plain : <Security::PlainPassword5>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text Field type <Security::PlainPassword5> - authentication string - length: x<=25	<i>optional parameter with default value: "plain : "</i> <i>The parameter is not visible during modification.</i> password required for authentication
[no] realm	Parameter type: <Gpon::Realm> Format: - realm required for authentication - length: x<=25	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> realm required for authentication

41.7 Voice ONT Secure URI profile Configuration command

Command Description

This command creates a Secure URI Profile.

It provides (via pointers to other profiles) both the URI for accessing information plus the security information necessary to access the information

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no sec-uri-profile (index) ) | ( sec-uri-profile (index) name <AsamProfileName> [ no
auth-securi-prof | auth-securi-prof <Gpon::AuthProfileName> ] uri-prof <Gpon::UriProfileName> )
```

Command Parameters

Table 41.7-1 "Voice ONT Secure URI profile Configuration command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...50]	a unique profile index

Table 41.7-2 "Voice ONT Secure URI profile Configuration command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> A string 1..32 characters long which uniquely identifies this Secure URI Profile
[no] auth-securi-prof	Parameter type: <Gpon::AuthProfileName> Format: (none <Gpon:AuthProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:AuthProfPtr>	<i>optional parameter with default value: "none"</i> <i>The parameter is not visible during modification.</i> Authentication security profile that contains network address of the security server

Parameter	Type	Description
	- Index of the Authentication security profile - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
uri-prof	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> uri profile that contains network address of the configuration server

Command Output

Table 41.7-3 "Voice ONT Secure URI profile Configuration command" Display parameters

Specific Information		
name	Type	Description
auth-securi-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the authentication security uri profile <i>This element is only shown in detail mode.</i>
uri-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the uri profile <i>This element is only shown in detail mode.</i>

41.8 GPON URI Profile Configuration Command

Command Description

This command creates the URI profile for accessing the configuration server. These profiles are normally associated with Voip Services.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no uri-prof (index) ) | ( uri-prof (index) name <AsamProfileName> [ no address | address <Gpon::UriProfileAddress> ] [ no version | version <Gpon::UriProfileVersionNbr> ] )
```

Command Parameters

Table 41.8-1 "GPON URI Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...100]	profile index

Table 41.8-2 "GPON URI Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> profile name
[no] address	Parameter type: <Gpon::UriProfileAddress> Format: - uri profile address - length: x<=100	<i>optional parameter with default value: ""</i> uri profile address that contains a Fully Qualified Domain Name (FQDN) or an IP Address (in dot notation)
[no] version	Parameter type: <Gpon::UriProfileVersionNbr> Format: - uri profile version number - range: [1...2147483647]	<i>optional parameter with default value: 1L</i> uri profile version number

41.9 GPON Tone Pattern Profile Configuration Command

Command Description

This command creates a profile that defines a tone (multi-frequency is supported) segment including duration and power. Multiple tone segment profiles are used to specify a tone that will be applied to the analog signal to the handset when a particular call event/condition occurs, such as sending a busy tone when the called party is busy.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no tone-seg-profile (index) ) | ( tone-seg-profile (index) name <AsamProfileName> freq1
<Gpon::ToneSegFrequency> power1 <Gpon::ToneSegPower> freq2 <Gpon::ToneSegFrequency> power2
<Gpon::ToneSegPower> freq3 <Gpon::ToneSegFrequency> power3 <Gpon::ToneSegPower> freq4
<Gpon::ToneSegFrequency> power4 <Gpon::ToneSegPower> modulation-freq
<Gpon::ToneSegModulationFrequency> modulation-power <Gpon::ToneSegPower> duration
<Gpon::ToneSegDuration> )
```

Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	mandatory parameter The parameter is not visible during modification. profile name
freq1	Parameter type: <Gpon::ToneSegFrequency> Format: - frequency - unit: Hz - range: [0...4000]	mandatory parameter The parameter is not visible during modification. frequency of one of the tone components
power1	Parameter type: <Gpon::ToneSegPower> Format:	mandatory parameter The parameter is not visible

41 Voice Ont Configuration Commands

Parameter	Type	Description
	- power level - unit: dBm - range: [-25.5...0.0]	during modification. power level of freq1
freq2	Parameter type: <Gpon::ToneSegFrequency> Format: - frequency - unit: Hz - range: [0...4000]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> frequency of one of the tone components
power2	Parameter type: <Gpon::ToneSegPower> Format: - power level - unit: dBm - range: [-25.5...0.0]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> power level of freq2
freq3	Parameter type: <Gpon::ToneSegFrequency> Format: - frequency - unit: Hz - range: [0...4000]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> frequency of one of the tone components
power3	Parameter type: <Gpon::ToneSegPower> Format: - power level - unit: dBm - range: [-25.5...0.0]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> power level of freq3
freq4	Parameter type: <Gpon::ToneSegFrequency> Format: - frequency - unit: Hz - range: [0...4000]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> frequency of one of the tone components
power4	Parameter type: <Gpon::ToneSegPower> Format: - power level - unit: dBm - range: [-25.5...0.0]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> power level of freq4
modulation-freq	Parameter type: <Gpon::ToneSegModulationFrequency> Format: - frequency - unit: Hz - range: [0...2000]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> modulation frequency for the tone segment
modulation-power	Parameter type: <Gpon::ToneSegPower> Format: - power level - unit: dBm - range: [-25.5...0.0]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> modulation power for the tone segment
duration	Parameter type: <Gpon::ToneSegDuration> Format: - duration - unit: milliseconds - range: [0...65535]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> duration of the tone segment

41.10 GPON Tone Pattern Sequence Profile Configuration Command

Command Description

This command creates a profile that defines a tone sequence by serially identifying tone segment profiles to associate for a sequence.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no tone-seq-profile (index) ) | ( tone-seq-profile (index) name <AsamProfileName>
pattern-prof1 <Gpon::ZeroToneSegProfile> [ no pattern-prof2 | pattern-prof2 <Gpon::ZeroToneSegProfile> ] [ no
pattern-prof3 | pattern-prof3 <Gpon::ZeroToneSegProfile> ] [ no pattern-prof4 | pattern-prof4
<Gpon::ZeroToneSegProfile> ] [ no pattern-prof5 | pattern-prof5 <Gpon::ZeroToneSegProfile> ] [ no pattern-prof6
| pattern-prof6 <Gpon::ZeroToneSegProfile> ] [ no pattern-prof7 | pattern-prof7 <Gpon::ZeroToneSegProfile> ] [
no pattern-prof8 | pattern-prof8 <Gpon::ZeroToneSegProfile> ] )
```

Command Parameters

41.11 Tone Event Profile Configuration Command

Command Description

This command is used to create a profile that contains the associations of tone sequence profiles or file ids to call event/conditions.

Note, this profile supports either method for making this association (use of the tone sequence profile or identifying a file on the ONT where a bit map of the tone is located).

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no tone-event-prof (index) ) | ( tone-event-prof (index) name <AsamProfileName> )
```

Command Parameters

Table 41.11-1 "Tone Event Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.11-2 "Tone Event Profile Configuration Command" Command Parameters

name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> profile name

41.12 GPON Busy Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Busy tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) busy-tone [ no tone-seq-prof | tone-seq-prof <Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat <Gpon::RepetitionNbr> ]
```

Command Parameters

[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: 0L</i> number of times the tone file is repeated

41.13 GPON First Call Wait Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of the first Call Wait tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) callwait1-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

41.14 GPON Second Call Wait Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of the second Call Wait tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) callwait2-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

41.15 GPON Third Call Wait Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of the third Call Wait tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) callwait3-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.15-2 "GPON Third Call Wait Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50]	optional parameter with default value: "none" tone sequence profile

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> uri profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: 0L</i> number of times the tone file is repeated

41.16 GPON Fourth Call Wait Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a fourth Call Wait tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) callwait4-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Command Parameters

Table 41.16-1 "GPON Fourth Call Wait Tone Event Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.16-2 "GPON Fourth Call Wait Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.17 GPON Alert Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Alert tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) alert-tone [ no tone-seq-prof | tone-seq-prof <Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat <Gpon::RepetitionNbr> ]
```

41.18 GPON Special Dial Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Special Dial tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) special-dial-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.19 GPON Special Info Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Special Info tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) special-info-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

41.20 GPON Release Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Release tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) release-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

41.21 GPON Congest Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a congest tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) congest-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.22 GPON Confirm Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Confirm tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) confirm-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

41.23 GPON Dial Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of the Dial tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) dial-tone [ no tone-seq-prof | tone-seq-prof <Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat <Gpon::RepetitionNbr> ]
```

41.24 GPON Message Wait Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Message wait tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) msg-wait-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

41.25 GPON Reorder Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Reorder tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) reorder-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]

41.26 GPON Ring Back Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Ring Back tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) ringback-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: 0L</i> number of times the tone file is repeated

41.27 GPON Roh Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Roh tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) roh-tone [ no tone-seq-prof | tone-seq-prof <Gpon::ToneSeqProfile> ]
[ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat <Gpon::RepetitionNbr> ]
```

41.28 GPON Stutter Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Stutter tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) stutter-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Parameter	Type	Description
	and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> uri profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: 0L</i> number of times the tone file is repeated

41.29 GPON Intrusion Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Intrusion tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) intrusion-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Command Parameters

Table 41.29-1 "GPON Intrusion Tone Event Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.29-2 "GPON Intrusion Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50]	optional parameter with default value: "none" tone sequence profile

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.30 GPON Dead Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Dead tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) dead-tone [ no tone-seq-prof | tone-seq-prof <Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat <Gpon::RepetitionNbr> ]
```

Command Parameters

Table 41.30-1 "GPON Dead Tone Event Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.30-2 "GPON Dead Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software.	<i>optional parameter with default value: "none"</i> tone segment profile

Parameter	Type	Description
	The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.31 GPON First User Defined Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a First User Defined tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) userdef1-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Command Parameters

Resource Identifier	Type	Description
(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.31-2 "GPON First User Defined Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50]	optional parameter with default value: "none" tone segment profile

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.32 GPON Second User Defined Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Second User Defined tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) userdef2-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50]	optional parameter with default value: "none" tone segment profile

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.33 GPON Third User Defined Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Third User Defined tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) userdef3-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Command Parameters

Table 41.33-1 "GPON Third User Defined Tone Event Profile Configuration Command" Resource Parameters

(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.33-2 "GPON Third User Defined Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50]	optional parameter with default value: "none" tone segment profile

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.34 GPON Fourth User Defined Tone Event Profile Configuration Command

Command Description

This command is used to change or configure the definition of a Fourth User Defined tone within the tone set.

As noted in the Tone Event Profile configuration command, the selection of the tone can be either via pointing to a Tone Sequence Profile, or by referencing a file on the ONT.

This command supports either mechanism.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont tone-event-prof (index) userdef4-tone [ no tone-seq-prof | tone-seq-prof
<Gpon::ToneSeqProfile> ] [ no file-prof | file-prof <Gpon::FileProfile> ] [ no repeat | repeat
<Gpon::RepetitionNbr> ]
```

Command Parameters

Resource Identifier	Type	Description
(index)	Format: - tone event profile index - range: [1...5]	profile index

Table 41.34-2 "GPON Fourth User Defined Tone Event Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] tone-seq-prof	Parameter type: <Gpon::ToneSeqProfile> Format: (none <Gpon::ToneSeqProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneSeqProfPtr> - profile index - range: [0...50]	optional parameter with default value: "none" tone segment profile

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] file-prof	Parameter type: <Gpon::FileProfile> Format: (none <Gpon::FileProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::FileProfPtr> - profile index - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile
[no] repeat	Parameter type: <Gpon::RepetitionNbr> Format: - repetition number - range: [0...10]	<i>optional parameter with default value: "0"</i> number of times the tone file is repeated

41.35 GPON Network Dial Plan Profile Configuration Command

Command Description

This command creates a profile that defines a Network Dial Plan.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no nwdial-plan-prof (index) ) | ( nwdial-plan-prof (index) name <AsamProfileName> [ no
critical-timeout | critical-timeout <Gpon::TimeOut> ] [ no partial-timout | partial-timout <Gpon::TimeOut> ] [ no
format | format <Gpon::PlanFormat> ] [ digitmap1 <Gpon::Digit> ] [ digitmap2 <Gpon::Digit> ] [ digitmap3
<Gpon::Digit> ] [ digitmap4 <Gpon::Digit> ] )
```

Command Parameters

Table 41.35-1 "GPON Network Dial Plan Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...20]	network dial plan profile

Table 41.35-2 "GPON Network Dial Plan Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	mandatory parameter The parameter is not visible during modification. name of profile
[no] critical-timeout	Parameter type: <Gpon::TimeOut> Format: - dial timeout - unit: sec - range: [1.000...40.000]	optional parameter with default value: 4L The parameter is not visible during modification. critical dial timeout in seconds
[no] partial-timout	Parameter type: <Gpon::TimeOut> Format: - dial timeout - unit: sec - range: [1.000...40.000]	optional parameter with default value: 16L The parameter is not visible during modification. partial dial timeout in seconds
[no] format	Parameter type: <Gpon::PlanFormat>	optional parameter with default

Parameter	Type	Description
	Format: (not-def h248 nsc) Possible values: - not-def : not defined - h248 : h.248 format using dial plan tokens - nsc : nsc format	<i>value: "h248"</i> <i>The parameter is not visible during modification.</i> specifies the dial plan format
digitmap1	Parameter type: <Gpon::Digit> Format: - ASCII character string - length: x<=256	<i>optional parameter</i> <i>The parameter is not visible during modification.</i> specifies part 1 of the actual digit map ascii symbols with delimiter '1'
digitmap2	Parameter type: <Gpon::Digit> Format: - ASCII character string - length: x<=256	<i>optional parameter</i> <i>The parameter is not visible during modification.</i> specifies part 2 of the actual digit map ascii symbols with delimiter '1'
digitmap3	Parameter type: <Gpon::Digit> Format: - ASCII character string - length: x<=256	<i>optional parameter</i> <i>The parameter is not visible during modification.</i> specifies part 3 of the actual digit map ascii symbols with delimiter '1'
digitmap4	Parameter type: <Gpon::Digit> Format: - ASCII character string - length: x<=256	<i>optional parameter</i> <i>The parameter is not visible during modification.</i> specifies part 4 of the actual digit map ascii symbols with delimiter '1'

41.36 Create a RTP profile

Command Description

This command creates a RTP profile which provides information required by Real Time Protocol.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no rtp-profile (index) ) | ( rtp-profile (index) name <Gpon::RtpProfileName> [ no
local-port-min | local-port-min <Gpon::LocalPortMin> ] [ no local-port-max | local-port-max
<Gpon::LocalPortMax> ] [ no dscp | dscp <Gpon::Dscp> ] [ no piggy-back-event | piggy-back-event
<Gpon::PiggyBackEvent> ] [ no tone-event | tone-event <Gpon::ToneEvent> ] [ no dtmf-event | dtmf-event
<Gpon::DtmfEvent> ] [ no cas-event | cas-event <Gpon::CasEvent> ] )
```

Command Parameters

Table 41.36-1 "Create a RTP profile" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - access identifier - range: [1...10]	access identifier of rtp profile

Table 41.36-2 "Create a RTP profile" Command Parameters

Parameter	Type	Description
name	Parameter type: <Gpon::RtpProfileName> Format: - unique rtp profile name - length: 1<=x<=32	mandatory parameter The parameter is not visible during modification. unique rtp profile name
[no] local-port-min	Parameter type: <Gpon::LocalPortMin> Format: - Local port - range: [5000...65000]	optional parameter with default value: 50000L The parameter is not visible during modification. base rtp port for voice traffic
[no] local-port-max	Parameter type: <Gpon::LocalPortMax> Format: - Local port - range: [5000...65000]	optional parameter with default value: 60000L The parameter is not visible during modification. highest rtp port for voice traffic
[no] dscp	Parameter type: <Gpon::Dscp> Format: - dscp setting - range: [0...63]	optional parameter with default value: 46L The parameter is not visible during modification.

Parameter	Type	Description
		value of dscp setting to use in ip header
[no] piggy-back-event	Parameter type: <Gpon::PiggyBackEvent> Format: (disabled enabled) Possible values: - disabled : disabled rtp piggyback events - enabled : enabled rtp poggyback events	<i>optional parameter with default value: "disabled"</i> <i>The parameter is not visible during modification.</i> handling of rtp piggy back events
[no] tone-event	Parameter type: <Gpon::ToneEvent> Format: (disabled enabled) Possible values: - disabled : disabled rtp tone events - enabled : enabled rtp tone events	<i>optional parameter with default value: "disabled"</i> <i>The parameter is not visible during modification.</i> handling tones via rtp tones
[no] dtmf-event	Parameter type: <Gpon::DtmfEvent> Format: (disabled enabled) Possible values: - disabled : disabled rtp dtmf events - enabled : enabled rtp dtmf events	<i>optional parameter with default value: "disabled"</i> <i>The parameter is not visible during modification.</i> handling dtmf via rtp dtmf
[no] cas-event	Parameter type: <Gpon::CasEvent> Format: (disabled enabled) Possible values: - disabled : disabled rtp cas events - enabled : enabled rtp cas events	<i>optional parameter with default value: "disabled"</i> <i>The parameter is not visible during modification.</i> handling cas via rtp cas

41.37 Create a Voice Service profile

Command Description

This command creates a Voice Service profile which provides information required voice service function.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no voice-serv-prof (index) ) | ( voice-serv-prof (index) name
<Gpon::VoiceServiceProfileName> [ no securi-prof | securi-prof <Gpon::SecureUriProfilePointer> ] [ no
toneset-prof | toneset-prof <Gpon::ToneEventProfilePointer> ] [ no ringingset-prof | ringingset-prof
<Gpon::RingEventProfilePointer> ] [ no announce-type | announce-type <Gpon::AnnounceType> ] [ no jitter-target
| jitter-target <Gpon::JitterTarget> ] [ no jitter-max | jitter-max <Gpon::JitterMax> ] [ no echo-cancel | echo-cancel
<Gpon::EchoCancel> ] [ no dtmf-level | dtmf-level <Gpon::DtmfLevel> ] [ no dtmf-duration | dtmf-duration
<Gpon::DtmfDuration> ] [ no hook-flash-min | hook-flash-min <Gpon::HookFlashMin> ] [ no hook-flash-max |
hook-flash-max <Gpon::HookFlashMax> ] [ no pstn-variant | pstn-variant <Gpon::PstnVariant> ] )
```

Command Parameters

Table 41.37-1 "Create a Voice Service profile" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - access identifier - range: [1...10]	access identifier of voice service profile

Table 41.37-2 "Create a Voice Service profile" Command Parameters

Parameter	Type	Description
name	Parameter type: <Gpon::VoiceServiceProfileName> Format: - unique voip media profile name - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> unique voice service profile name
[no] securi-prof	Parameter type: <Gpon::SecureUriProfilePointer> Format: (none <Gpon::SecureUriProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::SecureUriProfilePointer> - profile index - range: [0...50]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> voice service security profile pointer

Parameter	Type	Description
	Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] toneset-prof	Parameter type: <Gpon::ToneEventProfilePointer> Format: (none <Gpon::ToneEventProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ToneEventProfilePointer> - profile index - range: [0...5] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> tone set profile it contains tone definitions
[no] ringingset-prof	Parameter type: <Gpon::RingEventProfilePointer> Format: (none <Gpon::RingEventProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::RingEventProfilePointer> - profile index - range: [0...5] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> ringing set profile
[no] announce-type	Parameter type: <Gpon::AnnounceType> Format: (silence recorder-tone fast-busy voice not-applicable) Possible values: - silence : silence - recorder-tone : recorder type - fast-busy : fast busy - voice : voice - not-applicable : not applicable	<i>optional parameter with default value: 255L</i> <i>The parameter is not visible during modification.</i> treatment when subscriber goes off-hook
[no] jitter-target	Parameter type: <Gpon::JitterTarget> Format: - jitter target - range: [0...65535]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> target value of jitter buffer in msec
[no] jitter-max	Parameter type: <Gpon::JitterMax> Format: - jitter max - range: [0...65535]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i>

41 Voice Ont Configuration Commands

Parameter	Type	Description
		max buffer value of jitter buffer in msec
[no] echo-cancel	Parameter type: <Gpon::EchoCancel> Format: (disabled enabled) Possible values: - disabled : disabled echo cancellation - enabled : enabled echo cancellation	<i>optional parameter with default value: 1L</i> <i>The parameter is not visible during modification.</i> enable or disable echo cancellation
[no] dtmf-level	Parameter type: <Gpon::DtmfLevel> Format: - dtmf level - range: [-25...-3,0]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> power level of dtmf tone
[no] dtmf-duration	Parameter type: <Gpon::DtmfDuration> Format: - dtmf duration - range: [0...65535]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> duration the tone being sent to subscriber
[no] hook-flash-min	Parameter type: <Gpon::HookFlashMin> Format: - hook flash min - range: [0...65535]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> minimum duration to determine a hook flash event
[no] hook-flash-max	Parameter type: <Gpon::HookFlashMax> Format: - hook flash max - range: [0...65535]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> maximum duration to determine a hook flash event
[no] pstn-variant	Parameter type: <Gpon::PstnVariant> Format: - country code for the pots line - range: [0...999]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> current country code for pots line

Command Output

Table 41.37-3 "Create a Voice Service profile" Display parameters

Specific Information		
name	Type	Description
securi-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	security profile pointer <i>This element is always shown.</i>
toneset-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	tone event profile pointer <i>This element is always shown.</i>
ringingset-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	ringing set event profile pointer <i>This element is always shown.</i>

41.38 Create a VOIP Application Service Profile

Command Description

This command creates a VOIP Application service profile which provides configuration information regarding calling features.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no voip-app-service (index) ) | ( voip-app-service (index) name
<Gpon::VoipAppProfileName> [ no calling-number | calling-number <Gpon::CidCallingNumber> ] [ no
calling-name | calling-name <Gpon::CidCallingName> ] [ no caller-id-block | caller-id-block
<Gpon::CidCidBlock> ] [ no caller-id-number | caller-id-number <Gpon::CidCidNumber> ] [ no caller-id-name |
caller-id-name <Gpon::CidCidName> ] [ no anonymous-block | anonymous-block <Gpon::CidAcr> ] [ no
call-waiting | call-waiting <Gpon::CwaitCallWaiting> ] [ no callerid-announce | callerid-announce
<Gpon::CwaitIdAnnounce> ] [ no three-way-calling | three-way-calling <Gpon::Ctrans3WayCalling> ] [ no
call-transfer | call-transfer <Gpon::CtransCallTransfer> ] [ no call-hold | call-hold <Gpon::CtransCallHold> ] [ no
call-park | call-park <Gpon::CtransCallPark> ] [ no do-not-disturb | do-not-disturb <Gpon::CtransDoNotDisturb> ]
[ no flash-on-emerg-cal | flash-on-emerg-cal <Gpon::CtransFlashOnEmergency> ] [ no emer-ser-org-hold |
emer-ser-org-hold <Gpon::CtransEmergencyServiceOrginateHold> ] [ no six-way-calling | six-way-calling
<Gpon::Ctrans6WayCalling> ] [ no mwi-splash-ring | mwi-splash-ring <Gpon::CpresentMwiSplashRing> ] [ no
mwi-spl-dialtone | mwi-spl-dialtone <Gpon::CpresentMwiSpecialDialtone> ] [ no mwi-visual-indi |
mwi-visual-indi <Gpon::CpresentMwiVisualIndication> ] [ no call-fwd-indicate | call-fwd-indicate
<Gpon::CpresentCallFwdIndicate> ] [ no dir-conn-feature | dir-conn-feature <Gpon::DirConnFeature> ] [ no
dialtone-dely-opt | dialtone-dely-opt <Gpon::DialtoneDelayOpt> ] [ no dir-conn-prof | dir-conn-prof
<Gpon::DirConnectProfilePointer> ] [ no bridge-prof | bridge-prof <Gpon::BridgeProfilePointer> ] [ no conf-prof |
conf-prof <Gpon::ConfProfilePointer> ] )
```

Table 41.38-2 "Create a VOIP Application Service Profile" Command Parameters

Parameter	Type	Description
name	Parameter type: <Gpon::VoipAppProfileName> Format: - unique voip app profile name - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> unique voip app service profile

41 Voice Ont Configuration Commands

Parameter	Type	Description
[no] calling-number	Parameter type: <Gpon::CidCallingNumber> Format: (disable enable) Possible values: - disable : disable - enable : enable	name <i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> caller id supports calling number
[no] calling-name	Parameter type: <Gpon::CidCallingName> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> caller id supports calling name
[no] caller-id-block	Parameter type: <Gpon::CidCidBlock> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> block both cid number and name
[no] caller-id-number	Parameter type: <Gpon::CidCidNumber> Format: (public private) Possible values: - public : disable - private : enable	<i>optional parameter with default value: "public"</i> <i>The parameter is not visible during modification.</i> permanent presentation status for number
[no] caller-id-name	Parameter type: <Gpon::CidCidName> Format: (public private) Possible values: - public : disable - private : enable	<i>optional parameter with default value: "public"</i> <i>The parameter is not visible during modification.</i> permanent presentation status for name
[no] anonymous-block	Parameter type: <Gpon::CidAcr> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> anonymous cid blocking
[no] call-waiting	Parameter type: <Gpon::CwaitCallWaiting> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> call waiting feature supported
[no] callerid-announce	Parameter type: <Gpon::CwaitIdAnnounce> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> caller id announcement feature supported

Parameter	Type	Description
[no] three-way-calling	Parameter type: <Gpon::Ctrans3WayCalling> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. 3 way calling
[no] call-transfer	Parameter type: <Gpon::CtransCallTransfer> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. call transfer supported
[no] call-hold	Parameter type: <Gpon::CtransCallHold> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. call hold
[no] call-park	Parameter type: <Gpon::CtransCallPark> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. call park
[no] do-not-disturb	Parameter type: <Gpon::CtransDoNotDisturb> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. do not disturb
[no] flash-on-emerg-cal	Parameter type: <Gpon::CtransFlashOnEmergency> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. flash on emergency call
[no] emer-ser-org-hold	Parameter type: <Gpon::CtransEmergencyServiceOriginateHold> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. emergency service originate hold
[no] six-way-calling	Parameter type: <Gpon::Ctrans6WayCalling> Format: (disable enable) Possible values: - disable : disable - enable : enable	optional parameter with default value: "disable" The parameter is not visible during modification. 6 way calling

41 Voice Ont Configuration Commands

Parameter	Type	Description
[no] mwi-splash-ring	Parameter type: <Gpon::CpresentMwiSplashRing> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> message waiting indication splash ring
[no] mwi-spl-dialtone	Parameter type: <Gpon::CpresentMwiSpecialDialtone> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> message waiting indication special dial tone
[no] mwi-visual-indi	Parameter type: <Gpon::CpresentMwiVisualIndication> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> message waiting indication visual indication
[no] call-fwd-indicate	Parameter type: <Gpon::CpresentCallFwdIndicate> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> call forwarding indication
[no] dir-conn-feature	Parameter type: <Gpon::DirConnFeature> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> direct connect feature
[no] dialtone-dely-opt	Parameter type: <Gpon::DialtoneDelayOpt> Format: (disable enable) Possible values: - disable : disable - enable : enable	<i>optional parameter with default value: "disable"</i> <i>The parameter is not visible during modification.</i> dial tone delay option
[no] dir-conn-prof	Parameter type: <Gpon::DirConnectProfilePointer> Format: (none <Gpon::DirConnectProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::DirConnectProfilePointer> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> secure uri profile that contains ip of address of direct connect

Parameter	Type	Description
[no] bridge-prof	Parameter type: <Gpon::BridgeProfilePointer> Format: (none <Gpon::BridgeProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::BridgeProfilePointer> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> secure uri profile that contains ip address of bridge line agent
[no] conf-prof	Parameter type: <Gpon::ConfProfilePointer> Format: (none <Gpon::ConfProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::ConfProfilePointer> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> secure uri profile that contains ip address of conference factory

41.39 Create a VOIP media profile

Command Description

This command creates a VOIP media profile which provides information pertaining to voice encoding.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no voip-media-prof (index) ) | ( voip-media-prof (index) name
<Gpon::VoipMediaProfileName> [ no voiceserviceprof | voiceserviceprof <Gpon::VoiceServiceProfilePointer> ] [
no rtp-prof | rtp-prof <Gpon::RtpProfilePointer> ] [ no fax-mode | fax-mode <Gpon::FaxMode> ] [ no codec1st |
codec1st <Gpon::CodecOrder> ] [ no pkt-period1st | pkt-period1st <Gpon::PktPeriodOrd> ] [ no silence1st |
silence1st <Gpon::SilenceOrder> ] [ no codec2nd | codec2nd <Gpon::CodecOrder> ] [ no pkt-period2nd |
pkt-period2nd <Gpon::PktPeriodOrd> ] [ no silence2nd | silence2nd <Gpon::SilenceOrder> ] [ no codec3rd |
codec3rd <Gpon::CodecOrder> ] [ no pkt-period3rd | pkt-period3rd <Gpon::PktPeriodOrd> ] [ no silence3rd |
silence3rd <Gpon::SilenceOrder> ] [ no codec4th | codec4th <Gpon::CodecOrder> ] [ no pkt-period4th |
pkt-period4th <Gpon::PktPeriodOrd> ] [ no silence4th | silence4th <Gpon::SilenceOrder> ] [ no outofband-dtmf |
outofband-dtmf <Gpon::OutOfBand> ] )
```

41.40 GPON Ringing Pattern Profile Configuration Command

Command Description

This command creates a profile that defines a ringing segment including duration or whether it is silent. Multiple ringing segment profiles are used to specify the ringing that will be applied to the analog line to ring the phone. Only two types of ringing are supported ("normal" or "splash") are supported via this method..

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no ring-seg-prof (index) ) | ( ring-seg-prof (index) name <AsamProfileName> [ no
profile-ring | profile-ring <Gpon::ProfileRing> ] ring-duration <Gpon::RingDuration> )
```

Command Parameters

Table 41.40-1 "GPON Ringing Pattern Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...20]	index of profile

name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> name of profile
[no] profile-ring	Parameter type: <Gpon::ProfileRing> Format: (ringing silent) Possible values: - ringing : supplies ringing - silent : specifies a silent period	<i>optional parameter with default value: "ringing"</i> <i>The parameter is not visible during modification.</i> Ringing sequence profile.
ring-duration	Parameter type: <Gpon::RingDuration> Format: - duration of the tone segment in (msec). - unit: msec	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> Valid values are 0 to 65535 (0 to

41 Voice Ont Configuration Commands

Parameter	Type	Description
	- range: [0...65535]	65.535 seconds) A value of 0 means ring indefinitely until a call event occurs causing ringing to be removed from the lineDuration of the tone segment (in msec)

41.41 GPON Ringing Pattern Sequence Profile Configuration Command

Command Description

This command creates a profile that defines a ringing sequence by serially identifying ring segment profiles to associate for a ringing sequence

NOTE: Segment 1 is mandatory to be entered. The remainders are optional. Other than the zero value (profile ID), the same Ring pattern cannot be referenced more than twice within the same profile. To cause a repeating sequence, reuse the profile ID from pattern1 or name from that first profile reference to define the looping of ring segments. These patterns represent the play order of the ring segments

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no ring-seq-prof (index) ) | ( ring-seq-prof (index) name <AsamProfileName> pattern1
<Gpon::RingingProf> [ no pattern2 | pattern2 <Gpon::RingingProfPointer> ] [ no pattern3 | pattern3
<Gpon::RingingProfPointer> ] [ no pattern4 | pattern4 <Gpon::RingingProfPointer> ] [ no pattern5 | pattern5
<Gpon::RingingProfPointer> ] )
```

41.42 GPON Ring Event Profile Configuration Command

Command Description

This command can be used to create a profile that contains the associations of ringing sequence profiles or file ids to ringing selections. Note, this profile supports either method for making this association (use of the ringing sequence profile or identifying a file on the ONT that defines the ringing).

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no ringing-profile (index) ) | ( ringing-profile (index) name <AsamProfileName> [ no ringing-seq-prof | ringing-seq-prof <Gpon::RingingseqPointer> ] [ no ringing-file-prof | ringing-file-prof <Gpon::RingingfilePointer> ] [ no ringing-repeat | ringing-repeat <Gpon::RingRepeat> ] [ no splash-seq-prof | splash-seq-prof <Gpon::RingingseqPointer> ] [ no splash-file-prof | splash-file-prof <Gpon::RingingfilePointer> ] [ no splash-repeat | splash-repeat <Gpon::SplashRepeat> ] )
```

Command Parameters

41.43 GPON VOIP Feature Access Codes Profile Configuration Command

Command Description

This command creates a profile that defines a set of Feature Access Codes.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no feat-acccode-prof (index) ) | ( feat-acccode-prof (index) name <AsamProfileName> [ no
cancel-call-wait | cancel-call-wait <Gpon::Accesscode> ] [ no hold | hold <Gpon::Accesscode> ] [ no park | park
<Gpon::Accesscode> ] [ no act-caller-id | act-caller-id <Gpon::Accesscode> ] [ no deact-caller-id | deact-caller-id
<Gpon::Accesscode> ] [ no act-dnd | act-dnd <Gpon::Accesscode> ] [ no deact-dnd | deact-dnd
<Gpon::Accesscode> ] [ no dnd-pin | dnd-pin <Gpon::Accesscode> ] [ no emergency | emergency
<Gpon::Accesscode> ] [ no intercom | intercom <Gpon::Accesscode> ] [ no attend-call-trans | attend-call-trans
<Gpon::Accesscode> ] [ no blind-call-trans | blind-call-trans <Gpon::Accesscode> ] )
```

Command Parameters

Table 41.43-1 "GPON VOIP Feature Access Codes Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...20]	feature access codes profile.

Table 41.43-2 "GPON VOIP Feature Access Codes Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	mandatory parameter The parameter is not visible during modification. name of profile
[no] cancel-call-wait	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	optional parameter with default value: "" The parameter is not visible during modification. access code to cancel call waiting.

Parameter	Type	Description
[no] hold	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to hold a call
[no] park	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to park a call
[no] act-caller-id	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to activate caller id.
[no] deact-caller-id	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to deactivate caller id.
[no] act-dnd	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to activate do not disturb
[no] deact-dnd	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to de-activate do not disturb
[no] dnd-pin	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to to change the do not disturb pin.
[no] emergency	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to set the emergency service number.
[no] intercom	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to enable intercom service
[no] attend-call-trans	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> access code to select attended call transfer behavior.

41 Voice Ont Configuration Commands

Parameter	Type	Description
[no] blind-call-trans	Parameter type: <Gpon::Accesscode> Format: - access code - range: [0-9*#] - length: x<=5	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> select unattended call transfer behavior.

41.44 GPON Common VOIP Configuration

Command

Command Description

This command creates the common VoIP configuration for the ONT. It must be created after creating an IP Host on the ONT. It ties directly to the IP Host via the AID. Note, only one VoIP client can be supported in an ONT at this time.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no voip-config (voip-index) ) | ( voip-config (voip-index) protocol <Gpon::VoipProtocol> [
no conf-method | conf-method <Gpon::ConfMethod> ] [ no securi-prof | securi-prof <Gpon::SecuriProf> ] )
```

Command Parameters

Table 41.44-1 "GPON Common VOIP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(voip-index)	Format: (ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::IpHostId> ont:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Ng2::IpHostId>) Possible values: - ont:ng2 : ngpon2 ont - ont : ont Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId>	a unique interface index

Resource Identifier	Type	Description
	- the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Field type <Gpon::IpHostID> - iphost id Field type <Ng2::IpHostID> - iphost id (ngpon2)	

Table 41.44-2 "GPON Common VOIP Configuration Command" Command Parameters

Parameter	Type	Description
protocol	Parameter type: <Gpon::VoipProtocol> Format: (sip h248) Possible values: - sip : sip signalling protocol - h248 : h248 signalling protocol	<i>mandatory parameter</i> protocol
[no] conf-method	Parameter type: <Gpon::ConfMethod> Format: (omci ftp) Possible values: - omci : FTP Server - ftp : FTP Server	<i>optional parameter with default value: "omci"</i> configuration method
[no] securi-prof	Parameter type: <Gpon::SecuriProf> Format: (none <Gpon::SecuriProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::SecuriProfilePointer> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> securi prof

41.45 GPON Voice ONT POTS Rtp PM Mode Configuration Command

Command Description

This command allows the operator to configure the PM Mode of ONT POTS Rtp monitoring.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont pots-rtp (uni-index) [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 41.45-1 "GPON Voice ONT POTS Rtp PM Mode Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId>	gpon ont port index

41 Voice Ont Configuration Commands

Resource Identifier	Type	Description
	- the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Gpon Ont PotsPort Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Table 41.45-2 "GPON Voice ONT POTS Rtp PM Mode Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> ONT POTS Rtp performance monitoring

41.46 GPON ONT SIP Configuration Command

Command Description

This command creates the SIP configuration for the ONT. It must be created after creating a VOIP Configuration on the ONT. Note, only one VoIP client can be supported in an ONT at this time.

NOTE:

OLT prohibits the entry of the following range of well-known IP addresses for the parameters *primary-dns* and *secondary-dns*:

224.0.0.0 to 239.255.255.255 (multicast)

127.0.0.0 to 127.255.255.255 (loopback)

255.255.255.255 (broadcast)

User Level

The command can be accessed by operators with *sip,megaco* privileges, and executed by operators with *sip,megaco* privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no sip-config (sip-index) ) | ( sip-config (sip-index) [ no proxyserv-prof | proxyserv-prof
<Gpon::UriProfileName> ] [ no outproxyserv-prof | outproxyserv-prof <Gpon::UriProfileName> ] [ no primary-dns
| primary-dns <Gpon::IpAddress> ] [ no secondary-dns | secondary-dns <Gpon::IpAddress> ] [ no reg-expire-time |
reg-expire-time <Gpon::RegExpireTime> ] [ no re-reg-head-start | re-reg-head-start <Gpon::ReRegHeadStart> ] [
no aor-host-prt-prof | aor-host-prt-prof <Gpon::UriProfileName> ] [ no registrar-prof | registrar-prof
<Gpon::SecuriProf> ] [ no soft-sw-vendor | soft-sw-vendor <Gpon::SwVendor> ] [ no opt-tx-cntrl | opt-tx-cntrl
<Gpon::OpticalTxCntrl> ] [ no uri-format | uri-format <Gpon::UriFormat> ] [ no dscp | dscp <Gpon::SigDscp> ] [
no udp-port | udp-port <Gpon::SipUdpPort> ] )
```

Command Parameters

Table 41.46-1 "GPON ONT SIP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(sip-index)	Format: (ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::IpHostId> ont:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Ng2::IpHostId>) Possible values: - ont:ng2 : ngpon2 ont - ont : ont Field type <Eqpt::RackId> - the rack number	SIP ONT index

Resource Identifier	Type	Description
	Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Field type <Gpon::IpHostID> - iphost id Field type <Ng2::IpHostID> - iphost id (ngpon2)	

Table 41.46-2 "GPON ONT SIP Configuration Command" Command Parameters

Parameter	Type	Description
[no] proxyserv-prof	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile of the SIP proxy server for SIP signaling messages
[no] outproxyserv-prof	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile of the outbound SIP proxy server for SIP signaling messages
[no] primary-dns	Parameter type: <Gpon::IpAddress> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> primary SIP DNS server ip address

Parameter	Type	Description
[no] secondary-dns	Parameter type: <Gpon::IpAddress> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> secondary SIP DNS server ip address
[no] reg-expire-time	Parameter type: <Gpon::RegExpireTime> Format: - sip registration expiration time - unit: sec - range: [0...86400]	<i>optional parameter with default value: "3600"</i> SIP registration expiration time
[no] re-reg-head-start	Parameter type: <Gpon::ReRegHeadStart> Format: - Re-registration head start time - unit: sec - range: [0...600]	<i>optional parameter with default value: "360"</i> re-registration head start time
[no] aor-host-prt-prof	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile that contains the host or domain part of the SIP address of record
[no] registrar-prof	Parameter type: <Gpon::SecuriProf> Format: (none <Gpon::SecuriProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::SecuriProfilePointer> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> URI profile of the registrar server
[no] soft-sw-vendor	Parameter type: <Gpon::SwVendor> Format: - name of the sip gateway softswitch vendor - range: [A-Z] - length: x<=4	<i>optional parameter with default value: ""</i> name of the SIP gateway softswitch vendor
[no] opt-tx-cntrl	Parameter type: <Gpon::OpticalTxCntrl> Format: (disable enable) Possible values: - disable : disable optional transmission control - enable : enable optional transmission control	<i>optional parameter with default value: "disable"</i> optional transmission control indicating whether the ONT is enabled/disabled to transmit value options

Parameter	Type	Description
[no] uri-format	Parameter type: <Gpon::UriFormat> Format: (tel-uri sip-uri) Possible values: - tel-uri : tel uri format - sip-uri : sip uri format	<i>optional parameter with default value: "tel-uri"</i> URI format to specify the format of the URI in outgoing SIP messages
[no] dscp	Parameter type: <Gpon::SigDscp> Format: - dscp value - range: [0...63]	<i>optional parameter with default value: "24"</i> dscp setting value to use in the ip header of outgoing SIP signaling packets
[no] udp-port	Parameter type: <Gpon::SipUdpPort> Format: - udp port - range: [5000...6000]	<i>optional parameter with default value: "5060"</i> <i>The parameter is not visible during modification.</i> specifies the udp port number to be used for SIP signaling messages

Command Output

Specific Information		
name	Type	Description
proxyserv-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the URI profile that contains the ip address of the SIP proxy server for SIP signaling messages. <i>This element is always shown.</i>
outproxyserv-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the URI profile that contains the ip address of the outbound SIP proxy server for SIP signaling messages. <i>This element is always shown.</i>
aor-host-prt-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the URI profile that contains the host or domain part of the SIP address of record. <i>This element is always shown.</i>
registrar-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the secure URI profile that contains the IP address of the registrar server. <i>This element is always shown.</i>

41.47 Voice Ont SIP Agent PM Mode Configuration Command

Command Description

This command allows the operator to configure the PM Mode of ONT SIP Agent monitoring.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont sip-agent (ont-index) [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 41.47-1 "Voice Ont SIP Agent PM Mode Configuration Command" Resource Parameters

[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i> performance mode state

41.48 Voice Ont SIP Agent Call PM Mode Configuration Command

Command Description

This command allows the operator to configure the PM Mode of ONT SIP Agent Call monitoring.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont sip-call (ont-index) [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

41.49 Configure ont POT SIP

Command Description

This command edits a POT's port's SIP parameter for those line using SIP instead of MGC.

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont voice-sip-port (pots-index) [ no user-aor | user-aor <Gpon::UserAddress> ] [ no display-name
| display-name <Gpon::DisplayName> ] [ no val-scheme | val-scheme <Gpon::AuthSecValScheme> ] [ no
user-name | user-name <Gpon::AuthUserName> ] [ no password | password <Security::Password5> ] [ no realm |
realm <Gpon::Realm> ] [ no voice-mail-prof | voice-mail-prof <Gpon::VoiceMailProfilePointer> ] [ no
voice-mail-to | voice-mail-to <Gpon::VoiceMailTo> ] [ no ntwk-dp-prof | ntwk-dp-prof
<Gpon::NetDialPlanProfilePointer> ] [ no app-serv-prof | app-serv-prof <Gpon::AppServProfilePointer> ] [ no
ac-code-prof | ac-code-prof <Gpon::AccessCodeProfilePointer> ] [ no rlstimer | rlstimer <Gpon::RlsTimer> ] [ no
rohtimer | rohtimer <Gpon::RohTimer> ]
```

Command Parameters

Resource Identifier	Type	Description
(pots-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::ChannelGroup> - channel group number	an ontpots access identifier index

41 Voice Ont Configuration Commands

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Table 41.49-2 "Configure ont POT SIP" Command Parameters

Parameter	Type	Description
[no] user-aor	Parameter type: <Gpon::UserAddress> Format: - user identification - length: x<=50	<i>optional parameter with default value: ""</i> user address of record
[no] display-name	Parameter type: <Gpon::DisplayName> Format: - customer id used to display name in outgoing sip message - length: x<=25	<i>optional parameter with default value: ""</i> customer ID user for display name
[no] val-scheme	Parameter type: <Gpon::AuthSecValScheme> Format: (disabled md5-digest basic-authentic) Possible values: - disabled : Validation disabled - md5-digest : validate using md5 digest authentication - basic-authentic : Validate using basic authentication	<i>optional parameter with default value: "disabled"</i> validation scheme required for authentication
[no] user-name	Parameter type: <Gpon::AuthUserName> Format: - user name required for authentication - length: x<=50	<i>optional parameter with default value: ""</i> user name required for authentication
[no] password	Parameter type: <Security::Password5> Format: (prompt plain : <Security::PlainPassword5>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text Field type <Security::PlainPassword5> - authentication string - length: x<=25	<i>optional parameter with default value: "plain : "</i> password string hidden from users
[no] realm	Parameter type: <Gpon::Realm> Format: - realm required for authentication - length: x<=25	<i>optional parameter with default value: ""</i> realm for authentication
[no] voice-mail-prof	Parameter type: <Gpon::VoiceMailProfilePointer> Format: (none <Gpon::VoiceMailProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::VoiceMailProfilePointer>	<i>optional parameter with default value: 0L</i> voice mail profile contains sip voice-mail information

Parameter	Type	Description
	- profile index - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
[no] voice-mail-to	Parameter type: <Gpon::VoiceMailTo> Format: - voice mail subscription expiration time in seconds - unit: seconds - range: [0...86400]	<i>optional parameter with default value: 3600L</i> voice mail subscription expiration time in seconds
[no] ntwk-dp-prof	Parameter type: <Gpon::NetDialPlanProfilePointer> Format: (none <Gpon::NetDialPlanProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::NetDialPlanProfilePointer> - profile index - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> Network dial plan profile contains network dial plan information
[no] app-serv-prof	Parameter type: <Gpon::AppServProfilePointer> Format: (none <Gpon::AppServProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::AppServProfilePointer> - profile index - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> Application service profile that contains information related to calling features
[no] ac-code-prof	Parameter type: <Gpon::AccessCodeProfilePointer> Format: (none <Gpon::AccessCodeProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::AccessCodeProfilePointer> - profile index - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> VOIP access code profile that contains information related to administrative feature
[no] rlstimer	Parameter type: <Gpon::RlsTimer>	<i>optional parameter with default</i>

Parameter	Type	Description
	Format: - sip release timer - unit: seconds - range: [0...60]	<i>value: 10L</i> SIP release timer
[no] rohtimer	Parameter type: <Gpon::RohTimer> Format: - receiver off-hook timer - unit: seconds - range: [0...60]	<i>optional parameter with default value: 15L</i> Receiver off-Hook timer that specifies how long in seconds the line is in ROH condition

Command Output

name	Type	Description
ntwk-dp-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the authentication security profile pointer <i>This element is always shown.</i>
app-serv-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the authentication security profile pointer <i>This element is always shown.</i>
ac-code-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the authentication security profile pointer <i>This element is always shown.</i>

41.50 Voice ONT MGC Configuration command

Command Description

This command creates the MEGACO configuration of the ONT

NOTE: Only one VoIP client can be supported in an ONT at this time

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont ( no mgc-config (if-index) ) | ( mgc-config (if-index) pri-mgcuri-profid
<Gpon::ReqSecureUriProfileName> sec-mgcuri-profid <Gpon::ReqSecureUriProfileName> [ no protocol-ver |
protocol-ver <Gpon::PrctlVer> ] [ no msg-format | msg-format <Gpon::MsgFormat> ] [ no max-retry-time |
max-retry-time <Gpon::MaxRtryTime> ] [ no max-retries | max-retries <Gpon::MaxRetry> ] [ no status-delay-time |
status-delay-time <Gpon::DelayTime> ] base-termid <Gpon::TerminationId> [ no sig-dscp | sig-dscp
<Gpon::SigDscp> ] [ no udp-port | udp-port <Gpon::UdpPort> ] [ no sw-vendor | sw-vendor
<Gpon::MgcVendorName> ] [ no cnf-msg-profid | cnf-msg-profid <Gpon::UriProfileName> ] )
```

Command Parameters

Table 41.50-1 "Voice ONT MGC Configuration command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / 1 ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / 1) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port Field type <Ng2::ChannelGroup> - channel group number	ifindex of iphost uni

41 Voice Ont Configuration Commands

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port	

Table 41.50-2 "Voice ONT MGC Configuration command" Command Parameters

Parameter	Type	Description
pri-mgcuri-profid	Parameter type: <Gpon::ReqSecureUriProfileName> Format: (<Gpon:SecUriProfPtr> name : <AsamProfileName>) Possible values: - name : profile name Field type <Gpon:SecUriProfPtr> - Index of the sec-uri profile that contains the IP address of the server - range: [1...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>mandatory parameter</i> Uri profile that contains the ip address of the primary media gateway controller
sec-mgcuri-profid	Parameter type: <Gpon::ReqSecureUriProfileName> Format: (<Gpon:SecUriProfPtr> name : <AsamProfileName>) Possible values: - name : profile name Field type <Gpon:SecUriProfPtr> - Index of the sec-uri profile that contains the IP address of the server - range: [1...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>mandatory parameter</i> Uri profile that contains the ip address of the secondary media gateway controller
[no] protocol-ver	Parameter type: <Gpon::PrctlVer> Format: - Selects the version of MGC protocol signalling to be used - range: [0...2]	<i>optional parameter with default value: 0L</i> Selects the version of the MGC signaling protocol to be used
[no] msg-format	Parameter type: <Gpon::MsgFormat> Format: - Selects message format value - range: [0...2]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> Specifies the message format
[no] max-retry-time	Parameter type: <Gpon::MaxRtryTime> Format: - Specifies the maximum retry time for MGC transaction - unit: sec - range: [0...60]	<i>optional parameter with default value: 0L</i> Specifies the maximum retry time (in seconds) for MGC transaction
[no] max-retries	Parameter type: <Gpon::MaxRetry> Format: - Specifies the maximum number of times a message is transmitted to the MGC - range: [0...10]	<i>optional parameter with default value: 0L</i> Specifies the maximum number of times a message is transmitted to the MGC
[no] status-delay-time	Parameter type: <Gpon::DelayTime>	<i>optional parameter with default</i>

Parameter	Type	Description
	Format: - Service status delay time (in seconds) for changes in line service status - unit: sec - range: [0...60]	<i>value: 0L</i> Service status delay time (in seconds) for changes in line service status
base-termid	Parameter type: <Gpon::TerminationId> Format: - identifies the POTS port in H248 VoIP signalling messages. The first character must be alphabetic. The string 'ROOT' is not allowed. - range: [a-zA-Z0-9*/-_\$@.] - length: x<=25	<i>mandatory parameter</i> Base string for H248 physical termination Id
[no] sig-dscp	Parameter type: <Gpon::SigDscp> Format: - dscp value - range: [0...63]	<i>optional parameter with default value: 24L</i> DSCP value for use in outgoing signaling packets towards the Soft Switch
[no] udp-port	Parameter type: <Gpon::UdpPort> Format: - Specifies the UDP port number to be used for MGC signaling messages - range: [2000...3000]	<i>optional parameter with default value: 2944L</i> <i>The parameter is not visible during modification.</i> Specifies the UDP port number to be used for MGC signaling messages
[no] sw-vendor	Parameter type: <Gpon::MgcVendorName> Format: - vendor id - 4 ASCII characters - range: [a-zA-Z0-9] - length: 4	<i>optional parameter with default value: ""</i> Specifies the gateway soft switch Vendor
[no] cnf-msg-profid	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> Index or Name of the URI Profile that contains the Message Identifier string for H.248 messages

Command Output

Table 41.50-3 "Voice ONT MGC Configuration command" Display parameters

Specific Information		
name	Type	Description
pri-mgcuri-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the primary uri profile <i>This element is only shown in detail mode.</i>
sec-mgcuri-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the secondary uri profile <i>This element is only shown in</i>

41 Voice Ont Configuration Commands

name	Type	Description
		<i>detail mode.</i>
conf-mgcuri-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the H.248 message identifier uri profile <i>This element is only shown in detail mode.</i>

41.51 Voice ONT MGC PM monitoring command

Command Description

This command sets the PM Mode of ONT MGC Agent monitoring

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont mgc-agent (voip-index) [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 41.51-1 "Voice ONT MGC PM monitoring command" Resource Parameters

Resource Identifier	Type	Description
(voip-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / 1 ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / 1) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Possible values: - 1 : Gpon voip Port	a unique voip ont index

Table 41.51-2 "Voice ONT MGC PM monitoring command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i> This indicates whether MGC Performance Monitors should be collected for this MGC Config instance

41.52 Voice Ont Pots Call PM Mode Configuration Command

Command Description

This command allows the operator to configure the PM Mode of ONT POTS Call monitoring

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure voice ont pots-call (uni-idx) [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 41.52-1 "Voice Ont Pots Call PM Mode Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPotsPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier	identification of the ont interface index

41 Voice Ont Configuration Commands

Resource Identifier	Type	Description
	Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPotsPortId> - Gpon Ont Pots Port - range: [1...24]	

Table 41.52-2 "Voice Ont Pots Call PM Mode Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> enable/disable pm mode of ont-pots call monitoring

42- Debug Configuration Commands

42.1 Debug Configuration Command Tree	42-1496
42.2 Protocol Tracing Configuration Command	42-1497

42.1 Debug Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Debug Configuration Commands".

Command Tree

```
----configure
  ----debug-trace
    ----[no] protocol-trace
      - (trace-subject)
      - protocol
      - syslog
      - [no] events
      - [no] packet-summary
```

42.2 Protocol Tracing Configuration Command

Command Description

This commands allows the operator to enable/disable protocol tracing. The operator can enter the protocol, port and level of detail for which tracing can be enabled. It is mandatory to enable/disable atleast one of the tracings, events or packet-summary.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure debug-trace ( no protocol-trace (trace-subject) protocol <Debug::Protocol> ) | ( protocol-trace
(trace-subject) protocol <Debug::Protocol> syslog <Debug::SyslogMsgType> [ [ no ] events ] [ [ no ]
packet-summary ] )
```

Command Parameters

Table 42.2-1 "Protocol Tracing Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(trace-subject)	Format: (dsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Debug::PortId> atm-pvc : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Debug::PortId> : <Eqpt::VpiMandatoryId> : <Eqpt::VciMandatoryId> shdsl-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Debug::PortId> ethernet-line : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Debug::PortId> uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> voip : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni uni.ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId>) Possible values: - dsl-line : the xDSL line - atm-pvc : the PVC of the ADSL line - shdsl-line : a static shdsl line interface	subject for which tracing is enabled(e.g ADSL line,PVC)

Resource Identifier	Type	Description
	- ethernet-line : a native ethernet line interface - uni : GPON ONT uni interface - voip : virtual uni identifier - uni:ng2 : NGPON ONT uni interface Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Debug::PortId> - the portId Field type <Eqpt::VpiMandatoryId> - atm VPI Field type <Eqpt::VciMandatoryId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	
protocol	Parameter type: <Debug::Protocol> Format: (igmp dhcp arp dhcpv6 pppoe all) Possible values: - igmp : enable tracing for igmp protocol - dhcp : enable tracing for dhcp protocol - arp : enable tracing for arp protocol - dhcpv6 : enable tracing for dhcpv6 protocol - pppoe : enable tracing for pppoe protocol - all : enable tracing for all protocols	protocol to be traced

Table 42.2-2 "Protocol Tracing Configuration Command" Command Parameters

Parameter	Type	Description
syslog	Parameter type: <Debug::SyslogMsgType> Format: (tracing1	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i>

Parameter	Type	Description
	tracing2 tracing3 tracing4) Possible values: - tracing1 : msg type tracing1 used for syslog - tracing2 : msg type tracing2 used for syslog - tracing3 : msg type tracing3 used for syslog - tracing4 : msg type tracing4 used for syslog	msg type used to log trace msgs to syslog
[no] events	Parameter type: boolean	<i>optional parameter</i> enable events tracing
[no] packet-summary	Parameter type: boolean	<i>optional parameter</i> enable pkt summary tracing

43- Ethernet User Ports Configuration Commands

43.1 Ethernet User Ports Configuration Command Tree	43-1501
43.2 Ethernet Line Configuration Command	43-1502
43.3 Ethernet Line TCA Threshold Configuration Command	43-1504
43.4 Ethernet Line Mau Configuration Command	43-1506

43.1 Ethernet User Ports Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Ethernet User Ports Configuration Commands".

Command Tree

```

----configure
  ----ethernet
    ----line
      - (if-index)
      - port-type
      - [no] admin-up
      ----tca-line-threshold
        - [no] enable
        - [no] los
        - [no] fcs
        - [no] rx-octets
        - [no] tx-octets
        - [no] los-day
        - [no] fcs-day
        - [no] rx-octets-day
        - [no] tx-octets-day
      ----mau
        - (index)
        - type
        - power
        - [no] speed-auto-sense
        - [no] autonegotiate
        - [no] cap100base-tfd
        - [no] cap1000base-xfd
        - [no] cap1000base-tfd

```

43.2 Ethernet Line Configuration Command

Command Description

This command allows the operator to configure the ethernet line.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet line (if-index) [ port-type <ETHITF::PortType> ] [ [ no ] admin-up ]
```

Command Parameters

Table 43.2-1 "Ethernet Line Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port

Table 43.2-2 "Ethernet Line Configuration Command" Command Parameters

Parameter	Type	Description
port-type	Parameter type: <ETHITF::PortType> Format: (uni nni hc-uni uplink) Possible values: - uni : uni port type - nni : nni port type - hc-uni : hicap uni port type - uplink : uplink port type	<i>optional parameter</i> the whole network service model based on this interface
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> admin status is up (read-only for voicefxs interface)

43.3 Ethernet Line TCA Threshold Configuration Command

Command Description

This command allows the operator to configure the Threshold Crossing Alert (TCA) thresholds. The configuration is specific per ethernet line.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet line (if-index) tca-line-threshold [ [ no ] enable ] [ no los | los <ETHITF::TcaThresholdLOS> ]
[ no fcs | fcs <ETHITF::TcaThresholdFCS> ] [ no rx-octets | rx-octets <ETHITF::TcaThresholdMB> ] [ no
tx-octets | tx-octets <ETHITF::TcaThresholdMB> ] [ no los-day | los-day <ETHITF::TcaThresholdLOS> ] [ no
fcs-day | fcs-day <ETHITF::TcaThresholdFCS> ] [ no rx-octets-day | rx-octets-day <ETHITF::TcaThresholdMB> ]
[ no tx-octets-day | tx-octets-day <ETHITF::TcaThresholdMB> ]
```

Command Parameters

Table 43.3-1 "Ethernet Line TCA Threshold Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port

Table 43.3-2 "Ethernet Line TCA Threshold Configuration Command" Command Parameters

Parameter	Type	Description
[no] enable	Parameter type: boolean	<i>optional parameter</i> enable the reporting of TCA's for this ethernet line
[no] los	Parameter type: <ETHITF::TcaThresholdLOS> Format: - the tca threshold value (times), 0 - disable	<i>optional parameter with default value: 0</i> loss of signal error in 15 minute

Parameter	Type	Description
[no] fcs	Parameter type: <ETHITF::TcaThresholdFCS> Format: - the tca threshold value (frames), 0 - disable	<i>optional parameter with default value: 0</i> frame check sequence error in 15 minute
[no] rx-octets	Parameter type: <ETHITF::TcaThresholdMB> Format: - the tca threshold value (specify octets in MB), 0 - disable	<i>optional parameter with default value: 0</i> received octets in 15 minute (specify in MB)
[no] tx-octets	Parameter type: <ETHITF::TcaThresholdMB> Format: - the tca threshold value (specify octets in MB), 0 - disable	<i>optional parameter with default value: 0</i> transmitted octets in 15 minute (specify in MB)
[no] los-day	Parameter type: <ETHITF::TcaThresholdLOS> Format: - the tca threshold value (times), 0 - disable	<i>optional parameter with default value: 0</i> loss of signal error in 1 day
[no] fcs-day	Parameter type: <ETHITF::TcaThresholdFCS> Format: - the tca threshold value (frames), 0 - disable	<i>optional parameter with default value: 0</i> frame check sequence error in 1 day
[no] rx-octets-day	Parameter type: <ETHITF::TcaThresholdMB> Format: - the tca threshold value (specify octets in MB), 0 - disable	<i>optional parameter with default value: 0</i> received octets in 1 day (specify in MB)
[no] tx-octets-day	Parameter type: <ETHITF::TcaThresholdMB> Format: - the tca threshold value (specify octets in MB), 0 - disable	<i>optional parameter with default value: 0</i> transmitted octets in 1 day (specify in MB)

43.4 Ethernet Line Mau Configuration Command

Command Description

This command allows the operator to configure the Mau. The configuration is specific per ethernet line.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet line (if-index) mau (index) [ type <Ether::MAUType> ] [ power <ETHITF::Power> ] [ [ no ] speed-auto-sense ] [ [ no ] autonegotiate ] [ [ no ] cap100base-tfd ] [ [ no ] cap1000base-xfd ] [ [ no ] cap1000base-tfd ]
```

Command Parameters

Table 43.4-1 "Ethernet Line Mau Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port
(index)	Format: - port to which the MAU is connected - range: [1...2147483647]	identify MAU, among others connected to same interface

Table 43.4-2 "Ethernet Line Mau Configuration Command" Command Parameters

Parameter	Type	Description
type	Parameter type: <Ether::MAUType> Format: (10baset 100basexhd 100basexfd 100basexhd 100basexfd 1000basexhd 1000basexfd	<i>optional parameter</i> the mau type

44.2 ONT Ethernet Port Configuration Command

Command Description

This command allows the operator to modify ONT Ethernet port provisioning data.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet ont (uni-idx) [ no cust-info | cust-info <Gpon::CustInfo> ] [ auto-detect <Gpon::AutoDetect> ]
[ no power-control | power-control <Gpon::PowerControl> ] [ no pse-class | pse-class <Gpon::PSEClass> ] [ no
pse-pw-priority | pse-pw-priority <Gpon::PSEPwrPri> ] [ no pwr-override | pwr-override
<Gpon::PowerShedOverride> ] [ no lpt-mode | lpt-mode <Gpon::LPTMODE> ] [ no admin-state | admin-state
<Gpon::ItfAdminStatus> ]
```

Command Parameters

Table 44.2-1 "ONT Ethernet Port Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of the uni interface index

44 ONT Ethernet Port Configuration Command

Resource Identifier	Type	Description
	Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 44.2-2 "ONT Ethernet Port Configuration Command" Command Parameters

Parameter	Type	Description
[no] cust-info	Parameter type: <Gpon::CustInfo> Format: - a printable string - length: x<=80	<i>optional parameter with default value: "none"</i> port information
auto-detect	Parameter type: <Gpon::AutoDetect> Format: (10_100baset-auto 10baset-fd 100baset-fd 1000baset-fd auto-basetfd 10gig-fd 2.5gig-fd 5gig-fd 10baset-auto 10baset-hd 100baset-hd 1000baset-hd autobaset-hd 10_100_1000baset-auto 100baset-auto auto 1000baset-auto) Possible values: - 10_100baset-auto : 10/100/1000 Base T, auto sensing (note: this auto sensing behavior ensures backward compatibility with older software releases. It may result in the port negotiating to 1 Gbps) - 10baset-fd : 10 Base T, full duplex - 100baset-fd : 100 Base T, full duplex - 1000baset-fd : 1000 Base T, full duplex - auto-basetfd : 10/100/1000 Base T, full duplex - 10gig-fd : 10 Gig, full duplex only - 2.5gig-fd : 2.5 Gig, full duplex only - 5gig-fd : 5 Gig, full duplex only - 10baset-auto : 10 Base T, automatic sensing - 10baset-hd : 10 Base T, half Duplex - 100baset-hd : 100 Base T, half duplex - 1000baset-hd : 1000 Base T, half duplex - autobaset-hd : 10/100/1000 Base T, half duplex - 10_100_1000baset-auto : 10/100/1000 Base T, auto sensing - 100baset-auto : 100 Base T, auto sensing - auto : 10/100/1000 Base T, auto sensing - 1000baset-auto : 1000 Base T auto sensing	<i>optional parameter</i> auto detection configuration
[no] power-control	Parameter type: <Gpon::PowerControl> Format: (enable	<i>optional parameter with default value: "disable"</i> power control configuration

Parameter	Type	Description
	disable) Possible values: - enable : provide power to external equipment - disable : not provide power to external equipment	
[no] pse-class	Parameter type: <Gpon::PSEClass> Format: (0 1 2 3 4 5) Possible values: - 0 : Default output power - 1 : Class 0, the output power is 15.4w - 2 : Class 1, the output power is 4.0w - 3 : Class 2, the output power is 7.0w - 4 : Class 3, the output power is 15.4w - 5 : Class 4, the output power is 30.0w	<i>optional parameter with default value: "0"</i> power class configuration
[no] pse-pw-priority	Parameter type: <Gpon::PSEPwrPri> Format: (critical high low) Possible values: - critical : Prevents overcurrent situations by last disconnecting the ports with critical priority - high : Prevents overcurrent situations by disconnecting the ports with high priority - low : Prevents overcurrent situations by first disconnecting the ports with lower priority(Default)	<i>optional parameter with default value: "low"</i> power supply priority
[no] pwr-override	Parameter type: <Gpon::PowerShedOverride> Format: (enable disable) Possible values: - enable : port is excluded from data class power shedding - disable : port is included in data class power shedding	<i>optional parameter with default value: "disable"</i> configure power shedding
[no] lpt-mode	Parameter type: <Gpon::LPTMODE> Format: (not-supported enabled disabled) Possible values: - not-supported : ignore and don't send the configuration to ONT - enabled : enable the LPT mode on this port - disabled : disable the LPT mode on this port	<i>optional parameter with default value: "not-supported"</i> LinkPassThrough(LPT) mode configuration
[no] admin-state	Parameter type: <Gpon::IfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the interface

Command Output

Table 44.2-3 "ONT Ethernet Port Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	the operational state of the interface <i>This element is always shown.</i>

44.3 ONT Ethernet Port Physical Layer

Performance Monitoring Configuration Command

Command Description

Obsolete command, replaced by `configure ethernet ont phy pm`.

This command allows the operator to enable or disable PM on the ONT ethernet port physical layer.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet ont (uni-idx) port [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Obsolete command, replaced by `configure ethernet ont phy pm`.

Command Parameters

Table 44.3-1 "ONT Ethernet Port Physical Layer Performance Monitoring Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identification of the uni interface index

44.4 Ethernet ONT Uni Physical Layer Configuration Command

Command Description

This command allows the operator to provision performance monitoring for an Ethernet ONT physical layer UNI.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet ont (uni-idx) phy [ no pm | pm <Gpon::OntPmCollect> ]
```

Command Parameters

Table 44.4-1 "Ethernet ONT Uni Physical Layer Configuration Command" Resource Parameters

Resource Identifier	Type	Description

name	Type	Description
pm-intervals	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponEtherTrafficIntervalTable <i>This element is only shown in detail mode.</i>

44.5 Ethernet ONT Uni Layer 2 Configuration Command

Command Description

This command allows the operator to provision performance monitoring and threshold crossing alerts for an Ethernet ONT layer 2 UNI.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet ont (uni-idx) l2 [ no pm | pm <Gpon::OntPmCollect> ] [ no tca | tca <Gpon::OntPmCollect> ] [
no dropped-frames-up | dropped-frames-up <Gpon::ErrorCountThreshold> ] [ no dropped-frames-dn |
dropped-frames-dn <Gpon::ErrorCountThreshold> ]
```

Command Parameters

44.6 L2 UNI ONT Performance Monitor Extended 32bit Configuration Command

Command Description

This command sets the PM EXT parameters.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet ont (uni-idx) l2 pm-collect-ext [ no pm-collect | pm-collect <Gpon::OntPmCollect> ] [ no p-bits | p-bits <SignedInteger> ] [ no vlan-id | vlan-id <Vlan::VlanIndexOrZero> ]
```

Command Parameters

Table 44.6-1 "L2 UNI ONT Performance Monitor Extended 32bit Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId>	identification of the uni interface index

**Table 44.6-2 "L2 UNI ONT Performance Monitor Extended 32bit Configuration Command"
Command Parameters**

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> indicates whether enable this pm collect for this Ethernet Port
[no] p-bits	Parameter type: <SignedInteger> Format: - a signed integer	<i>optional parameter with default value: 0xFF</i> indicates the P bits of the TCI field are used to filter the PM data collected or not 0xFF: not used 0-7: p-bit used to filter data
[no] vlan-id	Parameter type: <Vlan::VlanIndexOrZero> Format: - vlan id - range: [0...4092]	<i>optional parameter with default value: 0</i> indicates the vlan-id bits of the TCI field are used to filter the PM data collected 0: not used Other value : this vlan-id used to filter data

44.7 UNI Port Shutdown-Ais Configuration Commands

Command Description

This attribute is linked to a CFM functionality on the ONU. It indicates if the ONU is programmed to autonomously shut down its UNI upon reception of a downstream AIS PDU on an UP MEP residing on top of the ONU UNI.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet ont (uni-idx) cfm [ [ no ] portshut-ais ]
```

Command Parameters

Table 44.7-1 "UNI Port Shutdown-Ais Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of the uni interface index

            - queueid
          ----[no] snoopmcastvlan
            - (vlanid)
          ----[no] usercvlan
            - (usercvlanid)
            - networkcvlan
          ----[no] mcastvlan
            - (mcastvlanid)
            - uservlan
```

45.2 Epon Ont ethernet Configuration Command

Command Description

This command allows the operator to configure ethernet parameters of ONT physical UNI

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet eont ( no port (uni-index) ) | ( port (uni-index) )
```

Command Parameters

Table 45.2-1 "Epon Ont ethernet Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::EontSlot> / <Epon::EontPort> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::EontSlot> - Epon Ont Slot - range: [1...16] Field type <Epon::EontPort> - Epon Ont Port - range: [1...64]	ONT UNI interface

45.3 Epon Ont Flow Configuration Command

Command Description

This command allows the operator to configure traffic flows at ONT physical UNI

Note: The ont flow can be created or deleted, but cannot be modified

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet eont port (uni-index) ( no filter (filterid) ) | ( filter (filterid) profileid <Epon::ProfileId>
precedence <Epon::Precedence> [ no acl | acl <Epon::Acl> ] [ no dot1p | dot1p <Epon::FilterPBit> ] [ no llid | llid
<Epon::Llid> ] queueid <Epon::QueueId> )
```

Command Parameters

Table 45.3-1 "Epon Ont Flow Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::EontSlot> / <Epon::EontPort> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::EontSlot> - Epon Ont Slot - range: [1...16] Field type <Epon::EontPort> - Epon Ont Port - range: [1...64]	ONT UNI interface
(filterid)	Format: - Filter ID - range: [1...8]	Filter identifier

Table 45.3-2 "Epon Ont Flow Configuration Command" Command Parameters

Parameter	Type	Description
profileid	Parameter type: <Epon::ProfileId> Format: - traffic profile ID - range: [1...8192]	<i>mandatory parameter</i> traffic profile ID used to classify traffic
precedence	Parameter type: <Epon::Precedence> Format: - flow precedence - range: [1...8]	<i>mandatory parameter</i> flow precedence
[no] acl	Parameter type: <Epon::Acl> Format: (pass drop) Possible values: - pass : flow behavior pass - drop : flow behavior drop	<i>optional parameter with default value: "pass"</i> flow behavior
[no] dot1p	Parameter type: <Epon::FilterPBit> Format: - default pbit - range: [0...7,255]	<i>optional parameter with default value: "255"</i> default pbit of this port
[no] llid	Parameter type: <Epon::Llid> Format: - logical link ID,only for EPON onu. As to DPOE, 1*1 llidpattern onu has 1 llid binding with 4 queues; 2*1 llidpattern onu has 2 llids, each llid binding with 4 queues; for 1*4/1*8/2*4 , llid n is fixedly binded with queue n,that is,llid 1 is binded with queue 1... - range: [1...1]	<i>optional parameter with default value: "1"</i> logical link id for this flow
queueid	Parameter type: <Epon::QueueId> Format: - queue for the flow,range 1-4 for EPON,range 1-8 for DPOE. As to DPOE, for 1*1/2*1/1*4 llidpattern onu, range is 1-4; for 1*8/2*4 llidpattern onu, range is 1-8. - range: [1...8]	<i>mandatory parameter</i> queue for this flow. Mandatory parameter.

45.4 Epon Ont Ethernet Multicast Vlan Configuration Command

Command Description

This command allows the operator to configure multicast vlan allowed for Ethernet port.

Note: The multicast vlan for port cannot be modified.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet eont port (uni-index) ( no snoopmcastvlan (vlanid) ) | ( snoopmcastvlan (vlanid) )
```

Command Parameters

Table 45.4-1 "Epon Ont Ethernet Multicast Vlan Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::EontSlot> / <Epon::EontPort> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::EontSlot> - Epon Ont Slot - range: [1...16] Field type <Epon::EontPort> - Epon Ont Port - range: [1...64]	ONT UNI interface
(vlanid)	Format: - vlan id - range: [1...4093]	multicast vlan id allowed for port

45.5 Epon Ont Ethernet Vlan Translation Configuration Command

Command Description

This command allows the operator to configure vlan translation for tagged packet on ont Ethernet port.

Note: The networkcvlan cannot be modified

Note: This command should be shown only if the vlanmode of the Ethernet port is translation, trunk or aggregation.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet eont port (uni-index) ( no usercvlan (usercvlanid) ) | ( usercvlan (usercvlanid) [ networkcvlan
<Epon::NwCvlanId> ] )
```

Command Parameters

Table 45.5-1 "Epon Ont Ethernet Vlan Translation Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::EontSlot> / <Epon::EontPort> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::EontSlot> - Epon Ont Slot - range: [1...16] Field type <Epon::EontPort> - Epon Ont Port - range: [1...64]	ONT UNI interface

Resource Identifier	Type	Description
(usercvlanid)	Format: - vlan id - range: [1...4093]	userside vlan id allowed for port

Table 45.5-2 "Epon Ont Ethernet Vlan Translation Configuration Command" Command Parameters

Parameter	Type	Description
networkcvlan	Parameter type: <Epon::NwCvlanId> Format: - vlan id - range: [1...4093]	<i>optional parameter</i> the networkside VLAN of the physical UNI and when you don't config the network VLAN, don't enter the keyword networkcvlan

45.6 Epon Ont Ethernet Multicast Vlan Translation Configuration Command

Command Description

This command allows the operator to configure multicast vlan translation if multiconf for this port is translation.

Note: the uservlan cannot be modified.

Note: This command should be shown only if the multiconf of the Ethernet port is translation.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ethernet eont port (uni-index) ( no mcastvlan (mcastvlanid) ) | ( mcastvlan (mcastvlanid) uservlan
<Epon::uservlan> )
```

Command Parameters

Table 45.6-1 "Epon Ont Ethernet Multicast Vlan Translation Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::EontSlot> / <Epon::EontPort> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::EontSlot> - Epon Ont Slot - range: [1...16] Field type <Epon::EontPort> - Epon Ont Port - range: [1...64]	ONT UNI interface

Resource Identifier	Type	Description
(mcastvlanid)	Format: - vlan id - range: [1...4093]	macst VLAN ID

Table 45.6-2 "Epon Ont Ethernet Multicast Vlan Translation Configuration Command" Command Parameters

Parameter	Type	Description
uservlan	Parameter type: <Epon::uservlan> Format: - vlan id - range: [1...4093]	<i>mandatory parameter</i> the userside VLAN

46- Efm Oam Configuration Commands

46.1 Efm Oam Configuration Command Tree	46-1537
46.2 Efm Oam Interface ConfigurationCommand	46-1538

46.1 Efm Oam Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Efm Oam Configuration Commands".

Command Tree

```
----configure
  ----efm-oam
    ----interface
      - (interface)
      - [no] admin-up
      - [no] passive-mode
      - [no] keep-alive-intvl
      - [no] response-intvl
      X data-length
      X bitrate
      X smac
      X dmac
```

46.2 Efm Oam Interface ConfigurationCommand

Command Description

This command will allow the operator to enable/disable EFM OAM on the specified Ethernet-like interface and configure the mode, alive timer and response timer intervals. In addition also the internal traffic generator data applicable to this interface can be configured.

User Level

The command can be accessed by operators with transport privileges, and executed by operators with transport privileges.

Command Syntax

The command has the following syntax:

```
> configure efm-oam interface (interface) [ [ no ] admin-up ] [ [ no ] passive-mode ] [ no keep-alive-intvl |
keep-alive-intvl <Ether::KeepAliveTimeTicks> ] [ no response-intvl | response-intvl <Ether::ResponseTimeTicks>
] [ data-length <Ether::TraffGenDataLengthType> ] [ bitrate <Ether::TraffGenBitRateType> ] [ smac
<Ether::MacAddr> ] [ dmac <Ether::MacAddr> ]
```

Command Parameters

Table 46.2-1 "Efm Oam Interface ConfigurationCommand" Resource Parameters

Resource Identifier	Type	Description
(interface)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	identification of EFM port / Ethernet port

Table 46.2-2 "Efm Oam Interface ConfigurationCommand" Command Parameters

Parameter	Type	Description
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> enable efm oam
[no] passive-mode	Parameter type: boolean	<i>optional parameter</i> oam mode is passive
[no] keep-alive-intvl	Parameter type: <Ether::KeepAliveTimeTicks> Format: - a timeout value expressed in seconds - unit: seconds - range: [1...300]	<i>optional parameter with default value: 300</i> keep alive time interval

Parameter	Type	Description
[no] response-intvl	Parameter type: <Ether::ResponseTimeTicks> Format: - a timeout value expressed in seconds - unit: seconds - range: [2...10]	<i>optional parameter with default value: 5</i> variable response interval
data-length	Parameter type: <Ether::TraffGenDataLengthType> Format: - A value of 1 up to 1500. Indicates length in bytes. - unit: byte - range: [1...1500]	<i>obsolete parameter that will be ignored</i> Internal traffic generator data: Length of datafield, in bytes, of the to be generated test traffic. Must be a value from 1 up to 1500.
bitrate	Parameter type: <Ether::TraffGenBitRateType> Format: (100k 1m 10m 100m 1g) Possible values: - 100k : bitrate = 100K bit/sec - 1m : bitrate = 1M bit/sec - 10m : bitrate = 10M bit/sec - 100m : bitrate = 100M bit/sec - 1g : bitrate = 1G bit/sec	<i>obsolete parameter that will be ignored</i> Internal traffic generator data: Bitrate of the to be generated test traffic.
smac	Parameter type: <Ether::MacAddr> Format: - mac address (aa:bb:cc:a1:02:03) - length: 6	<i>obsolete parameter that will be ignored</i> Internal traffic generator data: source MAC address.
dmac	Parameter type: <Ether::MacAddr> Format: - mac address (aa:bb:cc:a1:02:03) - length: 6	<i>obsolete parameter that will be ignored</i> Internal traffic generator data: destination MAC address.

47.2 Maintenance Domain Configuration Command

Command Description

This command is used to define a Maintenance Domain (MD) at particular maintenance level. There are 8 possible levels. Note that once created, the MD cannot be modified. To modify, delete the entry and create a new one.

Note that, if an MD is deleted, any subtending Maintenance Associations (MAs), and their subtending Maintenance Points (MPs), will be automatically deleted only if CCM Admin State is locked for all of the MAs.

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm ( no domain (domain-index) ) | ( domain (domain-index) name <Cfm::FormattedName> level
<Cfm::MdLevelType> )
```

Command Parameters

Table 47.2-1 "Maintenance Domain Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(domain-index)	Format: - Maintenance Domain (MD) index - range: [1...4294967295]	Maintenance Domain (MD) index

Table 47.2-2 "Maintenance Domain Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <Cfm::FormattedName> Format: (dns : <Cfm::PrintableString> mac : <Cfm::MacAddress> string : <Cfm::PrintableString> none) Possible values: - dns : DNS name (e.g. nokia.com) - mac : MAC address plus 2 hex octets, e.g. 11:22:33:44:55:66:77:88 - string : A character string (e.g. operator) - none : No MD name. Field type <Cfm::PrintableString> - all characters except for characters 0 to 31 - length: 1<=x<=43 Field type <Cfm::MacAddress> - MAC address plus 2 hex octets, e.g.	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> Maintenance Domain (MD) name type and unique name

47 CFM Configuration Commands

Parameter	Type	Description
	11:22:33:44:55:66:77:88 - length: 8	
level	Parameter type: <Cfm::MdLevelType> Format: - Maintenance Domain (MD) level - range: [0...7]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> Maintenance Domain (MD) level

47.3 Maintenance Association Configuration

Command

Command Description

This command is used to create or modify a Maintenance Association (MA). The VlanId has been made optional in the Command Syntax as VlanId is mandatory for creation and is not applicable for modification. Each Maintenance Domain (MD) can have one or more MAs.

Note that, if an MA is deleted, any subtending Maintenance Points (MPs) will automatically be deleted.

Maintenance Association (MA) name and type is unique within the domain. When MA name is not configured explicitly during MA creation, default ma name is computed as follows. Ex: default name for ma 1 is ma1 of string type

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm domain (domain-index) ( no association (association-index) ) | ( association (association-index) [
no bridgeport | bridgeport <Cfm::InterfaceZeroIndex> ] [ no vlan | vlan <Network::StackedVlan> ] [ no
mhf-creation | mhf-creation <Cfm::CfmMhfCreationType> ] [ name <Cfm::MaFormattedName> ] [ no ccm-interval
| ccm-interval <Cfm::CfmMaCcmInterval> ] [ [ no ] ccm-aware ] [ no ccm-admin-state | ccm-admin-state
<Cfm::CfmMaCcmAdminState> ] [ no mhf-location | mhf-location <Cfm::CfmMaMhfLocationType> ] [
ltm-filtering <Cfm::CfmMaLtmFilter> ] [ [ no ] dual-tag-aware ] )
```

Command Parameters

Table 47.3-1 "Maintenance Association Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(domain-index)	Format: - Maintenance Domain (MD) index - range: [1...4294967295]	Maintenance Domain (MD) index
(association-index)	Format: - Maintenance Association (MA) index. Unique within an MD - range: [1...4294967295]	Maintenance Association (MA) index. Unique within an MD

Table 47.3-2 "Maintenance Association Configuration Command" Command Parameters

Parameter	Type	Description
[no] bridgeport	Parameter type: <Cfm::InterfaceZeroIndex> Format: (none	optional parameter with default value: "none" The parameter is not visible

Parameter	Type	Description
	<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - none : no port - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	during modification. IfIndex of UNI
[no] vlan	Parameter type: <Network::StackedVlan> Format: (<Network::UVlanIndex> stacked : <Network::SVlanIndex> : <Network::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Network::UVlanIndex> - unstacked vlan identity - range: [1...4093] Field type <Network::SVlanIndex> - service vlan identity - range: [2...4093] Field type <Network::CVlanIndex>	optional parameter with default value: "stacked : 0 : 4097" The parameter is not visible during modification. when vlan is not specified it will be vlan Unaware MA

Parameter	Type	Description
	- customer vlan identity - range: [0...4093]	
[no] mhf-creation	Parameter type: <Cfm::CfmMhfCreationType> Format: (mhf-none mhf-default) Possible values: - mhf-none : No MHF creation for this VLAN ID - mhf-default : MHF creation for this VLAN ID on related bridge ports	<i>optional parameter with default value: "mhf-none"</i> MIP Half Function (MHF) creation control
name	Parameter type: <Cfm::MaFormattedName> Format: (pvid : <Cfm::MaNamePvid> string : <Cfm::MaNameCharstr> uint16 : <Cfm::MaNameUint16> vpnid : <Cfm::MaVpnid> icc : <Cfm::MaNameIcc>) Possible values: - pvid : [0...4094] - string : Raw ascii up to 45 Characters, except the character code 0-31(decimal) are not used - uint16 : [0..65535] - vpnid : RFC-2685 VPN ID Format(7 Octet): xxx:xxx, eg:000102:FFAA77BB, x is between 00 and FF - icc : Raw ascii exactly 13 characters, except the character code 0-31(decimal) are not used Field type <Cfm::MaNamePvid> - MaName Pvid Range [0...4094] - length: x<=4 Field type <Cfm::MaNameCharstr> - Raw ascii up to 45 Characters, except the character code 0-31 decimal - length: x<=45 Field type <Cfm::MaNameUint16> - MaName Uint16 Range [0...65535] - length: x<=5 Field type <Cfm::MaVpnid> - MaName VpnId 7 Octet Format : xxx:xxx, where x is a between 00 and FF eg:11FF33:AABBCCDD - length: 15 Field type <Cfm::MaNameIcc> - MaName Icc Raw ascii exactly 13 characters - length: 13	<i>optional parameter</i> Maintenance Association (MA) name and type is unique within the domain.
[no] ccm-interval	Parameter type: <Cfm::CfmMaCcmInterval> Format: (0 3.33ms 10ms 100ms 1 10 60 600) Possible values: - 0 : CCM Rx disable - 3.33ms : CCM Interval 3.33 mSecs - 10ms : CCM Interval 10 mSecs	<i>optional parameter with default value: "10"</i> CCM Tx Interval for the MA

47 CFM Configuration Commands

Parameter	Type	Description
	- 100ms : CCM Interval 100 mSecs - 1 : CCM Interval 1 secs - 10 : CCM Interval 10 secs - 60 : CCM Interval 1 Min - 600 : CCM Interval 10 Min	
[no] ccm-aware	Parameter type: boolean	<i>optional parameter</i> turn on the CCM frame processing on reception
[no] ccm-admin-state	Parameter type: <Cfm::CfmMaCcmAdminState> Format: (unlock lock) Possible values: - unlock : sets CCM AdminState to activate(unlock) ccm function - lock : sets CCM AdminState to de-activate(lock) ccm function	<i>optional parameter with default value: "lock"</i> activate(unlock)/de-activate(lock) CCM function on the MA
[no] mhf-location	Parameter type: <Cfm::CfmMaMhfLocationType> Format: (default ltuplink vbp onu ltuplink-vbp ltuplink-onu vbp-onu ltuplink-vbp-onu) Possible values: - default : default value: for GPON board, MIP is set on onu; for DSL board, MIP is set on vbp. - ltuplink : MIP is set on lt uplink - vbp : MIP is set on olt virtual bridgeport - onu : MIP is set on onu - ltuplink-vbp : MIPs are set on lt up link and virtual bridgeport - ltuplink-onu : MIPs are set on lt uplink and onu - vbp-onu : MIPs are set on virtual bridgeport and onu - ltuplink-vbp-onu : MIPs are set on olt uplink, virtual bridgeport and onu	<i>optional parameter with default value: "default"</i> <i>The parameter is not visible during modification.</i> MA Mhf Location : distinguish MIP location
ltm-filtering	Parameter type: <Cfm::CfmMaLtmFilter> Format: (enable disable) Possible values: - enable : enable ltm-filtering - disable : disable ltm-filtering	<i>optional parameter</i> Upstream LTM filtering enable/disable. default = enable
[no] dual-tag-aware	Parameter type: boolean	<i>optional parameter</i> Process CFM Messages upto 2 vlan tags in C-Vlan CC mode, refer OAM documentation for hardware support information.

47.4 Maintenance Association End Point Configuration Command

Command Description

This command is used to configure a Maintenance association End Point (MEP) within a Maintenance Association (MA). Each MA can have zero or more MEPs. Once a MEP is created, it cannot be modified. To modify the MEP, delete the entry and create a new one.

Note that there are correlations between a MEP and a VLAN port location. To create a MEP, the MEP's MA must be associated with the VLAN-port location's VLAN. Also if the VLAN-port is deleted, the related MEP(s) will automatically be deleted.

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm domain (domain-index) association (association-index) ( no mep (mepid) ) | ( mep (mepid)
location <Cfm::location> [ [ no ] cci-enable ] [ no ccm-priority | ccm-priority <Cfm::MepCcmPriority> ] [ no
equipment | equipment <Cfm::MepEquipmentType> ] [ no low-pri-defect | low-pri-defect
<Cfm::MepLowPriorityDefect> ] [ no fng-alarm-time | fng-alarm-time <Cfm::MepFngAlarmTime> ] [ no
fng-reset-time | fng-reset-time <Cfm::MepFngResetTime> ] [ [ no ] slm-resp-enable ] [ [ no ] dm-resp-enable ] [ no
lm-resp | lm-resp <Cfm::MepLmEnableDisable> ] [ [ no ] slm-init-enable ] [ no lm-init | lm-init
<Cfm::MepLmInitEnableDisable> ] )
```

Command Parameters

Maintenance association End Point (MEP) location

Parameter	Type	Description
	Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	
[no] cci-enable	Parameter type: boolean	<i>optional parameter</i> Enable CCM generation on the current MEP
[no] ccm-priority	Parameter type: <Cfm::MepCcmPriority> Format: - Priority value for CCMs transmitted by the MEP - range: [0...7]	<i>optional parameter with default value: 7UL</i> Priority value for CCMs transmitted by the MEP
[no] equipment	Parameter type: <Cfm::MepEquipmentType> Format: (default olt onu) Possible values: - default : Gpon Onu or Dsl - olt : Gpon LT - onu : Gpon Onu	<i>optional parameter with default value: "default"</i> <i>The parameter is not visible during modification.</i> Identifies the equipment type of mep ,only supported on Gpon Lt
[no] low-pri-defect	Parameter type: <Cfm::MepLowPriorityDefect> Format: (all-def mac-rem-err-xcon rem-err-xcon err-xcon xcon no-xcon) Possible values: - all-def : For DefRDICCM, DefMACstatus, DefRemoteCCM,DefErrorCCM, and DefXconCCM - mac-rem-err-xcon : Only DefMACstatus, DefRemoteCCM,DefErrorCCM, and DefXconCCM (default) - rem-err-xcon : Only DefRemoteCCM, DefErrorCCM, and DefXconCCM - err-xcon : Only DefErrorCCM and DefXconCCM - xcon : Only DefXconCCM - no-xcon : No defects DefXcon or lower are to be reported	<i>optional parameter with default value: "mac-rem-err-xcon"</i> The lowest priority defect that is allowed to generate fault alarm
[no] fng-alarm-time	Parameter type: <Cfm::MepFngAlarmTime> Format: - multiples of 250 ticks are supported(250,500,750,1000).default = 250 ticks(2.5sec) - unit: 1/100 sec - range: [250...1000]	<i>optional parameter with default value: 250L</i> The time in ticks(1 tick = 10ms) that defects must be present before a Fault alarm is issued.
[no] fng-reset-time	Parameter type: <Cfm::MepFngResetTime> Format: - multiples of 250 ticks are supported(250,500,750,1000).default = 1000 ticks(10sec) - unit: 1/100 sec - range: [250...1000]	<i>optional parameter with default value: 1000L</i> The time in ticks (1tick = 10ms) that defects must be absent before re-enabling a Fault Alarm.
[no] slm-resp-enable	Parameter type: boolean	<i>optional parameter</i> slm responder is enabled on the current mep
[no] dm-resp-enable	Parameter type: boolean	<i>optional parameter</i> dm responder is enabled on the current mep
[no] lm-resp	Parameter type: <Cfm::MepLmEnableDisable> Format:	<i>optional parameter with default value: "disable"</i>

47 CFM Configuration Commands

Parameter	Type	Description
	(disable enable-per-vlan enable-per-pbit) Possible values: - disable : lm responder is disabled on the current mep - enable-per-vlan : lm responder is enabled per vlan on the current mep - enable-per-pbit : lm responder is enabled per vlan per pbit on the current mep	configure LM responder on the current mep
[no] slm-init-enable	Parameter type: boolean	<i>optional parameter</i> slm initiator is enabled on the current mep
[no] lm-init	Parameter type: <Cfm::MepLmInitEnableDisable> Format: (disable enable-per-vlan enable-per-pbit) Possible values: - disable : lm initiator is disabled on the current mep - enable-per-vlan : lm initiator is enabled per vlan on the current mep - enable-per-pbit : lm initiator is enabled per vlan per pbit on the current mep	<i>optional parameter with default value: "disable"</i> configure lm initiator on the current mep

47.5 MEP located on ONU UNI enabled ITU-T Y.1731 Ethernet Alarm Indication Signal(ETH-AIS) function Configuration Commands

Command Description

This command allows the operator to enable or disable the ETH-AIS(ITU-T Y.1731) function for the MEP located on ONT UNI.

User Level

The command can be accessed by operators with alarm privileges, and executed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm domain (domain-index) association (association-index) mep (mepid) y1731ais [ [ no ] ais-enable ]
[ no meg-level | meg-level <Cfm::MepAisMegLevel> ] [ no period | period <Cfm::MepAisPeriod> ] [ no priority |
priority <Cfm::MepAisPriority> ] [ [ no ] portshut-enable ]
```

Command Parameters

Table 47.5-1 "MEP located on ONU UNI enabled ITU-T Y.1731 Ethernet Alarm Indication Signal(ETH-AIS) function Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(domain-index)	Format: - Maintenance Domain (MD) index - range: [1...4294967295]	Maintenance Domain (MD) index
(association-index)	Format: - Maintenance Association (MA) index. Unique within an MD - range: [1...4294967295]	Maintenance Association (MA) index. Unique within an MD
(mepid)	Format: - MA End Point (MEP) ID. Unique within an MA - range: [1...8191]	MA End Point (MEP) ID. Unique within an MA

Table 47.5-2 "MEP located on ONU UNI enabled ITU-T Y.1731 Ethernet Alarm Indication Signal(ETH-AIS) function Configuration Commands" Command Parameters

Parameter	Type	Description
[no] ais-enable	Parameter type: boolean	<i>optional parameter</i> AIS generation is enabled on the current MEP
[no] meg-level	Parameter type: <Cfm::MepAisMegLevel>	<i>optional parameter with default</i>

47 CFM Configuration Commands

Parameter	Type	Description
	Format: - Meg Level for AIS frames transmitted by the MEP - range: [0...7]	<i>value: 0L</i> MEG level at which the most immediate client layer MIPs and MEPs exist
[no] period	Parameter type: <Cfm::MepAisPeriod> Format: - Period of the AIS frames transmitted by the MEP, 0 (per second), 1 (per minute) - range: [0...1]	<i>optional parameter with default value: 0L</i> Determines transmission periodicity of frames with AIS information
[no] priority	Parameter type: <Cfm::MepAisPriority> Format: - Priority value for AIS frames transmitted by the MEP - range: [0...7]	<i>optional parameter with default value: 7L</i> Identifies the priority of frames with ETH-AIS information
[no] portshut-enable	Parameter type: boolean	<i>optional parameter</i> shutdown enabled on the current MEP

47.6 Active Remote Maintenance Association End Point Configuration Command

Command Description

This command is used to configure a Active Remote Maintenance association End Point (RMEP) within a Maintenance End Point (MEP). Once an active RMEP is created, it cannot be modified. To modify the Active RMEP, delete the entry and create a new one.

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm domain (domain-index) association (association-index) mep (mepid) ( no active-remote-mep (active-remote-mepid) ) | ( active-remote-mep (active-remote-mepid) )
```

Command Parameters

Table 47.6-1 "Active Remote Maintenance Association End Point Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(domain-index)	Format: - Maintenance Domain (MD) index - range: [1...4294967295]	Maintenance Domain (MD) index
(association-index)	Format: - Maintenance Association (MA) index. Unique within an MD - range: [1...4294967295]	Maintenance Association (MA) index. Unique within an MD
(mepid)	Format: - MA End Point (MEP) ID. Unique within an MA - range: [1...8191]	MA End Point (MEP) ID. Unique within an MA
(active-remote-mepid)	Format: - MA End Point (MEP) ID. Unique within an MA - range: [1...8191]	Active Remote MepID.

47.7 Remote Maintenance Association End Point Configuration Command

Command Description

This command is used to configure a Remote Maintenance association End Point (RMEP) within a Maintenance Association (MA). Remote MEP is useful only in case CCM is activated on an MA. Once a RMEP is created, it cannot be modified. To modify the RMEP, delete the entry and create a new one.

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm domain (domain-index) association (association-index) ( no remote-mep (rmepid) ) | ( remote-mep (rmepid) )
```

Command Parameters

Table 47.7-1 "Remote Maintenance Association End Point Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(domain-index)	Format: - Maintenance Domain (MD) index - range: [1...4294967295]	Maintenance Domain (MD) index
(association-index)	Format: - Maintenance Association (MA) index. Unique within an MD - range: [1...4294967295]	Maintenance Association (MA) index. Unique within an MD
(rmepid)	Format: - MA End Point (MEP) ID. Unique within an MA - range: [1...8191]	Remote MA End Point (MEP) ID. Unique within an MA

47.8 Synthetic Loss Measurement configuration Commands

Command Description

This command can be used to configure the parameters for synthetic loss measurement

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm slm [ no inactivity-time | inactivity-time <Cfm::slmInactivityTime> ]
```

Command Parameters

Table 47.8-2 "Synthetic Loss Measurement configuration Commands" Command Parameters

Parameter	Type	Description
[no] inactivity-time	Parameter type: <Cfm::slmInactivityTime> Format: - inactivity time - unit: seconds - range: [10...100]	<i>optional parameter with default value: 100L</i> value of slm inactivity timer

47.9 CFM PM-Proactive test management

Command

Command Description

This command is used to configure PM-Proactive tests.

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm y1731pm
```

47.10 CFM PM Proactive test management Command

Command Description

This command is used to configure PM Proactive tests.

User Level

The command can be accessed by operators with alarm , oam , vlan privileges, and executed by operators with alarm , oam , vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure cfm y1731pm ( no domain (domain-index) association <Cfm::CfmMaIndexType> mep
<Cfm::MepIdType> session-id <Cfm::SessionIdType> ) | ( domain (domain-index) association
<Cfm::CfmMaIndexType> mep <Cfm::MepIdType> session-id <Cfm::SessionIdType> type <Cfm::PmTestType>
target-mac <Vlan::MacAddr> [ no priority | priority <Vlan::Priority> ] [ [ no ] admin-up ] [ interval
<Cfm::PmIntervalType> ] [ size <Cfm::PmDataSizeType> ] [ measurement-intvl
<Cfm::PmMeasurementIntervalType> ] )
```

Command Parameters

Table 47.10-1 "CFM PM Proactive test management Command" Resource Parameters

Resource Identifier	Type	Description
(domain-index)	Format: - Maintenance Domain (MD) index - range: [1...4294967295]	Maintenance Domain Index.
association	Parameter type: <Cfm::CfmMaIndexType> Format: - Maintenance Association (MA) index. Unique within an MD - range: [1...4294967295]	Maintenance Association Index.
mep	Parameter type: <Cfm::MepIdType> Format: - MA End Point (MEP) ID. Unique within an MA - range: [1...8191]	Maintenance Association End Point (MEP) ID. Unique within an MA.
session-id	Parameter type: <Cfm::SessionIdType> Format: - Session Id for PM proactive - range: [1...3600]	PM Proactive test SessionId.

Table 47.10-2 "CFM PM Proactive test management Command" Command Parameters

Parameter	Type	Description
type	Parameter type: <Cfm::PmTestType>	<i>mandatory parameter</i>

47 CFM Configuration Commands

Parameter	Type	Description
	Format: (single-ended-slm single-ended-lm) Possible values: - single-ended-slm : sets test type to SLM - single-ended-lm : sets test type to LM	<i>The parameter is not visible during modification.</i> Y1731 PM Test type
target-mac	Parameter type: <Vlan::MacAddr> Format: - mac address (aa:bb:cc:a1:02:03) - unit: Byte - length: 6	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> MAC address of the PM responder(Target).
[no] priority	Parameter type: <Vlan::Priority> Format: - priority of ethernet frames - range: [0...7]	<i>optional parameter with default value: 7L</i> Priority. A 3 bit value to be used in the VLAN tag.
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> Start the PM test
interval	Parameter type: <Cfm::PmIntervalType> Format: - PM interval (sec) SLM: [1...10] LM: [60 or 300] - range: [1...10,60,300]	<i>optional parameter</i> Interval in which PM packets are transmitted.1sec - 10sec for SLM, 60sec or 300sec for LM
size	Parameter type: <Cfm::PmDataSizeType> Format: (not-applicable <Cfm::PmDataSize>) Possible values: - not-applicable : For single-ended-lm, the value of this object is not-applicable Field type <Cfm::PmDataSize> - Datasize for the SLM proactive test - range: [0...1500]	<i>optional parameter</i> Size of data TLV
measurement-intvl	Parameter type: <Cfm::PmMeasurementIntervalType> Format: (not-applicable <Cfm::PmMeasurementInterval>) Possible values: - not-applicable : For single-ended-lm, the value of this object is not-applicable Field type <Cfm::PmMeasurementInterval> - Measurement interval - unit: seconds - range: [60,300]	<i>optional parameter</i> The time for which the synthetic loss calculation is made periodically.

48- *Trouble-Shooting Configuration Commands*

48.1 Trouble-Shooting Configuration Command Tree	48-1562
48.2 Trouble-shooting Interface Configuration Commands	48-1563

48.1 Trouble-Shooting Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Trouble-Shooting Configuration Commands".

Command Tree

```
----configure
  ----trouble-shooting
    ----statistics
      ----[no] interface
        - (if-index)
```

48.2 Trouble-shooting Interface Configuration Commands

Command Description

This command allows the operator to enable or disable the extensive trouble-shooting counters.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure trouble-shooting statistics ( no interface (if-index) ) | ( interface (if-index) )
```

Command Parameters

Table 48.2-1 "Trouble-shooting Interface Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni uni:ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> :	interface index of the port

Resource Identifier	Type	Description
	<pre> <Eqpt::UnstackedVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan>) Possible values: - uni:ng2 : ng2 uni index - chpair : channel pair index - vlanport : vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE </pre>	

Resource Identifier	Type	Description
	Field type <Eqpt::ChannelPairId> - the channel pair identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Ng2::OntId> - the ONT identifier Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

49- *Trouble-Shooting Pbit Counter Configuration*

Command

49.1 Trouble-Shooting Pbit Counter Configuration Command Tree	49-1567
49.2 Trouble-shooting pbit counter Interface Configuration Commands	49-1568

49.1 Trouble-Shooting Pbit Counter Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Trouble-Shooting Pbit Counter Configuration Command".

Command Tree

```
----configure
  ----trouble-shooting
    ----pbit
      ----statistics
        ----[no] interface
          - (if-index)
```

49.2 Trouble-shooting pbit counter Interface Configuration Commands

Command Description

This command allows the operator to enable or disable trouble-shooting pbit counters.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

> configure trouble-shooting pbit statistics (no interface (if-index)) | (interface (if-index))

Command Parameters

Table 49.2-1 "Trouble-shooting pbit counter Interface Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> /	interface index of the Bridge port or vlan port

Resource Identifier	Type	Description
	<pre> <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> vlan:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan> vlan:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - vlan : vlan - uni:ng2 : ngpon2 UNI style identification - vlan:ng2 : ngpon2 vlan Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> </pre>	

49 Trouble-Shooting Pbit Counter Configuration Command

Resource Identifier	Type	Description
	- the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	

50- Trouble-Shooting Pon Interface Configuration Command

50.1 Trouble-Shooting Pon Interface Configuration Command Tree	50-1572
50.2 Trouble-shooting Pon Interface Configuration Commands	50-1573
50.3 Trouble-Shooting threshold Configuration Commands	50-1574
50.4 Trouble shooting Configuration Command	50-1575

50.1 Trouble-Shooting Pon Interface Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Trouble-Shooting Pon Interface Configuration Command".

Command Tree

```
----configure
  ----trouble-shooting
    ----pon
      ----statistics
        ----[no] interface
          - (if-index)
        ----threshold
          - [no] interval
        ----interface
          - (if-index)
          - [no] bw-th-up
          - [no] bw-th-dn
```

50.2 Trouble-shooting Pon Interface Configuration Commands

Command Description

This command allows the operator to enable or disable the extensive trouble-shooting counters over a Pon Line.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure trouble-shooting pon statistics ( no interface (if-index) ) | ( interface (if-index) )
```

Command Parameters

Table 50.2-1 "Trouble-shooting Pon Interface Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g-pon - x-pon : xgs-pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	interface index of the pon port

50.3 Trouble-Shooting threshold Configuration Commands

Command Description

This command is to configure the ethernet traffic tca detect interval

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

> configure trouble-shooting pon statistics threshold [no interval | interval <Gpon::TcaDetectIntval>]

Command Parameters

Table 50.3-2 "Trouble-Shooting threshold Configuration Commands" Command Parameters

Parameter	Type	Description
[no] interval	Parameter type: <Gpon::TcaDetectIntval> Format: - ethernet traffic tca detect interval for pon in second - range: [60...86400]	<i>optional parameter with default value: "300"</i> ethernet traffic tca detect interval for pon in second

50.4 Trouble shooting Configuration Command

Command Description

This command is to configure the pon threshold of bytes up or down.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure trouble-shooting pon statistics threshold interface (if-index) [ no bw-th-up | bw-th-up
<Gpon::TrbstBwThUp> ] [ no bw-th-dn | bw-th-dn <Gpon::TrbstBwThDn> ]
```

Command Parameters

Table 50.4-1 "Trouble shooting Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g-pon - x-pon : xgs-pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	interface index of the pon port

Table 50.4-2 "Trouble shooting Configuration Command" Command Parameters

Parameter	Type	Description
[no] bw-th-up	Parameter type: <Gpon::TrbstBwThUp> Format:	optional parameter with default value: "0"

50 Trouble-Shooting Pon Interface Configuration Command

Parameter	Type	Description
	- the attribute is used to specify the average rate threshold in kbps for upstream traffic,0 is disable - range: [0...4294967295]	the attribute is used to specify the average rate threshold in kbps for upstream traffic,0 is disable
[no] bw-th-dn	Parameter type: <Gpon::TrbstBwThDn> Format: - the attribute is used to specify the average rate threshold in kbps for downstream traffic,0 is disable - range: [0...4294967295]	<i>optional parameter with default value: "0"</i> the attribute is used to specify the average rate threshold in kbps for downstream traffic,0 is disable

51- Trouble-Shooting Color Counter Configuration Command

51.1 Trouble-Shooting Color Counter Configuration Command Tree	51-1578
51.2 Trouble-shooting color counter Interface Configuration Commands	51-1579

51.1 Trouble-Shooting Color Counter Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Trouble-Shooting Color Counter Configuration Command".

Command Tree

```
----configure
  ----trouble-shooting
    ----color
      ----statistics
        ----[no] interface
          - (if-index)
```

51.2 Trouble-shooting color counter Interface Configuration Commands

Command Description

This command allows the operator to enable or disable trouble-shooting color counters.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure trouble-shooting color statistics ( no interface (if-index) ) | ( interface (if-index) )
```

Command Parameters

Table 51.2-1 "Trouble-shooting color counter Interface Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> /	interface index of the vlan port

51 Trouble-Shooting Color Counter Configuration Command

Resource Identifier	Type	Description
	<pre> <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> vlan-port : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan>) Possible values: - vlan-port : vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::Vpild> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id </pre>	

52- IPoA/E IW Configuration Commands

52.1 IPoA/E IW Configuration Command Tree	52-1582
52.2 IPoA/E IW Interworking Port Configuration Command	52-1583
52.3 IPoA/E IW Gateway Configuration Command	52-1585

52.1 IPoA/E IW Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "IPoA/E IW Configuration Commands".

Command Tree

```
----configure
  ----ipoa/e-iw
    ----[no] port
      - (interworking-port)
      - user-ip
      - gw-ip
    ----[no] gateway
      - (vlanid)
      - gw-ip-addr
```

52.2 IPoA/E IW Interworking Port Configuration Command

Command Description

This command allows the operator to configure the parameter on the IPOA L2 interworking port level

User Level

The command can be accessed by operators with ip privileges, and executed by operators with ip privileges.

Command Syntax

The command has the following syntax:

```
> configure ipoa/e-iw ( no port (interworking-port) ) | ( port (interworking-port) [ user-ip <Ip::V4AddressHex> ] [ gw-ip <Ip::V4AddressHex> ] )
```

Command Parameters

Table 52.2-1 "IPoA/E IW Interworking Port Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(interworking-port)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VcId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpId> - atm VPI Field type <Eqpt::VcId> - atm VCI	index of rack/shelf/slot/port user-bridgeport

Table 52.2-2 "IPoA/E IW Interworking Port Configuration Command" Command Parameters

Parameter	Type	Description
user-ip	Parameter type: <Ip::V4AddressHex> Format: - IPv4-address	<i>optional parameter</i> ip address for user
gw-ip	Parameter type: <Ip::V4AddressHex> Format:	<i>optional parameter</i> ip address for next-hop gateway

52 IPoA/E IW Configuration Commands

Parameter	Type	Description
	- IPv4-address	

52.3 IPoA/E IW Gateway Configuration Command

Command Description

This command allows the operator to configure gateway address per L2 forwarder vlan

User Level

The command can be accessed by operators with ip privileges, and executed by operators with ip privileges.

Command Syntax

The command has the following syntax:

```
> configure ipoa/e-iw ( no gateway (vlanid) ) | ( gateway (vlanid) gw-ip-addr <Ip::V4AddressHex> )
```

Command Parameters

Table 52.3-1 "IPoA/E IW Gateway Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(vlanid)	Format: (<Network::UVlanIndex> stacked : <Network::SVlanIndex> : <Network::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Network::UVlanIndex> - unstacked vlan identity - range: [1...4093] Field type <Network::SVlanIndex> - service vlan identity - range: [2...4093] Field type <Network::CVlanIndex> - customer vlan identity - range: [0...4093]	vlan id

Table 52.3-2 "IPoA/E IW Gateway Configuration Command" Command Parameters

Parameter	Type	Description
gw-ip-addr	Parameter type: <Ip::V4AddressHex> Format: - IPv4-address	<i>mandatory parameter</i> the gateway ip address

53- LineTest Configuration Commands

53.2 Megaco LineTest Session Configuration Command

Command Description

This command allows the operator to configure the MEGACO LineTest session parameters.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure linetest cluster (cluster-id) ltsession (sessionid) [ session-cmd <LineTest::SessCmdForConfig> ] [
ownerid <Gauge> ] [ timeout-period <LineTest::TimeOutPerVoice> ] [ line-num <LineTest::LineNum> ] [
type-high <LineTest::ltTypeHigh> ] [ type-low <LineTest::ltTypeLow> ] [ test-parm-num
<LineTest::TestParmNum> ] [ test-mode <LineTest::TestModeForConfig> ] [ type-extend
<LineTest::ltTypeExtend> ]
```

Command Parameters

Table 53.2-1 "Megaco LineTest Session Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(sessionid)	Format: - available session id - range: [1]	uniquely identify of session

Table 53.2-2 "Megaco LineTest Session Configuration Command" Command Parameters

Parameter	Type	Description
session-cmd	Parameter type: <LineTest::SessCmdForConfig> Format: (create starttest sendinfo startinfo destroy recv-subtest start-subtest repeat endtest) Possible values:	<i>optional parameter</i> the linetest session command

53 LineTest Configuration Commands

Parameter	Type	Description
	- create : create a test session - starttest : transfer data done, start a test - sendinfo : start to transfer info data for an underway test - startinfo : transfer info data done, start info operation - destroy : destroy a test session - recv-subtest : start to transfer the sub-test's data - start-subtest : transfer sub-test's data done, start the sub-test - repeat : repeat the last test - endtest : end current test session	
ownerid	Parameter type: <Gauge> Format: - gauge	<i>optional parameter</i> ownerid of the session
timeout-period	Parameter type: <LineTest::TimeOutPerVoice> Format: - allows to set the whole test timer including all test \r\nitems of all lines for the session. Should be larger \r\nthan or equal to the sum of all lines' limited time plus\r\nline test management time <2s>. Each line's limited time\r\nis the sum of all the test items' limited time in this \r\nline. There are two exceptions: a) cable-pair-ident,\r\nwhich uses a fixed limitation 65~5400s;\r\nb) diagnosis-call, which uses a fixed limitation 42~120s.\r\n\r\nTest items' limited time(second):\r\n test type time \r\n- type-high\r\n group 20 \r\n feeded-ac-vol 3 \r\n foreign-ac-vol 10 \r\n feeded-dc-vol 3 \r\n foreign-dc-vol 15 \r\n feeding-current 3 \r\n resistance 6 \r\n capacitance 15 \r\n impedance 5 \r\n low-capacit-phone 20 \r\n force-ring-subscrib 120 \r\n dialton-delay 8 \r\n msocket-detection 6 \r\n- type-low\r\n ac-current 66 \r\n dc-current 66 \r\n noise-level 66 \r\n howler 120 \r\n status-monitored 3 \r\n talking-father 3 \r\n line-reverse-sub 60 \r\n p-meter-pulse-sub 6 \r\n ring-subscrib-sub 60 \r\n dpdtmf-signal-sub 60 \r\n userloop-sub 6 \r\n isdn-loopback 20 \r\n diagnosis-caller N/A \r\n diagnosis-callee N/A \r\n- type-extend\r\n gr909-ringer 20 \r\n gr909-dialtone-d 8 \r\n gr909-roh 20 \r\n gr909-hazardous-p 20 \r\n gr909-femf 20 \r\n gr909-resistive-f 20 - unit: second - range: [2...4294967295]	<i>optional parameter</i> timeout period
line-num	Parameter type: <LineTest::LineNum> Format: - line number in the session of test - range: [1...72]	<i>optional parameter</i> line number in the session of test
type-high	Parameter type: <LineTest::ltTypeHigh> Format: (none group feeded-ac-vol foreign-ac-vol feeded-dc-vol foreign-dc-vol feeding-current resistance capacitance impedance	<i>optional parameter</i> indicate line test items

Parameter	Type	Description
	low-capacit-phone force-ring-subscrib dialton-delay msocket-detection) Possible values: - none : null - group : group test, see group-opt argument for the content of the group test - feeded-ac-vol : feeded ac rms voltage test, HBit31/30/29 - foreign-ac-vol : foreign ac rms voltage test, HBit26/27/28 - feeded-dc-vol : feeded dc voltage test, HBit18/23/24/25 - foreign-dc-vol : foreign dc voltage test, HBit20/21/22 - feeding-current : feeding current test, HBit19 - resistance : insulating resistance test, HBit12/13/14/15/16/17 (ISDN line test only support HBit14/15/16/17) - capacitance : capacitance test, HBit8/9/10/11 - impedance : impedance test, HBit4/5/6/7 - low-capacit-phone : low capacitance phone detect test, HBit3 - force-ring-subscrib : force ring subscriber test, HBit2 - dialton-delay : dial tone delay test of user circuit only in idle , HBit1 - msocket-detection : termination (m socket detection) test, HBit0	
type-low	Parameter type: <LineTest::ltTypeLow> Format: (none ac-current dc-current noise-level howler status-monitored cable-pair-ident talking-father line-reverse-sub p-meter-pulse-sub ring-subscrib-sub dpdtmf-signal-sub userloop-sub isdn-loopback diagnosis-caller diagnosis-callee) Possible values: - none : null - ac-current : ac current test normal test, LBit29/30/31 - dc-current : dc current test normal test, LBit28/27/26 - noise-level : noise level normal test, LBit24 - howler : howler test under normal test, LBit22 - status-monitored : status monitored test, LBit20 - cable-pair-ident : cable pair identification test, LBit19 - talking-father : talking test (father test item), LBit18 - line-reverse-sub : line reverse test, subtest of talking test, LBit17 - p-meter-pulse-sub : private meter pulses test, subtest of talking test, LBit16 - ring-subscrib-sub : ring subscriber with auto ring test,	<i>optional parameter</i> indicate line test items

53 LineTest Configuration Commands

Parameter	Type	Description
	subtest of talking test, LBit15 - dpdtmf-signal-sub : dp/dtmf signal test, subtest of talking test, LBit14 - userloop-sub : resistance of user loop (tip-ring), subtest of talking test, LBit13 - isdn-loopback : isdn loop back test, LBit10 - diagnosis-caller : H248 Voice Diagnosis Caller test, LBit8 - diagnosis-callee : H248 Voice Diagnosis Callee test, LBit7	
test-parm-num	Parameter type: <LineTest::TestParmNum> Format: - parameter lines number in the session of test - range: [0...6]	<i>optional parameter</i> parameter lines number in the session for test
test-mode	Parameter type: <LineTest::TestModeForConfig> Format: (single interactive cablepair) Possible values: - single : the test will be end after one time - interactive : the interactive test - cablepair : the cable pair test	<i>optional parameter</i> test mode
type-extend	Parameter type: <LineTest::LtTypeExtend> Format: (none gr909-ringers gr909-dialtone-d gr909-roh gr909-hazardous-p gr909-femf gr909-resistive-f diagnosis-call) Possible values: - none : null - gr909-ringers : ringers test, ExBit26 - gr909-dialtone-d : draw and break dial tone delay test, ExBit25 - gr909-roh : receiver off hook test, ExBit24 - gr909-hazardous-p : hazardous potential test, ExBit23, - gr909-femf : foreign electromotive force test, ExBit22 - gr909-resistive-f : resistive faults test, ExBit21 - diagnosis-call : diagnosis call test, ExBit14	<i>optional parameter</i> indicate line test items

53.3 Megaco LineTest Line Configuration Command

Command Description

This command allows the operator to configure the MEGACO LineTest line parameters.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure linetest cluster (cluster-id) ltline (sessionid) lineid <Itf::LineTestMegacoLineId> [ line-status <LineTest::LineStatusForConfig> ]
```

Command Parameters

Table 53.3-1 "Megaco LineTest Line Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(sessionid)	Format: - available session id - range: [1]	uniquely identify of session
lineid	Parameter type: <Itf::LineTestMegacoLineId> Format: <Eqpt::NodeId> / <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::NewSlotId> / <Eqpt::MegacoPortId> Field type <Eqpt::NodeId> - the Node number Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::NewSlotId> - the LT slot number Field type <Eqpt::MegacoPortId> - the port number of Megaco	Identify of line

Table 53.3-2 "Megaco LineTest Line Configuration Command" Command Parameters

Parameter	Type	Description
line-status	Parameter type: <LineTest::LineStatusForConfig>	<i>optional parameter</i>

53 LineTest Configuration Commands

Parameter	Type	Description
	Format: (intest testover rstpartlyready) Possible values: - intest : put the line in test - testover : the line tested, and the result is ready for polling, it is read-only - rstpartlyready : defined for dp/dtmf test	status of line for test

53.4 MEGACO LineTest Param Configuration Command

Command Description

This command allows the operator to manage megaco linetest parameters.

User Level

The command can be accessed by operators with megaco privileges, and executed by operators with megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure linetest cluster (cluster-id) ltparm (sessionid) test-name(unit) <LineTest::TestTypeMegaco> [ value1
<LineTest::ParaValue1Voice> ] [ value2 <LineTest::ParaValue2Voice> ] [ value3 <LineTest::ParaValue3Voice> ]
[ value4 <LineTest::ParaValue4Voice> ] [ value5 <LineTest::ParaValue5Voice> ] [ min-threshold
<LineTest::TestThreshold> ] [ max-threshold <LineTest::TestThreshold> ] [ min-threshold2
<LineTest::TestThreshold> ] [ max-threshold2 <LineTest::TestThreshold> ] [ ltstrvalue1
<LineTest::ParaStringValueString> ]
```

Command Parameters

Table 53.4-1 "MEGACO LineTest Param Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(cluster-id)	Format: - the xvps cluster id - range: [1...8,11]	uniquely identify of this xvps cluster
(sessionid)	Format: - available session id - range: [1]	uniquely identify of session
test-name(unit)	Parameter type: <LineTest::TestTypeMegaco> Format: (feeded-ac-tr(mv) feeded-ac-tg(mv) feeded-ac-rg(mv) foreign-ac-tr(mv) foreign-ac-tg(mv) foreign-ac-rg(mv) feeded-dc-tr(mv) foreign-dc-tr(mv) foreign-dc-tg(mv) foreign-dc-rg(mv) feed-current(ua) feeded-dc-rt(mv)	test type

Resource Identifier	Type	Description
	- feeded-dc-tr(mv) : feeded dc voltage of user line (tip-ring) - foreign-dc-tr(mv) : foreign dc voltage of user line (tip-ring) - foreign-dc-tg(mv) : foreign dc voltage of user line (tip-ground) - foreign-dc-rg(mv) : foreign dc voltage of user line (ring-ground) - feed-current(ua) : feeding current (tip-ring) - feeded-dc-rt(mv) : feeded dc voltage of user line (ring-tip) - resist-tr(ohm) : insulating resistance of user line (tip-ring) - resist-rt(ohm) : insulating resistance of user line (ring-tip) - resist-tg(ohm) : insulating resistance of user line (tip-ground) - resist-rg(ohm) : insulating resistance of user line (ring-ground) - resist-tbat(ohm) : insulating battery resistance of user line (tip-bat) - resist-rbat(ohm) : insulating battery resistance of user line (ring-bat) - capacitanc-tr(nf) : capacitance of user line (tip-ring) - capacitanc-rt(nf) : capacitance of user line (ring-tip) - capacitanc-tg(nf) : capacitance of user line (tip-ground) - capacitanc-rg(nf) : capacitance of user line (ring-ground) - impedance-tr(ohm) : impedance of user circuit (tip-ring) - impedance-tg(ohm) : impedance of user circuit (tip-ground) - impedance-rg(ohm) : impedance of user circuit (ring-ground) - low-capacit-phone : low capacitance phone detect - force-ring-subscrib : force ring subscriber test - dialton-delay(ms) : dial tone delay of user circuit only in idle - msocket-detection : termination (m socket detection) - ac-current-tr(ua) : ac current test normal test (tip-ring) - ac-current-tg(ua) : ac current test normal test (tip-ground) - ac-current-rg(ua) : ac current test normal test (ring-ground) - dc-current-tr(ua) : dc current test normal test (tip-ring) - dc-current-tg(ua) : dc current test normal test (tip-ground) - dc-current-rg(ua) : dc current test normal test (ring-ground) - noise-lv-0.001dbm : noise level normal test - howler-test-park : howler test under normal test condition only in parking - status-monitored : status monitored test - cable-pair-ident : cable pair identification test - talking-father : talking test (father test item) - line-reverse-sub : line reverse test, subtest of talking test - p-meter-pulse-sub : private meter pulses test, subtest of talking test - ring-subscrib-sub : ring subscriber with auto ring test, subtest of talking test - dpdtmf-signal-sub : dp/dtmf signal test, subtest of talking test - userloop-sub(ohm) : resistance of user loop (tip-ring), subtest of talking test - feeded-dc-tg(mv) : feeded dc voltage of user line (tip-ground) - feeded-dc-rg(mv) : feeded dc voltage of user line (ring-ground)	

Resource Identifier	Type	Description
	- impedance-rt(ohm) : impedance of user circuit (ring-tip) - isdn-loopback : isdn loop back test - ringer-ren(mren) : gr909 ringer equivalency number testing - dialtone-delay-db(ms) : gr909 draw and break dial tone delay testing - gr909-roh : gr909 receiver off hook testing - gr909-hazardous-p : gr909 Hazardous Potential testing - gr909-femf : gr909 Foreign ElectroMotive Force testing - gr909-resistive-f : gr909 resistive faults testing - diagnosis-call(1/10s) : diagnosis call test	

Table 53.4-2 "MEGACO LineTest Param Configuration Command" Command Parameters

Parameter	Type	Description
value1	Parameter type: <LineTest::ParaValue1Voice> Format: - parameter value required for the execution of the \r\nspecified test type.\r\n<resistance tr/rt(ohm)>:\r\n Meaning: allows to configure whether it is required \r\n to test the 'signature' or not.\r\n Applicability : MELT only.\r\n Range: No(0) Yes(1)\r\n Default: No(0)\r\n <impedance tr/tg/rg(ohm)>:\r\n Meaning: allows to configure the frequency the test \r\n must run with.\r\n Range: 5~3000\r\n Default: 20 Unit: Hz\r\n <status-monitored>:\r\n Meaning: allows to configure whether to check real \r\n parking or short current state.\r\n Range: No(1) Yes(2)\r\n No default value.\r\n <cable-pair-ident>:\r\n Meaning: allows to configure the frequency the test \r\n must run with.\r\n Applicability : MELT only.\r\n Range: 300~3400\r\n Default: 800 Unit: Hz\r\n For SHDSL, only 800 Hz (default) and 1000 Hz are \r\n supported.\r\n <p-meter-pulse-sub>:\r\n Meaning: allows to configure the metering mode.\r\n Range: 1 TAPI_METER_MODE_TTX\r\n 2 TAPI_METER_MODE_REVPOL\r\n No default value.\r\n <dptmf-signal-sub>:\r\n Meaning: allows to configure the number of signals \r\n to be gathered.\r\n Range: 1~20\r\n No default value.\r\n <isdn-loopback>:\r\n Meaning: allows to configure the testside.\r\n Range: 1 LoopbackOnNTSide\r\n 2 LoopbackOnLtSide\r\n 3 LoopbackBothSide	<i>optional parameter</i> test parameter value1
value2	Parameter type: <LineTest::ParaValue2Voice> Format: - parameter value required for the execution of the \r\nspecified test type.\r\n<impedance tr/tg/rg(ohm)>:\r\n Meaning: allows to configure the RMS voltage level.\r\n Range: -150~+150\r\n Default: 15 Unit: V\r\n <cable-pair-ident>:\r\n Meaning: allows to configure the power level.\r\n Applicability : MELT only.\r\n Range: -600~0\r\n For XDSL, range is -600~-160\r\n For SHDSL, range is -340~-40\r\n Default: -160 Unit: 0.1 dbm	<i>optional parameter</i> test parameter value2
value3	Parameter type: <LineTest::ParaValue3Voice> Format: - parameter value3 is actually not used	<i>optional parameter</i> test parameter value3
value4	Parameter type: <LineTest::ParaValue4Voice> Format: - parameter value4 is actually not used	<i>optional parameter</i> test parameter value4

Parameter	Type	Description
value5	Parameter type: <LineTest::ParaValue5Voice> Format: - parameter value5 is actually not used	<i>optional parameter</i> test parameter value5
min-threshold	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold min of this test type
max-threshold	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold max of this test type
min-threshold2	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold2 min of this test type
max-threshold2	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold2 max of this test type
ltstrvalue1	Parameter type: <LineTest::ParaStringValueString> Format: - string parameter value required for the execution of the \r\nspecified test type.\r\n<diagnosis-call(1/10s)>:\r\n Meaning: allows to configure destination number.\r\n Applicability: NBLT only.\r\n Range: 0~9, *, #.\r\n No default value.\r\n Length: 1~16.	<i>optional parameter</i> test parameter string value1

53.5 SINGLE LineTest Session Configuration Command

Command Description

This command allows the operator to configure the single LineTest session parameters.

User Level

The command can be accessed by operators with sip , xdsl privileges, and executed by operators with sip , xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure linetest single ltsession (sessionid) [ session-cmd <LineTest::SessCmdForConfig> ] [ ownerid
<Gauge> ] [ timeout-period <LineTest::TimeOutPerSip> ] [ line-num <LineTest::LineNum> ] [ type-high
<LineTest::ltTypeHigh> ] [ type-low <LineTest::ltTypeLowSip> ] [ test-param-num <LineTest::TestParmNum> ] [
test-mode <LineTest::TestModeForConfig> ] [ inactive-timer <LineTest::InactTimer> ] [ type-extend
<LineTest::ltTypeExtendSip> ] [ no group-opt | group-opt <LineTest::ltGroupTestOpt> ] [ no busy-overwrite |
busy-overwrite <LineTest::ltBusyOverwriteFlag> ] [ no force-measure | force-measure <LineTest::ForceMeasure>
]
```

Command Parameters

Table 53.5-1 "SINGLE LineTest Session Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(sessionid)	Format: - available session id - range: [1...16]	uniquely identify of session

Table 53.5-2 "SINGLE LineTest Session Configuration Command" Command Parameters

Parameter	Type	Description
session-cmd	Parameter type: <LineTest::SessCmdForConfig> Format: (create starttest sendinfo startinfo destroy recv-subtest start-subtest repeat endtest) Possible values: - create : create a test session	<i>optional parameter</i> the linetest session command

Parameter	Type	Description
	- starttest : transfer data done, start a test - sendinfo : start to transfer info data for an underway test - startinfo : transfer info data done, start info operation - destroy : destroy a test session - recv-subtest : start to transfer the sub-test's data - start-subtest : transfer sub-test's data done, start the sub-test - repeat : repeat the last test - endtest : end current test session	
ownerid	Parameter type: <Gauge> Format: - gauge	<i>optional parameter</i> ownerid of the session
timeout-period	Parameter type: <LineTest::TimeOutPerSip> Format: - allows to set the whole test timer including all test \r\nitems of all lines for the session. Should be larger \r\nthan or equal to the sum of all lines' limited time plus\r\nline test management time <2s>. Each line's limited time\r\nis the sum of all the test items' limited time in this \r\nline. There are two exceptions: a) cable-pair-ident,\r\nwhich uses a fixed limitation 60~5400s;\r\nb) diagnosis-call, which uses a fixed limitation 42~120s.\r\nTest items' limited time(second):\r\n test type POTS MELT \r\n- type-high\r\n group 20 18 \r\n feeded-ac-vol 3 N/A \r\n foreign-ac-vol 10 5 \r\n feeded-dc-vol 3 N/A \r\n foreign-dc-vol 15 5 \r\n feeding-current 3 N/A \r\n resistance 6 18 \r\n capacitance 15 18 \r\n impedance 5 N/A \r\n low-capacit-phone 20 N/A \r\n force-ring-subscrib 120 N/A \r\n dialton-delay 8 N/A \r\n msocket-detection 6 N/A \r\n- type-low\r\n ac-current 66 N/A \r\n dc-current 66 N/A \r\n noise-level 66 N/A \r\n howler 120 N/A \r\n status-monitored 3 N/A \r\n talking-father 3 N/A \r\n line-reverse-sub 60 N/A \r\n p-meter-pulse-sub 6 N/A \r\n ring-subscrib-sub 60 N/A \r\n dpdtmf-signal-sub 60 N/A \r\n userloop-sub 6 N/A \r\n etsi-signature N/A 18 \r\n electronic-ringer 10 N/A \r\n longitudinal-current 3 N/A \r\n conductance 8 20 \r\n susceptance 8 20 \r\n iltf-hazardous-voltage 30 20 \r\n- type-extend\r\n iltf-term-signature N/A 20 \r\n iltf-term-capacitiv 15 20 \r\n iltf-ppa-test 15 20 \r\n roh-test 8 20 \r\n gr909-ringer 20 N/A \r\n gr909-dialtone-d 8 N/A \r\n gr909-roh 20 N/A \r\n gr909-hazardous-p 20 N/A \r\n gr909-femf 20 N/A \r\n gr909-resistive-f 20 N/A \r\n iltf-term-ringer 10 N/A \r\n zener-res-volt 8 20 \r\n isdn-pra-remotelb 2 N/A \r\n isdn-pra-ploadlb 2 N/A \r\n isdn-pra-locallb 4 N/A \r\n isdn-pra-cablelb 2 N/A \r\n cas-r2-remotelb 2 N/A \r\n cas-r2-ploadlb 2 N/A \r\n cas-r2-locallb 4 N/A \r\n cas-r2-cablelb 2 N/A - unit: second - range: [2...4294967295]	<i>optional parameter</i> timeout period
line-num	Parameter type: <LineTest::LineNum> Format: - line number in the session of test - range: [1...72]	<i>optional parameter</i> line number in the session of test (Max line number depends on the physical line number of the device)
type-high	Parameter type: <LineTest::ltTypeHigh>	<i>optional parameter</i>

53 LineTest Configuration Commands

Parameter	Type	Description
	Format: (none group feeded-ac-vol foreign-ac-vol feeded-dc-vol foreign-dc-vol feeding-current resistance capacitance impedance low-capacit-phone force-ring-subscrib dialton-delay msocket-detection) Possible values: - none : null - group : group test, see group-opt argument for the content of the group test - feeded-ac-vol : feeded ac rms voltage test, HBit31/30/29 - foreign-ac-vol : foreign ac rms voltage test, HBit26/27/28 - feeded-dc-vol : feeded dc voltage test, HBit18/23/24/25 - foreign-dc-vol : foreign dc voltage test, HBit20/21/22 - feeding-current : feeding current test, HBit19 - resistance : insulating resistance test, HBit12/13/14/15/16/17(ISDN line test only support HBit14/15/16/17) - capacitance : capacitance test, HBit8/9/10/11 - impedance : impedance test, HBit4/5/6/7 - low-capacit-phone : low capacitance phone detect test, HBit3 - force-ring-subscrib : force ring subscriber test, HBit2 - dialton-delay : dial tone delay test of user circuit only in idle , HBit1 - msocket-detection : termination (m socket detection) test, HBit0	indicate line test items
type-low	Parameter type: <LineTest::ltTypeLowSip> Format: (none ac-current dc-current noise-level howler status-monitored cable-pair-ident talking-father line-reverse-sub p-meter-pulse-sub ring-subscrib-sub dpdtmf-signal-sub userloop-sub etsi-signature electronic-ringer longitudinal-current conductance susceptance iltf-hazardous-voltage)	<i>optional parameter</i> indicate line test items

Parameter	Type	Description
	Possible values: - none : null - ac-current : ac current test normal test, LBit29/30/31 - dc-current : dc current test normal test, LBit28/27/26 - noise-level : noise level normal test, LBit24 - howler : howler test under normal test, LBit22 - status-monitored : status monitored test, LBit20 - cable-pair-ident : cable pair identification test, LBit19 - talking-father : talking test (father test item), LBit18 - line-reverse-sub : line reverse test, subtest of talking test, LBit17 - p-meter-pulse-sub : private meter pulses test, subtest of talking test, LBit16 - ring-subscrib-sub : ring subscriber with auto ring test, subtest of talking test, LBit15 - dpdtmf-signal-sub : dp/dtmf signal test, subtest of talking test, LBit14 - userloop-sub : resistance of user loop (tip-ring), subtest of talking test, LBit13 - etsi-signature : etsi signature test, including capacitance and resistance, LBit12/11, for MELT only - electronic-ringer : electronic ringer detect test, including capacitance and resistance, LBit12/11, for NPOT-B only - longitudinal-current : longitudinal current test, LBit9 - conductance : termination conductance test, LBit4/5/6 - susceptance : termination susceptance test, LBit1/2/3 - iltf-hazardous-voltage: hazardous voltage detection test, LBit0	
test-parm-num	Parameter type: <LineTest::TestParmNum> Format: - parameter lines number in the session of test - range: [0...6]	<i>optional parameter</i> parameter lines number in the session for test
test-mode	Parameter type: <LineTest::TestModeForConfig> Format: (single interactive cablepair) Possible values: - single : the test will be end after one time - interactive : the interactive test - cablepair : the cable pair test	<i>optional parameter</i> test mode
inactive-timer	Parameter type: <LineTest::InactTimer> Format: - session inactive timer, 0 means never destroy the session automatically - unit: second - range: [0,120...65535]	<i>optional parameter</i> session inactive timer
type-extend	Parameter type: <LineTest::ItTypeExtendSip> Format: (none iltf-term-signature iltf-term-capacitiv iltf-ppa-test roh-test gr909-ringers gr909-dialtone-d gr909-roh	<i>optional parameter</i> indicate line test items

Parameter	Type	Description
	gr909-hazardous-p gr909-femf gr909-resistive-f iltf-term-ringer zener-res-volt isdn-pra-remotelb isdn-pra-ploadlb isdn-pra-locallb isdn-pra-cablelb cas-r2-remotelb cas-r2-ploadlb cas-r2-locallb cas-r2-cablelb diagnosis-call) Possible values: - none : null - iltf-term-signature : galvanic signature detection, ExBit31, only applicable for MELT - iltf-term-capacitiv : end device capacitance >50nF detection, ExBit30 - iltf-ppa-test : ppa variant test, ExBit29 - roh-test : termination roh test, ExBit28 - gr909-ringers : ringers test, ExBit26 - gr909-dialtone-d : draw and break dial tone delay test, ExBit25 - gr909-roh : receiver off hook test, ExBit24 - gr909-hazardous-p : hazardous potential test, ExBit23, - gr909-femf : foreign electromotive force test, ExBit22 - gr909-resistive-f : resistive faults test, ExBit21 - iltf-term-ringer : Termination Ringer Testing, ExBit27, only applicable for NPOT-B/C - zener-res-volt : Zener Resistance and Voltage test, ExBit20/19 - isdn-pra-remotelb : ISDN PRA Remote loopback test, ExBit18 - isdn-pra-ploadlb : ISDN PRA Payload loopback test, ExBit17 - isdn-pra-locallb : ISDN PRA Local loopback test, ExBit16 - isdn-pra-cablelb : ISDN PRA Cable loopback test, ExBit15 - cas-r2-remotelb : CAS R2 Remote loopback test, ExBit18 - cas-r2-ploadlb : CAS R2 Payload loopback test, ExBit17 - cas-r2-locallb : CAS R2 Local loopback test, ExBit16 - cas-r2-cablelb : CAS R2 Cable loopback test, ExBit15 - diagnosis-call : diagnosis call test, ExBit14	
[no] group-opt	Parameter type: <LineTest::ltGroupTestOpt> Format: (none extended pots-collective melt-collective) Possible values: - none : identifier group test normal report value, HBit28/27/26/22/21/20/17/16/15/14/11/9/8 - extended : identifier group test extended report value, HBit28/27/26/22/21/20/17/16/15/14/11/9/8 - pots-collective : identifier pots collective tests, HBit28/27/26/22/21/20/17/16/15/14/11/9/8,	<i>optional parameter with default value: "none"</i> indicate line test items

Parameter	Type	Description
	LBit12/11/6/5/4/3/2/1, ExBit30/29/28/27/20/19 - melt-collective : identifier MELT collective tests, HBit28/27/26/22/21/20/17/16/15/14/11/9/8, LBit12/11/6/5/4/3/2/1, ExBit31/30/29/28/20/19	
[no] busy-overwrite	Parameter type: <LineTest::ltBusyOverwriteFlag> Format: (true false) Possible values: - true : busy overwrite enable - false : busy overwrite disable	<i>optional parameter with default value: "false"</i> Session Busy Overwrite status
[no] force-measure	Parameter type: <LineTest::ForceMeasure> Format: (true false) Possible values: - true : force the MELT measurement for requested line tests - false : force measurement is not required	<i>optional parameter with default value: "false"</i> status of line for test

53.6 SINGLE LineTest Line Configuration Command

Command Description

This command allows the operator to configure the single LineTest line parameters.

User Level

The command can be accessed by operators with sip , xdsl privileges, and executed by operators with sip , xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure linetest single ltline (sessionid) lineid <Itf::LineTestSingleLineId> [ line-status
<LineTest::LineStatusForConfig> ]
```

Command Parameters

Table 53.6-1 "SINGLE LineTest Line Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(sessionid)	Format: - available session id - range: [1...16]	uniquely identify of session
lineid	Parameter type: <Itf::LineTestSingleLineId> Format: <Eqpt::NodeId> / <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::NodeId> - the Node number Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	Identify of line

Table 53.6-2 "SINGLE LineTest Line Configuration Command" Command Parameters

Parameter	Type	Description
line-status	Parameter type: <LineTest::LineStatusForConfig> Format: (intest testover	<i>optional parameter</i> status of line for test

Parameter	Type	Description
	rstpartlyready) Possible values: - intest : put the line in test - testover : the line tested, and the result is ready for polling, it is read-only - rstpartlyready : defined for dp/dtmf test	

53.7 SINGLE LineTest Param Configuration Command

Command Description

This command allows the operator to manage single linetest parameters.

User Level

The command can be accessed by operators with sip , xdsl privileges, and executed by operators with sip , xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure linetest single ltparm (sessionid) test-name(unit) <LineTest::TestTypeSip> [ value1
<LineTest::ParaValue1Sip> ] [ value2 <LineTest::ParaValue2Sip> ] [ value3 <LineTest::ParaValue3Sip> ] [
value4 <LineTest::ParaValue4Sip> ] [ value5 <LineTest::ParaValue5Sip> ] [ min-threshold
<LineTest::TestThreshold> ] [ max-threshold <LineTest::TestThreshold> ] [ min-threshold2
<LineTest::TestThreshold> ] [ max-threshold2 <LineTest::TestThreshold> ] [ ltstrvalue1
<LineTest::ParaStrValueString> ]
```

Command Parameters

Resource Identifier	Type	Description
	- idle - msocket-detection : termination (m socket detection) - ac-current-tr(ua) : ac current test normal test (tip-ring) - ac-current-tg(ua) : ac current test normal test (tip-ground) - ac-current-rg(ua) : ac current test normal test (ring-ground) - dc-current-tr(ua) : dc current test normal test (tip-ring) - dc-current-tg(ua) : dc current test normal test (tip-ground) - dc-current-rg(ua) : dc current test normal test (ring-ground) - noise-lv-0.001dbm : noise level normal test - howler-test-park : howler test under normal test condition only in parking - status-monitored : status monitored test - cable-pair-ident : cable pair identification test - talking-father : talking test (father test item) - line-reverse-sub : line reverse test, subtest of talking test - p-meter-pulse-sub : private meter pulses test, subtest of talking test - ring-subscrib-sub : ring subscriber with auto ring test, subtest of talking test - dpdtmf-signal-sub : dp/dtmf signal test, subtest of talking test - userloop-sub(ohm) : resistance of user loop (tip-ring), subtest of talking test - capacit-sign(pf) : capacitance of etsi signature or electronic ringer - resist-sign(ohm) : resistance of etsi signature or electronic ringer - feeded-dc-tg(mv) : feeded dc voltage of user line (tip-ground) - feeded-dc-rg(mv) : feeded dc voltage of user line (ring-ground) - impedance-rt(ohm) : impedance of user circuit (ring-tip) - long-current(ua) : difference between the currents on the a-lead and the b-lead (longitudinal current) - diagnosis-caller : H248 Voice Diagnosis Caller - diagnosis-callee : H248 Voice Diagnosis Callee - conductance-tr(1/10us): Conductance of user line (Tip-Ring) - conductance-tg(1/10us): Conductance of user line (Tip-Ground) - conductance-rg(1/10us): Conductance of user line (Ring-Ground) - susceptance-tr(1/10us): Susceptance of user line (Tip-Ring) - susceptance-tg(1/10us): Susceptance of user line (Tip-Ground) - susceptance-rg(1/10us): Susceptance of user line (Ring-Ground) - hazardous-volt(1/2) : whether voltage value is hazardous or not(iltf-hazardous-voltage) - term-signature(1/0) : whether termination signature is detected(iltf-termination-signature) - term-capacitiv(1/0) : whether termination capacitance is detected(iltf-termination-capacitiv) - ppa-test(ppa-variant) : test ppa variant(iltf-ppa) - roh-test(1/0) : test termination roh - term_ringer(1/0) : whether termination ringer is detected	

Resource Identifier	Type	Description
	- ringer-ren(mren) : gr909 ringer equivalency number testing - dialtone-delay-db(ms) : gr909 draw and break dial tone delay testing - gr909-roh : gr909 receiver off hook testing - gr909-hazardous-p : gr909 Hazardous Potential testing - gr909-femf : gr909 Foreign ElectroMotive Force testing - gr909-resistive-f : gr909 resistive faults testing - zener-res(ohm) : test zener resistance - zener-volt(uv) : test zener voltage - remotelb : E1 or T1 Remote loopback test - ploaddb : E1 or T1 Payload loopback test - locallb : E1 or T1 Local loopback test - cablelb : E1 or T1 Cable loopback test - isdn-pra-remotelb : ISDN PRA Remote loopback test - isdn-pra-ploaddb : ISDN PRA Payload loopback test - isdn-pra-locallb : ISDN PRA Local loopback test - isdn-pra-cablelb : ISDN PRA Cable loopback test - cas-r2-remotelb : CAS R2 Remote loopback test - cas-r2-ploaddb : CAS R2 Payload loopback test - cas-r2-locallb : CAS R2 Local loopback test - cas-r2-cablelb : CAS R2 Cable loopback test - diagnosis-call(1/10s) : diagnosis call test	

Table 53.7-2 "SINGLE LineTest Param Configuration Command" Command Parameters

Parameter	Type	Description
value1	Parameter type: <LineTest::ParaValue1Sip> Format: - parameter value required for the execution of the \r\nspecified test type.\r\n<resistance tr/rt(ohm)>:\r\n Meaning: allows to configure whether it is required \r\n to test the 'signature' or not.\r\n Applicability : MELT only.\r\n Range: No(0) Yes(1)\r\n Default: No(0)\r\n <impedance tr/tg/rg(ohm)>:\r\n Meaning: allows to configure the frequency the test \r\n must run with.\r\n Range: 5~3000\r\n Default: 20 Unit: Hz\r\n <status-monitored>:\r\n Meaning: allows to configure whether to check real \r\n parking or short current state.\r\n Range: No(1) Yes(2)\r\n No default value.\r\n <cable-pair-ident>:\r\n Meaning: allows to configure the frequency the test \r\n must run with.\r\n Applicability : MELT only.\r\n Range: 300~3400\r\n Default: 800 Unit: Hz\r\n For SHDSL, only 800 Hz (default) and 1000 Hz are \r\n supported.\r\n <p-meter-pulse-sub>:\r\n Meaning: allows to configure the metering mode.\r\n Range: 1 TAPI_METER_MODE_TTX\r\n 2 TAPI_METER_MODE_REVPOL\r\n No default value.\r\n <dpdtmf-signal-sub>:\r\n Meaning: allows to configure the number of signals\r\n to be gathered.\r\n Range: 1~20\r\n No default value.\r\n <isdn-pra-locallb / cablelb>:\r\n Meaning: allows to configure the test pattern to be \r\n used for the loopback test.\r\n If no input is given, a 'Pseudo-random' pattern is \r\n defined and applied by the system.\r\n If an input is given (value in the range 0~254), the \r\n value defines the pattern (range 0x00~0xFE) to be used \r\n for the loopback test.\r\n Range: 0~254\r\n Default: 'Pseudo-random' pattern (no input	<i>optional parameter</i> test parameter value1

Parameter	Type	Description
	given)\r\n<cas-r2-locallb / cablelb>:\r\n Meaning: allows to configure the test pattern to be \r\n used for the loopback test.\r\n If no input is given, a 'Pseudo-random' pattern is \r\n defined and applied by the system.\r\n If an input is given (value in the range 0~254), the \r\n value defines the pattern (range 0x00~0xFE) to be used \r\n for the loopback test.\r\n Range: 0~254\r\n Default: 'Pseudo-random' pattern (no input given)	
value2	Parameter type: <LineTest::ParaValue2Sip> Format: - parameter value required for the execution of the \r\n unspecified test type.\r\n <impedance tr/tg/rg(ohm)>:\r\n Meaning: allows to configure the RMS voltage level.\r\n Range: -150~+150\r\n Default: 15 Unit: V\r\n \r\n <cable-pair-ident>:\r\n Meaning: allows to configure the power level.\r\n Applicability : MELT only.\r\n Range: -600~0\r\n For XDSL, range is -600~-160\r\n For SHDSL, range is -340~-40\r\n Default: -160 Unit: 0.1 dbm	<i>optional parameter</i> test parameter value2
value3	Parameter type: <LineTest::ParaValue3Sip> Format: - parameter value3 is actually not used	<i>optional parameter</i> test parameter value3
value4	Parameter type: <LineTest::ParaValue4Sip> Format: - parameter value4 is actually not used	<i>optional parameter</i> test parameter value4
value5	Parameter type: <LineTest::ParaValue5Sip> Format: - parameter value5 is actually not used	<i>optional parameter</i> test parameter value5
min-threshold	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold min of this test type
max-threshold	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold max of this test type
min-threshold2	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold2 min of this test type
max-threshold2	Parameter type: <LineTest::TestThreshold> Format: - threshold of the test type - range: [-2147483647...2147483647]	<i>optional parameter</i> threshold2 max of this test type
ltstrvalue1	Parameter type: <LineTest::ParaStringValueString> Format: - string parameter value required for the execution of the \r\n unspecified test type.\r\n <diagnosis-call(1/10s)>:\r\n Meaning: allows to configure destination number.\r\n Applicability: NBLT only.\r\n Range: 0~9, *, #,\r\n No default value.\r\n Length: 1~16.	<i>optional parameter</i> test parameter string value1

54- LACP Configuration Commands

54.1 LACP Configuration Command Tree	54-1615
54.2 LACP general configuration command	54-1616
54.3 LACP port configuration command	54-1617
54.4 LACP group configuration command	54-1618
54.5 LACP Group Port configuration command	54-1620

54.1 LACP Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "LACP Configuration Commands".

Command Tree

```
----configure
  ----link-agg
    ----general
      - [no] priority
    ----port
      - (port)
      - [no] passive-lacp
      - [no] short-timeout
      - [no] actor-port-prio
    ----group
      - (group)
      - load-sharing-policy
      - [no] max-active-port
      - [no] swo-threshold
      - [no] priority
      - swo-revert
      - mode
      - master-iwf
    ----[no] port
      - (port)
```

54.2 LACP general configuration command

Command Description

This command allows the operator to configure the general LACP parameters.

User Level

The command can be accessed by operators with lacp privileges, and executed by operators with lacp privileges.

Command Syntax

The command has the following syntax:

```
> configure link-agg general [ no priority | priority <Lacp::SysPriority> ]
```

Command Parameters

Table 54.2-2 "LACP general configuration command" Command Parameters

Parameter	Type	Description
[no] priority	Parameter type: <Lacp::SysPriority> Format: - the lacp system priority - range: [1...65535]	<i>optional parameter with default value: 1</i> the lacp system priority

54.3 LACP port configuration command

Command Description

This command allows the operator to configure the link aggregation port parameters.

User Level

The command can be accessed by operators with lacp privileges, and executed by operators with lacp privileges.

Command Syntax

The command has the following syntax:

```
> configure link-agg port (port) [ [ no ] passive-lacp ] [ [ no ] short-timeout ] [ no actor-port-prio | actor-port-prio
<Lacp::ActorPortPriority> ]
```

Command Parameters

Table 54.3-1 "LACP port configuration command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port

Table 54.3-2 "LACP port configuration command" Command Parameters

Parameter	Type	Description
[no] passive-lacp	Parameter type: boolean	<i>optional parameter</i> set lacp inactive for the actor
[no] short-timeout	Parameter type: boolean	<i>optional parameter</i> short timeout for the lacp protocol
[no] actor-port-prio	Parameter type: <Lacp::ActorPortPriority> Format: - la aggregate port priority - range: [0...65535]	<i>optional parameter with default value: "1"</i> port priority for the actor

54.4 LACP group configuration command

Command Description

This command allows the operator to configure the link aggregation group parameters.

User Level

The command can be accessed by operators with lacp privileges, and executed by operators with lacp privileges.

Command Syntax

The command has the following syntax:

```
> configure link-agg group (group) [ load-sharing-policy <Lacp::LoadSharingPolicy> ] [ no max-active-port |
max-active-port <Lacp::MaxActivePort> ] [ no swo-threshold | swo-threshold <Lacp::SwThreshold> ] [ no priority
| priority <Lacp::AggSysPri> ] [ swo-revert <Lacp::SwRevert> ] [ mode <Lacp::Mode> ] [ master-iwf
<Lacp::MasterIwf> ]
```

Command Parameters

Table 54.4-1 "LACP group configuration command" Resource Parameters

Resource Identifier	Type	Description
(group)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the link aggregation group

Table 54.4-2 "LACP group configuration command" Command Parameters

Parameter	Type	Description
load-sharing-policy	Parameter type: <Lacp::LoadSharingPolicy> Format: (mac-src mac-dst mac-src-dst ip-src ip-dst ip-src-dst l2-l3-hybrid-model) Possible values: - mac-src : source mac based - mac-dst : destination mac based	<i>optional parameter</i> link aggregation load sharing policy

Parameter	Type	Description
	- mac-src-dst : source and destination mac based - ip-src : source ip based - ip-dst : destination ip based - ip-src-dst : source and destination ip based - l2-l3-hybrid-model : l2 and l3 hybrid model based	
[no] max-active-port	Parameter type: <Lacp::MaxActivePort> Format: - max active port - range: [1...8]	<i>optional parameter with default value: 8</i> the max active port number in a LAG
[no] swo-threshold	Parameter type: <Lacp::SwThreshold> Format: - the switchover threshold in a cross-lt LAG - range: [0...8]	<i>optional parameter with default value: 0</i> the switchover threshold in a cross-lt LAG
[no] priority	Parameter type: <Lacp::AggSysPri> Format: - the lacp agg actor system priority - range: [0...65535]	<i>optional parameter with default value: "0"</i> the system priority in a LAG
swo-revert	Parameter type: <Lacp::SwRevert> Format: (disable enable) Possible values: - disable : disable switchover revert - enable : enable switchover revert	<i>optional parameter</i> the switchover revert flag in a cross-lt LAG
mode	Parameter type: <Lacp::Mode> Format: (static dynamic) Possible values: - static : static mode - dynamic : dynamic mode	<i>optional parameter</i> lacp mode
master-iwf	Parameter type: <Lacp::MasterIwf> Format: (auto unset) Possible values: - auto : app select the IWF connected to the primary link of the lag - unset : dummy lag	<i>optional parameter</i> master iwf value

54.5 LACP Group Port configuration command

Command Description

This command allows the operator to add/remove link aggregation group member ports.

User Level

The command can be accessed by operators with lacp privileges, and executed by operators with lacp privileges.

Command Syntax

The command has the following syntax:

```
> configure link-agg group (group) ( no port (port) ) | ( port (port) )
```

Command Parameters

Table 54.5-1 "LACP Group Port configuration command" Resource Parameters

Resource Identifier	Type	Description
(group)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the link aggregation group
(port)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	Interface index of the port

55- MSTP Configuration Commands

55.1 MSTP Configuration Command Tree	55-1622
55.2 MSTP general configuration Command	55-1623
55.3 MSTP Instance configuration Command	55-1625
55.4 MSTP Vlan-Instance Mapping configuration Command	55-1626
55.5 MSTP Port configuration Command	55-1627
55.6 MSTP Port-Instance configuration Command	55-1629

55.1 MSTP Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "MSTP Configuration Commands".

Command Tree

```
----configure
  ----xstp
    ----general
      - [no] enable-stp
      - [no] priority
      - [no] max-instance-num
      - [no] max-age
      - [no] hello-time
      - [no] forward-delay
      - [no] version
      - [no] tx-hold-count
      - [no] path-cost-type
      - [no] max-hop-count
      - region-name
      - [no] region-version
      - [no] config-id-sel
    ----[no] instance
      - (instance)
      - [no] priority
    ----[no] associate-vlan
      - (vlan)
  ----port
    - (port)
    - [no] priority
    - [no] enable-stp
    - path-cost
    - [no] edge-port
    - [no] admin-p2p
    - [no] hello-time
  ----port-instance
    - (port)
    - instance
    - [no] priority
    - [no] enable-stp
    - path-cost
```

55.2 MSTP general configuration Command

Command Description

This command allows the operator to configure the general MSTP parameters. The configuration of the parameters apply for the whole bridge.

The port, instance and port-instance specific MSTP parameters are in subsequent chapters.

The bridge max-age value should be less than or equal to $(2 * ((\text{forward-delay}/100) - 1))$ and should be greater than or equal to $(2 * ((\text{Port hello-time}/100) + 1))$.

The bridge hello-time is only applicable when the version is stp/rstp, in case of version mstp the port hello-time is used.

User Level

The command can be accessed by operators with mstp privileges, and executed by operators with mstp privileges.

Command Syntax

The command has the following syntax:

```
> configure xstp general [ [ no ] enable-stp ] [ no priority | priority <Mstp::StpPriority> ] [ no max-instance-num |
max-instance-num <Mstp::StpMaxInstanceNumber> ] [ no max-age | max-age <Mstp::StpMaxAge> ] [ no
hello-time | hello-time <Mstp::StpHelloTime> ] [ no forward-delay | forward-delay <Mstp::StpFwDelay> ] [ no
version | version <Mstp::StpProtVersion> ] [ no tx-hold-count | tx-hold-count <Mstp::StpTxHoldCount> ] [ no
path-cost-type | path-cost-type <Mstp::StpPathCostType> ] [ no max-hop-count | max-hop-count
<Mstp::StpMaxHopCount> ] [ region-name <Mstp::StpRegionName> ] [ no region-version | region-version
<Mstp::StpRegionVersion> ] [ no config-id-sel | config-id-sel <Mstp::StpConfigIdSelector> ]
```

Command Parameters

Table 55.2-2 "MSTP general configuration Command" Command Parameters

Parameter	Type	Description
[no] enable-stp	Parameter type: boolean	optional parameter all stp protocol operations start
[no] priority	Parameter type: <Mstp::StpPriority> Format: - stp bridge priority(n*4096) - range: [0...61440]	optional parameter with default value: 32768 stp bridge priority(n*4096)
[no] max-instance-num	Parameter type: <Mstp::StpMaxInstanceNumber> Format: - the max spanning trees number - range: [1...65]	optional parameter with default value: 65 the maximum number of spanning trees to be allowed
[no] max-age	Parameter type: <Mstp::StpMaxAge> Format: - stp max-age for root-bridge(n*100) - unit: 10msec - range: [600...4000]	optional parameter with default value: 2000 stp max-age for root-bridge(n*100)

55 MSTP Configuration Commands

Parameter	Type	Description
[no] hello-time	Parameter type: <Mstp::StpHelloTime> Format: - stp bridge hello time(n*100) - unit: 10msec - range: [100...1000]	<i>optional parameter with default value: 200</i> stp hello-time for bridge acting as root(n*100)
[no] forward-delay	Parameter type: <Mstp::StpFwDelay> Format: - stp bridge forward delay(n*100) - unit: 10msec - range: [400...3000]	<i>optional parameter with default value: 1500</i> forward delay value (n*100)
[no] version	Parameter type: <Mstp::StpProtVersion> Format: (stp-compatible rstp mstp) Possible values: - stp-compatible : spanning tree protocol IEEE 802.1D - rstp : rapid spanning tree protocol IEEE 802.1w - mstp : multiple spanning tree protocol IEEE 802.1s	<i>optional parameter with default value: "mstp"</i> spanning tree protocol version
[no] tx-hold-count	Parameter type: <Mstp::StpTxHoldCount> Format: - maximum transmission rate limit - range: [1...10]	<i>optional parameter with default value: 3</i> maximum transmission rate limit
[no] path-cost-type	Parameter type: <Mstp::StpPathCostType> Format: (16-bit 32-bit) Possible values: - 16-bit : stp-8021d-1998 path cost - 32-bit : stp-8021t-2001 path cost	<i>optional parameter with default value: "32-bit"</i> version of stp default path costs
[no] max-hop-count	Parameter type: <Mstp::StpMaxHopCount> Format: - maximum hop count value - unit: 10msec - range: [600...4000]	<i>optional parameter with default value: 2000</i> max hop count(n*100)
region-name	Parameter type: <Mstp::StpRegionName> Format: - name of the regions configuration - length: x<=32	<i>optional parameter</i> name of regions configuration(by default the bridge mac address)
[no] region-version	Parameter type: <Mstp::StpRegionVersion> Format: - version of the MSTP region - range: [0...65535]	<i>optional parameter with default value: 0</i> version of the MSTP region
[no] config-id-sel	Parameter type: <Mstp::StpConfigIdSelector> Format: - configuration id format selector to identify the bridge - range: [0...255]	<i>optional parameter with default value: 0</i> configuration id selector used to identify the bridge

55.3 MSTP Instance configuration Command

Command Description

This command allows the operator to configure the MSTP parameters for a specific MSTP instance.

User Level

The command can be accessed by operators with mstp privileges, and executed by operators with mstp privileges.

Command Syntax

The command has the following syntax:

```
> configure xstp ( no instance (instance) ) | ( instance (instance) [ no priority | priority <Mstp::StpPriority> ] )
```

Command Parameters

Table 55.3-1 "MSTP Instance configuration Command" Resource Parameters

Resource Identifier	Type	Description
(instance)	Format: - MSTP Instance - range: [1...64]	MSTP instance

Table 55.3-2 "MSTP Instance configuration Command" Command Parameters

Parameter	Type	Description
[no] priority	Parameter type: <Mstp::StpPriority> Format: - stp bridge priority(n*4096) - range: [0...61440]	<i>optional parameter with default value: 32768</i> the Bridge Priority(n*4096)

55.4 MSTP Vlan-Instance Mapping configuration

Command

Command Description

This command allows the operator to map/unmap VLANs to a specific MSTP instance. The VLAN can be associated with the MSTP instance without being configured first. One or more VLANs can be associated to an instance, but one VLAN can not be assigned to different instances.

User Level

The command can be accessed by operators with mstp privileges, and executed by operators with mstp privileges.

Command Syntax

The command has the following syntax:

```
> configure xstp instance (instance) ( no associate-vlan (vlan) ) | ( associate-vlan (vlan) )
```

Command Parameters

Table 55.4-1 "MSTP Vlan-Instance Mapping configuration Command" Resource Parameters

Resource Identifier	Type	Description
(instance)	Format: - MSTP Instance - range: [1...64]	MSTP instance
(vlan)	Format: (<Network::UVlanIndex> stacked : <Network::SVlanIndex> : <Network::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Network::UVlanIndex> - unstacked vlan identity - range: [1...4093] Field type <Network::SVlanIndex> - service vlan identity - range: [2...4093] Field type <Network::CVlanIndex> - customer vlan identity - range: [0...4093]	vlan id to be associated with the mstp instance

55.5 MSTP Port configuration Command

Command Description

This command allows the operator to configure the port parameters for the Common Instance.

By default mstp is disabled on the ports.

User Level

The command can be accessed by operators with mstp privileges, and executed by operators with mstp privileges.

Command Syntax

The command has the following syntax:

```
> configure xstp port (port) [ no priority | priority <Mstp::MstpPortPriority> ] [ [ no ] enable-stp ] [ path-cost
<Mstp::MstpPathCost> ] [ [ no ] edge-port ] [ no admin-p2p | admin-p2p <Mstp::MstpAdminP2PPort> ] [ no
hello-time | hello-time <Mstp::StpHelloTime> ]
```

Command Parameters

Table 55.5-1 "MSTP Port configuration Command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	Interface index of the lag

Table 55.5-2 "MSTP Port configuration Command" Command Parameters

Parameter	Type	Description
[no] priority	Parameter type: <Mstp::MstpPortPriority> Format: - mstp port priority(n*16) - range: [0...240]	<i>optional parameter with default value: 128</i> mstp port priority(n*16)
[no] enable-stp	Parameter type: boolean	<i>optional parameter</i> current Msti port state enabled
path-cost	Parameter type: <Mstp::MstpPathCost> Format: - port path cost - range: [1...200000000]	<i>optional parameter</i> port path cost
[no] edge-port	Parameter type: boolean	<i>optional parameter</i>

55 MSTP Configuration Commands

Parameter	Type	Description
[no] admin-p2p	Parameter type: <Mstp::MstpAdminP2PPort> Format: (force-true force-false auto) Possible values: - force-true : p2p link connection - force-false : shared media connection - auto : auto	port state enabled for the MSTP <i>optional parameter with default value: "auto"</i> admin p2p status of the LAN segment attached to the port
[no] hello-time	Parameter type: <Mstp::StpHelloTime> Format: - stp bridge hello time(n*100) - unit: 10msec - range: [100...1000]	<i>optional parameter with default value: 200</i> port hello time(n*100)

55.6 MSTP Port-Instance configuration Command

Command Description

This command allows the operator to configure the MSTP parameters for a specific port-instance configuration. In order to be able to configure the port-instance parameters, the port must be member of the vlan-port map. This configuration applies to the Mstp.

User Level

The command can be accessed by operators with mstp privileges, and executed by operators with mstp privileges.

Command Syntax

The command has the following syntax:

```
> configure xstp port-instance (port) instance <Mstp::MstpInstance> [ no priority | priority
<Mstp::MstpPortPriority> ] [ [ no ] enable-stp ] [ path-cost <Mstp::MstpPathCost> ]
```

Command Parameters

Table 55.6-1 "MSTP Port-Instance configuration Command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the lag
instance	Parameter type: <Mstp::MstpInstance> Format: - MSTP Instance - range: [1...64]	mstp instance

Table 55.6-2 "MSTP Port-Instance configuration Command" Command Parameters

Parameter	Type	Description
[no] priority	Parameter type: <Mstp::MstpPortPriority> Format: - mstp port priority(n*16) - range: [0...240]	optional parameter with default value: 128 mstp port priority(n*16)
[no] enable-stp	Parameter type: boolean	optional parameter current Msti port state enabled
path-cost	Parameter type: <Mstp::MstpPathCost> Format:	optional parameter port path cost

55 MSTP Configuration Commands

Parameter	Type	Description
	- port path cost - range: [1...200000000]	

56- Application Intelligence Configuration Commands

56.1 Application Intelligence Configuration Command Tree	56-1632
56.2 Application configuration command	56-1633
56.3 AI Platform configuration command	56-1634
56.4 Application 'download and installation' configuration command	56-1636

56.1 Application Intelligence Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Application Intelligence Configuration Commands".

Command Tree

```
----configure
----ai
----[no] application
- (application)
- [no] uri
----[no] platform
- (slot)
- virtualplatform
- [no] adminstate
- [no] oamadminstate
- [no] mngtvlan
- [no] ipaddresstype
- [no] ipaddressandmask
- [no] defaultgateway
----[no] application
- (application)
- [no] adminstate
```

56.2 Application configuration command

Command Description

This command is used to register an Application and the Uniform Resource Identifier (URI) from where it can be downloaded.

Obviously a correct URI is essential to have a successful download.

Typical examples for a URI: http://<some-address> or ftp://<some-address>

The system does not perform a URI syntax / semantic check at Application configuration time.

Instead the URI will be used only at the time an Application is configured to be installed on a specific AI Platform and failures will be reported at that time.

Note that this data can not be changed when the Application is planned for download and installation on an AI Platform.

User Level

The command can be accessed by operators with ai privileges, and executed by operators with ai privileges.

Command Syntax

The command has the following syntax:

```
> configure ai ( no application (application) ) | ( application (application) [ no uri | uri <AI::Uri> ] )
```

Command Parameters

Table 56.2-1 "Application configuration command" Resource Parameters

Resource Identifier	Type	Description
(application)	Format: - a name for the Application - range: [a-zA-Z0-9!#\$%&()*+-./:;=?@[_~] - length: 1<=x<=31	The name of the Application

Table 56.2-2 "Application configuration command" Command Parameters

Parameter	Type	Description
[no] uri	Parameter type: <AI::Uri> Format: - a uri name - range: [a-zA-Z0-9!#\$%&()*+-./:;=?@[_~] - length: x<=255	<i>optional parameter with default value: ""</i> name of the Uniform Resource Identifier (URI). Typical examples for a URI: http://<some-address> or ftp://<some-address>

56.3 AI Platform configuration command

Command Description

This command is used to administratively (un)lock an AI Platform and to configure the parameters that will allow external OAM access to it.

Unlocking the platform causes the platform to start up.

Locking the AI Platform results in bringing it down which means also that all Applications are down.

Note that a modify of OAM parameters requires the locking of the external OAM parameters which makes the external OAM access unavailable.

User Level

The command can be accessed by operators with ai privileges, and executed by operators with ai privileges.

Command Syntax

The command has the following syntax:

```
> configure ai ( no platform (slot) virtualplatform <AI::VirtualPlatform> ) | ( platform (slot) virtualplatform
<AI::VirtualPlatform> [ no adminstate | adminstate <AI::AdminState> ] [ no oamadminstate | oamadminstate
<AI::AdminState> ] [ no mngtvlan | mngtvlan <Vlan::VlanNameIndex> ] [ no ipaddresstype | ipaddresstype
<AI::IpAddressType> ] [ no ipaddressandmask | ipaddressandmask <Ip::AddressAndMask> ] [ no defaultgateway |
defaultgateway <Aaa::InetAddress> ] )
```

Command Parameters

Table 56.3-1 "AI Platform configuration command" Resource Parameters

Resource Identifier	Type	Description
(slot)	Format: (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	slot Id of the AI Platform
virtualplatform	Parameter type: <AI::VirtualPlatform> Format: - AI Virtual Platform Index within the Slot - range: [1]	virtual Id within the slot of the AI Platform

Table 56.3-2 "AI Platform configuration command" Command Parameters

Parameter	Type	Description
[no] adminstate	Parameter type: <AI::AdminState> Format: (unlocked locked) Possible values:	<i>optional parameter with default value: "locked"</i> determines if the AI Platform shall be started up

Parameter	Type	Description
	- unlocked : The identified resource is allowed to be used - locked : The identified resource is not allowed to be used	
[no] oamadminstate	Parameter type: <AI::AdminState> Format: (unlocked locked) Possible values: - unlocked : The identified resource is allowed to be used - locked : The identified resource is not allowed to be used	<i>optional parameter with default value: "locked"</i> determines if an external OAM mngt interface shall be provided
[no] mngtvlan	Parameter type: <Vlan::VlanNameIndex> Format: - vlan id - range: [1...4093]	<i>optional parameter with default value: "4093"</i> management VLAN providing external OAM access to the AI Platform
[no] ipaddresstype	Parameter type: <AI::IpAddressType> Format: ipv4 Possible values: - ipv4 : ipv4	<i>optional parameter with default value: "ipv4"</i> the type of the IP address within the ipaddressandmask and the defaultgateway parameters
[no] ipaddressandmask	Parameter type: <Ip::AddressAndMask> Format: <Ip::V4Address> / <Ip::PrefixLength> Field type <Ip::V4Address> - IPv4-address Field type <Ip::PrefixLength> - IP address prefix length - range: [0...30]	<i>optional parameter with default value: "0.0.0.0/0"</i> OAM IP address to access the AI Platform
[no] defaultgateway	Parameter type: <Aaa::InetAddress> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> default gateway IP address

56.4 Application 'download and installation' configuration command

Command Description

This command is used to configure the Applications to be downloaded and installed on a specified AI Platform.

User Level

The command can be accessed by operators with ai privileges, and executed by operators with ai privileges.

Command Syntax

The command has the following syntax:

```
> configure ai platform (slot)virtualplatform <AI::VirtualPlatform> ( no application (application) ) | ( application (application) [ no adminstate | adminstate <AI::AdminState> ] )
```

Command Parameters

Table 56.4-1 "Application 'download and installation' configuration command" Resource Parameters

Resource Identifier	Type	Description
(slot)	Format: (nt-a nt-b) Possible values: - nt-a : nt-a slot - nt-b : nt-b slot	slot Id of the AI Platform
virtualplatform	Parameter type: <AI::VirtualPlatform> Format: - AI Virtual Platform Index within the Slot - range: [1]	virtual Id within the slot of the AI Platform
(application)	Format: - a name for the Application - range: [a-zA-Z0-9!#\$%&()*+-./:;=?@[_~] - length: 1<=x<=31	the unique Application name

Table 56.4-2 "Application 'download and installation' configuration command" Command Parameters

Parameter	Type	Description
[no] adminstate	Parameter type: <AI::AdminState> Format: (unlocked locked) Possible values: - unlocked : The identified resource is allowed to be used	<i>optional parameter with default value: "locked"</i> determines if the Application shall be downloaded and installed

56 Application Intelligence Configuration Commands

Parameter	Type	Description
	- locked : The identified resource is not allowed to be used	

57- NGpon2 Channel Group/Sub Channel Group Configuration Commands

57.1 NGpon2 Channel Group/Sub Channel Group Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "NGpon2 Channel Group/Sub Channel Group Configuration Commands".

Command Tree

```
----configure
  ----channel-group
    ----[no] id
      - (channel-group-id)
      - [no] name
      - [no] polling-period
      - [no] raman-reduct
      - [no] ng2sys-id
      - [no] admin-state
    ----[no] channel-pair
      - (channel-pair)
    ----subchannel-group
      ----[no] id
        - (subchannel-group)
        - [no] name
        - [no] auth-method
        - [no] mcast-encrypt
        - [no] fec-dn
        - [no] closest-ont
        - [no] diff-reach
        - [no] admin-state
        - [no] cpi
      ----[no] channel-pair
        - (channel-pair)
```

57.2 NGpon2 Channel Group Configuration Command

Command Description

This command configures a NGpon2 Channel Group.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-group ( no id (channel-group-id) ) | ( id (channel-group-id) [ no name | name <Ng2::Label> ] [ no polling-period | polling-period <Ng2::ChanGrpPollingPeriod> ] [ no raman-reduct | raman-reduct <Ng2::RamanReduction> ] [ no ng2sys-id | ng2sys-id <Ng2::SysId> ] [ no admin-state | admin-state <Gpon::ItfAdminStatus> ] )
```

Command Parameters

Table 57.2-1 "NGpon2 Channel Group Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group-id)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	identification of the channel group index

Table 57.2-2 "NGpon2 Channel Group Configuration Command" Command Parameters

Parameter	Type	Description
[no] name	Parameter type: <Ng2::Label> Format: - a printable string - length: x<=50	<i>optional parameter with default value: ""</i> textual string that can be used to label this channel group
[no] polling-period	Parameter type: <Ng2::ChanGrpPollingPeriod> Format: - period between autodetection procedure on each pair in the group - unit: 1/10 sec - range: [1...864000]	<i>optional parameter with default value: 100</i> period between autodetection procedure on each pair in the group
[no] raman-reduct	Parameter type: <Ng2::RamanReduction> Format: (enable disable) Possible values:	<i>optional parameter with default value: "disable"</i> enable/disable Raman Reduction code for this channel group

Parameter	Type	Description
	- enable : raman reduction code enabled - disable : raman reduction code disabled	
[no] ng2sys-id	Parameter type: <Ng2::SysId> Format: - ng2sysid - 5 hex characters - length: x<=5	<i>optional parameter with default value: "00000"</i> ng2sysid
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the channel group

Command Output

Table 57.2-3 "NGpon2 Channel Group Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	operational state of the channel group <i>This element is always shown.</i>

57.3 NGpon2 Channel Group Member Association Command

Command Description

This command associates a NGpon2 Channel Pair with a Channel Group.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-group id (channel-group-id) ( no channel-pair (channel-pair) ) | ( channel-pair (channel-pair) )
```

Command Parameters

Table 57.3-1 "NGpon2 Channel Group Member Association Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group-id)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	identification of the channel group index
(channel-pair)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel-pair associated with this channel-group

57.4 NGpon2 Sub Channel Group Configuration Command

Command Description

This command configures a NGpon2 Sub Channel Group.

Note: The value of sig-degrade-th must be greater than sig-fail-th (i.e. sig-degrade-th must represent a lower BER value)

The value of closest-ont can be changed only after setting the administrative status to down.

The value of diff-reach can be changed only after setting the administrative status to down. When an ONT is located at a greater distance than is configured, its reply will be delayed and may disturb other PON traffic.

The value of fec-dn can be changed only after setting the administrative status to down. If the FEC change is made while the admin status is up, then it must be set to down and then put back to up for the change to take place.

The value of auth-method can be changed only after setting the administrative status to down.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-group id (channel-group-id) subchannel-group ( no id (subchannel-group) ) | ( id (subchannel-group) [ no name | name <Ng2::Label> ] [ no auth-method | auth-method <Ng2::SubChanAuthMethod> ] [ no mcast-encrypt | mcast-encrypt <Ng2::MCastEncryption> ] [ no fec-dn | fec-dn <Gpon::FecDn> ] [ no closest-ont | closest-ont <Ng2::OntDistance> ] [ no diff-reach | diff-reach <Ng2::PonDiffReach> ] [ no admin-state | admin-state <Gpon::ItfAdminStatus> ] [ no cpi | cpi <Ng2::SubchannelGroupCpi> ] )
```

Command Parameters

Table 57.4-1 "NGpon2 Sub Channel Group Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group-id)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	identification of the channel group index
(subchannel-group)	Format: - subchannel group number - range: [1...4]	identification of the subchannel group index

Table 57.4-2 "NGpon2 Sub Channel Group Configuration Command" Command Parameters

57 NGpon2 Channel Group/Sub Channel Group Configuration Commands

Parameter	Type	Description
[no] name	Parameter type: <Ng2::Label> Format: - a printable string - length: x<=50	<i>optional parameter with default value: ""</i> textual string that can be used to label this subchannel group
[no] auth-method	Parameter type: <Ng2::SubChanAuthMethod> Format: (sn-slid logical loidpre logical-std loidpre-std) Possible values: - sn-slid : Serial Number and SLID authentication - logical : logical authentication - loidpre : loid precedence mix authentication - logical-std : standard logical authentication - loidpre-std : standard loid precedence mix authentication	<i>optional parameter with default value: "sn-slid"</i> authentication method used for ONTs in this subchannel group
[no] mcast-encrypt	Parameter type: <Ng2::MCastEncryption> Format: (enable disable) Possible values: - enable : multicast encryption enabled - disable : multicast encryption disabled	<i>optional parameter with default value: "disable"</i> enable/disable downstream multicast GEM encryption mode
[no] fec-dn	Parameter type: <Gpon::FecDn> Format: (enable disable) Possible values: - enable : fec is enabled - disable : fec is disabled	<i>optional parameter with default value: "enable"</i> use of fec in downstream direction for all olt transmissions
[no] closest-ont	Parameter type: <Ng2::OntDistance> Format: - closest ont distance - unit: km - range: [0,20]	<i>optional parameter with default value: 0L</i> the distance of the closest ont on the pon
[no] diff-reach	Parameter type: <Ng2::PonDiffReach> Format: - pon differential reach - unit: km - range: [20,40]	<i>optional parameter with default value: 20L</i> the maximum differential logical reach on the PON
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the subchannel group
[no] cpi	Parameter type: <Ng2::SubchannelGroupCpi> Format: - channel partition index - range: [0...15]	<i>optional parameter with default value: 0L</i> channel partition index of the subchannel group

Command Output

Table 57.4-3 "NGpon2 Sub Channel Group Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	operational state of the subchannel group <i>This element is always shown.</i>

57.5 NGpon2 Sub Channel Group Member Association Command

Command Description

This command associates a NGpon2 Channel Pair with a Sub Channel Group.

This will only be possible if the channel-pair has the same channel-speed as the rest of the members

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-group id (channel-group-id) subchannel-group id (subchannel-group) ( no channel-pair (channel-pair) ) | ( channel-pair (channel-pair) )
```

Command Parameters

Table 57.5-1 "NGpon2 Sub Channel Group Member Association Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group-id)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	identification of the channel group index
(subchannel-group)	Format: - subchannel group number - range: [1...4]	identification of the subchannel group index
(channel-pair)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel-pair associated with this subchannel-group

58.2 Pon Configuration Command

Command Description

This command allows the operator to configure range mode of all GPON interface.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon [ no pwrbrst-mode | pwrbrst-mode <Gpon::PowerBurstMode> ] [ no range-mode | range-mode <Gpon::RangeMode> ]
```

Command Parameters

Table 58.2-2 "Pon Configuration Command" Command Parameters

Parameter	Type	Description
[no] pwrbrst-mode	Parameter type: <Gpon::PowerBurstMode> Format: (disable enable) Possible values: - disable : disable power burst detection mode - enable : enable power burst detection mode	<i>optional parameter with default value: "disable"</i> power burst detection mode for gpon
[no] range-mode	Parameter type: <Gpon::RangeMode> Format: (normal alientolerant) Possible values: - normal : use normal mode - alientolerant : use alien tolerant range mode which allows ONTs to range in the presence of Alien ONUs	<i>optional parameter with default value: "normal"</i> range mode for gpon

58.3 Pon Interface Configuration Command

Command Description

This command allows the operator to configure the provisioning data associated with a PON interface.

Note: The value of sig-degrade-th must be greater than sig-fail-th (i.e. sig-degrade-th must represent a lower BER value)

The value of closest-ont can be changed only after setting the administrative status to down.

The value of diff-reach can be changed only after setting the administrative status to down.

The value of fec-dn can be changed only after setting the administrative status to down. If the FEC change is made while the admin status is up, then it must be set to down and then put back to up for the change to take place.

The value of auth-method can be changed only after setting the administrative status to down.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) [ no label | label <Gpon::Label> ] [ no ber-calc-period | ber-calc-period
<Gpon::BerCalcPeriod> ] [ no polling-period | polling-period <Gpon::PollingPeriod> ] [ no sig-degrade-th |
sig-degrade-th <Gpon::SignalDegThreshold> ] [ no sig-fail-th | sig-fail-th <Gpon::SignalFailThreshold> ] [ no
fec-dn | fec-dn <Gpon::FecDn> ] [ no raman-reduct | raman-reduct <Gpon::RamanReduct> ] [ no closest-ont |
closest-ont <Gpon::OntDistance> ] [ no diff-reach | diff-reach <Gpon::PonDiffReach> ] [ no pon-tag | pon-tag
<Gpon::PonTag> ] [ no pon-id | pon-id <Gpon::PonXgId> ] [ no mcast-encrypt | mcast-encrypt
<Gpon::McEncrypt> ] [ no auth-method | auth-method <Gpon::AuthMethod> ] [ no ponid-interval | ponid-interval
<Gpon::GponIdInterval> ] [ no ponid-odn | ponid-odn <Gpon::GponIdOdn> ] [ no ponid-identifier |
ponid-identifier <Gpon::GponId> ] [ no max-ranging-onts | max-ranging-onts <Gpon::MaxRangingOnts> ] [ no
tconts-per-frame | tconts-per-frame <Gpon::TcontsPerFrame> ] [ no admin-state | admin-state
<Gpon::ItfAdminStatus> ] [ no pon-speed | pon-speed <Gpon::PonSpeed> ] [ no burst-overhead | burst-overhead
<Gpon::BurstModeOverhead> ] [ no onu-prov-mode | onu-prov-mode <Gpon::OnuProvMode> ]
```

Command Parameters

Table 58.3-1 "Pon Interface Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>)	pon index

Resource Identifier	Type	Description
	Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	

Table 58.3-2 "Pon Interface Configuration Command" Command Parameters

Parameter	Type	Description
[no] label	Parameter type: <Gpon::Label> Format: - char string - length: x<=80	<i>optional parameter with default value: ""</i> label of the pon port
[no] ber-calc-period	Parameter type: <Gpon::BerCalcPeriod> Format: - ber measurement period - unit: 1/10 sec - range: [1...864000]	<i>optional parameter with default value: 10L</i> measurement period to determine whether a signal degraded alarm has occurred for an ont
[no] polling-period	Parameter type: <Gpon::PollingPeriod> Format: - polling period - unit: 1/10 sec - range: [1...864000]	<i>optional parameter with default value: 100L</i> period between two consecutive times the autodetection procedure on pon is executed
[no] sig-degrade-th	Parameter type: <Gpon::SignalDegThreshold> Format: - signal degrade threshold (x) - unit: 10 ^ (-x) - range: [4...10]	<i>optional parameter with default value: 9L</i> ber threshold used to detect signal degrade alarms for onts
[no] sig-fail-th	Parameter type: <Gpon::SignalFailThreshold> Format: - signal fail threshold (x) - unit: 10 ^ (-x) - range: [3...8]	<i>optional parameter with default value: 5L</i> ber threshold used to detect a signal fail alarms for onts
[no] fec-dn	Parameter type: <Gpon::FecDn> Format: (enable disable) Possible values: - enable : fec is enabled - disable : fec is disabled	<i>optional parameter with default value: "disable,ngpon : enable"</i> use of fec in downstream direction for all olt transmissions
[no] raman-reduct	Parameter type: <Gpon::RamanReduct> Format: (enable disable) Possible values: - enable : raman reduction code enabled - disable : raman reduction code disabled	<i>optional parameter with default value: "disable"</i> use of raman reduction code for overlay video in downstream direction
[no] closest-ont	Parameter type: <Gpon::OntDistance>	<i>optional parameter with default</i>

58 Pon Configuration Commands

Parameter	Type	Description
	Format: - closest ont distance(ngpon range is [0,20] unit: km) - unit: km - range: [0...40]	<i>value: 0L</i> the distance of the closest ont on the pon
[no] diff-reach	Parameter type: <Gpon::PonDiffReach> Format: - pon differential reach(ngpon range is [20,40] unit: km) - unit: km - range: [20,34,40]	<i>optional parameter with default value: 20L</i> the maximum differential logical reach on the PON
[no] pon-tag	Parameter type: <Gpon::PonTag> Format: - Pon Tag - 16 hex characters - length: x<=16	<i>optional parameter with default value: "0000000000000000"</i> label of the pon port
[no] pon-id	Parameter type: <Gpon::PonXgId> Format: - Pon Id - 8 hex characters - length: x<=8	<i>optional parameter with default value: "00000000"</i> label of the pon port
[no] mcast-encrypt	Parameter type: <Gpon::McEncrypt> Format: (enable disable) Possible values: - enable : mcast encryption is enabled - disable : mcast encryption is disabled	<i>optional parameter with default value: "disable"</i> Multicast encryption enable
[no] auth-method	Parameter type: <Gpon::AuthMethod> Format: (sn-slid logical loidpre logical-std loidpre-std loid-sn-slid) Possible values: - sn-slid : sn and slid authentication - logical : logical authentication - loidpre : loid precedence mix authentication - logical-std : standard logical authentication - loidpre-std : standard loid precedence mix authentication - loid-sn-slid : loid,sn and slid mixing authentication	<i>optional parameter with default value: "sn-slid"</i> ont authentication mode option for this pon interface level
[no] ponid-interval	Parameter type: <Gpon::GponIdInterval> Format: - interval time - unit: second - range: [0...60]	<i>optional parameter with default value: 0L</i> interval to send GPON-ID PLOAM message in second
[no] ponid-odn	Parameter type: <Gpon::GponIdOdn> Format: (a b bplus c cplus auto) Possible values: - a : ODN Level A - b : ODN Level B - bplus : ODN Level B+ - c : ODN Level C	<i>optional parameter with default value: "auto"</i> ODN class of the pon port

Parameter	Type	Description
	- cplus : ODN Level C+ - auto : Auto Detected	
[no] ponid-identifier	Parameter type: <Gpon::GponId> Format: - Pon Id - 14 hex characters - length: 14	<i>optional parameter with default value: "00000000000000"</i> label of the pon port
[no] max-ranging-onts	Parameter type: <Gpon::MaxRangingOnt> Format: - ranging onts number;if 0 indicates bandwidth calculated by provisioned onts; other value indicates pre-configured onts - range: [0...128]	<i>optional parameter with default value: 128L</i> max ranging ont number for guaranteed bandwidth cac
[no] tconts-per-frame	Parameter type: <Gpon::TcontsPerFrame> Format: - maximum number of tconts per upstream frame, to calculate guaranteed bandwidth(GPON range is [1...64], XGSPON and XGPON1 range[0...64]) - range: [0...64]	<i>optional parameter with default value: "64L,xgs : 44L,ngpon : 16L"</i> max service tcont number per gtc frame
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the interface
[no] pon-speed	Parameter type: <Gpon::PonSpeed> Format: (nominal 10g-10g 10g-2.5g) Possible values: - nominal : nominal line rate of the pon technology : 2.5g down / 1.25g up for gpon; 10g down / dual-rate up for ngpon - 10g-10g : 10g down / 10g up - 10g-2.5g : 10g down / 2.5g up	<i>optional parameter with default value: "nominal"</i> pon speed
[no] burst-overhead	Parameter type: <Gpon::BurstModeOverhead> Format: (robust reduced) Possible values: - robust : robust - reduced : reduced	<i>optional parameter with default value: "robust"</i> burst mode overhead
[no] onu-prov-mode	Parameter type: <Gpon::OnuProvMode> Format: (semi-auto auto) Possible values: - semi-auto : ONU semi-auto provisioning. Template file needs to be specified in ONT config - auto : ONU auto provisioning. Template file selection done automatically based on ONT type	<i>optional parameter with default value: "semi-auto"</i> ONU auto provisioning mode

Command Output

Table 58.3-3 "Pon Interface Configuration Command" Display parameters

Specific Information

58 Pon Configuration Commands

name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	operational state of the interface <i>This element is always shown.</i>

58.4 Pon GEM Port Performance Monitoring Configuration Command

Command Description

This command allows the operator to set the PM mode of OLT side GEM based counters for errored fragments.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) tc-layer [ no pm-collect | pm-collect <Gpon::OntPmTcaCollect> ]
```

Command Parameters

Table 58.4-1 "Pon GEM Port Performance Monitoring Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

Table 58.4-2 "Pon GEM Port Performance Monitoring Configuration Command" Command

Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmTcaCollect> Format: (none pm-enable tca-enable) Possible values: - none : no pm - pm-enable : enable pm - tca-enable : enable tca	<i>optional parameter with default value: "pm-enable"</i> olt-side aggregate TC Layer performance monitoring

58.5 OLT-SIDE TC-layer Performance Monitoring Counter Thresholds Configuration Command for PON

Command Description

This command allows the operator to enable configuration of performance Monitoring counter thresholds for OLT-Side TC-layer errored fragments.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) tc-layer-threshold [ no error-frags-up | error-frags-up
<Gpon::TcaThresholdValue> ]
```

Command Parameters

Table 58.5-1 "OLT-SIDE TC-layer Performance Monitoring Counter Thresholds Configuration Command for PON" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId>	pon index

Parameter	Type	Description
[no] error-frags-up	Parameter type: <Gpon::TcaThresholdValue> Format: (disabled <Gpon::TcaThresholdValue>) Possible values: - disabled : threshold is disabled Field type <Gpon::TcaThresholdValue> - tc-layer tca threshold value (4294967295=disabled) - range: [0...4294967294,4294967295]	<i>optional parameter with default value: "disabled"</i> tca setting for errored gem fragments

58.6 Multicast TC-layer Performance Monitoring Command for PON

Command Description

This command allows the operator to enable or disable the OLT-side Multicast Port Performance Monitor collection for the PON.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) mcast-tc-layer [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 58.6-1 "Multicast TC-layer Performance Monitoring Command for PON" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

58.7 XGPON Physical-layer Performance Monitoring Command for PON

Command Description

This command allows the operator to enable or disable the OLT-side XGPON Physical Performance Monitor collection for the PON.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) phy-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 58.7-1 "XGPON Physical-layer Performance Monitoring Command for PON" Resource Parameters

Resource Identifier	Type	Description

name	Type	Description
interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval This element is always shown.

58.8 XGPON Upstream FEC Performance Monitoring Command for PON

Command Description

This command allows the operator to enable or disable the OLT-side XGPON upstream FEC Performance Monitor collection for the PON.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) fec-tc-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 58.8-1 "XGPON Upstream FEC Performance Monitoring Command for PON" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

Table 58.8-2 "XGPON Upstream FEC Performance Monitoring Command for PON" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i> OLT-side upstream FEC performance monitoring

Command Output

Specific Information		
name	Type	Description
interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval <i>This element is always shown.</i>

58.9 XGPON TC-layer Performance Monitoring

Command for PON

Command Description

This command allows the operator to enable or disable the OLT-side XGPON TC-layer Performance Monitor collection for the PON.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) xg-tc-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Specific Information		
name	Type	Description
interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval <i>This element is always shown.</i>

58.10 OTDR enable Command for PON

Command Description

This command allows the operator to enable or disable the otdr functionality on the given pon.

Besides the enable and disable option, a third option "test" is possible. This option is only to be used in lab conditions to immediately collect the otdr measurement data and as a result generate load on the i2c bus.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) otdr [ no mode | mode <Gpon::OTDRenable> ]
```

Command Parameters

Table 58.10-1 "OTDR enable Command for PON" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

Table 58.10-2 "OTDR enable Command for PON" Command Parameters

58 Pon Configuration Commands

Parameter	Type	Description
[no] mode	Parameter type: <Gpon::OTDRenable> Format: (enable disable test) Possible values: - enable : otdr enable - disable : otdr disable - test : otdr test : only to be used in lab conditions	<i>optional parameter with default value: "disable"</i> enable otdr

58.11 PON Utilization PM Configuration Command

Command Description

This command configures the PON and ONT utilization performance monitoring modes for a PON.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) utilization [ no pon-pmcollect | pon-pmcollect <Gpon::PonUtilPmTcaCollect> ]
[ no ont-pmcollect | ont-pmcollect <Gpon::PonUtilOntPmCollect> ] [ no ontbulk-pmcollect | ontbulk-pmcollect
<Gpon::OntPmCollect> ]
```

Command Parameters

Table 58.11-1 "PON Utilization PM Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

[no] ontbulk-pmcollect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> pon utilization ont pm bulk collectable via BFMU

58.12 PON Utilization TCA Threshold Configuration Command

Command Description

This command configures the utilization TCA threshold parameters for a PON.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) utilization threshold [ no txmcutilhi | txmcutilhi
<Gpon::PonUtilTcaThresholdPercent> ] [ no txmcutilmd | txmcutilmd <Gpon::PonUtilTcaThresholdPercent> ] [ no

58 Pon Configuration Commands

Parameter	Type	Description
	Format: (disabled <Gpon::PonUtilTcaThresholdPercent>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaThresholdPercent> - utilization percentage threshold - range: [0...100]	<i>value: "disabled"</i> Utilization level (percentage) that will result in declaration of T-DBACONGPERIODMD alarm
[no] dbacongperiodlo	Parameter type: <Gpon::PonUtilTcaThresholdPercent> Format: (disabled <Gpon::PonUtilTcaThresholdPercent>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaThresholdPercent> - utilization percentage threshold - range: [0...100]	<i>optional parameter with default value: "disabled"</i> Utilization level (percentage) that will result in declaration of T-DBACONGPERIODLO alarm
[no] txucdropfrmhi	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-TXUCDROPPFRMHI alarm
[no] txucdropfrmmmd	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-TXUCDROPPFRMMD alarm
[no] txucdropfrmlo	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-TXUCDROPPFRMLO alarm
[no] txmcdropfrmhi	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-TXMCDROPPFRMHI alarm

Parameter	Type	Description
[no] txmcdropfrmmd	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	optional parameter with default value: "disabled" Number of dropped frames that will result in declaration of T-TXMCDROPFRMMD alarm
[no] txmcdropfrmlo	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	optional parameter with default value: "disabled" Number of dropped frames that will result in declaration of T-TXMCDROPFRMLO alarm
[no] txbcdropfrmhi	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	optional parameter with default value: "disabled" Number of dropped frames that will result in declaration of T-TXBCDROPFRMHI alarm
[no] txbcdropfrmmd	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	optional parameter with default value: "disabled" Number of dropped frames that will result in declaration of T-TXBCDROPFRMMD alarm
[no] txbcdropfrmlo	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	optional parameter with default value: "disabled" Number of dropped frames that will result in declaration of T-TXBCDROPFRMLO alarm
[no] rxtotdropfrmhi	Parameter <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled	optional parameter with default value: "disabled" Dropped frames that will result in declaration of T-RXTOTCDROPFRMHI alarm

58 Pon Configuration Commands

Parameter	Type	Description
	Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	
[no] rxtotdropfrmmmd	Parameter type: <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-RXTOTDROPPFRMMD alarm
[no] rxtotdropfrmlo	Parameter type: <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-RXTOTCDROPPFRMLO alarm
[no] numtcint	Parameter type: <Gpon::PonUtilTcaInterval> Format: (1 <Gpon::PonUtilTcaInterval>) Possible values: - 1 : Initial Default Field type <Gpon::PonUtilTcaInterval> - interval threshold - range: [1...96]	<i>optional parameter with default value: "1"</i> Number of contiguous 5-minute intervals for the non-DBA PON utilization thresholds to be exceeded for TCA alarm generation or clearing
[no] numtcintdba	Parameter type: <Gpon::PonUtilTcaInterval> Format: (1 <Gpon::PonUtilTcaInterval>) Possible values: - 1 : Initial Default Field type <Gpon::PonUtilTcaInterval> - interval threshold - range: [1...96]	<i>optional parameter with default value: "1"</i> Number of contiguous 5-minute intervals for the DBA PON congestion thresholds to be exceeded for TCA alarm generation or clearing
[no] dbacongthresh	Parameter type: <Gpon::PonUtilTcaCongThreshold> Format: (90 <Gpon::PonUtilTcaCongThreshold>) Possible values: - 90 : Initial Default Field type <Gpon::PonUtilTcaCongThreshold> - dba congestion percentage threshold - range: [0...100]	<i>optional parameter with default value: "90"</i> Configured DBA congestion threshold as a percentage of the maximum consumable bandwidth

58.13 Deactivate Ont threshold Configuration Commands

Command Description

This command allows the operator to configure deactivate ont threshold.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) deact-ont-tca [ no mode | mode <Gpon::DeactOnuTcaMode> ] [ no
monitor-interval | monitor-interval <Gpon::DeactOnuInterval> ]
```

Command Parameters

Table 58.13-1 "Deactivate Ont threshold Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

Table 58.13-2 "Deactivate Ont threshold Configuration Commands" Command Parameters

58 Pon Configuration Commands

Parameter	Type	Description
[no] mode	Parameter type: <Gpon::DeactOnuTcaMode> Format: (disable percent number) Possible values: - disable : disable mode - percent : percentage mode - number : number mode	<i>optional parameter with default value: "disable"</i> Used to specify PON or Channel-Pair deactivated ONT detection mode.
[no] monitor-interval	Parameter type: <Gpon::DeactOnuInterval> Format: - tca interval - unit: second - range: [5...300]	<i>optional parameter with default value: 30L</i> Used to specify PON or Channel-Pair deactivated ONT detection interval.

58.14 Deactivate Ont threshold Configuration Commands

Command Description

This command allows the operator to configure deactivate ont threshold.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) deact-ont-tca threshold-percent [ no high | high <Gpon::DeactOnuTcaPctHigh>
] [ no high-clr | high-clr <Gpon::DeactOnuTcaPctHigh> ] [ no low | low <Gpon::DeactOnuTcaPctLow> ] [ no
low-clr | low-clr <Gpon::DeactOnuTcaPctLow> ]
```

Command Parameters

Table 58.14-1 "Deactivate Ont threshold Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

Table 58.14-2 "Deactivate Ont threshold Configuration Commands" Command Parameters

Parameter	Type	Description
[no] high	Parameter type: <Gpon::DeactOnuTcaPctHigh> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 90L</i> Used to specify PON or Channel-Pair deactivated ONT detection high threshold in percent.
[no] high-clr	Parameter type: <Gpon::DeactOnuTcaPctHigh> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 90L</i> Used to specify PON or Channel-Pair deactivated ONT detection high clear threshold in percent.
[no] low	Parameter type: <Gpon::DeactOnuTcaPctLow> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 40L</i> Used to specify PON or Channel-Pair deactivated ONT detection low threshold in percent.
[no] low-clr	Parameter type: <Gpon::DeactOnuTcaPctLow> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 40L</i> Used to specify PON or Channel-Pair deactivated ONT detection low clear threshold in percent.

58.15 Deactivate Ont threshold Configuration Commands

Command Description

This command allows the operator to configure deactivate ont threshold.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon interface (pon-idx) deact-ont-tca threshold-number [ no high | high
<Gpon::DeactOnuTcaNbrHigh> ] [ no high-clr | high-clr <Gpon::DeactOnuTcaNbrHigh> ] [ no low | low
<Gpon::DeactOnuTcaNbrLow> ] [ no low-clr | low-clr <Gpon::DeactOnuTcaNbrLow> ]
```

Command Parameters

Table 58.15-1 "Deactivate Ont threshold Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(pon-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> x-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> 25g-pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId>) Possible values: - 25g-pon : 25g pon - x-pon : Xgs pon Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::XPonId> - the XGS PON identifier Field type <Eqpt::M25GPonId> - the 25G PON identifier	pon index

Table 58.15-2 "Deactivate Ont threshold Configuration Commands" Command Parameters

Parameter	Type	Description
[no] high	Parameter type: <Gpon::DeactOnuTcaNbrHigh> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 57L</i> Used to specify PON or Channel-Pair deactivated ONT detection high threshold in number.
[no] high-clr	Parameter type: <Gpon::DeactOnuTcaNbrHigh> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 57L</i> Used to specify PON or Channel-Pair deactivated ONT detection high clear threshold in number.
[no] low	Parameter type: <Gpon::DeactOnuTcaNbrLow> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 25L</i> Used to specify PON or Channel-Pair deactivated ONT detection low threshold in number.
[no] low-clr	Parameter type: <Gpon::DeactOnuTcaNbrLow> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 25L</i> Used to specify PON or Channel-Pair deactivated ONT detection low clear threshold in number.

58.16 Power Shedding Profile Configuration Command

Command Description

Obsolete command, replaced by configure generic-pon power-shed-prof.

This command allows the operator to configure the Power Shedding Profiles.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon ( no power-shed-prof (profile-idx) ) | ( power-shed-prof (profile-idx) profile-name
<AsamProfileName> [ no restore-time | restore-time <Gpon::RestoreTime> ] [ no data-class-time | data-class-time
<Gpon::DataClassTime> ] [ no voice-class-time | voice-class-time <Gpon::VoiceClassTime> ] [ no
video-class-time | video-class-time <Gpon::VideoClassTime> ] [ no dsl-class-time | dsl-class-time
<Gpon::DslClassTime> ] [ no ces-class-time | ces-class-time <Gpon::CesClassTime> ] )
```

Obsolete command, replaced by configure generic-pon power-shed-prof.

Command Parameters

Table 58.16-1 "Power Shedding Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(profile-idx)	Format: - profile index - range: [1...50]	profile index

Table 58.16-2 "Power Shedding Profile Configuration Command" Command Parameters

Parameter	Type	Description
profile-name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> name of the profile
[no] restore-time	Parameter type: <Gpon::RestoreTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> time delay required before resetting timers to zero after a full power restore

Parameter	Type	Description
[no] data-class-time	Parameter type: <Gpon::DataClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> time delay required before shedding power for data uni classes.
[no] voice-class-time	Parameter type: <Gpon::VoiceClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> the time delay required before shedding power for voice uni classes.
[no] video-class-time	Parameter type: <Gpon::VideoClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> the time delay required before shedding power for the video ani class.
[no] dsl-class-time	Parameter type: <Gpon::DslClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> the time delay required before shedding power for dsl uni classes.
[no] ces-class-time	Parameter type: <Gpon::CesClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> the time delay required before shedding power for ces uni classes.

Command Output

Table 58.16-3 "Power Shedding Profile Configuration Command" Display parameters

Specific Information		
name	Type	Description
scope	Parameter type: <Gpon::Scope> (local network) Possible values: - local : local scope - network : network wide scope	scope of the profile <i>This element is always shown.</i>

58.17 Voice ONT Secure URI profile Configuration command

Command Description

This command creates a Secure URI Profile.

It provides (via pointers to other profiles) both the URI for accessing information plus the security information necessary to access the information

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon ( no sec-uri-profile (index) ) | ( sec-uri-profile (index) name <AsamProfileName> [ no
auth-securi-prof | auth-securi-prof <Gpon::AuthProfileName> ] uri-prof <Gpon::UriProfileName> )
```

Command Parameters

Table 58.17-1 "Voice ONT Secure URI profile Configuration command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...50]	a unique profile index

Table 58.17-2 "Voice ONT Secure URI profile Configuration command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> A string 1..32 characters long which uniquely identifies this Secure URI Profile
[no] auth-securi-prof	Parameter type: <Gpon::AuthProfileName> Format: (none <Gpon:AuthProfPtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:AuthProfPtr>	<i>optional parameter with default value: "none"</i> <i>The parameter is not visible during modification.</i> Authentication security profile that contains network address of the security server

Parameter	Type	Description
	- Index of the Authentication security profile - range: [0...20] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	
uri-prof	Parameter type: <Gpon::UriProfileName> Format: (none <Gpon:UriProfilePtr> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon:UriProfilePtr> - Index of the URI profile that contains the IP address of the server - range: [0...100] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> uri profile that contains network address of the configuration server

Command Output

Table 58.17-3 "Voice ONT Secure URI profile Configuration command" Display parameters

Specific Information		
name	Type	Description
auth-securi-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the authentication security uri profile <i>This element is only shown in detail mode.</i>
uri-prof-name	Parameter type: <Gpon::IgnoredPrintableString> - ignored printable string	name of the uri profile <i>This element is only shown in detail mode.</i>

58.18 GPON Authentication Security Profile Configuration Command

Command Description

This command creates the profile for accessing the server storing authentication security information for contacting network addresses. These profiles are normally associated with Voip Services that must reference common authentication information.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon ( no auth-sec-prof (index) ) | ( auth-sec-prof (index) name <AsamProfileName> [ no
validation-scheme | validation-scheme <Gpon::AuthSecValScheme> ] [ no user-name | user-name
<Gpon::AuthUserName> ] [ no password | password <Security::Password5> ] [ no realm | realm <Gpon::Realm> ]
)
```

Command Parameters

Table 58.18-1 "GPON Authentication Security Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...20]	profile index

Table 58.18-2 "GPON Authentication Security Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> profile name
[no] validation-scheme	Parameter type: <Gpon::AuthSecValScheme> Format: (disabled md5-digest basic-authentic) Possible values: - disabled : Validation disabled	<i>optional parameter with default value: "md5-digest"</i> <i>The parameter is not visible during modification.</i> validation scheme required for authentication

58 Pon Configuration Commands

Parameter	Type	Description
	- md5-digest : validate using md5 digest authentication - basic-authentic : Validate using basic authentication	
[no] user-name	Parameter type: <Gpon::AuthUserName> Format: - user name required for authentication - length: x<=50	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> user name required for authentication
[no] password	Parameter type: <Security::Password5> Format: (prompt plain : <Security::PlainPassword5>) Possible values: - prompt : prompts the operator for a password - plain : the password in plain text Field type <Security::PlainPassword5> - authentication string - length: x<=25	<i>optional parameter with default value: "plain : "</i> <i>The parameter is not visible during modification.</i> password required for authentication
[no] realm	Parameter type: <Gpon::Realm> Format: - realm required for authentication - length: x<=25	<i>optional parameter with default value: ""</i> <i>The parameter is not visible during modification.</i> realm required for authentication

58.19 GPON URI Profile Configuration Command

Command Description

This command creates the URI profile for accessing the configuration server. These profiles are normally associated with Voip Services.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure pon ( no uri-prof (index) ) | ( uri-prof (index) name <AsamProfileName> [ no address | address
<Gpon::UriProfileAddress> ] [ no version | version <Gpon::UriProfileVersionNbr> ] )
```

Command Parameters

Table 58.19-1 "GPON URI Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - profile index - range: [1...100]	profile index

Table 58.19-2 "GPON URI Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> profile name
[no] address	Parameter type: <Gpon::UriProfileAddress> Format: - uri profile address - length: x<=100	<i>optional parameter with default value: ""</i> uri profile address that contains a Fully Qualified Domain Name (FQDN) or an IP Address (in dot notation)
[no] version	Parameter type: <Gpon::UriProfileVersionNbr> Format: - uri profile version number - range: [1...2147483647]	<i>optional parameter with default value: 1L</i> uri profile version number

59- Uni Ont Configuration Commands

59.1 Uni Ont Configuration Command Tree	59-1693
59.2 Uni Ont Video Configuration Command	59-1694
59.3 Uni Ont TC layer Ccounters Configuration Command	59-1696

59.1 Uni Ont Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Uni Ont Configuration Commands".

Command Tree

```
----configure
  ----uni
    ----ont
      ----video
        - (ont-index)
        - [no] pwr-override
        - [no] service-timer
        - [no] admin-state
      ----tc-layer
        - (ont-index)
        - [no] pm-collect
```

59.2 Uni Ont Video Configuration Command

Command Description

This command allows the operator to configure a uni ont video.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure uni ont video (ont-index) [ [ no ] pwr-override ] [ no service-timer | service-timer
<Gpon::UniServiceTimer> ] [ no admin-state | admin-state <Gpon::UniAdminState> ]
```

Command Parameters

Table 59.2-1 "Uni Ont Video Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ont-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14]	gpon ont index

Resource Identifier	Type	Description
	Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 59.2-2 "Uni Ont Video Configuration Command" Command Parameters

Parameter	Type	Description
[no] pwr-override	Parameter type: boolean	<i>optional parameter</i> exclude the port from video overlay class power shedding
[no] service-timer	Parameter type: <Gpon::UniServiceTimer> Format: - RF service timer in hours. - unit: hour - range: [-1,0...48]	<i>optional parameter with default value: -1</i> RF service timer in hours.
[no] admin-state	Parameter type: <Gpon::UniAdminState> Format: (unlocked locked) Possible values: - unlocked : activates the video port - locked : deactivates the video port	<i>optional parameter with default value: "locked"</i> administrative state of the video port

Command Output

Table 59.2-3 "Uni Ont Video Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Gpon::UniOperState> (enabled disabled unknown) Possible values: - enabled : enable the port - disabled : disable the port - unknown : unknown state	operational state of the video port <i>This element is always shown.</i>

59.3 Uni Ont TC layer Ccounters Configuration Command

Command Description

This command allows the operator to configure a uni ont tc layer counters.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure uni ont tc-layer (ont-index) [ no pm-collect | pm-collect <Gpon::UniPmCollect> ]
```

Command Parameters

Table 59.3-1 "Uni Ont TC layer Ccounters Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ont-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId>	gpon ont index

Resource Identifier	Type	Description
	- Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 59.3-2 "Uni Ont TC layer Ccounters Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::UniPmCollect> Format: (disable enable) Possible values: - disable : disable the gem-port performance monitors - enable : enable the gem-port performance monitors	<i>optional parameter with default value: "disable"</i> enable/disable TC Layer Performance monitors

60- CES Configuration Commands

60.1 CES Configuration Command Tree	60-1699
60.2 CES Maintenance Profile Configuration Command	60-1701
60.3 CES Service Port Provisioning Configuration Command	60-1703
60.4 CES Service PM Mode Configuration Command	60-1706
60.5 CES Service Configuration Command	60-1708
60.6 CES Service Gem Port Configuration Command	60-1713
60.7 CES Service Configuration Command	60-1715

60.1 CES Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "CES Configuration Commands".

Command Tree

```

----configure
  ----ces

60.2 CES Maintenance Profile Configuration Command

Command Description

This command allows the operator to configure CES Maintenance profile.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ces ont ( no profile (profile-idx) ) | ( profile (profile-idx) profile-name <AsamProfileName> [ no
jitter-buff-max | jitter-buff-max <Ces::JitterBuffMax> ] [ no fill-policy | fill-policy <Ces::FillPolicy> ] [ no
rbit-recv-policy | rbit-recv-policy <Ces::RbitRecvPolicy> ] [ no lbit-recv-policy | lbit-recv-policy
<Ces::LbitRecvPolicy> ] )
```

Command Parameters

Table 60.2-1 "CES Maintenance Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(profile-idx)	Format: - ces maintenance profile index value - range: [1...20]	ces maintenance profile index value

Table 60.2-2 "CES Maintenance Profile Configuration Command" Command Parameters

Parameter	Type	Description
profile-name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> ces maintenance profile name
[no] jitter-buff-max	Parameter type: <Ces::JitterBuffMax> Format: - maximum depth for jitter buffer in micro seconds. For values except 0 that are not multiples of 8 are rounded up so that the result is effective range of 1..200 milliseconds - range: [0...1600]	<i>optional parameter with default value: "0"</i> maximum depth of the jitter buffer
[no] fill-policy	Parameter type: <Ces::FillPolicy> Format: (ont-default all-ones idle)	<i>optional parameter with default value: "ont-default"</i> payload bit pattern

60 CES Configuration Commands

Parameter	Type	Description
	Possible values: - ont-default : ONT default vendor-specific - all-ones : play out all 1s - idle : play out DS1 idle	
[no] rbit-recv-policy	Parameter type: <Ces::RbitRecvPolicy> Format: (no-act all-ones idle) Possible values: - no-act : no action - all-ones : use service-specific RAI/REI/RDI code - idle : idle signalling and idle payload	<i>optional parameter with default value: "no-act"</i> rbit receive policy
[no] lbit-recv-policy	Parameter type: <Ces::LbitRecvPolicy> Format: (ssais idle) Possible values: - ssais : use service specific AIS code - idle : idle signalling and idle payload	<i>optional parameter with default value: "ssais"</i> lbit receive policy

60.3 CES Service Port Provisioning Configuration Command

Command Description

This command allows the operator to configure ONT CESUNI port provisioning data. All modifications are service affecting.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ces ont line (uni-idx) [ mode <Ces::PortStructure> ] [ frame <Ces::Frame> ] [ no encoding | encoding <Ces::Encoding> ] [ no line-length | line-length <Ces::LineLength> ] [ [ no ] pwr-override ] [ no sst | sst <Ces::BponLoopBack> ] [ no admin-state | admin-state <Gpon::ItfAdminStatus> ]
```

Command Parameters

Table 60.3-1 "CES Service Port Provisioning Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	interface index of the ces ont uni

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 60.3-2 "CES Service Port Provisioning Configuration Command" Command Parameters

Parameter	Type	Description
mode	Parameter type: <Ces::PortStructure> Format: (unstructured structured) Possible values: - unstructured : unstructured mode - structured : structured mode	<i>optional parameter</i> DS1/E1 port structure
frame	Parameter type: <Ces::Frame> Format: (esf sf unframed pcm30 pcm31) Possible values: - esf : extended superframe(only for DS1 and mode=structured) - sf : superframe(only for DS1 and mode=structured) - unframed : unframed(valid only and mode=unstructured) - pcm30 : pcm 30(only for E1 and mode=structured) - pcm31 : pcm 31(only for E1 and mode=structured)	<i>optional parameter</i> port framing
[no] encoding	Parameter type: <Ces::Encoding> Format: (b8zs ami hdb3) Possible values: - b8zs : b8zs encoding scheme(only for DS1) - ami : ami encoding scheme - hdb3 : hdb3 encoding scheme(only for E1)	<i>optional parameter with default value: "b8zs"</i> port encoding
[no] line-length	Parameter type: <Ces::LineLength> Format: (0to133ft 133to266ft 266to399ft 399to533ft 533to655ft 7andhalfdb 15db 22andhalfdb 75ohms 120ohms) Possible values: - 0to133ft : 0 - 133 ft (only for DS1) - 133to266ft : 133 - 266 ft (only for DS1) - 266to399ft : 266 - 399 ft (only for DS1)	<i>optional parameter with default value: ""</i> length of the twisted pair cable

Parameter	Type	Description
	- 399to533ft : 399 - 533 ft (only for DS1) - 533to655ft : 533 - 655 ft (only for DS1) - 7andhalfdb : 7.5 db (only for DS1) - 15db : 15 db (only for DS1) - 22andhalfdb : 22.5 db (only for DS1) - 75ohms : 75 ohms (only for E1) - 120ohms : 120 ohms (only for E1)	
[no] pwr-override	Parameter type: boolean	<i>optional parameter</i> port excluded from CES class power shedding
[no] sst	Parameter type: <Ces::BponLoopBack> Format: (no-loopback line-loopback inward-loopback) Possible values: - no-loopback : no loopback - line-loopback : line loopback - inward-loopback : inward loopback	<i>optional parameter with default value: "no-loopback"</i> loop back configuration
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the interface

Command Output

Table 60.3-3 "CES Service Port Provisioning Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	the operational state of the interface <i>This element is always shown.</i>
card-type	Parameter type: <Ces::CardConfig> (ds1 e1) Possible values: - ds1 : DS1 card - e1 : E1 card	card type <i>This element is always shown.</i>

60.4 CES Service PM Mode Configuration Command

Command Description

This command allows the operator to configure the PM Mode of CESUNI ports on a specific ONT

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ces ont line (uni-idx) port [ no pm-collect | pm-collect <Ces::GemPmCollectInd> ]
```

Command Parameters

Table 60.4-1 "CES Service PM Mode Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId>	interface index of the ces ont uni

Resource Identifier	Type	Description
	- Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 60.4-2 "CES Service PM Mode Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Ces::GemPmCollectInd> Format: (enable disable) Possible values: - enable : enable PM (L2 only) - disable : disable PM (L2 only)	<i>optional parameter with default value: "disable"</i> CES port Performance monitor

60.5 CES Service Configuration Command

Command Description

This command allows the operator to configure CES service.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ces ont ( no service (uni-idx) service-nbr <Ces::ServiceNumber> ) | ( service (uni-idx) service-nbr
<Ces::ServiceNumber> [ no service-type | service-type <Ces::ServiceType> ] [ no label | label <Ces::Label> ] [ no
signaling | signaling <Ces::Signalling> ] [ no timeslot-map | timeslot-map <Ces::TimeSlotMap> ] [ no payload-size
| payload-size <Ces::PayloadSize> ] [ no pl-encap-delay | pl-encap-delay <Ces::PayloadEncapDelay> ] [ no
timing-mode | timing-mode <Ces::TimingNode> ] [ no transmit-ckt-id | transmit-ckt-id <Ces::TransmitCktId> ] [
no expected-ckt-id | expected-ckt-id <Ces::ExpectedCktId> ] [ no maintenance-prof | maintenance-prof
<Ces::MaintProfIndex> ] [ no dest-mac-address | dest-mac-address <Ces::DestMacAddress> ] [ no rtp-enable |
rtp-enable <Ces::RtpEnable> ] vlan <Vlan::Index> [ no admin-up | admin-up <Ces::AdminState> ] [ no udp-port |
udp-port <Ces::UdpPort> ] [ no dscp | dscp <Ces::DscpSetting> ] [ no farend-ipinfo | farend-ipinfo
<Ces::FarEndIpInfo> ] [ no rtp-clock-ref | rtp-clock-ref <Ces::RtpClockRef> ] [ no rtp-ts-mode | rtp-ts-mode
<Ces::RtpTimeStampMode> ] [ no rtp-ptyp-pay | rtp-ptyp-pay <Ces::RtpPayloadTypePayloadChannel> ] [ no
rtp-ptyp-sig | rtp-ptyp-sig <Ces::RtpPayloadTypeSigChannel> ] [ no rtp-sync-pay | rtp-sync-pay
<Ces::RtpSyncSourcePayloadChannel> ] [ no rtp-sync-sig | rtp-sync-sig <Ces::RtpSyncSourceSigChannel> ] [ no
rtp-exp-ptyp-pay | rtp-exp-ptyp-pay <Ces::RtpExpectedPayloadTypePayloadChannel> ] [ no rtp-exp-ptyp-sig |
rtp-exp-ptyp-sig <Ces::RtpExpectedPayloadTypeSigChannel> ] [ no rtp-exp-sync-pay | rtp-exp-sync-pay
<Ces::RtpExpectedSyncSourcePayloadChannel> ] [ no rtp-exp-sync-sig | rtp-exp-sync-sig
<Ces::RtpExpectedSyncSourceSigChannel> ] )
```

Command Parameters

Table 60.5-1 "CES Service Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	interface index of the ces ont uni

Resource Identifier	Type	Description
	Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	
service-nbr	Parameter type: <Ces::ServiceNumber> Format: - interval number - range: [1]	service number

Table 60.5-2 "CES Service Configuration Command" Command Parameters

Parameter	Type	Description
[no] service-type	Parameter type: <Ces::ServiceType> Format: (12 13) Possible values: - 12 : Layer2 (ethernet) - 13 : layer3 (IP/UDP)	<i>optional parameter with default value: "12"</i> <i>The parameter is not visible during modification.</i> underlying transport type - ethernet (12) vs. udp/ip (13)
[no] label	Parameter type: <Ces::Label> Format: - label of the service - length: x<=20	<i>optional parameter with default value: ""</i> label of the service
[no] signaling	Parameter type: <Ces::Signalling> Format: (no-sig cas) Possible values: - no-sig : no signalling - cas : carried in a separate signalling channel	<i>optional parameter with default value: "no-sig"</i> <i>The parameter is not visible during modification.</i> signaling
[no] timeslot-map	Parameter type: <Ces::TimeSlotMap> Format: - time slot map - length: 4	<i>optional parameter with default value: "ff : ff : ff : 00"</i> time slot map
[no] payload-size	Parameter type: <Ces::PayloadSize> Format: - payload size, applicable only if service type is unstructured;value 192 for DS1 and 256 for E1. - range: [192,256]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> payload size
[no] pl-encap-delay	Parameter type: <Ces::PayloadEncapDelay> Format: - payload encapsulation delay, number of 125 microsecond frames to be encapsulated in each PW packet;only significant and required in structured mode. - range: [8,16,24,32,64]	<i>optional parameter with default value: 0L</i> payload encapsulation delay
[no] timing-mode	Parameter type: <Ces::TimingNode> Format: (net diff adaptive loop) Possible values: - net : network timing - diff : differential timing - adaptive : adaptive timing - loop : loop timing	<i>optional parameter with default value: "adaptive"</i> timing mode of the TDM service

60 CES Configuration Commands

Parameter	Type	Description
[no] transmit-ckt-id	Parameter type: <Ces::TransmitCktId> Format: - transmit circuit id (L2 only) - length: 8	<i>optional parameter with default value: "00 : 00 : 00 : 00 : 00 : 00 : 00 : 00"</i> transmit circuit id (L2 only)
[no] expected-ckt-id	Parameter type: <Ces::ExpectedCktId> Format: - expected circuit id (L2 only) - length: 8	<i>optional parameter with default value: "00 : 00 : 00 : 00 : 00 : 00 : 00 : 00"</i> expected circuit id (L2 only)
[no] maintenance-prof	Parameter type: <Ces::MaintProfIndex> Format: (none <Ces::MaintProfIndex>) Possible values: - none : no profile to associate Field type <Ces::MaintProfIndex> - a ces maintenance profile index value - range: [0...20]	<i>optional parameter with default value: "none"</i> maintenance profile
[no] dest-mac-address	Parameter type: <Ces::DestMacAddress> Format: - a mac-address (example : 01:02:03:04:05:06) (L2 only) - length: 6	<i>optional parameter with default value: "00 : 00 : 00 : 00 : 00 : 00"</i> destination mac address (L2 only)
[no] rtp-enable	Parameter type: <Ces::RtpEnable> Format: (enabled disabled) Possible values: - enabled : enable rtp - disabled : disable rtp	<i>optional parameter with default value: "disabled"</i> rtp enable
vlan	Parameter type: <Vlan::Index> Format: (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndexStacked> <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndexStacked> - service vlan identity - range: [1...4093] Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> vlan id
[no] admin-up	Parameter type: <Ces::AdminState> Format: (unlocked locked) Possible values: - unlocked : start sending upstream allocation grants - locked : stop sending upstream allocation grants	<i>optional parameter with default value: "unlocked"</i> administrative state of the service
[no] udp-port	Parameter type: <Ces::UdpPort> Format: - udp port (L3 only) - range: [2142,49152...65535]	<i>optional parameter with default value: 2142L</i> <i>The parameter is not visible during modification.</i> unique udp port number for l3 service (L3 only)

Parameter	Type	Description
[no] dscp	Parameter type: <Ces::DscpSetting> Format: - to set the DSCP value that the Voip Client will use - range: [0...63]	<i>optional parameter with default value: 46L</i> DSCP Value (L3 only)
[no] farend-ipinfo	Parameter type: <Ces::FarEndIpInfo> Format: - far end URI. Example = udp://<ip-addr>:<udp-port> (L3 only) - length: x<=50	<i>optional parameter with default value: ""</i> URI of the far-end termination point (L3 only)
[no] rtp-clock-ref	Parameter type: <Ces::RtpClockRef> Format: - frequency of the common timing reference (L3 only) - range: [0...1000]	<i>optional parameter with default value: 0L</i> frequency of the common timing reference (in multiples of 8 kHz) (L3 only)
[no] rtp-ts-mode	Parameter type: <Ces::RtpTimeStampMode> Format: (unknown absolute differential) Possible values: - unknown : not applicable (L3 only) - absolute : absolute mode (L3 only) - differential : differential mode (L3 only)	<i>optional parameter with default value: "unknown"</i> Mode in which RTP timestamps are generated in the TDM to PSN direction (L3 only)
[no] rtp-ptyp-pay	Parameter type: <Ces::RtpPayloadTypePayloadChannel> Format: - RTP payload type for the payload channel in the TDM to PSN direction (L3 only) - range: [96...127]	<i>optional parameter with default value: 96L</i> RTP payload type for the payload channel in the TDM to PSN direction (L3 only)
[no] rtp-ptyp-sig	Parameter type: <Ces::RtpPayloadTypeSigChannel> Format: - RTP payload type for the signalling channel (L3 only) - range: [0]	<i>optional parameter with default value: 0L</i> RTP payload type for the signalling channel in the TDM to PSN direction (L3 only)
[no] rtp-sync-pay	Parameter type: <Ces::RtpSyncSourcePayloadChannel> Format: - RTP synchronization source for the payload channel (L3 only) - range: [0...65535]	<i>optional parameter with default value: 0L</i> RTP synchronization source for the payload channel in the TDM to PSN direction (L3 only)
[no] rtp-sync-sig	Parameter type: <Ces::RtpSyncSourceSigChannel> Format: - RTP synchronization source for the signalling channel (L3 only) - range: [0]	<i>optional parameter with default value: 0L</i> RTP synchronization source for the signalling channel in the TDM to PSN direction (L3 only)
[no] rtp-exp-ptyp-pay	Parameter type: <Ces::RtpExpectedPayloadTypePayloadChannel> Format: - RTP payload type for the payload channel (L3 only) - range: [0...127]	<i>optional parameter with default value: 0L</i> RTP expected payload type for the payload channel in the PSN to TDM direction (L3 only)
[no] rtp-exp-ptyp-sig	Parameter type: <Ces::RtpExpectedPayloadTypeSigChannel> Format: - RTP payload type for the signalling channel (L3 only) - range: [0]	<i>optional parameter with default value: 0L</i> RTP expected payload type for the signalling channel in the PSN to TDM direction (L3 only)
[no] rtp-exp-sync-pay	Parameter type: <Ces::RtpExpectedSyncSourcePayloadChannel> Format: - RTP synchronization source for the payload channel (L3 only)	<i>optional parameter with default value: 0L</i> RTP expected synchronization source for the payload channel in

Parameter	Type	Description
	only) - range: [0...65535]	the TDM to PSN direction (L3 only)
[no] rtp-exp-sync-sig	Parameter type: <Ces::RtpExpectedSyncSourceSigChannel> Format: - RTP synchronization source for the signalling channel (L3 only) - range: [0]	<i>optional parameter with default value: 0L</i> RTP expected synchronization source for the signalling channel in the TDM to PSN direction (L3 only)

Command Output

Table 60.5-3 "CES Service Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Ces::OperState> (enabled disabled unknown) Possible values: - enabled : enable the service - disabled : disable the service - unknown : unknown state	operational state of the service <i>This element is always shown.</i>
maint-prof-name	Parameter type: <Ces::IgnoredPrintableString> - ignored printable string	ces maintenance profile <i>This element is always shown.</i>

60.6 CES Service Gem Port Configuration Command

Command Description

This command allows the operator to configure CES gem port performance monitor.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ces ont service (uni-idx)service-nbr <Ces::ServiceNumber> tc-layer [ no pm-collect | pm-collect
<Ces::GemPmCollectInd> ]
```

Command Parameters

Table 60.6-1 "CES Service Gem Port Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	interface index of the ces ont uni
service-nbr	Parameter type: <Ces::ServiceNumber> Format: - interval number - range: [1]	service number

Table 60.6-2 "CES Service Gem Port Configuration Command" Command Parameters

60 CES Configuration Commands

Parameter	Type	Description
[no] pm-collect	Parameter type: <Ces::GemPmCollectInd> Format: (enable disable) Possible values: - enable : enable PM (L2 only) - disable : disable PM (L2 only)	<i>optional parameter with default value: "disable"</i> TC Layer performance monitoring

60.7 CES Service Configuration Command

Command Description

This command allows the operator to configure CES pseudo-wire performance monitor.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ces ont service (uni-idx)service-nbr <Ces::ServiceNumber> pseudo-wire [ no pm-collect | pm-collect
<Ces::PwPmCollectInd> ]
```

Command Parameters

Table 60.7-1 "CES Service Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier	interface index of the ces ont uni
service-nbr	Parameter type: <Ces::ServiceNumber> Format: - interval number - range: [1]	service number

Table 60.7-2 "CES Service Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Ces::PwPmCollectInd> Format:	optional parameter with default value: "disable"

60 CES Configuration Commands

Parameter	Type	Description
	(enable disable) Possible values: - enable : enable PM - disable : disable PM	pseudo-wire performance monitor

61- ANI ONT Configuration Commands

61.1 ANI ONT Configuration Command Tree	61-1718
61.2 ANI ONT Thershold Configuration Command	61-1719
61.3 ANI ONT Video Configuration Command	61-1721

61.1 ANI ONT Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "ANI ONT Configuration Commands".

Command Tree

```
----configure
  ----ani
    ----ont
      ----[no] tca-thresh
        - (ont-idx)
        - [no] lower-optical-th
        - [no] upper-optical-th
        - [no] rssi-profile
      ----[no] video
        - (ont-idx)
        - [no] plnd-agc-mode
        - [no] agc-offset
        - [no] lower-optical-th
        - [no] upper-optical-th
```

61.2 ANI ONT Thershold Configuration Command

Command Description

This command edits provisioning data associated with an ONT ANI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ani ont ( no tca-thresh (ont-idx) ) | ( tca-thresh (ont-idx) [ no lower-optical-th | lower-optical-th
<Gpon::OpticalthreshLow> ] [ no upper-optical-th | upper-optical-th <Gpon::OpticalthreshHigh> ] [ no rssi-profile |
rssi-profile <Gpon::RssiProfileId> ] )
```

Command Parameters

Table 61.2-1 "ANI ONT Thershold Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Table 61.2-2 "ANI ONT Thershold Configuration Command" Command Parameters

61 ANI ONT Configuration Commands

Parameter	Type	Description
[no] lower-optical-th	Parameter type: <Gpon::OpticalthreshLow> Format: - optical level ONT uses to declare the low recieved - unit: dBm - range: [-127...0.5]	<i>optional parameter with default value: 0.5</i> indicates the optical level the ONT uses to declare the Low received.Value 0.5 dBm means ONT internal choice which would be MIB default 1
[no] upper-optical-th	Parameter type: <Gpon::OpticalthreshHigh> Format: - optical level ONT uses to declare the high recieved - unit: dBm - range: [-127...0.5]	<i>optional parameter with default value: 0.5</i> indicates the optical level the ONT uses to declare the High received.Value 0.5 dBm means ONT internal choice which would be MIB default 1
[no] rssi-profile	Parameter type: <Gpon::RssiProfileId> Format: - an unique index value for the rssi profile(0-200 configurable) - range: [0...200]	<i>optional parameter with default value: "0"</i> an unique index of the rssi profile(0-200)

61.3 ANI ONT Video Configuration Command

Command Description

This command edits provisioning data associated with a ONTVIDANI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ani ont ( no video (ont-idx) ) | ( video (ont-idx) [ no plnd-agc-mode | plnd-agc-mode
<Gpon::AgcMode> ] [ no agc-offset | agc-offset <Gpon::AgcOffset> ] [ no lower-optical-th | lower-optical-th
<Gpon::VidOpticalThresh> ] [ no upper-optical-th | upper-optical-th <Gpon::VidOpticalThresh> ] )
```

Command Parameters

Table 61.3-1 "ANI ONT Video Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Table 61.3-2 "ANI ONT Video Configuration Command" Command Parameters

61 ANI ONT Configuration Commands

Parameter	Type	Description
[no] plnd-agc-mode	Parameter type: <Gpon::AgcMode> Format: (no-agc broad-band-agc) Possible values: - no-agc : No AGC is used - broad-band-agc : Broadband RF AGC is used	<i>optional parameter with default value: "broad-band-agc"</i> allows provisioning of the ONT's AGC capabilities
[no] agc-offset	Parameter type: <Gpon::Agcoffset> Format: - Offset value to be used for Broadband RF AGC or Optical - unit: db - range: [-12...12]	<i>optional parameter with default value: 2</i> indicates the offset value to be used for Broadband RF AGC or Optical
[no] lower-optical-th	Parameter type: <Gpon::Vidopticalthresh> Format: - optical level the ONT uses to declare the Video-OOR high/Low alarm - unit: dBm - range: [-12...6]	<i>optional parameter with default value: -9.5</i> indicates the optical level the ONT uses to declare the Video-OOR Low alarm
[no] upper-optical-th	Parameter type: <Gpon::Vidopticalthresh> Format: - optical level the ONT uses to declare the Video-OOR high/Low alarm - unit: dBm - range: [-12...6]	<i>optional parameter with default value: 1.0</i> indicates the optical level the ONT uses to declare the Video-OOR high alarm

62- ONT HPNA Configuration Commands

62.1 ONT HPNA Configuration Command Tree	62-1724
62.2 ONT HPNA Configuration Command	62-1725
62.3 ONT HPNA L2 Port Performance Monitoring Configuration Command	62-1728
62.4 Hpna ONT Uni Layer 2 Configuration Command	62-1730

62.1 ONT HPNA Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "ONT HPNA Configuration Commands".

Command Tree

```
----configure
----hpna
----ont
  - (uni-idx)
  - cust-info
  - [no] pwr-override
  - [no] master-mode
  - [no] admin-state
  ----X port
  ----l2
    - [no] pm
    - [no] tca
    - [no] dropped-frames-up
    - [no] dropped-frames-dn
```

62.2 ONT HPNA Configuration Command

Command Description

This command allows the operator to modify ONT HPNA port provisioning data.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure hpna ont (uni-idx) [ cust-info <Gpon::CustomerInfo> ] [ no pwr-override | pwr-override
<Gpon::OntPwrShedState> ] [ no master-mode | master-mode <Gpon::HpnaMasterSelect> ] [ no admin-state |
admin-state <Gpon::ItfAdminStatus> ]
```

Command Parameters

Table 62.2-1 "ONT HPNA Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot	identification of the hpna interface index

Resource Identifier	Type	Description
	- range: [1...14] - Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 62.2-2 "ONT HPNA Configuration Command" Command Parameters

Parameter	Type	Description
cust-info	Parameter type: <Gpon::CustomerInfo> Format: - char string - length: x<=80	<i>optional parameter</i> information for HPNA port
[no] pwr-override	Parameter type: <Gpon::OntPwrShedState> Format: (enabled disabled) Possible values: - enabled : enabled - disabled : disabled	<i>optional parameter with default value: "disabled"</i> power settings to be included for data class power shedding
[no] master-mode	Parameter type: <Gpon::HpnaMasterSelect> Format: (default auto forced) Possible values: - default : default master mode - auto : auto master mode - forced : forced master mode	<i>optional parameter with default value: "default"</i> master mode of HPNA mac
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the interface

Command Output

Table 62.2-3 "ONT HPNA Configuration Command" Display parameters

Specific Information		
name	Type	Description
base-mac-address	Parameter type: <Ces::DestMacAddress> - a mac-address (example : 01:02:03:04:05:06) (L2 only) - length: 6	base mac address <i>This element is always shown.</i>
port-configuration	Parameter type: <Gpon::HpnaConfigStatus> (unknown coax_12_28 phone_12_28) Possible values: - unknown : cant reach the ont or the ont didnt return a response to the query - coax_12_28 : not supported - phone_12_28 : not supported	configuration status of hpna uni <i>This element is always shown.</i>
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing	the operational state of the interface <i>This element is always shown.</i>

name	Type	Description
	unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	

62.3 ONT HPNA L2 Port Performance Monitoring Configuration Command

Command Description

Obsolete command, replaced by configure hpna ont l2 pm.

This command allows the operator to enable or disable PM on the HPNA layer 2 ports of the ONT.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure hpna ont (uni-idx) port [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Obsolete command, replaced by configure hpna ont l2 pm.

Command Parameters

Table 62.3-1 "ONT HPNA L2 Port Performance Monitoring Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identification of the hpna interface index

Resource Identifier	Type	Description
	- the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] - Gpon Ont Port Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 62.3-2 "ONT HPNA L2 Port Performance Monitoring Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> hpna port layer 2 performance monitoring

62.4 Hpna ONT Uni Layer 2 Configuration Command

Command Description

This command allows the operator to provision performance monitoring and threshold crossing alerts for an Hpna ONT layer 2 UNI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure hpna ont (uni-idx) l2 [ no pm | pm <Gpon::OntPmCollect> ] [ no tca | tca <Gpon::OntPmCollect> ] [ no
dropped-frames-up | dropped-frames-up <Gpon::ErrorCountThreshold> ] [ no dropped-frames-dn |
dropped-frames-dn <Gpon::ErrorCountThreshold> ]
```

Command Parameters

Table 62.4-1 "Hpna ONT Uni Layer 2 Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of the hpna interface index

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 62.4-2 "Hpna ONT Uni Layer 2 Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> l2 pm collection
[no] tca	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> l2 threshold crossing alerts
[no] dropped-frames-up	Parameter type: <Gpon::ErrorCountThreshold> Format: (disable <Gpon::ErrorCountThreshold>) Possible values: - disable : disable tca Field type <Gpon::ErrorCountThreshold> - error count threshold (0-4294967295) - range: [0...4294967295]	<i>optional parameter with default value: "disable"</i> incoming (upstream) dropped frames threshold
[no] dropped-frames-dn	Parameter type: <Gpon::ErrorCountThreshold> Format: (disable <Gpon::ErrorCountThreshold>) Possible values: - disable : disable tca Field type <Gpon::ErrorCountThreshold> - error count threshold (0-4294967295) - range: [0...4294967295]	<i>optional parameter with default value: "disable"</i> outgoing (downstream) dropped frames threshold

Command Output

Table 62.4-3 "Hpna ONT Uni Layer 2 Configuration Command" Display parameters

Specific Information		
name	Type	Description
pm-intervals	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponEtherTrafficIntervalTable <i>This element is only shown in detail mode.</i>

63- L2UNI Configuration Commands

63.1 L2UNI Configuration Command Tree	63-1733
63.2 L2 UNI ONT Performance Monitor Configuration Command	63-1734
63.3 L2 UNI ONT Performance Monitor Extended 32bit Configuration Command	63-1736

63.1 L2UNI Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "L2UNI Configuration Commands".

Command Tree

```
----configure
  ----l2uni
    ----ont
      ----performance-monitor
        - (if-index)
        - [no] pm-collect
        - [no] pm-collect-64bit
      ----pm-collect-ext
        - [no] pm-collect
        - [no] p-bits
        - [no] vlan-id
      ----tc-layer-threshold
        - (if-index)
        - [no] dropped-frames-up
        - [no] dropped-frames-dn
```

63.2 L2 UNI ONT Performance Monitor Configuration Command

Command Description

This command sets the PM Mode of ONTL2UNI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure l2uni ont performance-monitor (if-index) [ no pm-collect | pm-collect <Gpon::OntPmTcaCollect> ] [
no pm-collect-64bit | pm-collect-64bit <Gpon::Ont64bitPmCollect> ]
```

Command Parameters

Table 63.2-1 "L2 UNI ONT Performance Monitor Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	interface index of the port

Resource Identifier	Type	Description
	Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 63.2-2 "L2 UNI ONT Performance Monitor Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmTcaCollect> Format: (none pm-enable tca-enable) Possible values: - none : no pm - pm-enable : enable pm - tca-enable : enable tca	<i>optional parameter with default value: "none"</i> indicates whether Ethernet Traffic Performance Monitors should be collected for this Ethernet Port.
[no] pm-collect-64bit	Parameter type: <Gpon::Ont64bitPmCollect> Format: (none pm-enable) Possible values: - none : no pm - pm-enable : enable pm	<i>optional parameter with default value: "none"</i> indicates whether Ethernet Traffic Performance Monitors should be collected for this Ethernet Port.

63.3 L2 UNI ONT Performance Monitor Extended 32bit Configuration Command

Command Description

This command sets the PM EXT parameters.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure l2uni ont performance-monitor (if-index) pm-collect-ext [ no pm-collect | pm-collect
<Gpon::OntPmCollect> ] [ no p-bits | p-bits <SignedInteger> ] [ no vlan-id | vlan-id <Vlan::VlanIndexOrZero> ]
```

Command Parameters

Table 63.3-1 "L2 UNI ONT Performance Monitor Extended 32bit Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId>	interface index of the port

Resource Identifier	Type	Description
	- the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

**Table 63.3-2 "L2 UNI ONT Performance Monitor Extended 32bit Configuration Command"
Command Parameters**

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> indicates whether enable this pm collect for this Ethernet Port
[no] p-bits	Parameter type: <SignedInteger> Format: - a signed integer	<i>optional parameter with default value: 0xFF</i> indicates the P bits of the TCI field are used to filter the PM data collected or not 0xFF: not used 0-7: p-bit used to filter data
[no] vlan-id	Parameter type: <Vlan::VlanIndexOrZero> Format: - vlan id - range: [0...4092]	<i>optional parameter with default value: 0</i> indicates the vlan-id bits of the TCI field are used to filter the PM data collected 0: not used Other value : this vlan-id used to filter data

63.4 TC-layer Performance Monitoring Counter Thresholds Configuration Command for ONTL2UNI

Command Description

This command allows the operator to enable configuration of performance Monitoring counter thresholds for ONTL2UNI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure l2uni ont tc-layer-threshold (if-index) [ no dropped-frames-up | dropped-frames-up
<Gpon::TcaThresholdValue> ] [ no dropped-frames-dn | dropped-frames-dn <Gpon::TcaThresholdValue> ]
```

Command Parameters

64.1 IpHost Configuration Command Tree	64-1741
64.2 Voice Ont IP-Host Configuration Command	64-1742
64.3 Voice Ont IP-Host PM Mode Configuration Command	64-1746

64.1 IpHost Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "IpHost Configuration Commands".

Command Tree

```
----configure
  ----[no] iphost
    ----[no] ont
      - (index)
      - [no] ip-address
      - [no] net-mask
      - [no] default-router
      - [no] dns-addr
      - [no] sec-dns-addr
      - [no] dhcp
      - [no] dhcp-dscp
      - [no] host-id
      - [no] ping
      - [no] traceroute
      - vlan
      - [no] admin-state
    ----performance-monitor
      - [no] pm-collect
```

64.2 Voice Ont IP-Host Configuration Command

Command Description

This command creates an IP host in the ONT. It must be created prior to creating services on an ONT that will use this IP stack.

Prior to entering this command the following must have been already created: S-VLAN to associate for this stack The ONT for this stack

If DHCP is enabled, the addressed obtain will override manual provisioning of ip-address, net-mask, default-router
NOTE: Allowable range for IP address is 0.0.0.0 to 255.255.255.255 OLT prohibits the entry of the following range of well-known IP addresses: 224.0.0.0 to 239.255.255.255 (multicast) 127.0.0.0 to 127.255.255.255 (loopback) 256.256.256.256 (broadcast)

User Level

The command can be accessed by operators with sip,megaco,vlan privileges, and executed by operators with sip,megaco,vlan privileges.

Command Syntax

The command has the following syntax:

```
> configure iphost ( no ont (index) ) | ( ont (index) [ no ip-address | ip-address <Gpon::Ipaddr> ] [ no net-mask |
net-mask <Gpon::Ipaddr> ] [ no default-router | default-router <Gpon::Ipaddr> ] [ no dns-addr | dns-addr
<Gpon::Ipaddr> ] [ no sec-dns-addr | sec-dns-addr <Gpon::Ipaddr> ] [ no dhcp | dhcp <Gpon::IpHostDhcp> ] [ no
dhcp-dscp | dhcp-dscp <Gpon::SigDscp> ] [ no host-id | host-id <Gpon::ClientID> ] [ no ping | ping <Gpon::Ping>
] [ no traceroute | traceroute <Gpon::Traceroute> ] [ vlan <Vlan::Index> ] [ no admin-state | admin-state
<Gpon::ItfAdminStatus> ] )
```

Command Parameters

Table 64.2-2 "Voice Ont IP-Host Configuration Command" Command Parameters

Parameter	Type	Description
[no] ip-address	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> IP address of the IP Host at the ONT. Note: IP@ and net-mask are required parameters and need to be entered at the same time.
[no] net-mask	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> IP address network mask of the IP Host at the ONT. Note: IP@ and net-mask are required parameters and need to be entered at the same time.
[no] default-router	Parameter type: <Gpon::Ipaddr>	<i>optional parameter with default</i>

64 IpHost Configuration Commands

Parameter	Type	Description
	Format: - IPv4-address	value: "0.0.0.0" IP address of the default router
[no] dns-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	optional parameter with default value: "0.0.0.0" address of the primary DNS server(when dhcp is disabled)
[no] sec-dns-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	optional parameter with default value: "0.0.0.0" address of the secondary DNS server(when dhcp is disabled)
[no] dhcp	Parameter type: <Gpon::IpHostDhcp> Format: (enabled disabled) Possible values: - enabled : DHCP is enabled - disabled : DHCP is disabled	optional parameter with default value: "disabled" designate whether DHCP is enabled
[no] dhcp-dscp	Parameter type: <Gpon::SigDscp> Format: - dscp value - range: [0...63]	optional parameter with default value: 24 dscp value for use in outgoing dhcp packets
[no] host-id	Parameter type: <Gpon::ClientID> Format: - to uniquely identify the VoIP Client. - length: x<=25	optional parameter with default value: "" dhcp option 61 clientid associated with the ip host
[no] ping	Parameter type: <Gpon::Ping> Format: (enabled disabled) Possible values: - enabled : enable the ping facility - disabled : disable the ping facility	optional parameter with default value: "disabled" determines whether host should respond to ping
[no] traceroute	Parameter type: <Gpon::Traceroute> Format: (enabled disabled) Possible values: - enabled : enable the traceroute facility - disabled : disable the traceroute facility	optional parameter with default value: "disabled" determines whether host should respond to traceroute messages
vlan	Parameter type: <Vlan::Index> Format: (<Vlan::UVlanIndex> stacked : <Vlan::SVlanIndexStacked> <Vlan::CVlanIndex>) Possible values: - stacked : stacked vlan identity Field type <Vlan::UVlanIndex> - unstacked vlan identity - range: [1...4093,4096] Field type <Vlan::SVlanIndexStacked> - service vlan identity - range: [1...4093] Field type <Vlan::CVlanIndex> - customer vlan identity - range: [0...4093]	optional parameter The parameter is not visible during modification. vlan-id
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format:	optional parameter with default value: "up"

Parameter	Type	Description
	(up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>The parameter is not visible during creation.</i> administrative state of the interface

Command Output

Table 64.2-3 "Voice Ont IP-Host Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	operational state of the interface <i>This element is always shown.</i>

64.3 Voice Ont IP-Host PM Mode Configuration Command

Command Description

This command allows the operator to configure the PM Mode of ONT IP Host monitoring

User Level

The command can be accessed by operators with sip,megaco privileges, and executed by operators with sip,megaco privileges.

Command Syntax

The command has the following syntax:

```
> configure iphost ont (index) performance-monitor [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 64.3-1 "Voice Ont IP-Host PM Mode Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: (ont : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::IpHostID> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> ont:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Ng2::IpHostID> vlanport:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlanport:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni : <Eqpt::UnstackedVlan>) Possible values: - ont:ng2 : ngpon2 ont - vlanport:ng2 : ngpon2 vlanport - ont : ont - vlanport : vlanport Field type <Eqpt::RackId> - the rack number	a unique interface index

Resource Identifier	Type	Description
	Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Gpon::IpHostID> - iphost id Field type <Ng2::IpHostID> - iphost id (ngpon2) Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	

Table 64.3-2 "Voice Ont IP-Host PM Mode Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i>

65.1 ONT VEIP Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "ONT VEIP Configuration Commands".

Command Tree

```

----configure
  ----veip
    ----ont
      - (uni-idx)
      - [no] domain-name
      - [no] lpt-mode
      - [no] admin-state
      ----X port
        - [no] pm-collect
      ----l2
        - [no] pm
        - [no] pm-64bit
        - [no] tca
        - [no] dropped-frames-up
        - [no] dropped-frames-dn
      ----pm-ext
        - [no] pm-collect
        - [no] p-bits
        - [no] vlan-id

```

65.2 ONT VEIP Configuration Command

Command Description

This command allows the operator to modify ONT VEIP port provisioning data.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure veip ont (uni-idx) [ no domain-name | domain-name <Gpon::DomainName> ] [ no lpt-mode | lpt-mode <Gpon::LPTMODE> ] [ no admin-state | admin-state <Gpon::ItfAdminStatus> ]
```

Command Parameters

Table 65.2-1 "ONT VEIP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14]	identification of the uni interface index

Resource Identifier	Type	Description
	Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 65.2-2 "ONT VEIP Configuration Command" Command Parameters

Parameter	Type	Description
[no] domain-name	Parameter type: <Gpon::DomainName> Format: - to uniquely identify the VEIP Client. - length: x<=25	<i>optional parameter with default value: "none"</i> Domain Name to identify VEIP
[no] lpt-mode	Parameter type: <Gpon::LPTMODE> Format: (not-supported enabled disabled) Possible values: - not-supported : ignore and don't send the configuration to ONT - enabled : enable the LPT mode on this port - disabled : disable the LPT mode on this port	<i>optional parameter with default value: "not-supported"</i> LinkPassThrough(LPT) mode configuration
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the interface

Command Output

Table 65.2-3 "ONT VEIP Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	the operational state of the interface <i>This element is always shown.</i>

65.3 ONT VEIP Port L2 Performance Monitoring Configuration Command

Command Description

Obsolete command, replaced by `configure veip ont l2 pm`.

This command allows the operator to enable or disable PM on the VEIP layer 2 ports of the ONT.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure veip ont (uni-idx) port [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Obsolete command, replaced by `configure veip ont l2 pm`.

Command Parameters

Table 65.3-1 "ONT VEIP Port L2 Performance Monitoring Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identification of the uni interface index

Resource Identifier	Type	Description
	- the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]	

Table 65.3-2 "ONT VEIP Port L2 Performance Monitoring Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> veip port layer 2 performance monitoring

65.4 Veip ONT Uni Layer 2 Configuration Command

Command Description

This command allows the operator to provision performance monitoring and threshold crossing alerts for an Veip ONT layer 2 UNI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure veip ont (uni-idx) l2 [ no pm | pm <Gpon::OntPmCollect> ] [ no pm-64bit | pm-64bit
<Gpon::OntPmCollect> ] [ no tca | tca <Gpon::OntPmCollect> ] [ no dropped-frames-up | dropped-frames-up
<Gpon::ErrorCountThreshold> ] [ no dropped-frames-dn | dropped-frames-dn <Gpon::ErrorCountThreshold> ]
```

Command Parameters

Table 65.4-1 "Veip ONT Uni Layer 2 Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId>	identification of the uni interface index

		<i>This element is only shown in detail mode.</i>

65.5 L2 UNI ONT Performance Monitor Extended 32bit Configuration Command

Command Description

This command sets the PM EXT parameters.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure veip ont (uni-idx) l2 pm-ext [ no pm-collect | pm-collect <Gpon::OntPmCollect> ] [ no p-bits | p-bits <SignedInteger> ] [ no vlan-id | vlan-id <Vlan::VlanIndexOrZero> ]
```

Command Parameters

```

66.2 MoCA ONT Uni Configuration Command

Command Description

This command configures a MoCA ONT uni.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure moca ont (uni-idx) [ no cust-info | cust-info <Gpon::CustInfo> ] [ no tx-pwr | tx-pwr <Moca::TxPwr> ]
[ no net-coord | net-coord <Moca::NetworkCoordinator> ] [ no snr-margin | snr-margin
<Moca::SignalToNoiseRatioMargin> ] [ no password | password <Moca::Password> ] [ no privacy | privacy
<Moca::Privacy> ] [ no bw-alarm-thresh | bw-alarm-thresh <Moca::minBwAlarmThreshold> ] [ no auto-pwr-ctl |
auto-pwr-ctl <Moca::AutomaticPowerControl> ] [ no pwr-override | pwr-override <Gpon::PowerShedOverride> ] [
no admin-state | admin-state <Gpon::ItfAdminStatus> ]
```

Command Parameters

Table 66.2-2 "MoCA ONT Uni Configuration Command" Command Parameters

Parameter	Type	Description
[no] cust-info	Parameter type: <Gpon::CustInfo> Format: - a printable string - length: x<=80	optional parameter with default value: "" port label
[no] tx-pwr	Parameter type: <Moca::TxPwr> Format: - transmitter power level in dBm - range: [-31...0]	optional parameter with default value: -14L target transmitter power level (dBm)
[no] net-coord	Parameter type: <Moca::NetworkCoordinator> Format: (auto always never) Possible values: - auto : negotiate for network coordinator - always : always be the network coordinator - never : never be the network coordinator	optional parameter with default value: "auto" moca network coordinating role
[no] snr-margin	Parameter type: <Moca::SignalToNoiseRatioMargin> Format: - threshold above measured rx noise floor in dBm - range: [-3...3]	optional parameter with default value: 2L margin above Rx noise floor for variations in return loss (dBm)
[no] password	Parameter type: <Moca::Password> Format: - hidden moca encryption key - length: x<=17	optional parameter with default value: "" hidden moca encryption key (0-17 numeric characters)
[no] privacy	Parameter type: <Moca::Privacy> Format: (enable disable) Possible values: - enable : link-layer security activated - disable : link-layer security deactivated	optional parameter with default value: "disable" link layer security
[no] bw-alarm-thresh	Parameter type: <Moca::minBwAlarmThreshold> Format: (disable <Moca::minBwAlarmThreshold>) Possible values: - disable : disable bw threshold alarm Field type <Moca::minBwAlarmThreshold> - minimum phy link bandwidth (Mbps) between two nodes - range: [0,57...3200]	optional parameter with default value: 180L minimum phy link bandwidth between two nodes (Mbps)
[no] auto-pwr-ctl	Parameter type: <Moca::AutomaticPowerControl> Format: (enable disable) Possible values: - enable : apc enabled	optional parameter with default value: "enable" automatic power control

Parameter	Type	Description
[no] pwr-override	- disable : apc disabled Parameter type: <Gpon::PowerShedOverride> Format: (enable disable) Possible values: - enable : port is excluded from data class power shedding - disable : port is included in data class power shedding	<i>optional parameter with default value: "disable"</i> power shed override
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	<i>optional parameter with default value: "down"</i> <i>The parameter is not visible during creation.</i> administrative status of the interface

Command Output

Table 66.2-3 "MoCA ONT Uni Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown - dormant : dormant,no traffic is passing - no-value : no entry in the table	operational state of the interface <i>This element is always shown.</i>

66.3 MoCA ONT Uni Physical Layer Configuration Command

Command Description

This command allows the operator to provision performance monitoring and threshold crossing alerts for a MoCA ONT physical layer UNI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure moca ont (uni-idx) phy [ no pm | pm <Gpon::OntPmCollect> ] [ no tca | tca <Gpon::OntPmCollect> ] [ no rx-err | rx-err <Gpon::ErrorCountThreshold> ]
```

Command Parameters

Table 66.3-1 "MoCA ONT Uni Physical Layer Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId> / <Gpon::OntPortId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId>	identification of the uni interface index

Resource Identifier	Type	Description
	- the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14] Field type <Gpon::OntPortId> - Gpon Ont Port - range: [1...16]

66.4 MoCA ONT Uni Layer 2 Configuration Command

Command Description

This command allows the operator to provision performance monitoring and threshold crossing alerts for a MoCA ONT layer 2 UNI.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure moca ont (uni-idx) l2 [ no pm | pm <Gpon::OntPmCollect> ] [ no tca | tca <Gpon::OntPmCollect> ] [
no dropped-frames-up | dropped-frames-up <Gpon::ErrorCountThreshold> ] [ no dropped-frames-dn |
dropped-frames-dn <Gpon::ErrorCountThreshold> ]
```

Command Parameters

67- Configure NTP parameters on a specific ONT

67.1 Configure NTP parameters on a specific ONT Tree	67-1769
67.2 Configure NTP parameters on a specific ONT	67-1770

67.1 Configure NTP parameters on a specific ONT Tree

Description

This chapter gives an overview of nodes that are handled by "Configure NTP parameters on a specific ONT".

Command Tree

```
----configure
  ----ntp
    ----[no] ont
      - (ont-idx)
      - [no] client-state
      - [no] config-mode
      - [no] server1-ip-addr
      - [no] server2-ip-addr
      - [no] server3-ip-addr
      - [no] oper-mode
      - [no] key-identifier
      - [no] key
```

67.2 Configure NTP parameters on a specific ONT

Command Description

This command sets the NTP parameters on a specific ONT, in case of server1-ip-addr, server2-ip-addr and server3-ip-addr, following range of ip-addresses are not allowed: 127.0.0.0 to 127.255.255.255 (loopback)

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure ntp ( no ont (ont-idx) ) | ( ont (ont-idx) [ no client-state | client-state <Gpon::ClientState> ] [ no
config-mode | config-mode <Gpon::ConfigMode> ] [ no server1-ip-addr | server1-ip-addr <Gpon::Ipaddr> ] [ no
server2-ip-addr | server2-ip-addr <Gpon::Ipaddr> ] [ no server3-ip-addr | server3-ip-addr <Gpon::Ipaddr> ] [ no
oper-mode | oper-mode <Gpon::OperMode> ] [ no key-identifier | key-identifier <Gpon::KeyIdIdentifier> ] [ no key |
key <Gpon::OntNtpKey> ] )
```

Command Parameters

Table 67.2-1 "Configure NTP parameters on a specific ONT" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of the ont

Table 67.2-2 "Configure NTP parameters on a specific ONT" Command Parameters

Parameter	Type	Description
[no] client-state	Parameter type: <Gpon::ClientState> Format: (on off) Possible values: - on : indicates ntp Client On - off : indicates ntp Client Off	<i>optional parameter with default value: "off"</i> indicates whether ntp client should be on or off
[no] config-mode	Parameter type: <Gpon::ConfigMode> Format: (dhcp manual) Possible values: - dhcp : dhcp mode - manual : manual	<i>optional parameter with default value: "dhcp"</i> used to designate whether dhcp is designated as the method by which the ont obtains ntp server addresses
[no] server1-ip-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> ip address of the 1st ntp server.
[no] server2-ip-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> ip address of the second ntp server.
[no] server3-ip-addr	Parameter type: <Gpon::Ipaddr> Format: - IPv4-address	<i>optional parameter with default value: "0.0.0.0"</i> ip Address of the third ntp server
[no] oper-mode	Parameter type: <Gpon::OperMode> Format: (unicast multicast broadcast) Possible values: - unicast : unicast mode of operation - multicast : multicast mode of operation - broadcast : broadcast mode of operation	<i>optional parameter with default value: "unicast"</i> ntp mode of operation
[no] key-identifier	Parameter type: <Gpon::KeyIdentifier> Format: - key that should be used by the ntp server - range: [0...65535]	<i>optional parameter with default value: 0</i> specifies the key that should be used by the ntp server
[no] key	Parameter type: <Gpon::OntNtpKey> Format: - actual key used by the ont - length: x<=16	<i>optional parameter with default value: ""</i> specifies the actual key used by the ont

68.2 Channel Pair Profiles Configuration Command

Command Description

This command allows the operator to configure the provisioning data associated with a channel pair profile.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> configure channel-pair profiles

68.3 Channel-Pair Wavelength Profile Configuration Command

Command Description

This command allows the operator to configure the Channel-pair Wavelength Profiles.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair profiles ( no wavelength-prof (profile-idx) ) | ( wavelength-prof (profile-idx) name
<AsamProfileName> upstream-channel-id <Gpon::ChannelId> downstream-channel-id <Gpon::ChannelId>
downstream-lambda <Gpon::DownstreamLambda> )
```

Command Parameters

Table 68.3-1 "Channel-Pair Wavelength Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(profile-idx)	Format: - profile index (Note that index [1..8], 33 and 34 are used for the default profiles) - range: [1...34]	profile index

Table 68.3-2 "Channel-Pair Wavelength Profile Configuration Command" Command Parameters

Parameter	Type	Description
name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> name of the profile
upstream-channel-id	Parameter type: <Gpon::ChannelId> Format: - channel id - range: [1...16]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> up-channel id, must be 1 in case of XGS-PON
downstream-channel-id	Parameter type: <Gpon::ChannelId> Format: - channel id - range: [1...16]	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> down-channel id
downstream-lambda	Parameter type: <Gpon::DownstreamLambda> Format:	<i>mandatory parameter</i> <i>The parameter is not visible</i>

68 Channel Pair Configuration Commands

Parameter	Type	Description
	- downstream lambda range for a channel-pair - range: [131000,149000,156000...161000]	<i>during modification.</i> downstream wavelength for the channel-pair using this profile

68.4 Channel Pair Interface Configuration

Command

Command Description

This command allows the operator to configure the provisioning data associated with a channel pair interface.

The value of channel-speed can be only changed if the channel pair is not currently a member of a subchannelgroup. All channel pairs in a subchannelgroup must have the same channel-speed. The equipped optics will not be checked against the configured speed. It is up to the operator to ensure that these match.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) [ no label | label <Gpon::Label> ] [ no pon-tag | pon-tag
<Gpon::PonTag> ] [ no x-pon-id | x-pon-id <Ng2::XPonId> ] [ no max-ranging-onts | max-ranging-onts
<Ng2::ChanPairMaxRangingOnt> ] [ no tconts-per-frame | tconts-per-frame <Ng2::ChanPairTcontsPerFrame> ] [
no ber-calc-period | ber-calc-period <Ng2::ChanPairBerPeriod> ] [ no sig-degrade-th | sig-degrade-th
<Ng2::ChanPairSdThreshold> ] [ no sig-fail-th | sig-fail-th <Ng2::ChanPairSfThreshold> ] [ no wavelength-prof |
wavelength-prof <Gpon::WavelengthProfile> ] [ no channel-speed | channel-speed <Gpon::ChannelSpeed> ] [ no
burst-overhead | burst-overhead <Gpon::BurstModeOverhead> ] [ no admin-label | admin-label
<Ng2::AdminLabel> ] [ no onu-prov-mode | onu-prov-mode <Gpon::OnuProvMode> ] [ no admin-state |
admin-state <Gpon::ItfAdminStatus> ]
```

Command Parameters

Table 68.4-1 "Channel Pair Interface Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.4-2 "Channel Pair Interface Configuration Command" Command Parameters

Parameter	Type	Description
[no] label	Parameter type: <Gpon::Label> Format: - char string - length: x<=80	<i>optional parameter with default value: ""</i> label of the channel pair port
[no] pon-tag	Parameter type: <Gpon::PonTag> Format: - Pon Tag - 16 hex characters - length: x<=16	<i>optional parameter with default value: "0000000000000000"</i> label of the channel-pair port
[no] x-pon-id	Parameter type: <Ng2::XPonId> Format: - Pon Id - 8 hex characters - length: x<=8	<i>optional parameter with default value: "00000000"</i> label of the channelpair port, used when channelpair is in XGS-mode
[no] max-ranging-onts	Parameter type: <Ng2::ChanPairMaxRangingOnt> Format: - ranging onts number;if 0 indicates bandwidth calculated by provisioned onts; other value indicates pre-configured onts - range: [0...128]	<i>optional parameter with default value: 128L</i> max ranging ont number for guaranteed bandwidth cac
[no] tconts-per-frame	Parameter type: <Ng2::ChanPairTcontsPerFrame> Format: - tcont number to calculate the guaranteed bandwidth. Range: XGSPON and XGPON1 [0..64], NGPON2 [0..16] - range: [0...64]	<i>optional parameter with default value: 16L</i> max service tcont number per gtc frame
[no] ber-calc-period	Parameter type: <Ng2::ChanPairBerPeriod> Format: - ber caculate period used to detect determine whether an SDi/SFi alarm has occurred for an ONT. default = 10 - unit: 1/10 sec - range: [1...864000]	<i>optional parameter with default value: 10L</i> ber caculate period used to detect determine whether an SDi/SFi alarm has occurred for an ONT
[no] sig-degrade-th	Parameter type: <Ng2::ChanPairSdThreshold> Format: - ber threshold used to detect a signal degrade alarms for onts default = 9 - range: [4...10]	<i>optional parameter with default value: 9L</i> the BER threshold used to detect Signal Degrade alarms for ONTs on this PON
[no] sig-fail-th	Parameter type: <Ng2::ChanPairSfThreshold> Format: - ber threshold used to detect a signal fail alarms for onts default = 5 - range: [3...8]	<i>optional parameter with default value: 5L</i> the BER threshold used to detect Signal Fail alarms for ONTs on this PON
[no] wavelength-prof	Parameter type: <Gpon::WavelengthProfile> Format: (none <Gpon::WavelengthProfile> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::WavelengthProfile> - profile index - range: [0...34] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> wavelength profile
[no] channel-speed	Parameter type: <Gpon::ChannelSpeed> Format: (unplanned	<i>optional parameter with default value: "unplanned"</i> channel speed

Parameter	Type	Description
	10g-10g 10g-2.5g 2.5g-2.5g 10g-dualrate) Possible values: - unplanned : unplanned - 10g-10g : 10g down / 10g up - 10g-2.5g : 10g down / 2.5g up - 2.5g-2.5g : 2.5g down / 2.5 up - 10g-dualrate : 10g down / dual-rate up	
[no] burst-overhead	Parameter type: <Gpon::BurstModeOverhead> Format: (robust reduced) Possible values: - robust : robust - reduced : reduced	optional parameter with default value: "robust" burst mode overhead
[no] admin-label	Parameter type: <Ng2::AdminLabel> Format: - Admin label - 7 hex characters - length: x<=7	optional parameter with default value: "0000000" admin label of the channelpair port, used when channelpair is in TWDM-mode
[no] onu-prov-mode	Parameter type: <Gpon::OnuProvMode> Format: (semi-auto auto) Possible values: - semi-auto : ONU semi-auto provisioning. Template file needs to be specified in ONT config - auto : ONU auto provisioning. Template file selection done automatically based on ONT type	optional parameter with default value: "semi-auto" ONU auto provisioning mode
[no] admin-state	Parameter type: <Gpon::ItfAdminStatus> Format: (up down) Possible values: - up : set the admin-state to up - down : set the admin-state to down	optional parameter with default value: "down" The parameter is not visible during creation. administrative status of the interface

Command Output

Table 68.4-3 "Channel Pair Interface Configuration Command" Display parameters

Specific Information		
name	Type	Description
oper-state	Parameter type: <Itf::ifOperStatus> (up down testing unknown dormant no-value) Possible values: - up : up,traffic can pass - down : down,no traffic is passing - testing : testing,no traffic is passing - unknown : unknown	operational state of the interface <i>This element is always shown.</i>

name	Type	Description
	- dormant : dormant,no traffic is passing - no-value : no entry in the table	
actual-lambda-down	Parameter type: <Gpon::ActualDownstreamLambda> - downstream lambda range for a channel-pair - range: [131000,149000,156000...161000]	the actual lambda used in downstream <i>This element is always shown.</i>

68.5 Channel Pair XGEM Port Performance Monitoring Configuration Command

Command Description

This command allows the operator to set the PM mode of OLT side XGEM based counters for errored fragments.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) tc-layer [ no pm-collect | pm-collect <Gpon::OntPmTcaCollect> ]
```

Command Parameters

Table 68.5-1 "Channel Pair XGEM Port Performance Monitoring Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.5-2 "Channel Pair XGEM Port Performance Monitoring Configuration Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmTcaCollect> Format: (none pm-enable tca-enable) Possible values: - none : no pm - pm-enable : enable pm - tca-enable : enable tca	<i>optional parameter with default value: "pm-enable"</i> olt-side aggregate TC Layer performance monitoring

68.6 OLT-SIDE TC-layer Performance Monitoring Counter Thresholds Configuration Command for channel pair

Command Description

This command allows the operator to enable configuration of performance Monitoring counter thresholds for OLT-Side TC-layer errored fragments.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) tc-layer-threshold [ no error-frags-up | error-frags-up <Gpon::TcaThresholdValue> ]
```

Command Parameters

Table 68.6-1 "OLT-SIDE TC-layer Performance Monitoring Counter Thresholds Configuration Command for channel pair" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.6-2 "OLT-SIDE TC-layer Performance Monitoring Counter Thresholds Configuration Command for channel pair" Command Parameters

Parameter	Type	Description
[no] error-frags-up	Parameter type: <Gpon::TcaThresholdValue> Format: (disabled <Gpon::TcaThresholdValue>)	optional parameter with default value: "disabled" tca setting for errored gem fragments

Parameter	Type	Description
	Possible values: - disabled : threshold is disabled Field type <Gpon::TcaThresholdValue> - tc-layer tca threshold value (4294967295=disabled) - range: [0...4294967294,4294967295]	

68.7 Multicast TC-layer Performance Monitoring

Command for channel pair

Command Description

This command allows the operator to enable or disable the OLT-side Multicast Port Performance Monitor collection for the channel pair.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) mcast-tc-layer [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 68.7-1 "Multicast TC-layer Performance Monitoring Command for channel pair" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.7-2 "Multicast TC-layer Performance Monitoring Command for channel pair" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> OLT-side multicast performance monitoring

Command Output

Table 68.7-3 "Multicast TC-layer Performance Monitoring Command for channel pair" Display parameters

Specific Information		
name	Type	Description
interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval. <i>This element is always shown.</i>

68.8 NGPON2 Physical-layer Performance Monitoring Command for channel pair

Command Description

This command allows the operator to enable or disable the OLT-side NGPON2 Physical Performance Monitor collection for the channel pair.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) phy-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

**Table 68.8-1 "NGPON2 Physical-layer Performance Monitoring Command for channel pair"
Resource Parameters**

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

**Table 68.8-2 "NGPON2 Physical-layer Performance Monitoring Command for channel pair"
Command Parameters**

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i> OLT-side NGPON2 Physical performance monitoring

Command Output

interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval. <i>This element is always shown.</i>

68.9 NGPON2 Upstream FEC Performance Monitoring Command for channel pair

Command Description

This command allows the operator to enable or disable the OLT-side NGPON2 upstream FEC Performance Monitor collection for the channel pair.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) fec-tc-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

**Table 68.9-1 "NGPON2 Upstream FEC Performance Monitoring Command for channel pair"
Resource Parameters**

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

**Table 68.9-2 "NGPON2 Upstream FEC Performance Monitoring Command for channel pair"
Command Parameters**

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	optional parameter with default value: "disable" OLT-side upstream FEC performance monitoring

Command Output

Table 68.9-3 "NGPON2 Upstream FEC Performance Monitoring Command for channel pair"
Display parameters

Specific Information		
name	Type	Description
interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval. This element is always shown.

68.10 NGPON2 TC-layer Performance Monitoring

Command for channel pair

Command Description

This command allows the operator to enable or disable the OLT-side NGPON2 TC-layer Performance Monitor collection for the channel pair.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) xg-tc-layer [ no pm-collect | pm-collect <Gpon::PmEnable> ]
```

Command Parameters

Table 68.10-1 "NGPON2 TC-layer Performance Monitoring Command for channel pair" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.10-2 "NGPON2 TC-layer Performance Monitoring Command for channel pair" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::PmEnable> Format: (disable enable) Possible values: - disable : disable the collection - enable : enable the collection	<i>optional parameter with default value: "disable"</i> OLT-side tc-layer performance monitoring

Command Output

Specific Information		
name	Type	Description
interval-no	Parameter type: <SignedInteger> - a signed integer	number of rows currently present in the gponMulticastServiceOltsideGemInterval. This element is always shown.

68.11 Trouble shooting Configuration Command

Command Description

This command is to configure the channel-pair threshold of bytes up or down.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> configure channel-pair interface (chanpair-idx) troubleshooting

Command Parameters

Table 68.11-1 "Trouble shooting Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

68.12 Trouble-shooting Interface Configuration Commands

Command Description

This command allows the operator to enable or disable the extensive trouble-shooting counters.

By default troubleshooting is not enabled on a channelpair.

Note however that this default is not displayed by an info config neither info config detail.

When troubleshooting is enabled on a specific channelpair, info config and info config detail will both report it.

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

> configure channel-pair interface (chanpair-idx) troubleshooting (no enable) | (enable)

Command Parameters

Table 68.12-1 "Trouble-shooting Interface Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

68.13 Trouble shooting Configuration Command

Command Description

This command is to configure the channel-pair threshold of bytes up or down.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) troubleshooting threshold [ no upstr-bw-thresh | upstr-bw-thresh
<Gpon::TrbstBwThUp> ] [ no downstr-bw-thresh | downstr-bw-thresh <Gpon::TrbstBwThDn> ]
```

Command Parameters

Table 68.13-1 "Trouble shooting Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.13-2 "Trouble shooting Configuration Command" Command Parameters

Parameter	Type	Description
[no] upstr-bw-thresh	Parameter type: <Gpon::TrbstBwThUp> Format: - the attribute is used to specify the average rate threshold in kbps for upstream traffic,0 is disable - range: [0...4294967295]	<i>optional parameter with default value: "0"</i> the attribute is used to specify the average rate threshold in kbps for upstream traffic,0 is disable
[no] downstr-bw-thresh	Parameter type: <Gpon::TrbstBwThDn> Format: - the attribute is used to specify the average rate threshold in kbps for downstream traffic,0 is disable - range: [0...4294967295]	<i>optional parameter with default value: "0"</i> the attribute is used to specify the average rate threshold in kbps for downstream traffic,0 is disable

68.14 Channel Pair Utilization PM Configuration Command

Command Description

This command configures the channel-pair and ont utilization performance monitoring modes for a channel-pair.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) utilization [ no chpair-pmcollect | chpair-pmcollect
<Gpon::PonUtilPmTcaCollect> ] [ no ont-pmcollect | ont-pmcollect <Gpon::PonUtilOntPmCollect> ] [ no
ontbulk-pmcollect | ontbulk-pmcollect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 68.14-1 "Channel Pair Utilization PM Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.14-2 "Channel Pair Utilization PM Configuration Command" Command Parameters

Parameter	Type	Description
[no] chpair-pmcollect	Parameter type: <Gpon::PonUtilPmTcaCollect> Format: (none pm-enable tca-enable inherit) Possible values: - none : no pm - pm-enable : enable pm	<i>optional parameter with default value: "inherit"</i> channel-pair utilization performance monitoring

68 Channel Pair Configuration Commands

Parameter	Type	Description
	- tca-enable : enable tca - inherit : inherit from generic-pon (system-wide) pon-pmcollect and threshold values	
[no] ont-pmcollect	Parameter type: <Gpon::PonUtilOntPmCollect> Format: (enable disable inherit) Possible values: - enable : enable PM - disable : disable PM - inherit : inherit from generic-pon (system-wide) ont-pmcollect value	<i>optional parameter with default value: "inherit"</i> channel-pair utilization ont detailed performance monitoring
[no] ontbulk-pmcollect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> channel-pair utilization ont pm bulk collectable via BFMU

68.15 Channel Pair Utilization TCA Threshold Configuration Command

Command Description

This command configures the utilization TCA threshold parameters for a channel-pair.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) utilization threshold [ no txmcutilhi | txmcutilhi
<Gpon::PonUtilTcaThresholdPercent> ] [ no txmcutilmd | txmcutilmd <Gpon::PonUtilTcaThresholdPercent> ] [ no
txmcutillo | txmcutillo <Gpon::PonUtilTcaThresholdPercent> ] [ no txtotutilhi | txtotutilhi
<Gpon::PonUtilTcaThresholdPercent> ] [ no txtotutilmd | txtotutilmd <Gpon::PonUtilTcaThresholdPercent> ] [ no
txtotutillo | txtotutillo <Gpon::PonUtilTcaThresholdPercent> ] [ no rxtotutilhi | rxtotutilhi
<Gpon::PonUtilTcaThresholdPercent> ] [ no rxtotutilmd | rxtotutilmd <Gpon::PonUtilTcaThresholdPercent> ] [ no

[no] rxtotdropfrmmd	Parameter - range: [0...1000000000] type: <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values:	optional parameter with default value: "disabled" number of dropped frames that will result in declaration of T-RXTOTDROPFRMMD alarm

68 Channel Pair Configuration Commands

Parameter	Type	Description
	- disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	
[no] rxtotdropfrmlo	Parameter type: <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> number of dropped frames that will result in declaration of T-RXTOTCDROPFRMLO alarm
[no] numtcint	Parameter type: <Gpon::PonUtilTcaInterval> Format: (1 <Gpon::PonUtilTcaInterval>) Possible values: - 1 : Initial Default Field type <Gpon::PonUtilTcaInterval> - interval threshold - range: [1...96]	<i>optional parameter with default value: "1"</i> number of contiguous 5-minute intervals for the non-DBA utilization thresholds to be exceeded for tca alarm
[no] numtcintdba	Parameter type: <Gpon::PonUtilTcaInterval> Format: (1 <Gpon::PonUtilTcaInterval>) Possible values: - 1 : Initial Default Field type <Gpon::PonUtilTcaInterval> - interval threshold - range: [1...96]	<i>optional parameter with default value: "1"</i> number of contiguous 5-minute intervals for the DBA congestion thresholds to be exceeded for tca alarm
[no] dbacongthresh	Parameter type: <Gpon::PonUtilTcaCongThreshold> Format: (90 <Gpon::PonUtilTcaCongThreshold>) Possible values: - 90 : Initial Default Field type <Gpon::PonUtilTcaCongThreshold> - dba congestion percentage threshold - range: [0...100]	<i>optional parameter with default value: "90"</i> DBA congestion threshold as a percentage of the maximum consumable bandwidth

68.16 Deactivate Ont threshold Configuration Commands

Command Description

This command allows the operator to configure deactivate ont threshold.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) deact-ont-tca [ no mode | mode <Gpon::DeactOnuTcaMode> ] [
no monitor-interval | monitor-interval <Gpon::DeactOnuInterval> ]
```

Command Parameters

Table 68.16-1 "Deactivate Ont threshold Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.16-2 "Deactivate Ont threshold Configuration Commands" Command Parameters

Parameter	Type	Description
[no] mode	Parameter type: <Gpon::DeactOnuTcaMode> Format: (disable percent number) Possible values: - disable : disable mode - percent : percentage mode - number : number mode	<i>optional parameter with default value: "disable"</i> Used to specify PON or Channel-Pair deactivated ONT detection mode.
[no] monitor-interval	Parameter type: <Gpon::DeactOnuInterval>	<i>optional parameter with default</i>

68 Channel Pair Configuration Commands

Parameter	Type	Description
	Format: - tca interval - unit: second - range: [5...300]	<i>value: 30L</i> Used to specify PON or Channel-Pair deactivated ONT detection interval.

68.17 Deactivate Ont threshold Configuration Commands

Command Description

This command allows the operator to configure deactivate ont threshold.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) deact-ont-tca threshold-percent [ no high | high
<Gpon::DeactOnuTcaPctHigh> ] [ no high-clr | high-clr <Gpon::DeactOnuTcaPctHigh> ] [ no low | low
<Gpon::DeactOnuTcaPctLow> ] [ no low-clr | low-clr <Gpon::DeactOnuTcaPctLow> ]
```

Command Parameters

Table 68.17-1 "Deactivate Ont threshold Configuration Commands" Resource Parameters

Resource Identifier	Type	Description
(chanpair-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair index

Table 68.17-2 "Deactivate Ont threshold Configuration Commands" Command Parameters

Parameter	Type	Description
[no] high	Parameter type: <Gpon::DeactOnuTcaPctHigh> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 90L</i> Used to specify PON or Channel-Pair deactivated ONT detection high threshold in percent.
[no] high-clr	Parameter type: <Gpon::DeactOnuTcaPctHigh> Format: - tca threshold in percent	<i>optional parameter with default value: 90L</i> Used to specify PON or

68 Channel Pair Configuration Commands

Parameter	Type	Description
	- range: [1...100]	Channel-Pair deactivated ONT detection high clear threshold in percent.
[no] low	Parameter type: <Gpon::DeactOnuTcaPctLow> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 40L</i> Used to specify PON or Channel-Pair deactivated ONT detection low threshold in percent.
[no] low-clr	Parameter type: <Gpon::DeactOnuTcaPctLow> Format: - tca threshold in percent - range: [1...100]	<i>optional parameter with default value: 40L</i> Used to specify PON or Channel-Pair deactivated ONT detection low clear threshold in percent.

68.18 Deactivate Ont threshold Configuration Commands

Command Description

This command allows the operator to configure deactivate ont threshold.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair interface (chanpair-idx) deact-ont-tca threshold-number [ no high | high
<Gpon::DeactOnuTcaNbrHigh> ] [ no high-clr | high-clr <Gpon::DeactOnuTcaNbrHigh> ] [ no low | low
<Gpon::DeactOnuTcaNbrLow> ] [ no low-clr | low-clr <Gpon::DeactOnuTcaNbrLow> ]
```

Command Parameters

Parameter	Type	Description
[no] high	Parameter type: <Gpon::DeactOnuTcaNbrHigh> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 57L</i> Used to specify PON or Channel-Pair deactivated ONT detection high threshold in number.
[no] high-clr	Parameter type: <Gpon::DeactOnuTcaNbrHigh> Format: - tca threshold in number	<i>optional parameter with default value: 57L</i> Used to specify PON or

68 Channel Pair Configuration Commands

Parameter	Type	Description
	- range: [1...128]	Channel-Pair deactivated ONT detection high clear threshold in number.
[no] low	Parameter type: <Gpon::DeactOnuTcaNbrLow> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 25L</i> Used to specify PON or Channel-Pair deactivated ONT detection low threshold in number.
[no] low-clr	Parameter type: <Gpon::DeactOnuTcaNbrLow> Format: - tca threshold in number - range: [1...128]	<i>optional parameter with default value: 25L</i> Used to specify PON or Channel-Pair deactivated ONT detection low clear threshold in number.

68.19 Trouble-Shooting threshold Configuration Commands

Command Description

This command is to configure the ethernet traffic tca detect interval

User Level

The command can be accessed by operators with security privileges, and executed by operators with security privileges.

Command Syntax

The command has the following syntax:

```
> configure channel-pair troubleshooting [ no bw-meter-interval | bw-meter-interval <Gpon::TcaDetectIntval> ]
```

Command Parameters

Table 68.19-2 "Trouble-Shooting threshold Configuration Commands" Command Parameters

Parameter	Type	Description
[no] bw-meter-interval	Parameter type: <Gpon::TcaDetectIntval> Format: - ethernet traffic tca detect interval for pon in second - range: [60...86400]	<i>optional parameter with default value: "300"</i> ethernet traffic tca detect interval for channel pair in second

    ----otdr
      - [no] mode

```

69.2 Epon Interface Configuration Command

Command Description

This command allows the operator to configure the provisioning data associated with a EPON interface.

Note: The value of sig-degrade-th must be greater than sig-fail-th (i.e. sig-degrade-th must represent a lower BER value).

The value of fec-dn can be changed only after setting the administrative status to down. If the FEC change is made while the adm in status is up, then it must be set to down and then put back to up for the change to take place.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure epon ( no interface (epon-idx) ) | ( interface (epon-idx) [ no polling-period | polling-period
<epon::pollingperiod> ] [ no dba-polling0 | dba-polling0 <epon::dbapollinginterval0> ] [ no dba-polling1 |
dba-polling1 <epon::dbapollinginterval1> ] [ no dba-polling2 | dba-polling2 <epon::dbapollinginterval2> ] [ no
dba-polling3 | dba-polling3 <epon::dbapollinginterval3> ] [ no dba-polling4 | dba-polling4
<epon::dbapollinginterval4> ] [ no dba-polling5 | dba-polling5 <epon::dbapollinginterval5> ] [ no dba-polling6 |
dba-polling6 <epon::dbapollinginterval6> ] [ no dba-polling7 | dba-polling7 <epon::dbapollinginterval7> ] [ no
auth-mode | auth-mode <epon::authmode> ] [ no pm-collect | pm-collect <epon::pmcollect> ] [ no fec-dn | fec-dn
<epon::fecdn> ] [ no rssi | rssi <epon::rssiadmind> ] [ no rx-pwr-low | rx-pwr-low <epon::rxpowerlow> ] [ no
rx-pwr-high | rx-pwr-high <epon::rxpowerhigh> ] [ no op-module-type | op-module-type <epon::opmoduletype> ] [
no pon-port-mode | pon-port-mode <epon::ponportmode> ] [ no idlepwrta | idlepwrta <epon::idlepwrta> ] [ no
idlepwrthreshold | idlepwrthreshold <epon::idlth> ] )
```

Command Parameters

Table 69.2-1 "Epon Interface Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(epon-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	Pon interface

Table 69.2-2 "Epon Interface Configuration Command" Command Parameters

Parameter	Type	Description
[no] polling-period	Parameter type: <epon::pollingperiod> Format: - discovery window for onu register - range: [10...65540]	<i>optional parameter with default value: 1000L</i> discovery window for ONT register
[no] dba-polling0	Parameter type: <epon::dbapollinginterval0> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 15L</i> DBA polling interval time for level-0
[no] dba-polling1	Parameter type: <epon::dbapollinginterval1> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 30L</i> DBA polling interval time for level-1
[no] dba-polling2	Parameter type: <epon::dbapollinginterval2> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 60L</i> DBA polling interval time for level-2
[no] dba-polling3	Parameter type: <epon::dbapollinginterval3> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 60L</i> DBA polling interval time for level-3
[no] dba-polling4	Parameter type: <epon::dbapollinginterval4> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 60L</i> DBA polling interval time for level-4
[no] dba-polling5	Parameter type: <epon::dbapollinginterval5> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 60L</i> DBA polling interval time for level-5
[no] dba-polling6	Parameter type: <epon::dbapollinginterval6> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 60L</i> DBA polling interval time for level-6
[no] dba-polling7	Parameter type: <epon::dbapollinginterval7> Format: - DBA polling interval per pon interface - range: [0...65535]	<i>optional parameter with default value: 60L</i> DBA polling interval time for level-7
[no] auth-mode	Parameter type: <epon::authmode> Format: (mix mac logicalid) Possible values: - mix : - mac : - logicalid :	<i>optional parameter with default value: "mix"</i> authentication mode for ONT
[no] pm-collect	Parameter type: <epon::pmcollect> Format: (enable disable) Possible values: - enable : PM collection enabled - disable : PM collection disabled	<i>optional parameter with default value: "disable"</i> Performance monitor switch
[no] fec-dn	Parameter type: <epon::fecdn> Format: (enable disable) Possible values:	<i>optional parameter with default value: "disable"</i> enable or disable FEC in Downstream direction

69 Epon Configuration Commands

Parameter	Type	Description
	- enable : fec is enabled - disable : fec is disabled	
[no] rssi	Parameter type: <epon::rssiadmin> Format: (enable disable) Possible values: - enable : RSSI function enabled - disable : RSSI function disabled	<i>optional parameter with default value: "disable"</i> Enable or disable RSSI function on this PON
[no] rx-pwr-low	Parameter type: <epon::rxpowerlow> Format: <Epon::float> Field type <Epon::float> - OLT side TCA threshold - unit: dbm - range: [-40...8.2]	<i>optional parameter with default value: "-27"</i> alarm low threshold for RXPWR
[no] rx-pwr-high	Parameter type: <epon::rxpowerhigh> Format: <Epon::float> Field type <Epon::float> - OLT side TCA threshold - unit: dbm - range: [-40...8.2]	<i>optional parameter with default value: "-6"</i> alarm high threshold for RXPWR
[no] op-module-type	Parameter type: <epon::opmoduletype> Format: (auto 1000base-px20h 1000base-px20 10/1gbase-prx 10gbase-pr-d3 10g1g/1gbase-prx 10g1g/10gbase-pr) Possible values: - auto : auto - 1000base-px20h : 1000base-px20h - 1000base-px20 : 1000base-px20 - 10/1gbase-prx : 10/1gbase-prx - 10gbase-pr-d3 : 10gbase-pr-d3 - 10g1g/1gbase-prx : 10g1g/1gbase-prx - 10g1g/10gbase-pr : 10g1g/10gbase-pr	<i>optional parameter with default value: "auto"</i> identify optical module type
[no] pon-port-mode	Parameter type: <epon::ponportmode> Format: (1g 10g-asym 1g,10g-asym 10g-sym 1g,10g-sym 10g-asym,10g-sym 1g,10g-asym,10g-sym) Possible values: - 1g : 1g - 10g-asym : 10g asymmetric - 1g,10g-asym : 1g, 10g asymmetric - 10g-sym : 10g symmetric - 1g,10g-sym : 1g, 10g symmetric - 10g-asym,10g-sym : 10g asymmetric, 10g symmetric - 1g,10g-asym,10g-sym : 1g, 10g asymmetric, 10g	<i>optional parameter with default value: "1g,10g-asym,10g-sym"</i> Pon port mode, to limit the registered ont type

Parameter	Type	Description
	symmetric	
[no] idlepwtca	Parameter type: <epon::idlepwtca> Format: (enable disable) Possible values: - enable : enable pon idle pwr monitor - disable : disable pon idle pwr monitor	<i>optional parameter with default value: "disable"</i> Pon idle pwr monitor
[no] idlepwrthreshold	Parameter type: <epon::idlth> Format: <Epon::floatidlepwr> Field type <Epon::floatidlepwr> - OLT side TCA threshold - unit: dbm - range: [-40...8.164]	<i>optional parameter with default value: "-30"</i> add a new idlepwrthreshold parameter

69.3 OTDR enable Command for PON

Command Description

This command allows the operator to enable or disable the otdr functionality on the given epon.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure epon interface (epon-idx) otdr [ no mode | mode <Epon::OTDRenable> ]
```

Command Parameters

Table 69.3-1 "OTDR enable Command for PON" Resource Parameters

Resource Identifier	Type	Description
(epon-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	Pon interface

Table 69.3-2 "OTDR enable Command for PON" Command Parameters

Parameter	Type	Description
[no] mode	Parameter type: <Epon::OTDRenable> Format: (enable disable test) Possible values: - enable : otdr enable - disable : otdr disable - test : otdr test	<i>optional parameter with default value: "disable"</i> enable otdr

70.2 Epon Filter Profile Configuration Command

Command Description

This command allows the operator to configure an ont filter profile.

Note: The profile could not be modified.

This object contains a table for defining classification and filter rules by operator. The max field for one rule could be specified is 4.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure epon profiles ( no filter (profile-idx) ) | ( filter (profile-idx) profile-name <AsamProfileName> [ no
classfandv1 | classfandv1 <Epon::ClassVal> ] [ no classac1 | classac1 <Epon::ClassAc> ] [ no classfandv2 |
classfandv2 <Epon::ClassVal> ] [ no classac2 | classac2 <Epon::ClassAc> ] [ no classfandv3 | classfandv3
<Epon::ClassVal> ] [ no classac3 | classac3 <Epon::ClassAc> ] [ no classfandv4 | classfandv4 <Epon::ClassVal> ]
[ no classac4 | classac4 <Epon::ClassAc> ] )
```

Command Parameters

Table 70.2-1 "Epon Filter Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(profile-idx)	Format: - filter profile id - range: [1...8192]	index to the Profile

Table 70.2-2 "Epon Filter Profile Configuration Command" Command Parameters

Parameter	Type	Description
profile-name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> A string 1..32 characters long which uniquely identifies this Profile
[no] classfandv1	Parameter type: <Epon::ClassVal> Format: (dmac : <Epon::Mac16Addr> smac : <Epon::Mac16Addr> vlanpriority : <Epon::ClassVal> vlanid : <Epon::ClassVal> ethtype : <Epon::EthHexType> dip : <Epon::IpAdd> sip : <Epon::IpAdd>	<i>optional parameter with default value: "noconfig : 65535"</i> field and value for classification

70 Epon Profile Configuration Commands

Parameter	Type	Description
	- ipprecedence : - sport : - dport : - ipprotocol : - noconfig : fv not set value - Field type <Epon::Mac16Addr> - mac-address (example : 01:02:03:04:05:06) - length: 6 - Field type <Epon::IpAdd> - Source/Destination IP Address - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::EthHexType> - eth type(example : 8860) - range: [a-fA-F0-9] - length: 1<=x<=4 - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::ClassVal> - EponTcClassifierFieldsType - Field type <Epon::ClassVal> - EponTcClassifierFieldsType	
[no] classac3	Parameter type: <Epon::ClassAc> Format: (match nomatch equal nonequal nogreater noless fieldexist fieldnoexist acnoconfig) Possible values: - match : always match - nomatch : nevermatch - equal : equal - nonequal : not equal - nogreater : less than or equal - noless : greater than or equal - fieldexist : field exist - fieldnoexist : field not exist - acnoconfig : ac not set value	<i>optional parameter with default value: "acnoconfig"</i> action for classification
[no] classfandv4	Parameter type: <Epon::ClassVal> Format: (dmac : <Epon::Mac16Addr> smac : <Epon::Mac16Addr> vlanpriority : <Epon::ClassVal> vlanid : <Epon::ClassVal>	<i>optional parameter with default value: "noconfig : 65535"</i> field and value for classification

Parameter	Type	Description
	ethtype : <Epon::EthHexType> dip : <Epon::IpAddr> sip : <Epon::IpAddr> ipversion : <Epon::ClassVal> ipdscp : <Epon::ClassVal> ipprecedence : <Epon::ClassVal> sport : <Epon::ClassVal> dport : <Epon::ClassVal> ipprotocol : <Epon::ClassVal> noconfig : <Epon::ClassVal>) Possible values: - dmac : - smac : - vlanpriority : - vlanid : - ethtype : - dip : - sip : - ipversion : - ipdscp : - ipprecedence : - sport : - dport : - ipprotocol : - noconfig : fv not set value Field type <Epon::Mac16Addr> - mac-address (example : 01:02:03:04:05:06) - length: 6 Field type <Epon::IpAddr> - Source/Destination IP Address Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::EthHexType> - eth type(example : 8860) - range: [a-fA-F0-9] - length: 1<=x<=4 Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::ClassVal> - EponTcClassifierFieldsType Field type <Epon::ClassVal> - EponTcClassifierFieldsType	
[no] classac4	Parameter type: <Epon::ClassAc> Format: (match nomatch equal nonequal nogreater	<i>optional parameter with default value: "acnoconfig"</i> action for classification

70 Epon Profile Configuration Commands

Parameter	Type	Description
	noless fieldexist fieldnoexist acnoconfig) Possible values: - match : always match - nomatch : nevermatch - equal : equal - nonequal : not equal - nogreater : less than or equal - noless : greater than or equal - fieldexist : field exist - fieldnoexist : field not exist - acnoconfig : ac not set value	

70.3 Epon Digit Map Profile Configuration Command

Command Description

This command allows the operator to configure a sip digit map profile.

profile-name - A string 1..32 characters long which uniquely identifies this Profile.

substring - SIP Digit Map string.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure epon profiles ( no digitmap (profile-idx) substr-idx <AsamProfileIndex> ) | ( digitmap (profile-idx)
  substr-idx <AsamProfileIndex> profile-name <AsamProfileName> substring <Epon::substring> )
```

Command Parameters

Table 70.3-1 "Epon Digit Map Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(profile-idx)	Format: - a profile index - range: [1...250]	index to the eponSIPDigitMapProfileTable
substr-idx	Parameter type: <AsamProfileIndex> Format: - a profile index - range: [1...250]	sub-string index to the eponSIPDigitMapProfileTable

Table 70.3-2 "Epon Digit Map Profile Configuration Command" Command Parameters

Parameter	Type	Description
profile-name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> A string 1 to 32 characters long which uniquely identifies this Profile
substring	Parameter type: <Epon::substring> Format: - sub string index to the SIP Digit Map Profile - length: x<=256	<i>mandatory parameter</i> SIP Digit Map string

70.4 Epon Alarm Control Profile Configuration Command

Command Description

This command allows the operator to configures an ont alarm control profile.

Note: The profile can be modified.

This object contains a table for defining alarm control bitmap by operator. Each bit indicates a sort of ONU alarm is enable or disable

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure epon profiles ( no ontalarm (name) ) | ( ontalarm (name) [ [ no ] equip-alm ] [ [ no ] power-alm ] [ [ no ] batt-miss ] [ [ no ] batt-fail ] [ [ no ] batt-volt-low ] [ [ no ] phy-intr-alm ] [ [ no ] selftest-fail ] [ [ no ] otemp-hi-alm ] [ [ no ] otemp-lo-alm ] [ [ no ] iad-conn-fail ] [ [ no ] pon-ifswitch ] [ [ no ] rxpow-hi-alm ] [ [ no ] rxpow-lo-alm ] [ [ no ] txpow-hi-alm ] [ [ no ] txpow-lo-alm ] [ [ no ] txbi-hi-alm ] [ [ no ] txbi-lo-alm ] [ [ no ] vcc-hi-alm ] [ [ no ] vcc-lo-alm ] [ [ no ] temp-hi-alm ] [ [ no ] temp-lo-alm ] [ [ no ] rxpow-hi-warn ] [ [ no ] rxpow-lo-warn ] [ [ no ] txpow-hi-warn ] [ [ no ] txpow-lo-warn ] [ [ no ] txbi-hi-warn ] [ [ no ] txbi-lo-warn ] [ [ no ] vcc-hi-warn ] [ [ no ] vcc-lo-warn ] [ [ no ] temp-hi-warn ] [ [ no ] temp-lo-warn ] [ [ no ] ethp-aneg-fl ] [ [ no ] ethp-los ] [ [ no ] ethp-fail ] [ [ no ] ethp-loopback ] [ [ no ] ethp-conges ] [ [ no ] potsp-fail ] [ [ no ] e1port-fail ] [ [ no ] e1-tim-unlock ] [ [ no ] e1-los ] )
```

Command Parameters

Table 70.4-1 "Epon Alarm Control Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - name of the Alarm Control profile - length: 1<=x<=32	A unique profile name

Table 70.4-2 "Epon Alarm Control Profile Configuration Command" Command Parameters

Parameter	Type	Description
[no] equip-alm	Parameter type: boolean	<i>optional parameter</i> enable EquipmentAlarm
[no] power-alm	Parameter type: boolean	<i>optional parameter</i> enable PowerAlarm
[no] batt-miss	Parameter type: boolean	<i>optional parameter</i> enable BatteryMissing
[no] batt-fail	Parameter type: boolean	<i>optional parameter</i>

Parameter	Type	Description
		enable BatteryFailure
[no] batt-volt-low	Parameter type: boolean	<i>optional parameter</i> enable BatteryVoltLow
[no] phy-intr-alm	Parameter type: boolean	<i>optional parameter</i> enable PhysicalIntrusionAlarm
[no] selftest-fail	Parameter type: boolean	<i>optional parameter</i> enable ONUSelfTestFailure
[no] otemp-hi-alm	Parameter type: boolean	<i>optional parameter</i> enable ONUTempHighAlarm
[no] otemp-lo-alm	Parameter type: boolean	<i>optional parameter</i> enable ONUTempLowAlarm
[no] iad-conn-fail	Parameter type: boolean	<i>optional parameter</i> enable IADConnectionFailure
[no] pon-ifswitch	Parameter type: boolean	<i>optional parameter</i> enable PON_IFSwitch
[no] rxpow-hi-alm	Parameter type: boolean	<i>optional parameter</i> enable RXPowerHighAlarm
[no] rxpow-lo-alm	Parameter type: boolean	<i>optional parameter</i> enable RXPowerLowAlarm
[no] txpow-hi-alm	Parameter type: boolean	<i>optional parameter</i> enable TXPowerHighAlarm
[no] txpow-lo-alm	Parameter type: boolean	<i>optional parameter</i> enable TXPowerLowAlarm
[no] txbi-hi-alm	Parameter type: boolean	<i>optional parameter</i> enable TXBiasHighAlarm
[no] txbi-lo-alm	Parameter type: boolean	<i>optional parameter</i> enable TXBiasLowAlarm
[no] vcc-hi-alm	Parameter type: boolean	<i>optional parameter</i> enable VccHighAlarm
[no] vcc-lo-alm	Parameter type: boolean	<i>optional parameter</i> enable VccLowAlarm
[no] temp-hi-alm	Parameter type: boolean	<i>optional parameter</i> enable TempHighAlarm
[no] temp-lo-alm	Parameter type: boolean	<i>optional parameter</i> enable TempLowAlarm
[no] rxpow-hi-warn	Parameter type: boolean	<i>optional parameter</i> enable RXPowerHighWarning
[no] rxpow-lo-warn	Parameter type: boolean	<i>optional parameter</i> enable RXPowerLowWarning
[no] txpow-hi-warn	Parameter type: boolean	<i>optional parameter</i> enable TXPowerHighWarning
[no] txpow-lo-warn	Parameter type: boolean	<i>optional parameter</i> enable TXPowerLowWarning
[no] txbi-hi-warn	Parameter type: boolean	<i>optional parameter</i> enable TXBiasHighWarning
[no] txbi-lo-warn	Parameter type: boolean	<i>optional parameter</i> enable TXBiasLowWarning
[no] vcc-hi-warn	Parameter type: boolean	<i>optional parameter</i> enable VccHighWarning
[no] vcc-lo-warn	Parameter type: boolean	<i>optional parameter</i> enable VccLowWarning
[no] temp-hi-warn	Parameter type: boolean	<i>optional parameter</i> enable TempHighWarning
[no] temp-lo-warn	Parameter type: boolean	<i>optional parameter</i> enable TempLowWarning
[no] ethp-aneg-fl	Parameter type: boolean	<i>optional parameter</i> enable EthPortAutoNegFailure

70 Epon Profile Configuration Commands

Parameter	Type	Description
[no] ethp-los	Parameter type: boolean	<i>optional parameter</i> enable EthPortLOS
[no] ethp-fail	Parameter type: boolean	<i>optional parameter</i> enable EthPortFailure
[no] ethp-loopback	Parameter type: boolean	<i>optional parameter</i> enable EthPortLoopback
[no] ethp-conges	Parameter type: boolean	<i>optional parameter</i> enable EthPortCongestion
[no] potsp-fail	Parameter type: boolean	<i>optional parameter</i> enable POTSPortFailure
[no] e1port-fail	Parameter type: boolean	<i>optional parameter</i> enable E1PortFailure
[no] e1-tim-unlock	Parameter type: boolean	<i>optional parameter</i> enable E1TimingUnlock
[no] e1-los	Parameter type: boolean	<i>optional parameter</i> enable E1LOS

71- Epon Profile Configuration Commands

71.1 Epon Profile Configuration Command Tree	71-1834
71.2 OTDR enable Command for PON	71-1835

71.1 Epon Profile Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Epon Profile Configuration Commands".

Command Tree

```
----configure
  ----epon
    ----alarm
      ----[no] flag
        - (alarm-idx)
        - software-version
        - [no] fireware-version
        - flag-alarm-state
```

71.2 OTDR enable Command for PON

Command Description

This command allows the operator to enable or disable the otdr functionality on the given epon.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure epon alarm ( no flag (alarm-idx) ) | ( flag (alarm-idx) software-version <Epon::SoftWareVersion> [ no
fireware-version | fireware-version <Epon::FireWareVersion> ] flag-alarm-state <Epon::FlagAlarmState> )
```

Command Parameters

Table 71.2-1 "OTDR enable Command for PON" Resource Parameters

Resource Identifier	Type	Description
(alarm-idx)	Format: - the epon alarm flag index - range: [1...250]	index to the alarm

Table 71.2-2 "OTDR enable Command for PON" Command Parameters

Parameter	Type	Description
software-version	Parameter type: <Epon::SoftWareVersion> Format: - Epon alarm sw version - length: x<=16	<i>mandatory parameter</i> the software version
[no] fireware-version	Parameter type: <Epon::FireWareVersion> Format: - Epon alarm fw version - length: x<=16	<i>optional parameter with default value: ""</i> the fireware version
flag-alarm-state	Parameter type: <Epon::FlagAlarmState> Format: (sameasctc21 diffwithctc21) Possible values: - sameasctc21 : alarm state is same as ctc - diffwithctc21 : alarm state is not same as ctc	<i>mandatory parameter</i> the flag alarm state

72- Tr069 Server Management Configuration Commands

72.1 Tr069 Server Management Configuration Command Tree	72-1837
72.2 ONT Tr069 Configuration Command	72-1838

72.1 Tr069 Server Management Configuration

Command Tree

Description

This chapter gives an overview of nodes that are handled by "Tr069 Server Management Configuration Commands".

Command Tree

```
----configure
  ----tr069serv
    ----[no] ont
      - (uni-idx)
      - [no] securi-prof
      - [no] vlan
      - [no] pbit
      - [no] admin-state
```

72.2 ONT Tr069 Configuration Command

Command Description

This command allows the operator to set ONT Tr069 provisioning data.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure tr069serv ( no ont (uni-idx) ) | ( ont (uni-idx) [ no securi-prof | securi-prof
<Gpon::SecureUriProfilePointer> ] [ no vlan | vlan <Gpon::Tr069VlanId> ] [ no pbit | pbit <Gpon::Pbit> ] [ no
admin-state | admin-state <Gpon::AdminStatus> ] )
```

Command Parameters

Table 72.2-1 "ONT Tr069 Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId>	identification of the uni interface index

Resource Identifier	Type	Description
	- the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Table 72.2-2 "ONT Tr069 Configuration Command" Command Parameters

Parameter	Type	Description
[no] securi-prof	Parameter type: <Gpon::SecureUriProfilePointer> Format: (none <Gpon::SecureUriProfilePointer> name : <AsamProfileName>) Possible values: - none : no profile to associate - name : profile name Field type <Gpon::SecureUriProfilePointer> - profile index - range: [0...50] Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: 0L</i> Tr069 server security profile pointer
[no] vlan	Parameter type: <Gpon::Tr069VlanId> Format: - vlan id for tr069 server - range: [1...4093,4097]	<i>optional parameter with default value: 4097</i> vlan id for tr069 server
[no] pbit	Parameter type: <Gpon::Pbit> Format: - gpon pbit - range: [0...7]	<i>optional parameter with default value: 0</i> p-bit value for tr069 server
[no] admin-state	Parameter type: <Gpon::AdminStatus> Format: (down up) Possible values: - down : set the admin-state to down - up : set the admin-state to up	<i>optional parameter with default value: "down"</i> administrative status of the interface

73- Snmp Agent Management Configuration Commands

73.1 Snmp Agent Management Configuration Command Tree	73-1841
73.2 ONT Snmp-agent Configuration Command	73-1842

73.1 Snmp Agent Management Configuration

Command Tree

Description

This chapter gives an overview of nodes that are handled by "Snmp Agent Management Configuration Commands".

Command Tree

```
----configure
  ----snmp-agent
    ----[no] ont
      - (uni-idx)
      - [no] read-community
      - [no] write-community
      - [no] iphc-vlan
```

73.2 ONT Snmp-agent Configuration Command

Command Description

This command allows the operator to set ONT Snmp-agent provisioning data.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure snmp-agent ( no ont (uni-idx) ) | ( ont (uni-idx) [ no read-community | read-community
<Gpon::CommunityString> ] [ no write-community | write-community <Gpon::CommunityString> ] [ no iphc-vlan
| iphc-vlan <Gpon::MgmtVlanId> ] )
```

Command Parameters

Table 73.2-1 "ONT Snmp-agent Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(uni-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId>	identification of the uni interface index

Resource Identifier	Type	Description
	- the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Table 73.2-2 "ONT Snmp-agent Configuration Command" Command Parameters

Parameter	Type	Description
[no] read-community	Parameter type: <Gpon::CommunityString> Format: - ont community string - length: 1<=x<=24	<i>optional parameter with default value: "public"</i> read community for snmp agent
[no] write-community	Parameter type: <Gpon::CommunityString> Format: - ont community string - length: 1<=x<=24	<i>optional parameter with default value: "private"</i> write community for snmp agent
[no] iphc-vlan	Parameter type: <Gpon::MgmtVlanId> Format: - vlan id for management service - range: [0,1...4093]	<i>optional parameter with default value: 0</i> iphc vlan for snmp agent

74- Distributed Router Configuration Commands

74.1 Distributed Router Configuration Command Tree	74-1845
74.2 Drouter IP Configuration Command	74-1846
74.3 Inbound MPLS LSP Configuration Command	74-1848
74.4 Static Outbound MPLS LSP Configuration Command	74-1849
74.5 SDP Configuration Command	74-1851

74.1 Distributed Router Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Distributed Router Configuration Commands".

Command Tree

```

----configure
  ----dist-router
    ----[no] interface
      - (lt-vlan)
      - [no] addrtype
      - ip-address
      - [no] mpls
    ----mpls
      ----[no] interface
        - (index)
        - label-map
      ----[no] static-lsp
        - (lsp-name)
        - interface
        - push
        - [no] nexthopaddrtype
        - nexthop
    ----[no] sdp
      - (sdp-id)
      - lsp-name
  
```

74.2 Drouter IP Configuration Command

Command Description

This command allows the operator to configure a distributed router IP interface on a linecard and assign an IP address.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-router ( no interface (lt-vlan) ) | ( interface (lt-vlan) [ no addrtype | addrtype
<Drouter::IpAddressType> ] ip-address <Drouter::IntfAddAndMask> [ [ no ] mpls ] )
```

Command Parameters

Table 74.2-1 "Drouter IP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(lt-vlan)	Format: (slot-vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> : <Eqpt::UnstackedVlan> slot-stacked : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> : <Eqpt::SVlan> : <Eqpt::CVlan>) Possible values: - slot-vlan : slot unstacked (supported vlan [1...4093]) - slot-stacked : slot stacked (supported cvlan [0...4093]) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	lt-vlan index

Table 74.2-2 "Drouter IP Configuration Command" Command Parameters

Parameter	Type	Description
[no] addrtype	Parameter type: <Drouter::IpAddressType> Format: (ipv4	<i>optional parameter with default value: "ipv4"</i> specify the type of IP address

Parameter	Type	Description
	ipv6) Possible values: - ipv4 : ipv4 - ipv6 : ipv6	
ip-address	Parameter type: <Drouter::IntfAddAndMask> Format: <Drouter::V4AddressHex> / <Drouter::PrefixLength> Field type <Drouter::V4AddressHex> - IP Address Field type <Drouter::PrefixLength> - prefix length of the subnet - range: [1...31]	<i>mandatory parameter</i> specify IP Address
[no] mpls	Parameter type: boolean	<i>optional parameter</i> enable MPLS on the IP interface

74.3 Inbound MPLS LSP Configuration Command

Command Description

This command allows the operator to configure an inbound MPLS LSP, include the MPLS label of an incoming MPLS tunnel.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-router mpls ( no interface (index) label-map <Drouter::InSegLabel> ) | ( interface (index) label-map <Drouter::InSegLabel> )
```

Command Parameters

Table 74.3-1 "Inbound MPLS LSP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: (slot-vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> : <Eqpt::UnstackedVlan> slot-stacked : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> : <Eqpt::SVlan> : <Eqpt::CVlan>) Possible values: - slot-vlan : slot unstacked - slot-stacked : slot stacked Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	MPLS enabled ip interface index
label-map	Parameter type: <Drouter::InSegLabel> Format: - MPLS Insegment label - range: [32...1023]	Specify incoming MPLS label

74.4 Static Outbound MPLS LSP Configuration Command

Command Description

This command allows the operator to configure a static outbound MPLS LSP, include the MPLS label and nexthop of an outgoing MPLS tunnel.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-router mpls ( no static-lsp (lsp-name) ) | ( static-lsp (lsp-name) interface <Drouter::IfIndex> push
<Drouter::OutLabel> [ no nexthopaddrtype | nexthopaddrtype <Drouter::IpAddressType> ] nexthop
<Ip::V4AddressHex> )
```

Command Parameters

Table 74.4-1 "Static Outbound MPLS LSP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(lsp-name)	Format: - LSP name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	Administrative name for the LSP

Table 74.4-2 "Static Outbound MPLS LSP Configuration Command" Command Parameters

Parameter	Type	Description
interface	Parameter type: <Drouter::IfIndex> Format: (slot-vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> : <Eqpt::UnstackedVlan> slot-stacked : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> : <Eqpt::SVlan> : <Eqpt::CVlan>) Possible values: - slot-vlan : slot unstacked - slot-stacked : slot stacked Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	<i>mandatory parameter</i> specify the outgoing interface

74 Distributed Router Configuration Commands

Parameter	Type	Description
	Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	
push	Parameter type: <Drouter::OutLabel> Format: - Out Label - range: [1...1048575]	<i>mandatory parameter</i> specify the outgoing label
[no] nexthopaddrtype	Parameter type: <Drouter::IpAddressType> Format: (ipv4 ipv6) Possible values: - ipv4 : ipv4 - ipv6 : ipv6	<i>optional parameter with default value: "ipv4"</i> specify the type of next hop IP address
nexthop	Parameter type: <Ip::V4AddressHex> Format: - IPv4-address	<i>mandatory parameter</i> Next hop IP address

74.5 SDP Configuration Command

Command Description

This command allows the operator to configure an SDP (typically corresponding to an MPLS tunnel).

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-router ( no sdp (sdp-id) ) | ( sdp (sdp-id) lsp-name <Drouter::MplsLspName> )
```

Command Parameters

Table 74.5-1 "SDP Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(sdp-id)	Format: - SDP ID - range: [1...17407]	SDP Identifier

Table 74.5-2 "SDP Configuration Command" Command Parameters

Parameter	Type	Description
lsp-name	Parameter type: <Drouter::MplsLspName> Format: - LSP name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> LSP name to set the LSP list

75.1 Distributed Service Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Distributed Service Configuration Commands".

Command Tree

```
----configure
  ----[no] dist-service
    - (service-id)
    - [no] service-type
    - [no] qos-profile
  ----[no] sdp
    - (spoke-sdp-id)
    - egress-vc-label
    - ingress-vc-label
  ----apipe-sdp
    - (spoke-sdpid)
    - [no] max-cells
    - [no] max-delay
  ----[no] apipe-pvc
    - (atm-pvc)
    - in-mapped-vpi
    - in-mapped-vci
    - out-mapped-vpi
    - out-mapped-vci
```

75.2 Distributed Service Configuration Command

Command Description

This command allows the operator to configure a distributed service.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-service (service-id) [ no service-type | service-type <Drouter::ServiceType> ] [ no qos-profile | qos-profile <Qos::QosSessionProfileName> ]
```

Command Parameters

Table 75.2-1 "Distributed Service Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(service-id)	Format: - Service ID - range: [1...2147483647]	Service Identifier

Table 75.2-2 "Distributed Service Configuration Command" Command Parameters

Parameter	Type	Description
[no] service-type	Parameter type: <Drouter::ServiceType> Format: (unknown epipe p3pipe tls vprn ies mirror apipe fpipe ipipe cpipe) Possible values: - unknown : unknown - epipe : epipe - p3pipe : p3pipe - tls : tls - vprn : vprn - ies : ies - mirror : mirror	<i>optional parameter with default value: "apipe"</i> Service type to be configured

Parameter	Type	Description
	- apipe : apipe - fpipe : fpipe - ipipe : ipipe - cpipe : cpipe	
[no] qos-profile	Parameter type: <Qos::QosSessionProfileName> Format: (none name : <Qos::IgnoredQosProfileName>) Possible values: - none : no profile name to associate - name : enter profile name to be associated Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "none"</i> qos profile attached to the service

75.3 SDP Binding Configuration Command

Command Description

This command allows the operator to associate an SDP (typically corresponding to an MPLS tunnel) to a service.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-service (service-id) ( no sdp (spoke-sdp-id) ) | ( sdp (spoke-sdp-id) egress-vc-label  
<Drouter::EgressLabel> ingress-vc-label <Drouter::IngressLabel> )
```

Command Parameters

Table 75.3-1 "SDP Binding Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(service-id)	Format: - Service ID - range: [1...2147483647]	Service Identifier
(spoke-sdp-id)	Format: id : <Drouter::SdpId> Possible values: - id : SDP ID Field type <Drouter::SdpId> - SDP ID - range: [1...17407]	SDP Identifier

Table 75.3-2 "SDP Binding Configuration Command" Command Parameters

Parameter	Type	Description
egress-vc-label	Parameter type: <Drouter::EgressLabel> Format: - MPLS Egress label - range: [1...1048575]	<i>mandatory parameter</i> MPLS label used by this device to send packets out
ingress-vc-label	Parameter type: <Drouter::IngressLabel> Format: - MPLS ingress label - range: [2048...18431]	<i>mandatory parameter</i> MPLS label used by the far-end device

75.4 APIPE SDP Binding Configuration Command

Command Description

This command allows the operator to configure the particular association between an SDP (typically corresponding to an MPLS tunnel) and an APIPE service, including the specific handling of upstream cell concatenation. It is used to configure an ATM Pseudowire on a linecard.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-service (service-id) apipe-sdp (spoke-sdpid) [ no max-cells | max-cells <Drouter::MaxCells> ] [ no max-delay | max-delay <Drouter::MaxDelay> ]
```

Command Parameters

Table 75.4-1 "APIPE SDP Binding Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(service-id)	Format: - Service ID - range: [1...2147483647]	Service Identifier
(spoke-sdpid)	Format: id : <Drouter::SdpId> Possible values: - id : SDP ID Field type <Drouter::SdpId> - SDP ID - range: [1...17407]	SDP Identifier

Table 75.4-2 "APIPE SDP Binding Configuration Command" Command Parameters

Parameter	Type	Description
[no] max-cells	Parameter type: <Drouter::MaxCells> Format: - Maximum number of ATM cells to accumulate into a MPLS packet - range: [1...8]	<i>optional parameter with default value: 1</i> Maximum number of ATM cells to accumulate into a MPLS packet
[no] max-delay	Parameter type: <Drouter::MaxDelay> Format: - Maximum amount of time to wait while performing ATM cell concatenation into an MPLS packet - unit: msec - range: [1...10]	<i>optional parameter with default value: 4</i> Maximum amount of time to wait while performing ATM cell concatenation into an MPLS packet

75.5 VCL Binding Configuration Command

Command Description

This command allows the operator to configure an ATM cross-connect between an ATM PVC on the DSL line and the ATM VPI/VCI value used in an ATM Pseudowire.

User Level

The command can be accessed by operators with drouter privileges, and executed by operators with drouter privileges.

Command Syntax

The command has the following syntax:

```
> configure dist-service (service-id) ( no apipe-pvc (atm-pvc) ) | ( apipe-pvc (atm-pvc) in-mapped-vpi
<Drouter::InMappedVpi> in-mapped-vci <Drouter::InMappedVci> out-mapped-vpi <Drouter::OutMappedVpi>
out-mapped-vci <Drouter::OutMappedVci> )
```

Command Parameters

Table 75.5-1 "VCL Binding Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(service-id)	Format: - Service ID - range: [1...2147483647]	Service Identifier
(atm-pvc)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI	atm pvc index

Table 75.5-2 "VCL Binding Configuration Command" Command Parameters

Parameter	Type	Description
in-mapped-vpi	Parameter type: <Drouter::InMappedVpi> Format:	<i>mandatory parameter</i> atm inmapped vpi value for the

Parameter	Type	Description
	- In-mapped VPI - range: [0...255]	apipe service
in-mapped-vci	Parameter type: <Drouter::InMappedVci> Format: - In-mapped VCI - range: [32...65535]	<i>mandatory parameter</i> atm inmapped vci value for the apipe service
out-mapped-vpi	Parameter type: <Drouter::OutMappedVpi> Format: - Out-mapped VPI - range: [0...255]	<i>mandatory parameter</i> atm outmapped vpi value for the apipe service
out-mapped-vci	Parameter type: <Drouter::OutMappedVci> Format: - Out-mapped VCI - range: [32...65535]	<i>mandatory parameter</i> atm outmapped vci value for the apipe service

76- BCMP Configuration Commands

76.1 BCMP Configuration Command Tree	76-1861
76.2 BCMP system Configuration Commands	76-1862

76.1 BCMP Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "BCMP Configuration Commands".

Command Tree

```
----configure
  ----bcmp
    ----system
      - [no] adminstate
      - [no] serveripaddr
      - [no] serverudpport
```

76.2 BCMP system Configuration Commands

Command Description

This command allows the operator to manage the BCMP system parameters.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure bcmp system [ no adminstate | adminstate <bcmp::bcmpAdminState> ] [ no serveripaddr | serveripaddr <Ip::V4Address> ] [ no serverudpport | serverudpport <bcmp::bcmpServerUdpPort> ]
```

Command Parameters

Table 76.2-2 "BCMP system Configuration Commands" Command Parameters

Parameter	Type	Description
[no] adminstate	Parameter type: <bcmp::bcmpAdminState> Format: (enable-bcmp disable-bcmp) Possible values: - enable-bcmp : start bcmp protocol handling in the system - disable-bcmp : stop bcmp protocol handling in the system	<i>optional parameter with default value: "disable-bcmp"</i> the switch to specify the admin state of BCMP subsystem
[no] serveripaddr	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter with default value: "192.168.100.100"</i> the IP address of BCMP server
[no] serverudpport	Parameter type: <bcmp::bcmpServerUdpPort> Format: - the Bcmp Server Udp port - range: [1...65535]	<i>optional parameter with default value: 5000</i> the Socket UDP port of BCMP server

77.2 Generic PON Data Path Integrity Threshold command

Command Description

This command configures the PON/Channel-pair Data Path Integrity Threshold

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> configure generic-pon dpinteg-threshold <Gpon::dpintegThreshold>

Command Parameters

Table 77.2-2 "Generic PON Data Path Integrity Threshold command" Command Parameters

Parameter	Type	Description
dpinteg-threshold	Parameter type: <Gpon::dpintegThreshold> Format: - Datapath Integrity Threshold - range: [0...100]	<i>optional parameter</i> configure data-path integrity threshold value for gpon/ngpon2

77.3 Generic PON Utilization PM Mode Configuration Command

Command Description

This command configures the generic PON (system-wide) utilization performance monitoring modes for PONs and channel-pairs.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure generic-pon utilization [ no pon-pmcollect | pon-pmcollect <Gpon::OntPmTcaCollect> ] [ no ont-pmcollect | ont-pmcollect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 77.3-2 "Generic PON Utilization PM Mode Configuration Command" Command Parameters

Parameter	Type	Description
[no] pon-pmcollect	Parameter type: <Gpon::OntPmTcaCollect> Format: (none pm-enable tca-enable) Possible values: - none : no pm - pm-enable : enable pm - tca-enable : enable tca	<i>optional parameter with default value: "none"</i> system-wide PON / channel-pair utilization performance monitoring
[no] ont-pmcollect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> system-wide utilization ONT detailed performance monitoring

77.4 Generic PON Utilization TCA Threshold Configuration Command

Command Description

This command configures the generic PON (system-wide) utilization TCA threshold parameters for PONs and channel-pairs.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure generic-pon utilization threshold [ no txmcutilhi | txmcutilhi <Gpon::PonUtilTcaThresholdPercent> ] [
no txmcutilmd | txmcutilmd <Gpon::PonUtilTcaThresholdPercent> ] [ no txmcutillo | txmcutillo
<Gpon::PonUtilTcaThresholdPercent> ] [ no txtotutilhi | txtotutilhi <Gpon::PonUtilTcaThresholdPercent> ] [ no
txtotutilmd | txtotutilmd <Gpon::PonUtilTcaThresholdPercent> ] [ no txtotutillo | txtotutillo
<Gpon::PonUtilTcaThresholdPercent> ] [ no rxtotutilhi | rxtotutilhi <Gpon::PonUtilTcaThresholdPercent> ] [ no

[no] rxtotdropfrmlo	Parameter type: <Gpon::PonUtilTcaDroppedPacketsThreshold> Format: (disabled <Gpon::PonUtilTcaDroppedPacketsThreshold>) Possible values: - disabled : threshold is disabled Field type <Gpon::PonUtilTcaDroppedPacketsThreshold> - dropped frames threshold - range: [0...1000000000]	<i>optional parameter with default value: "disabled"</i> Number of dropped frames that will result in declaration of T-RXTOTCDROPFMRMLO alarm

Parameter	Type	Description
[no] numtcint	Parameter type: <Gpon::PonUtilTcaInterval> Format: (1 <Gpon::PonUtilTcaInterval>) Possible values: - 1 : Initial Default Field type <Gpon::PonUtilTcaInterval> - interval threshold - range: [1...96]	<i>optional parameter with default value: "1"</i> Number of contiguous 5-minute intervals for the non-DBA PON utilization thresholds to be exceeded for TCA alarm generation or clearing
[no] numtcintdba	Parameter type: <Gpon::PonUtilTcaInterval> Format: (1 <Gpon::PonUtilTcaInterval>) Possible values: - 1 : Initial Default Field type <Gpon::PonUtilTcaInterval> - interval threshold - range: [1...96]	<i>optional parameter with default value: "1"</i> Number of contiguous 5-minute intervals for the DBA PON congestion thresholds to be exceeded for TCA alarm generation or clearing
[no] dbacongthresh	Parameter type: <Gpon::PonUtilTcaCongThreshold> Format: (90 <Gpon::PonUtilTcaCongThreshold>) Possible values: - 90 : Initial Default Field type <Gpon::PonUtilTcaCongThreshold> - dba congestion percentage threshold - range: [0...100]	<i>optional parameter with default value: "90"</i> Configured DBA congestion threshold as a percentage of the maximum consumable bandwidth

77.5 System ONT Configuration Command

Command Description

This command is to configure the system wide ONT related parameters.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure generic-pon ont [ no slid-mode | slid-mode <Gpon::SlidMode> ] [ no sn-bundle-timer | sn-bundle-timer
<Gpon::SnBundleTimer> ] [ no sw-ver-mis-block | sw-ver-mis-block <Gpon::SwVerMisBlock> ] [ no
sn-autounlock | sn-autounlock <Gpon::OntAuthMode> ]
```

Command Parameters

Table 77.5-2 "System ONT Configuration Command" Command Parameters

Parameter	Type	Description
[no] slid-mode	Parameter type: <Gpon::SlidMode> Format: (ascii hexa-dec) Possible values: - ascii : ascii interpretation for subscriber location - hexa-dec : hexadecimal mode interpretation for subscriber location	<i>optional parameter with default value: "ascii"</i> display interpretation for gpon/ngpon2 subscriber location id
[no] sn-bundle-timer	Parameter type: <Gpon::SnBundleTimer> Format: - the system timer for auto bundling sn - unit: hour - range: [1...72]	<i>optional parameter with default value: 24L</i> the system timer for bundling sn with loid/slid when gpon/ngpon2 ont is in auto-bundle mode
[no] sw-ver-mis-block	Parameter type: <Gpon::SwVerMisBlock> Format: (enable disable) Possible values: - enable : block the user traffic when ont version mismatch - disable : do not block the user traffic when ont version mismatch	<i>optional parameter with default value: "enable"</i> the control behavior of user traffic block when for gpon/ngpon2 ont version mismatch
[no] sn-autounlock	Parameter type: <Gpon::OntAuthMode> Format: (disable enable) Possible values:	<i>optional parameter with default value: "disable"</i> unlock ONT automatically after ONT authenticated

Parameter	Type	Description
	- disable : disable unlock ONT automatically after ONT authenticated - enable : enable unlock ONT automatically after ONT authenticated	

77.6 Power Shedding Profile Configuration Command

Command Description

This command allows the operator to configure the Power Shedding Profiles for gpon and ngpon2

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure generic-pon ( no power-shed-prof (profile-idx) ) | ( power-shed-prof (profile-idx) profile-name
<AsamProfileName> [ no restore-time | restore-time <Gpon::RestoreTime> ] [ no data-class-time | data-class-time
<Gpon::DataClassTime> ] [ no voice-class-time | voice-class-time <Gpon::VoiceClassTime> ] [ no
video-class-time | video-class-time <Gpon::VideoClassTime> ] [ no dsl-class-time | dsl-class-time
<Gpon::DslClassTime> ] [ no ces-class-time | ces-class-time <Gpon::CesClassTime> ] )
```

Command Parameters

Table 77.6-1 "Power Shedding Profile Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(profile-idx)	Format: - profile index - range: [1...50]	profile index

Table 77.6-2 "Power Shedding Profile Configuration Command" Command Parameters

Parameter	Type	Description
profile-name	Parameter type: <AsamProfileName> Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	<i>mandatory parameter</i> <i>The parameter is not visible during modification.</i> name of the profile
[no] restore-time	Parameter type: <Gpon::RestoreTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible during modification.</i> time delay required before resetting timers to zero after a full power restore
[no] data-class-time	Parameter type: <Gpon::DataClassTime> Format: - zero means no-shed, and one means immediate-shed	<i>optional parameter with default value: 0L</i> <i>The parameter is not visible</i>

Parameter	Type	Description
	- unit: secs - range: [0...28800]	during modification. time delay required before shedding power for data uni classes.
[no] voice-class-time	Parameter type: <Gpon::VoiceClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	optional parameter with default value: 0L The parameter is not visible during modification. the time delay required before shedding power for voice uni classes.
[no] video-class-time	Parameter type: <Gpon::VideoClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	optional parameter with default value: 0L The parameter is not visible during modification. the time delay required before shedding power for the video uni class.
[no] dsl-class-time	Parameter type: <Gpon::DslClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	optional parameter with default value: 0L The parameter is not visible during modification. the time delay required before shedding power for dsl uni classes.
[no] ces-class-time	Parameter type: <Gpon::CesClassTime> Format: - zero means no-shed, and one means immediate-shed - unit: secs - range: [0...28800]	optional parameter with default value: 0L The parameter is not visible during modification. the time delay required before shedding power for ces uni classes.

Command Output

Table 77.6-3 "Power Shedding Profile Configuration Command" Display parameters

Specific Information		
name	Type	Description
scope	Parameter type: <Gpon::Scope> (local network) Possible values: - local : local scope - network : network wide scope	scope of the profile <i>This element is always shown.</i>

77.7 OLT GIS info Configuration Command

Command Description

This command configures the OLT GIS info.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure generic-pon gis-info [ no longitude | longitude <Gpon::OltLongitude> ] [ no latitude | latitude <Gpon::OltLatitude> ] [ no elevation | elevation <Gpon::OltElevation> ] [ no horizontal-error | horizontal-error <Gpon::OltHrzErr> ] [ no altitude-error | altitude-error <Gpon::OltAltErr> ] [ no area-code | area-code <Gpon::OltAreaCode> ] [ no timestamp | timestamp <Gpon::OltTimestamp> ] [ no gis-digest | gis-digest <Gpon::OltGisDigest> ] [ no gis-check | gis-check <Gpon::OltGisCheck> ]
```

Command Parameters

Table 77.7-2 "OLT GIS info Configuration Command" Command Parameters

Parameter	Type	Description
[no] longitude	Parameter type: <Gpon::OltLongitude> Format: - longitude of the GIS info - unit: degree - range: [-180.00000...180.00000]	<i>optional parameter with default value: "0.00000"</i> longitude of GIS info
[no] latitude	Parameter type: <Gpon::OltLatitude> Format: - latitude of the GIS info - unit: degree - range: [-90.00000...90.00000]	<i>optional parameter with default value: "0.00000"</i> latitude of GIS info
[no] elevation	Parameter type: <Gpon::OltElevation> Format: - latitude of the GIS info - unit: meter - range: [-32768...32767]	<i>optional parameter with default value: "0"</i> elevation of GIS info
[no] horizontal-error	Parameter type: <Gpon::OltHrzErr> Format: - horizontal error of the GIS info - unit: meter - range: [0...65535]	<i>optional parameter with default value: "0"</i> horizontal error of GIS info
[no] altitude-error	Parameter type: <Gpon::OltAltErr> Format: - altitude error of the GIS info - unit: meter	<i>optional parameter with default value: "0"</i> altitude error of GIS info

Parameter	Type	Description
	- range: [0...65535]	
[no] area-code	Parameter type: <Gpon::OltAreaCode> Format: - altitude error of the GIS info - 12 Decimal charaters - length: 12	<i>optional parameter with default value: "000000000000"</i> area code of GIS info
[no] timestamp	Parameter type: <Gpon::OltTimestamp> Format: - the seconds eclapsed since 1970-01-01:00:00:00 - unit: Seconds - range: [0...4294967295]	<i>optional parameter with default value: "0"</i> timestamp of GIS info
[no] gis-digest	Parameter type: <Gpon::OltGisDigest> Format: - digest of the GIS info - 16 hex characters - length: 16	<i>optional parameter with default value: "0000000000000000"</i> GIS digest of GIS info
[no] gis-check	Parameter type: <Gpon::OltGisCheck> Format: - check of the GIS info - 4 hex characters - length: 4	<i>optional parameter with default value: "0000"</i> GIS digest of GIS info

77.8 System PONLOS Alarm Re-define Switch

Command Description

This command configures PONLOS (system-wide) alarm redefine switch for PONs and channel-pairs.

if disable, "PONLOS" means original Loss of Signal; if enable, "PONLOS" will be redefined for trunk fiber broken

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> configure generic-pon alarmflag [no ponlos-alarm-ctrl | ponlos-alarm-ctrl <Gpon::Alarmflag>]

Command Parameters

Table 77.8-2 "System PONLOS Alarm Re-define Switch" Command Parameters

Parameter	Type	Description
[no] ponlos-alarm-ctrl	Parameter type: <Gpon::Alarmflag> Format: (enable disable) Possible values: - enable : enable means trunk Fiber cutoff alarm - disable : disable means PONLOS alarm	<i>optional parameter with default value: "disable"</i> if disable, PONLOS means original Loss of Signal; if enable, PONLOS will be redefined for trunk fiber broken

78- CLI Alias Configuration Command

78.1 CLI Alias Configuration Command Tree	78-1882
78.2 CLI Alias Configuration Command	78-1883

78.1 CLI Alias Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "CLI Alias Configuration Command".

Command Tree

```
----configure
----[no] alias
  - (name)
  - (value)
```

78.2 CLI Alias Configuration Command

Command Description

This command allows the operator to configure CLI alias commands for the system.

Alias names may not match any of the reserved cli node keywords. Alias names may not contain whitespace or chars '?' or '#'. Alias names may not match an existing alias value.

Alias values may not contain chars '?' or '#'. '\n' or '\r' are disallowed unless they are used within literal string parameters. An alias value may not match an existing alias name.

Cli command parameters entered as part of the alias value will not be validated until the alias is executed.

The order of the displayed alias commands when executing the 'info configure alias' command does not persist after an NT switchover or reset.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> configure alias (name) (value)

Command Parameters

Table 78.2-1 "CLI Alias Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - alias name for the command - range: [a-z0-9] - length: 2<=x<=8	alias name

Table 78.2-2 "CLI Alias Configuration Command" Command Parameters

Parameter	Type	Description
(value)	Format: - command string for alias - length: 2<=x<=128	<i>mandatory parameter</i> command string for alias

79- Dhcp-Server Configuration Data

79.1 Dhcp-Server Configuration Data Tree	79-1885
79.2 Dhcp-Server Configuration Data	79-1886

79.1 Dhcp-Server Configuration Data Tree

Description

This chapter gives an overview of nodes that are handled by "Dhcp-Server Configuration Data".

Command Tree

```
----configure
  ----dhcp-server
    - start-addr
    - stop-addr
    - [no] lease-time
    - (restart)
```

79.2 Dhcp-Server Configuration Data

Command Description

This command allows the operator to manage the dhcp server information

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure dhcp-server [ start-addr <Ip::V4Address> ] [ stop-addr <Ip::V4Address> ] [ no lease-time | lease-time <CWMP::LeaseTime> ] [ (restart) ]
```

Command Parameters

Table 79.2-2 "Dhcp-Server Configuration Data" Command Parameters

Parameter	Type	Description
start-addr	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter</i> the start address of dynamic IP pool
stop-addr	Parameter type: <Ip::V4Address> Format: - IPv4-address	<i>optional parameter</i> the stop address of dynamic IP pool
[no] lease-time	Parameter type: <CWMP::LeaseTime> Format: - the lease time for the client - unit: sec - range: [300...259200] - length: 300<=x<=259200	<i>optional parameter with default value: 43200L</i> the lease time for the client. The range of the value is [300s, 259200s]
(restart)	Format: restart Possible values: - restart : restart the dhcp server	<i>optional parameter</i> to restart the dhcp server, the dhcp-server configuration will be effective after restarting dhcp server

80- Cwmp platform Configuration Commands

80.1 Cwmp platform Configuration Command Tree	80-1888
80.2 Cwmp Platform Configuration Commands	80-1889

80.1 Cwmp platform Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Cwmp platform Configuration Commands".

Command Tree

```
----configure
  ----cwmp
    ----plt
      - [no] adminstate
```

80.2 Cwmp Platform Configuration Commands

Command Description

This command configure cwmp platform for nat function.

Note: Once the remaining-lease timer has expired, esponding user interface.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure cwmp plt [ no adminstate | adminstate <CWMP::AdminStatus> ]
```

Command Parameters

Table 80.2-2 "Cwmp Platform Configuration Commands" Command Parameters

Parameter	Type	Description
[no] adminstate	Parameter type: <CWMP::AdminStatus> Format: (unlocked locked) Possible values: - unlocked : the identified resource is allowed to be used - locked : the identified resource is not allowed to be used	<i>optional parameter with default value: "locked"</i> enable or disable the cwmp platform

81- *NAPT aging-time configuration Command*

81.1 NAPT aging-time configuration Command Tree	81-1891
81.2 NAPT aging-time configuration Command	81-1892

81.1 NAPT aging-time configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "NAPT aging-time configuration Command".

Command Tree

```
----configure
  ----nat
    - [no] aging-time
```

81.2 NAPT aging-time configuration Command

Command Description

This command is used to provision the aging time for the nat table.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure nat [ no aging-time | aging-time <CWMP::AgingTime> ]
```

Command Parameters

Table 81.2-2 "NAPT aging-time configuration Command" Command Parameters

Parameter	Type	Description
[no] aging-time	Parameter type: <CWMP::AgingTime> Format: - The range of the value is [60s, 240s], the default value is 120 seconds. - range: [60...240]	<i>optional parameter with default value: 120</i> the aging time for the napt record.

82- E1 Configuration Commands

82.1 E1 Configuration Command Tree	82-1894
82.2 E1 Configuration Command	82-1895

82.1 E1 Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "E1 Configuration Commands".

Command Tree

```
----configure
  ----e1
    ----line
      - (if-index)
      - [no] active
      - [no] line-coding
      - [no] framing-mode
      - [no] crc
      - [no] multi-framing
      - [no] transmit-clk-src
      - [no] line-impedance
      - [no] admin-up
```

82.2 E1 Configuration Command

Command Description

This command allows the operator to configure the E1 line.

User Level

The command can be accessed by operators with xdsl privileges, and executed by operators with xdsl privileges.

Command Syntax

The command has the following syntax:

```
> configure e1 line (if-index) [ [ no ] active ] [ no line-coding | line-coding <E1::LineCoding> ] [ no framing-mode
| framing-mode <E1::FramingMode> ] [ no crc | crc <E1::Crc> ] [ no multi-framing | multi-framing
<E1::MultiFraming> ] [ no transmit-clk-src | transmit-clk-src <E1::TransmitClkSrc> ] [ no line-impedance |
line-impedance <E1::LineImpedance> ] [ [ no ] admin-up ]
```

Command Parameters

Table 82.2-1 "E1 Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(if-index)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number	interface index of the port

Table 82.2-2 "E1 Configuration Command" Command Parameters

Parameter	Type	Description
[no] active	Parameter type: boolean	<i>optional parameter</i> set the span-profile active
[no] line-coding	Parameter type: <E1::LineCoding> Format: (ami hdb3) Possible values: - ami : Specifies Alternate Mark Inversion (AMI) as the linecode type - hdb3 : Specifies High-Density Bipolar 3 (HDB3) as the linecode type	<i>optional parameter with default value: "hdb3"</i> encoding type of the E1 interface
[no] framing-mode	Parameter type: <E1::FramingMode>	<i>optional parameter with default</i>

82 E1 Configuration Commands

Parameter	Type	Description
	Format: (unframed framed) Possible values: - unframed : Unframed E1 type - framed : Framed E1 type	<i>value: "unframed"</i> specifies framing of E1 interface
[no] crc	Parameter type: <E1::Crc> Format: (disable enable) Possible values: - disable : no CRC4 - enable : Enable CRC4	<i>optional parameter with default value: "disable"</i> enable or disable CRC4 for this e1 interface
[no] multi-framing	Parameter type: <E1::MultiFraming> Format: (disable enable) Possible values: - disable : No multi framing - enable : Enable multi framing	<i>optional parameter with default value: "disable"</i> Specifies if multi framing to be used
[no] transmit-clk-src	Parameter type: <E1::TransmitClkSrc> Format: (external internal) Possible values: - external : Specifies that the network clock source is used - internal : Specifies that the internal clock source is used	<i>optional parameter with default value: "external"</i> Specifies clock source to be used for the e1 interface
[no] line-impedance	Parameter type: <E1::LineImpedance> Format: (75ohms 120ohms) Possible values: - 75ohms : indicates the line impedance value unbalanced 75ohms - 120ohms : indicates the line impedance value balanced 120 ohms	<i>optional parameter with default value: "120ohms"</i> Nominal line impedance
[no] admin-up	Parameter type: boolean	<i>optional parameter</i> admin status is up

83- LLDPMed Configuration Commands

83.1 LLDPMed Configuration Command Tree	83-1898
83.2 LLDPMed Configuration Command	83-1899
83.3 LLDP port configuration	83-1900
83.4 LLDP MED Local Media Policy configuration	83-1903

83.1 LLDPMed Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "LLDPMed Configuration Commands".

Command Tree

```
----configure
  ----lldp-med
    ----[no] port
      - (port-index)
      - [no] adminstatus
      - [no] tx-msgtxinterval
      - [no] tx-msgtxhold
      - [no] tx-reinitdelay
      - [no] tx-txcreditmax
      - [no] tx-msgfasttx
      - [no] tx-txfastinit
    ----[no] media-policy
      - (port-index)
      - app-type
      - vlan-id
      - priority
      - dscp
      - unknown
      - tagged
```

83.2 LLDPMed Configuration Command

Command Description

This command allows the operator to specify LLDPMed parameters.

LLDP is specified as IEEE 802.1ab, while MED is specified by TIA-1057.

Currently only port config table and local media policy table are supported.

User Level

The command can be accessed by operators with lldpmed privileges, and executed by operators with lldpmed privileges.

Command Syntax

The command has the following syntax:

> configure lldp-med

83.3 LLDP port configuration

Command Description

LLDP port configuration implemented by private MIB definition which is based on:

<http://www.ieee802.org/1/files/public/MIBs/LLDP-V2-MIB-201502160000Z.txt>

User Level

The command can be accessed by operators with `lldpmed` privileges, and executed by operators with `lldpmed` privileges.

Command Syntax

The command has the following syntax:

```
> configure lldp-med ( no port (port-index) ) | ( port (port-index) [ no adminstatus | adminstatus
<LLDP::AdminStatus> ] [ no tx-msgtxinterval | tx-msgtxinterval <LLDP::MsgTxInterval> ] [ no tx-msgtxhold |
tx-msgtxhold <LLDP::MsgTxHold> ] [ no tx-reinitdelay | tx-reinitdelay <LLDP::ReinitDelay> ] [ no
tx-txcreditmax | tx-txcreditmax <LLDP::CreditMax> ] [ no tx-msgfasttx | tx-msgfasttx <LLDP::MsgFastTx> ] [ no
tx-txfastinit | tx-txfastinit <LLDP::MsgTxFastInit> ] )
```

Command Parameters

Table 83.3-1 "LLDP port configuration" Resource Parameters

Resource Identifier	Type	Description
(port-index)	Format: (uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - uni : uni - uni:ng2 : ngpon2 UNI style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId>	uni port

Resource Identifier	Type	Description
	- the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Table 83.3-2 "LLDP port configuration" Command Parameters

Parameter	Type	Description
[no] adminstatus	Parameter type: <LLDP::AdminStatus> Format: (tx-only rx-only tx-and-rx disabled) Possible values: - tx-only : txOnly - rx-only : rxOnly - tx-and-rx : txAndRx - disabled : disabled	<i>optional parameter with default value: "tx-and-rx"</i> The administratively desired status of the local LLDP agent.
[no] tx-msgtxinterval	Parameter type: <LLDP::MsgTxInterval> Format: - The interval at which LLDP frames are transmitted on behalf of this LLDP agent. - range: [5...32768]	<i>optional parameter with default value: 30</i> The interval at which LLDP frames are transmitted on behalf of this LLDP agent.
[no] tx-msgtxhold	Parameter type: <LLDP::MsgTxHold> Format: - The time-to-live value expressed as a multiple of the lldpV2MessageTxInterval object. - range: [2...10]	<i>optional parameter with default value: 4</i> msg tx hold multiplier
[no] tx-reinitdelay	Parameter type: <LLDP::ReinitDelay> Format: - the delay (in units of seconds) from when admin status becomes 'disabled' until re-initialization is attempted. - range: [1...10]	<i>optional parameter with default value: 2</i> delay (in units of seconds) from port disabled until re-initiated.
[no] tx-txcreditmax	Parameter type: <LLDP::CreditMax> Format: - The maximum number of consecutive LLDPDUs that can be transmitted at any time. - range: [1...100]	<i>optional parameter with default value: 5</i> The maximum number of consecutive LLDPDUs that can be transmitted at any time.
[no] tx-msgfasttx	Parameter type: <LLDP::MsgFastTx> Format: - The interval at which LLDP frames are transmitted on behalf of this LLDP agent during fast transmission period - range: [1...3600]	<i>optional parameter with default value: 1</i> tx interval during fast transmission period
[no] tx-txfastinit	Parameter type: <LLDP::MsgTxFastInit> Format: - determines the number of transmissions that are made in	<i>optional parameter with default value: 4</i> the number of transmissions that

83 LLDPMed Configuration Commands

Parameter	Type	Description
	fast transmission mode. - range: [1...8]	are made in fast transmission mode.

83.4 LLDP MED Local Media Policy configuration

Command Description

The MIB table *lldpXMedLocMediaPolicyTable* is readonly. To support modification of it, a private copy with read/write access has been introduced.

User Level

The command can be accessed by operators with *lldpmed* privileges, and executed by operators with *lldpmed* privileges.

Command Syntax

The command has the following syntax:

```
> configure lldp-med ( no media-policy (port-index) app-type <LLDP::AppType> ) | ( media-policy (port-index)
app-type <LLDP::AppType> vlan-id <Eqpt::VlanId> priority <Eqpt::Priority> dscp <Qos::DscpCodepoint>
unknown <LLDP::Boolean> tagged <LLDP::Boolean> )
```

Command Parameters

Table 83.4-1 "LLDP MED Local Media Policy configuration" Resource Parameters

Resource Identifier	Type	Description
(port-index)	Format: (uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / vuni) Possible values: - uni : uni - uni:ng2 : ngpon2 UNI style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId>	uni port

84- Dual-Parenting Configuration Commands

84.1 Dual-Parenting Configuration Command Tree

84-1907

84.1 Dual-Parenting Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "Dual-Parenting Configuration Commands".

Command Tree

----configure
----dual-parenting

85- Dual-Parenting ProtGrp Configuration Commands

85.1 Dual-Parenting ProtGrp Configuration Command Tree	85-1909
85.2 Dual-Parenting ProtGrp Configuration Command	85-1910

85.1 Dual-Parenting ProtGrp Configuration

Command Tree

Description

This chapter gives an overview of nodes that are handled by "Dual-Parenting ProtGrp Configuration Commands".

Command Tree

```
----configure
  ----dual-parenting
    ----[no] protection-group
      - (local-port)
      - prot-type
      - peer-node-name
      - protection-group-id
      - [no] prot-group-status
```

85.2 Dual-Parenting ProtGrp Configuration Command

Command Description

This command allows the operator to configure dual-parenting protection group. The system will decide which port of the two becomes active. In case of failure of one port the other port will take over. A forced switchover can also be triggered manually by the operator.

The port protection group is identified by the first port in the group that is intended to be protected. The following parameters can be configured for the protection group :

- *local-port-index*: the local-port-index that will ensure the protection of the first one.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure dual-parenting ( no protection-group (local-port) ) | ( protection-group (local-port) prot-type
<Equipm::DualParentProtGrpType> peer-node-name <Equipm::DualParentProtGrpPeerNodeName>
protection-group-id <Equipm::DualParentProtGrpId> [ [ no ] prot-group-status ] )
```

Command Parameters

Table 85.2-1 "Dual-Parenting ProtGrp Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(local-port)	Format: (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelPairId>	the local port identifier of the dual-parenting in the protection group

Resource Identifier	Type	Description
	- the channel pair identifier	

Table 85.2-2 "Dual-Parenting ProtGrp Configuration Command" Command Parameters

Parameter	Type	Description
prot-type	Parameter type: <Equipm::DualParentProtGrpType> Format: (primary secondary) Possible values: - primary : primary node - secondary : secondary node	<i>mandatory parameter</i> the dual-parenting protection group pro-type
peer-node-name	Parameter type: <Equipm::DualParentProtGrpPeerNodeName> Format: - a printable string - length: 1<=x<=127	<i>mandatory parameter</i> the dual-parenting peer-node-name
protection-group-id	Parameter type: <Equipm::DualParentProtGrpId> Format: - index of dual-parenting protection group - range: [1...127]	<i>mandatory parameter</i> the protection group id in the dual-parenting protection group
[no] prot-group-status	Parameter type: boolean	<i>optional parameter</i>

86- Dual-Parenting local-node Configuration Commands

86.1 Dual-Parenting local-node Configuration Command Tree	86-1913
86.2 Dual-Parenting local-node Configuration Command	86-1914

86.1 Dual-Parenting local-node Configuration

Command Tree

Description

This chapter gives an overview of nodes that are handled by "Dual-Parenting local-node Configuration Commands".

Command Tree

```
----configure
  ----dual-parenting
    ----[no] local-node
      - (node-id)
      - node-name
      - ip_subnet
```

86.2 Dual-Parenting local-node Configuration

Command

Command Description

This command allows the operator to configure a local node . The system will decide which port of the two becomes active. In case of failure of one port the other port will take over. A forced switchover can also be triggered manually by the operator.

The port protection group is identified by the first port in the group that is intended to be protected. The following parameters can be configured for the protection group :

- *local-node-id: the local-node-id that will ensure the protection of the first one.*

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure dual-parenting ( no local-node (node-id) ) | ( local-node (node-id) node-name
<Equipm::DualParentProtGrpLocalNodeName> ip_subnet <Ip::V4Address> )
```

Command Parameters

Table 86.2-1 "Dual-Parenting local-node Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(node-id)	Format: - index of node id - range: [1...15]	the config of dual-parenting local-node id

Table 86.2-2 "Dual-Parenting local-node Configuration Command" Command Parameters

Parameter	Type	Description
node-name	Parameter type: <code><Equipm::DualParentProtGrpLocalNodeName></code> Format: - a printable string - length: 1<=x<=127	<i>mandatory parameter</i> the dual-parenting of local-node-name
ip_subnet	Parameter type: <code><Ip::V4Address></code> Format: - IPv4-address	<i>mandatory parameter</i> the ip_subnet of local-node.must config it like:x.x.0.0

87- Dual-Parenting peer-node Configuration Commands

87.1 Dual-Parenting peer-node Configuration Command Tree	87-1916
87.2 Dual-Parenting peer-node Configuration Command	87-1917

87.1 Dual-Parenting peer-node Configuration

Command Tree

Description

This chapter gives an overview of nodes that are handled by "Dual-Parenting peer-node Configuration Commands".

Command Tree

```
----configure
  ----dual-parenting
    ----[no] peer-node
      - (node-id)
      - node-name
      - sync-vlan
```

87.2 Dual-Parenting peer-node Configuration

Command

Command Description

This command allows the operator to configure peer node. The system will decide which port of the two becomes active. In case of failure of one port the other port will take over. A forced switchover can also be triggered manually by the operator.

The port protection group is identified by the first port in the group that is intended to be protected. The following parameters can be configured for the protection group :

- *peer-node-id: the peer-node-id that will ensure the protection of the first one.*

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure dual-parenting ( no peer-node (node-id) ) | ( peer-node (node-id) node-name
<Equipm::DualParentProtGrpPeerNodeName> sync-vlan <Eqpt::SyncVlanId> )
```

Command Parameters

Table 87.2-1 "Dual-Parenting peer-node Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(node-id)	Format: - index of node id - range: [1...15]	the config of dual-parenting peer-node id

Table 87.2-2 "Dual-Parenting peer-node Configuration Command" Command Parameters

Parameter	Type	Description
node-name	Parameter type: <Equipm::DualParentProtGrpPeerNodeName> Format: - a printable string - length: 1<=x<=127	<i>mandatory parameter</i> the dual-parenting of peer-node name
sync-vlan	Parameter type: <Eqpt::SyncVlanId> Format: - Sync vlan index - range: [2...4093]	<i>mandatory parameter</i> the sync-vlan-id for dual-parenting typeb

88- *Interface Management Configuration*

Commands

88.1 Interface Management Configuration Command Tree	88-1919
88.2 TC-layer Performance Monitoring Command	88-1920

88.1 Interface Management Configuration

Command Tree

Description

This chapter gives an overview of nodes that are handled by "Interface Management Configuration Commands".

Command Tree

```
----configure
  ----tc-layer
    ----ont-side
      - (ont-idx)
      - [no] pm-collect
```

88.2 TC-layer Performance Monitoring Command

Command Description

This command allows the operator to enable or disable the ONT-side Gem Port Performance Monitor collection for the ONT.

User Level

The command can be accessed by operators with equipment privileges, and executed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> configure tc-layer ont-side (ont-idx) [ no pm-collect | pm-collect <Gpon::OntPmCollect> ]
```

Command Parameters

Table 88.2-1 "TC-layer Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> voip:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> mcast : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> voip : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> mcast:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId>) Possible values: - mcast : multicast - mcast:ng2 : ngpon2 multicast style identification - uni : uni - uni:ng2 : ngpon2 UNI style identification - voip : voip - voip:ng2 : voip Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	ONT index

Resource Identifier	Type	Description
	- the LT slot number - Field type <Eqpt::PonId> - the PON identifier - Field type <Eqpt::ChannelGroupId> - the channel group identifier - Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier - Field type <Eqpt::OntId> - the ONT identifier - Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier - Possible values: - vuni : virtual NGPON2 uni identifier - Field type <Eqpt::OntSlotId> - the ONT SLOT identifier - Field type <Eqpt::OntPortId> - the ONT PORT identifier - Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier - Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Table 88.2-2 "TC-layer Performance Monitoring Command" Command Parameters

Parameter	Type	Description
[no] pm-collect	Parameter type: <Gpon::OntPmCollect> Format: (enable disable) Possible values: - enable : enable PM - disable : disable PM	<i>optional parameter with default value: "disable"</i> pm collect enable

89- IPv6 Configuration Commands

89.1 IPv6 Configuration Command Tree	89-1923
89.2 ipv6 anti-spoofing Configuration Command	89-1924

89.1 IPv6 Configuration Command Tree

Description

This chapter gives an overview of nodes that are handled by "IPv6 Configuration Commands".

Command Tree

```
----configure
  ----ipv6-antispoofing
    ----slot
      - (slot)
      - [no] bit-len
```

89.2 ipv6 anti-spoofing Configuration Command

Command Description

This command allows the operator to configure the bit length of the IPv6 address on which IPv6 anti-spoofing based.

User Level

The command can be accessed by operators with ip privileges, and executed by operators with ip privileges.

Command Syntax

The command has the following syntax:

```
> configure ipv6-antispoofing slot (slot) [ no bit-len | bit-len <ipv6::bitLength> ]
```

Command Parameters

Table 89.2-1 "ipv6 anti-spoofing Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(slot)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId>) Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	the physical number of the slot

Table 89.2-2 "ipv6 anti-spoofing Configuration Command" Command Parameters

Parameter	Type	Description
[no] bit-len	Parameter type: <ipv6::bitLength> Format: - number of bits that is checked during IPv6 address anti-spoofing. - range: [64,128]	<i>optional parameter with default value: "64"</i> bit length of the IPv6 address on which IPv6 anti-spoofing based

90.2 mcast Channel Configuration Command

Command Description

This command allows the operator to create and configure the mcast channel parameters.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ( no channel (port) ) | ( channel (port) [ no perm-pkg-bitmap | perm-pkg-bitmap
<Igmp::PermPkgBitMap> ] [ no max-num-group | max-num-group <Igmp::ChannelMaxNumGroup> ] [ no mode |
mode <Igmp::ChannelProtocolMode> ] [ (cac-disable) ] [ (ip-anti-spoof-dis) ] [ no igmp-version | igmp-version
<Igmp::UserItfVersion> ] [ no mld-version | mld-version <Igmp::MldUserItfVersion> ] [ no forking | forking
<Igmp::ForkingStatus> ] [ no lt-ont-signaling | lt-ont-signaling <Igmp::ChannelLtOntSignaling> ] [ no
mc-pbit-value | mc-pbit-value <Igmp::McPbitValue> ] [ no mcast-vlan-id | mcast-vlan-id
<Igmp::ProtocolMcastVlan> ] [ no mc-vlan-xlate | mc-vlan-xlate <Igmp::mcVlanXlateAdmin> ] [ no
mcast-svc-context | mcast-svc-context <Igmp::McastSvcCtxtName> ] [ no max-msg-rate | max-msg-rate
<Igmp::ChannelMaxMsgRate> ] [ no ip-version | ip-version <Igmp::ip-version> ] )
```

Command Parameters

Table 90.2-1 "mcast Channel Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> /	identification of the port, vlanport or virtual channel

Resource Identifier	Type	Description
	Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Field type <Eqpt::OntId> - the ONT identifier Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier,range 1 for EPON,range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	

Table 90.2-2 "mcast Channel Configuration Command" Command Parameters

Parameter	Type	Description
[no] perm-pkg-bitmap	Parameter type: <IgmP::PermPkgBitMap> Format: - a binary string - length: 128	<i>optional parameter with default value:</i> "01 : 00 : 00 : 00 : 00 : 00 : : 00 :" packages, the user is allowed to join
[no] max-num-group	Parameter type: <IgmP::ChannelMaxNumGroup> Format: - Max group number this port can support.The value depends on the board type and port type,please refer to the	<i>optional parameter with default value:</i> 0 Max group number this port can support.The value depends on the

Parameter	Type	Description
	product information document for detail. - range: [0...2048]	board type and port type, please refer to the product information document for detail.
[no] mode	Parameter type: <Igmp::ChannelProtocolMode> Format: (ipoe pppoe) Possible values: - ipoe : IPoE mode - pppoe : PPPoE mode	<i>optional parameter with default value: "ipoe"</i> protocol mode (ipoe or pppoe)
(cac-disable)	Format: (cac-disable cac) Possible values: - cac-disable : disables bandwidth CAC for conf. streams, default=enable - cac : enables bandwidth CAC for conf. streams, default=enable	<i>obsolete parameter that will be ignored</i> bandwidth CAC for pre-configured multicast streams
(ip-anti-spoof-dis)	Format: (ip-anti-spoof-dis ip-anti-spoof) Possible values: - ip-anti-spoof-dis : disables IP@ anti-spoofing, default=enable - ip-anti-spoof : enables IP@ anti-spoofing, default=enable	<i>obsolete parameter that will be ignored</i> enables IP@ anti-spoofing on this user-interface
[no] igmp-version	Parameter type: <Igmp::UserItfVersion> Format: (system-inherited 2 3) Possible values: - system-inherited : inherits GMQs to user version from the system level - 2 : IGMPV2 GMQs - 3 : IGMPV3 GMQs	<i>optional parameter with default value: "system-inherited"</i> version of the IGMP protocol
[no] mld-version	Parameter type: <Igmp::MldUserItfVersion> Format: (system-inherited 1 2) Possible values: - system-inherited : inherits GMQs to user version from the system level - 1 : MLDV1 GMQs - 2 : MLDV2 GMQs	<i>optional parameter with default value: "system-inherited"</i> version of the MLD protocol
[no] forking	Parameter type: <Igmp::ForkingStatus> Format: (system-inherited enable disable) Possible values: - system-inherited : inherits forking status from the system level - enable : enable IGMP forking - disable : disable IGMP forking	<i>optional parameter with default value: "system-inherited"</i> forking status of the IGMP protocol
[no] lt-ont-signaling	Parameter type: <Igmp::ChannelLtOntSignaling> Format:	<i>optional parameter with default value: "inherited"</i>

90 Mcast control Configuration Commands

Parameter	Type	Description
	(enabled disabled inherited) Possible values: - enabled : lt to ont signaling is enabled - disabled : lt to ont signaling is disabled - inherited : inherits lt to ont signaling from the system level	<i>The parameter is not visible during modification.</i> lt to ont signaling parameter
[no] mc-pbit-value	Parameter type: <Igmp::McPbitValue> Format: - default P-bit value to be used by the ONT on the UNI-side for downstream multicast traffic towards subscribers - range: [0...8]	<i>optional parameter with default value: 8</i> default P-bit value to be used by the ONT on the UNI-side for downstream multicast traffic towards subscribers
[no] mcast-vlan-id	Parameter type: <Igmp::ProtocolMcastVlan> Format: - vlan selection value - range: [0...4093]	<i>optional parameter with default value: 0</i> vlan selection for multicast channel
[no] mc-vlan-xlate	Parameter type: <Igmp::mcVlanXlateAdmin> Format: (enabled disabled) Possible values: - enabled : allow mcast vlan translation - disabled : disallow mcast vlan translation	<i>optional parameter with default value: "disabled"</i> to enable or disable mcast vlan translation
[no] mcast-svc-context	Parameter type: <Igmp::McastSvcCtxtName> Format: (name : <Qos::IgnoredQosProfileName> default) Possible values: - default : Default profile is associated - name : Name of the multicast service context profile Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	<i>optional parameter with default value: "default"</i> Multicast Service Context Name
[no] max-msg-rate	Parameter type: <Igmp::ChannelMaxMsgRate> Format: - Maximum number of Upstream IGMP messages that can be received on this IGMP channel - unit: messages/second - range: [0...256]	<i>optional parameter with default value: 0</i> Default value 0 indicates that the value is inherited from what is set in the system wide setting using command - configure qos dsl-ctrl-pkt-policer sustained-rate [1...64] burst-size [1...128]
[no] ip-version	Parameter type: <Igmp::ip-version> Format: (ipv4 ipv6) Possible values: - ipv4 : support IGMP - ipv6 : support MLD	<i>optional parameter with default value: "ipv4"</i> the protocol the user want to use, IGMP(ipv4) or MLD(ipv6).

90.3 IGMP Channel Permission Package Members Configuration Command

Command Description

This command allows the operator to configure the IGMP channel permission package members.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control channel (port) ( no fullview-packages (package) ) | ( fullview-packages (package) )
```

Command Parameters

Table 90.3-1 "IGMP Channel Permission Package Members Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpiId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId>	identification of the port, vlanport or virtual channel

Resource Identifier	Type	Description
	vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> vlan:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan>) Possible values: - vlan : vlan port - vlan:ng2 : ngpon2 vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Field type <Eqpt::OntId> - the ONT identifier	

Resource Identifier	Type	Description
	Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	
(package)	Format: - the package number - range: [1...1024]	package member

90.4 IGMP Channel Preview Package Members Configuration Command

Command Description

This command allows the operator to configure the IGMP channel preview package members.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control channel (port) ( no preview-packages (package) ) | ( preview-packages (package) )
```

Command Parameters

Table 90.4-1 "IGMP Channel Preview Package Members Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VciId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VciId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : <Eqpt::VpId> : <Eqpt::VciId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> : <Eqpt::UnstackedVlan> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId>	identification of the port, vlanport or virtual channel

Resource Identifier	Type	Description
	vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip : <Eqpt::UnstackedVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni : <Eqpt::UnstackedVlan> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / voip <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / vuni vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> : <Eqpt::UnstackedVlan> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::LLId> vlan:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : stacked : <Eqpt::SVlan> : <Eqpt::CVlan> vlan:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> : <Eqpt::UnstackedVlan>) Possible values: - vlan : vlan port - vlan:ng2 : ngpon2 vlan port Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PortId> - the port number Field type <Eqpt::VpiId> - atm VPI Field type <Eqpt::VciId> - atm VCI Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Field type <Eqpt::OntId> - the ONT identifier	

90 Mcast control Configuration Commands

Resource Identifier	Type	Description
	Possible values: - voip : virtual uni identifier obsolete alternative replaced by vuni - vuni : virtual uni identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier Field type <Eqpt::LLId> - the LLID identifier, range 1 for EPON, range 1-8 for DPOE Possible values: - stacked : stacked vlan identity Field type <Eqpt::UnstackedVlan> - unstacked vlan id Field type <Eqpt::SVlan> - service vlan id Field type <Eqpt::CVlan> - customer vlan id	
(package)	Format: - the package number - range: [1...1024]	package member

90.5 mcast System Configuration Command

Command Description

This command allows the operator to configure the mcast parameters that are globally applicable to the Node.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control system [ no src-ip-address | src-ip-address <Ip::V4Address> ] [ no v6-src-ip-address |
v6-src-ip-address <Igmp::Ipv6LinkLocalAddress> ] [ [ no ] verify-checksum ] [ no query-interval | query-interval
<Igmp::SystemQueryInterval> ] [ no max-rsp-time | max-rsp-time <Igmp::SystemQueryMaxResponseTime> ] [ no
robustness | robustness <Igmp::SystemRobustness> ] [ no mem-query-int | mem-query-int
<Igmp::MembQueryIntvl> ] [ no last-memb-cnt | last-memb-cnt <Igmp::MembQueryCount> ] [ no
last-max-rsp-tim | last-max-rsp-tim <Igmp::SystemLastMembMaxRespTime> ] [ no host-report-intv |
host-report-intv <Igmp::SystemUnsolicitedReportIntvl> ] [ [ no ] start ] [ no preview-valid | preview-valid
<Igmp::SystemPrevalidIntvl> ] [ no cdr-validation | cdr-validation <Igmp::SystemPrecdrvalidIntvl> ] [ [ no ]
cdr-generation ] [ no except-cdr-rate | except-cdr-rate <Igmp::CDRGenerationForSingles> ] [ no cdr-export |
cdr-export <Igmp::CDRGenerationMethod> ] [ no cdr-file-aging | cdr-file-aging <Igmp::CDRFileAgingTime> ] [
no cdr-polling | cdr-polling <Igmp::CDRSystemPollingCycle> ] [ no user-igmp-version | user-igmp-version
<Igmp::igmpSystemGMQToUserSideVersion> ] [ no netw-igmp-version | netw-igmp-version
<Igmp::V3ProcessingAdminStatus> ] [ no user-mld-version | user-mld-version
<Igmp::igmpSystemMLDGMQToUserSideVersion> ] [ no netw-mld-version | netw-mld-version
<Igmp::MldProcessingAdminStatus> ] [ no v3-max-num-rec | v3-max-num-rec
<Igmp::V3MaxNumRecordsReport> ] [ [ no ] forking ] [ [ no ] lt-ont-signaling ] [ [ no ] vlan-selection ] [ [ no ]
disc-lwr-version ] [ no uncfg-mcast-supp | uncfg-mcast-supp <Igmp::igmpSystemUncfgMcastSupport> ]
```

Command Parameters

Table 90.5-2 "mcast System Configuration Command" Command Parameters

Parameter	Type	Description
[no] src-ip-address	Parameter type: <Ip::V4Address> Format: - IPv4-address	optional parameter with default value: "0.0.0.0" source ip addr which is tx in every mcast IP datagram
[no] v6-src-ip-address	Parameter type: <Igmp::Ipv6LinkLocalAddress> Format: - ipv6 link local address	optional parameter with default value: "::: source ipv6 address(link local address) which is tx in every mcast IP datagram
[no] verify-checksum	Parameter type: boolean	optional parameter verification performed on Rx mcast frame
[no] query-interval	Parameter type: <Igmp::SystemQueryInterval>	optional parameter with default

90 Mcast control Configuration Commands

Parameter	Type	Description
	Format: - interval at which general membership queries transmitted - unit: sec - range: [2...3175]	<i>value: 125</i> interval at which general membership queries transmitted
[no] max-rsp-time	Parameter type: <Igmp::SystemQueryMaxResponseTime> Format: - max query response time advertised in queries - unit: 1/10 sec - range: [1...31744]	<i>optional parameter with default value: 100</i> max query response time advertised in queries 1/10 sec
[no] robustness	Parameter type: <Igmp::SystemRobustness> Format: - tuning for the expected packet loss on a subnet - range: [1...10]	<i>optional parameter with default value: 2</i> expected pkt loss on subnet
[no] mem-query-int	Parameter type: <Igmp::MembQueryIntvl> Format: - spacing between GSQs (group-specific queries) - unit: 1/10 sec - range: [2...31744]	<i>optional parameter with default value: 10</i> minimum interval between group-specific queries
[no] last-memb-cnt	Parameter type: <Igmp::MembQueryCount> Format: - number of GSQs (group-specific queries) to be sent - range: [1...10]	<i>optional parameter with default value: 2</i> number of GSQs (group-specific queries) to be sent
[no] last-max-rsp-tim	Parameter type: <Igmp::SystemLastMembMaxRespTime> Format: - allows shorter max response time - unit: 1/10 sec - range: [1...31744]	<i>optional parameter with default value: 2</i> allows shorter max response time
[no] host-report-intv	Parameter type: <Igmp::SystemUnsolicitedReportIntvl> Format: - interval of repetitions of host's report of grp membership - unit: 1/10 sec - range: [1...255]	<i>optional parameter with default value: 10</i> interval of repetitions of host's report of grp membership
[no] start	Parameter type: boolean	<i>optional parameter</i> start Mcast app module
[no] preview-valid	Parameter type: <Igmp::SystemPrevalidIntvl> Format: - time interval that confirm the preview session is valid - unit: sec - range: [1...120]	<i>optional parameter with default value: 8</i> time interval that confirm the preview session is valid
[no] cdr-validation	Parameter type: <Igmp::SystemPrecdrvalidIntvl> Format: (none <Igmp::SystemPrecdrvalidIntvl>) Possible values: - none : CDR generation valid immediately Field type <Igmp::SystemPrecdrvalidIntvl> - minimum session time for generating a CDR - unit: sec - range: [0...120]	<i>optional parameter with default value: 2</i> minimum session time for generating a CDR
[no] cdr-generation	Parameter type: boolean	<i>optional parameter</i> start CDR generation in the system
[no] except-cdr-rate	Parameter type: <Igmp::CDRGenerationForSingles> Format: - limit the generation of CDR records - unit: min - range: [1...30]	<i>optional parameter with default value: 3</i> limit the generation of the CDR records

Parameter	Type	Description
[no] cdr-export	Parameter type: <Igmpp::CDRGenerationMethod> Format: (local-file-storage remote-logging) Possible values: - local-file-storage : method the cdr generated and forwarded - remote-logging : remote logging method	<i>optional parameter with default value: "local-file-storage"</i> the method the cdr is to be generated and forwarded
[no] cdr-file-aging	Parameter type: <Igmpp::CDRFileAgingTime> Format: - configure the CDR file aging time - unit: hour - range: [4...24]	<i>optional parameter with default value: 8</i> configure the CDR file aging time
[no] cdr-polling	Parameter type: <Igmpp::CDRSystemPollingCycle> Format: - configure the polling period for the CDR records, in multiples of 60 - unit: sec - range: [60...900]	<i>optional parameter with default value: 180</i> configure the polling period for the CDR records
[no] user-igmp-version	Parameter type: <Igmpp::igmpSystemGMQToUserSideVersion> Format: (2 3) Possible values: - 2 : IGMPv2 GMQs - 3 : IGMPv3 GMQs	<i>optional parameter with default value: "3"</i> version of the IGMP protocol
[no] netw-igmp-version	Parameter type: <Igmpp::V3ProcessingAdminStatus> Format: (2 3) Possible values: - 2 : IGMP version2 - 3 : IGMP version3	<i>optional parameter with default value: "3"</i> version for IGMP packet to receive/forward to n/w side
[no] user-mld-version	Parameter type: <Igmpp::igmpSystemMLDGMQToUserSideVersion> Format: (1 2) Possible values: - 1 : MLDv1 GMQs - 2 : MLDv2 GMQs	<i>optional parameter with default value: "2"</i> version of the MLD protocol
[no] netw-mld-version	Parameter type: <Igmpp::MldProcessingAdminStatus> Format: (1 2) Possible values: - 1 : MLDV1 version1 - 2 : MLDV2 version2	<i>optional parameter with default value: "2"</i> version for MLD packet to receive/forward to n/w side
[no] v3-max-num-rec	Parameter type: <Igmpp::V3MaxNumRecordsReport> Format: - max number of records in an IGMPv3 membership report - range: [0...10]	<i>optional parameter with default value: 3</i> max num of group records in one IGMPv3 or MLDv2 report (2 exp N)
[no] forking	Parameter type: boolean	<i>optional parameter</i> enable IGMP forking in the system level
[no] lt-ont-signaling	Parameter type: boolean	<i>optional parameter</i>

90 Mcast control Configuration Commands

Parameter	Type	Description
		enables It to ont signaling at system level
[no] vlan-selection	Parameter type: boolean	<i>optional parameter</i> enable vlan selection
[no] disc-lwr-version	Parameter type: boolean	<i>optional parameter</i> discard lower version packets
[no] uncfg-mcast-supp	Parameter type: <Igmpr::igmpSystemUncfgMcastSupport> Format: (legacy asmandssm) Possible values: - legacy : enable un-configured SSM and ASM support for GPON LTs and un-configured ASM support alone for DSL LTs - asmandssm : enable unconfigured SSM and ASM support for GPON and DSL LT cards	<i>optional parameter with default value: "legacy"</i> enable un-configured SSM/ASM support for GPON/DSL LT cards

90.6 IGMP System CDR Type Configuration Command

Command Description

This command allows the operator to configure the IGMP system Call Detail Record

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control system cdr-type [ [ no ] periodic ] [ no period | period <Igmp::IntermGenCDRPeriod> ] [
[ no ] attempt-max-pview ] [ [ no ] attempt-blackout ] [ [ no ] attempt-no-perm ]
```

Command Parameters

Table 90.6-2 "IGMP System CDR Type Configuration Command" Command Parameters

Parameter	Type	Description
[no] periodic	Parameter type: boolean	<i>optional parameter</i> interim CDR records generated for fullview/preview
[no] period	Parameter type: <Igmp::IntermGenCDRPeriod> Format: - intermediate CDR generation period, in multiples of 5 - unit: min - range: [15...60]	<i>optional parameter with default value: 15</i> intermediate CDR generation period
[no] attempt-max-pview	Parameter type: boolean	<i>optional parameter</i> CDR generated when max nbr preview exceeded is true
[no] attempt-blackout	Parameter type: boolean	<i>optional parameter</i> CDR generated allowed when blackout period is active
[no] attempt-no-perm	Parameter type: boolean	<i>optional parameter</i> CDR generated to join a mcast with no access rights

90.7 MLD Vlan System Configuration Command

Command Description

This command allows the operator to configure the MLD parameters on a per Vlan basis.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ipv6
```

90.8 MLD Vlan System Configuration Command

Command Description

This command allows the operator to configure the MLD parameters on a per Vlan basis.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ipv6 ( no vlan (vlan-id) ) | ( vlan (vlan-id) netw-mld-version
<Igmp::VlanMldV2ProcessStatus> [ no mldv2-max-num-rec | mldv2-max-num-rec
<Igmp::MldV2MaxNumRecordReport> ] )
```

Command Parameters

Table 90.8-1 "MLD Vlan System Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(vlan-id)	Format: - vlan index - range: [1...4093]	index of the system vlan

Table 90.8-2 "MLD Vlan System Configuration Command" Command Parameters

Parameter	Type	Description
netw-mld-version	Parameter type: <Igmp::VlanMldV2ProcessStatus> Format: (1 2) Possible values: - 1 : MLD version1 - 2 : MLD version2	<i>mandatory parameter</i> MLD version of the protocol
[no] mldv2-max-num-rec	Parameter type: <Igmp::MldV2MaxNumRecordReport> Format: - max num of group records in one MLDv2 report (2 exp N) - range: [0...10]	<i>optional parameter with default value: 3</i> max num of group records in one MLDv2 report (2 exp N)

90.9 IGMP Vlan System Configuration Command

Command Description

This command allows the operator to configure the IGMP parameters on a per Vlan basis.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ipv4
```

90.10 IGMP Vlan System Configuration Command

Command Description

This command allows the operator to configure the IGMP parameters on a per Vlan basis.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ipv4 ( no vlan (vlan-id) ) | ( vlan (vlan-id) netw-igmp-version
<Igmp::VlanV3ProcessStatus> [ no v3-max-num-rec | v3-max-num-rec <Igmp::V3MaxNumRecordReport> ] )
```

Command Parameters

Table 90.10-1 "IGMP Vlan System Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(vlan-id)	Format: - vlan index - range: [1...4093]	index of the system vlan

Table 90.10-2 "IGMP Vlan System Configuration Command" Command Parameters

Parameter	Type	Description
netw-igmp-version	Parameter type: <Igmp::VlanV3ProcessStatus> Format: (2 3) Possible values: - 2 : IGMP version2 - 3 : IGMP version3	<i>mandatory parameter</i> IGMP version of the protocol
[no] v3-max-num-rec	Parameter type: <Igmp::V3MaxNumRecordReport> Format: - max num of group records in one IGMPv3 or MLDv2 report (2 exp N) - range: [0...10]	<i>optional parameter with default value: 3</i> max num of group records in one IGMPv3 report (2 exp N)

90.11 mcast Multicast Vlan Translation Command

Command Description

This command allows the operator configure source-pon vlan translation.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ( no mc-vlan-xlate (nwvlan) ) | ( mc-vlan-xlate (nwvlan) ponvlan <Igmp::mcPonVlanId> )
```

Command Parameters

Table 90.11-1 "mcast Multicast Vlan Translation Command" Resource Parameters

Resource Identifier	Type	Description
(nwvlan)	Format: - the multicast vlan id - range: [2...4093]	identification of the network-side virtual lan

Table 90.11-2 "mcast Multicast Vlan Translation Command" Command Parameters

Parameter	Type	Description
ponvlan	Parameter type: <Igmp::mcPonVlanId> Format: - vlan index - range: [1...4093]	<i>mandatory parameter</i> identification of the pon-side virtual lan

90.12 Multicast Pon Vlan Translation Command

Command Description

This command allows the operator configure source-pon vlan translation on pon port.

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control ( no mc-pon-vlan-xlate (pon) nwvlan <Igmp::mcSrcVlanId> ) | ( mc-pon-vlan-xlate (pon) nwvlan <Igmp::mcSrcVlanId> ponvlan <Igmp::mcPonVlanId> )
```

Command Parameters

Table 90.12-1 "Multicast Pon Vlan Translation Command" Resource Parameters

Resource Identifier	Type	Description
(pon)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	identification of the pon interface
nwvlan	Parameter type: <Igmp::mcSrcVlanId> Format: - the multicast vlan id - range: [2...4093]	identification of the network-side virtual lan

Table 90.12-2 "Multicast Pon Vlan Translation Command" Command Parameters

Parameter	Type	Description
ponvlan	Parameter type: <Igmp::mcPonVlanId> Format: - vlan index - range: [1...4093]	<i>mandatory parameter</i> identification of the pon-side virtual lan

90.13 Multicast Service Context Configuration

Command

Command Description

This command allows the operator to configure multicast service context

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

> configure mcast-control (no mcast-svc-context (name)) | (mcast-svc-context (name))

Command Parameters

Table 90.13-1 "Multicast Service Context Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(name)	Format: - a profile name - range: [a-zA-Z0-9-_.] - length: 1<=x<=32	A unique profile name for the service context

90.14 mcast Package Bitmaps Configuration Command

Command Description

This command allows the operator to configure mcast package bitmaps. The package is intended primarily for use by a network/element manager, such as an AMS, to support multiple sets of packages in different regions.

A package is a group of zero or more multicast sources that share a common access permission. Grouping the source channels into one or more packages provides flexibility for the service provider to deliver different levels of services to the end users; for example, "Basic Package", "Middle-Tier Package", and "Premium Package".

***NOTE:** There is no requirement to configure the package. If the package is modified, there is no effect on the multicast source.*

User Level

The command can be accessed by operators with igmp privileges, and executed by operators with igmp privileges.

Command Syntax

The command has the following syntax:

```
> configure mcast-control package (index) [ no name | name <Igmp::igmpPackageName> ] [ no template-name |
template-name <Igmp::igmpPackageTemplateName> ] [ no template-version | template-version
<Igmp::igmpPackageTemplateVersion> ]
```

Command Parameters

Table 90.14-1 "mcast Package Bitmaps Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of the package - range: [1...1024]	index of the package

Table 90.14-2 "mcast Package Bitmaps Configuration Command" Command Parameters

Parameter	Type	Description
[no] name	Parameter type: <Igmp::igmpPackageName> Format: - a printable string - length: x<=32	<i>optional parameter with default value: ""</i> name of the package
[no] template-name	Parameter type: <Igmp::igmpPackageTemplateName> Format: - a printable string - length: x<=32	<i>optional parameter with default value: ""</i> name of the service template containing this pkg
[no] template-version	Parameter type: <Igmp::igmpPackageTemplateVersion> Format: - version of the service template containing this package	<i>optional parameter with default value: 0</i> version of the service template

91.2 Slot Status Command

Command Description

This command shows the slot status. The following information is shown for each slot:

- *type* : describes the type of the unit that is currently present in the slot.
- *capab-profile*: capability profile assigned to the slot, applicable for line boards, NTIOs and mini-NT NRNT-A.
- *oper-status*: describes whether the unit is able to perform its normal operation.
- *error-status*: provides the reason why the board is not operational. These values correspond to the alarms generated in case of a failure.
- *available-status*: provides further information regarding the state of the unit.
- *manufacturer*: provides an identification of the unit manufacturer.
- *inventory-pba*: provides the Nokia Printed Board Assembly code of the unit.
- *inventory-fpba*: provides the Nokia Printed Board Assembly code of the unit which also identifies the boot software.
- *inventory-ics*: provides the Item Change Status iteration code of the unit.
- *inventory-clei*: provides the (USA) Common Language Equipment Identification code of the unit.
- *serial-no*: provides the serial number of the board.
- *failed-test*: provides identification of the last failing test using four numbers, from MSB to LSB:
 - - table number (1 byte)
 - - segment number (1 byte)
 - - case number (1 byte)
 - - check number (1 byte)

As long as there has been no failing self test, the value of this attribute will be 0.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment slot [ (slot) ]
```

Command Parameters

availability	Parameter type: <Equipm::AvailStatus> (available in-test failed power-off not-installed offline dependency ext-managed) Possible values: - available : - in-test : - failed :	Specifies the state of the board. It is set to available after a successful selftest of the board (if applicable). <i>This element is always shown.</i>

91 Equipment Status Commands

name	Type	Description
	- power-off : - not-installed : - offline : - dependency : - ext-managed :	
alarm-profile	Parameter type: <Equipm::AlarmProf> (none name : <PrintableString-0-32>) Possible values: - none : no profile name to associate - name : profile name Field type <PrintableString-0-32> - a printable string - length: x<=32	The name of the customized alarm profile that is allocated to the board, if any. <i>This element is only shown in detail mode.</i>
capab-profile	Parameter type: <Equipm::CapabilityProfile> Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	To display the configured profile of the board. <i>This element is only shown in detail mode.</i>
operational-mode	Parameter type: <Equipm::OperationalMode> (not-set gpon xgs mpm-gpon-xgs dual-gpon u-ngpon twenty-five-g ng-pon2 mpm-gpon-xgpon) Possible values: - not-set : cage mode not-set - gpon : cage mode set to gpon - xgs : cage mode set to xgs - mpm-gpon-xgs : cage mode set to mpm-gpon-xgs - dual-gpon : cage mode set to dual-gpon - u-ngpon : cage mode set to u-ngpon - twenty-five-g : cage mode set to 25g - ng-pon2 : cage mode set to ng-pon2 - mpm-gpon-xgpon : cage mode set to mpm-gpon-xgpon	To display the configured profile of the board. <i>This element is only shown in detail mode.</i>
manufacturer	Parameter type: <PrintableString> - printable string	Specifies the company of the board. <i>This element is only shown in detail mode.</i>
mnemonic	Parameter type: <PrintableString> - printable string	Specifies the name of the board. <i>This element is only shown in detail mode.</i>
pba-code	Parameter type: <PrintableString> - printable string	Specifies the Nokia printed board assembly code of of the board. <i>This element is only shown in detail mode.</i>
fpba-code	Parameter type: <PrintableString> - printable string	Specifies the Nokia printed board assembly code of the board, which also identifies the boot software. <i>This element is only shown in detail mode.</i>
fpba-ics	Parameter type: <PrintableString>	Specifies the item change status

name	Type	Description
	- printable string	iteration code of the board. <i>This element is only shown in detail mode.</i>
clei-code	Parameter type: <PrintableString> - printable string	Specifies the common language equipment identification code of the board. <i>This element is only shown in detail mode.</i>
serial-no	Parameter type: <PrintableString> - printable string	Specifies the serial number of the board. <i>This element is only shown in detail mode.</i>
failed-test	Parameter type: <Equipm::Octet-4> - a binary string	Specifies the last failing test. <i>This element is only shown in detail mode.</i>
lt-restart-time	Parameter type: <Equipm::restartTime> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	The last restart time. This element is supported on LTs as well as NTs. <i>This element is only shown in detail mode.</i>
lt-restart-cause	Parameter type: <Equipm::eqptBoardLastRestartCause> (poweron watchdog cold_reset warm_reset hot_reset hot_reload clean_data emergency_build poweron_reset commit_failure timezone_modified other) Possible values: - poweron : restart after power on - watchdog : restart triggered by HW watchdog timeout - cold_reset : HW reset of the board with selftest - warm_reset : HW reset of the board without selftest - hot_reset : operational SW restart without HW reset - hot_reload : operational SW reload and restart without HW reset - clean_data : operational SW triggered HW reset with DB clean - emergency_build : cold reset when error escalation mechanism keeps failing - poweron_reset : operational SW triggered restart as poweron - commit_failure : restart due to new SW package commit failure - timezone_modified : restart reported due to a change in Time Zone offset - other : restart due to unknown reason	the cause of the most recent restart of the board <i>This element is only shown in detail mode.</i>
lt-restart-num short name: restrt-cnt	Parameter type: <Counter> - 32 bit counter	the number of times the board has restarted (It is only applicable for LTs) <i>This element is always shown.</i>
restart-cnt-per-lt	Parameter type: <Counter>	the number of times the board has

91 Equipment Status Commands

name	Type	Description
	- 32 bit counter	restarted(applicable for LTs and Per LT basis, not like Per slot(lt-restart-num) counter) <i>This element is only shown in detail mode.</i>
mgnt-entity-oamipaddr	Parameter type: <Ip::V4Address> - IPv4-address	an ip address is used to as the oam ip. <i>This element is only shown in detail mode.</i>
mgnt-entity-pairnum	Parameter type: <SignedInteger> - a signed integer	the paired number on the xvps's shelf. <i>This element is only shown in detail mode.</i>
dual-host-ip	Parameter type: <Ip::V4Address> - IPv4-address	the dual host ip address <i>This element is only shown in detail mode.</i>
dual-host-loc	Parameter type: <Equipm::Dualhost> (<Eqpt::MultiRackId> / <Eqpt::MultiShelfId> none) Possible values: - none : no host lsm location Field type <Eqpt::MultiRackId> - the rack number Field type <Eqpt::MultiShelfId> - the shelf number	the dual host lsm location <i>This element is only shown in detail mode.</i>
board-40gkr4	Parameter type: <Equipm::board40GKR4> (inherited disable enable) Possible values: - inherited : enable or disable 40G KR4 of the board is controlled by system level parameter - disable : the board should not work in 40GKR4 no matter the value of system level - enable : the board should work in 40GKR4 no matter the value of system level	To display the 40GKR4 of the board. <i>This element is only shown in detail mode.</i>

91.3 Profile Description Command

Command Description

This command displays the information related to a profile. The following information is shown for each profile:

- *profile-id* : displays the profile-id associated with a profile name
- *description* : displays the description of the profile.
- *board-type*: displays the board type associated with a given profile

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment capab-profile [ (profilename) ]
```

Command Parameters

Table 91.3-1 "Profile Description Command" Resource Parameters

Resource Identifier	Type	Description
(profilename)	Format: Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	the profile name

Command Output

Table 91.3-2 "Profile Description Command" Display parameters

Specific Information		
name	Type	Description
profile-id	Parameter type: <AsamProfilePointer> - a pointer to a profile or profile index - range: [0...65535]	The profile id of the corresponding profile name. <i>This element is always shown.</i>
description	Parameter type: <PrintableString> - printable string	Description of the profile <i>This element is always shown.</i>
board-type	Parameter type: <Equipm::Profile> Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	Description of the profile <i>This element is always shown.</i>

91.4 Applique Status Command

Command Description

This command shows the applique status. The following information is shown for each applique slot:

- *type*: provides the type of the applique that is currently present in the slot.
- *oper-status*: describes whether the applique is able to perform its normal operation.
- *error-status*: describes the reason why the applique is not operational. These values correspond to the alarms generated in case of a failure.
- *available-status*: provides further information regarding the state of the applique.
- *manufacturer*: provides an identification of the applique manufacturer.
- *inventory-pba*: provides the Nokia Printed Board Assembly code of the applique.
- *inventory-fpba*: provides the Nokia Printed Board Assembly code of the applique which also identifies the boot software.
- *inventory-ics*: provides the Item Change Status iteration code of the applique.
- *inventory-clei*: provides the (USA) Common Language Equipment Identification code of the applique.
- *serial-no*: provides the serial number of the applique.
- *failed-test*: provides the identification of the last failing test using four numbers, from MSB to LSB:
 - - table number (1 byte)
 - - segment number (1 byte)
 - - case number (1 byte)
 - - check number (1 byte)

As long as there has been no failing self test, the value of this attribute will be 0.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment applique [ (applique) ]
```

Command Parameters

Table 91.4-1 "Applique Status Command" Resource Parameters

Resource Identifier	Type	Description
(applique)	Format: (iont : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::AppliqueSlotId> lp : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::LtAppliqueSlotId> ntio-1 ntio-2) Possible values: - iont : an nt applique slot	the physical applique position

Resource Identifier	Type	Description
	- lp : an lt applique slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::AppliqueSlotId> - the applique slot number Field type <Eqpt::LtAppliqueSlotId> - the LT Applique slot number	

Command Output

Table 91.4-2 "Applique Status Command" Display parameters

Specific Information		
name	Type	Description
planned-type	Parameter type: <Equipm::AppliqueType> Data driven field type Possible values are depending on the actual configuration and software. serial-no	Parameter type: <PrintableString> - printable string	Specifies the serial number of the board. <i>This element is only shown in detail mode.</i>
failed-test	Parameter type: <Equipm::Octet-4> - a binary string	Specifies the last failing test. <i>This element is only shown in detail mode.</i>

91.5 Shelf Summary Status Command

Command Description

This commands shows a summary of the slots in a shelf.

The least significant bit of the first byte shown corresponds to the slot position 1.

User Level

none

Command Syntax

The command has the following syntax:

> show equipment shelf-summary [(shelf)]

Command Parameters

Table 91.5-1 "Shelf Summary Status Command" Resource Parameters

Resource Identifier	Type	Description
(shelf)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	the physical shelf position

Command Output

Table 91.5-2 "Shelf Summary Status Command" Display parameters

Specific Information		
name	Type	Description
changes	Parameter type: <Counter> - 32 bit counter	Number of configuration or status changes for slots/boards within this shelf. <i>This element is always shown.</i>
occupied-slots	Parameter type: <Equipm::Octet-8> - a binary string - length: 8	Specifies the occupation of slots. <i>This element is only shown in detail mode.</i>
admin-unlocked	Parameter type: <Equipm::Octet-8> - a binary string - length: 8	Specifies the administrative state of the boards whether it is locked or not. <i>This element is only shown in detail mode.</i>
oper-unlocked	Parameter type: <Equipm::Octet-8> - a binary string	Specifies the operational state of the boards whether it is locked or

91 Equipment Status Commands

name	Type	Description
	- length: 8	not. <i>This element is only shown in detail mode.</i>
avail-boards	Parameter type: <Equipm::Octet-8> - a binary string - length: 8	Specifies the availability state of the boards whether it is available or not. <i>This element is only shown in detail mode.</i>
mismatches	Parameter type: <Equipm::Octet-8> - a binary string - length: 8	Specifies any mismatch between the actual board-type and the planned board-type. <i>This element is always shown.</i>
alarms	Parameter type: <Equipm::Octet-8> - a binary string - length: 8	Specifies the boards which generated an alarm. <i>This element is always shown.</i>

91.6 Protection Element Status Command

Command Description

This command shows the protected element-related parameter of the equipment.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment protection-element [(slot-id)]

Command Parameters

Table 91.6-1 "Protection Element Status Command" Resource Parameters

Resource Identifier	Type	Description
(slot-id)	Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> vlt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::VirtualSlotId>) Possible values: - lt : lt-slot - vlt : virtual LT slot (VVPS board can only be planned at NANT-E / FANT-F) - nt-a : nt-a slot - nt-b : nt-b slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::VirtualSlotId> - the virtual LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	Index in eqpt Prot Element Table

Command Output

Table 91.6-2 "Protection Element Status Command" Display parameters

Specific Information

name	Type	Description
standby-status	Parameter type: <Equipm::ProtElementStandbyStatus> (providing-service hot-standby cold-standby idle) Possible values: - providing-service : providing services - hot-standby : hot standby - cold-standby : cold standby - idle : idle	The standby status of the protection group element. <i>This element is always shown.</i>
group-id	Parameter type: <Equipm::ProtGroupId> - index of protection group - range: [1...109]	The belonged group id of protection element. <i>This element is always shown.</i>
redcy-ctrl-status	Parameter type: <Equipm::ProtElementRedcyCtrlStatus> (normal forced_active) Possible values: - normal : enables redundancy (active or standby) - forced_active : forces the element to be active	the redcy ctrl status of the protection group element. <i>This element is always shown.</i>
stdby-stat-chg-reason short name: stdby-chg-reas	Parameter type: <Equipm::ProtElementStandByStatusChgReason> (none prot-grp-lckd forced-active (peernt-link-unav lk-unav) peer-lckd peer-not-plan peer-not-plugin db-not-sync shub-not-sync shub-sdkfail shub-recov-sdkfail shub-hwfail shub-dyn-syncfail shub-stat-syncfail shub-peer-commfail (shub-failure shub-fail) (lk-grp-notavail lk-grp-ntav) lt-not-enabled (shub-higig-failure shub-higig-fail) (shub-discovery-failure shub-disc-fail) (shub-reconcile-failure shub-recon-fail) (dpoe-application-fail dpoe-app-fail) (dpoe-communicate-fail dpoe-comm-fail) (dpoe-synchronize-fail dpoe-sync-fail) (dpoe-unreachable dpoe-unrchble)) Possible values: - none : standby state is hot standby or not applicable (default value) - prot-grp-lckd : redundancy not enabled - forced-active : active board is put to forced active - peernt-link-unav : standby NT link not available - lk-unav : standby NT link not available - peer-lckd : standby board locked - peer-not-plan : standby board not planned - peer-not-plugin : standby board not plugged in - db-not-sync : database not synchronized	reason why the standby-status of the protection-group is changed <i>This element is always shown.</i>

91 Equipment Status Commands

name	Type	Description
	- shub-not-sync : shub data not synchronized - shub-sdkfail : stdby shub detected non-recov sdk failure - shub-recov-sdkfail : stdby shub detected recov sdk failure - shub-hwfail : stdby shub detected hw failure - shub-dyn-syncfail : shub dynamic data not synchronized - shub-stat-syncfail : shub static data not synchronized - shub-peer-commfail : stdby shub lost communication with active shub - shub-failure : stdby shub not alive - shub-fail : stdby shub not alive - lk-grp-notavail : link group not available - lk-grp-ntav : link group not available - lt-not-enabled : LT not enabled in case of LT redundancy - shub-higig-failure : shub HiGig failure - shub-higig-fail : shub HiGig failure - shub-discovery-failure: shub unable to discover its peer - shub-disc-fail : shub unable to discover its peer - shub-reconcile-failure: shub unable to synchronise with peer - shub-recon-fail : shub unable to synchronise with peer - dpoe-application-fail : dpoe has detected application failure - dpoe-app-fail : dpoe has detected application failure - dpoe-communicate-fail : dpoe has lost communication with active dpoe - dpoe-comm-fail : dpoe has lost communication with active dpoe - dpoe-synchronize-fail : dpoe unable to synchronise with peer - dpoe-sync-fail : dpoe unable to synchronise with peer - dpoe-unreachable : dpoe is unreachable - dpoe-unrchble : dpoe is unreachable	

91.7 Protection Group Status Command

Command Description

This command shows the parameters related to protection groups.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment protection-group [ (prot-group-id) ]
```

Command Parameters

Table 91.7-1 "Protection Group Status Command" Resource Parameters

Resource Identifier	Type	Description
(prot-group-id)	Format: - a signed integer	Index in eqpt Prot Group Table

Command Output

Table 91.7-2 "Protection Group Status Command" Display parameters

Specific Information		
name	Type	Description
admin-status	Parameter type: <Equipm::PortGroupAdminStatus> (unlock lock) Possible values: - unlock : unlock - lock : lock	distinguishes the administration-status <i>This element is always shown.</i>
service-status	Parameter type: <Equipm::ServiceStatus> (in-service not-in-service) Possible values: - in-service : the protection group is in service - not-in-service : the protection group is not in service	indicate the service status of protection group, a protection group and its elements are not configurable when it is out of service <i>This element is always shown.</i>
eps-quenchfactor	Parameter type: <Equipm::TimeTicks> - timer value for quench mechanish - unit: 1/100 sec	timervalue of quenching mechanism, 0 is valid value <i>This element is only shown in detail mode.</i>
prot-group-type	Parameter type: <Equipm::PortGroupType> (one-plus-one one-for-n)	distinguishes between 1+1 and 1:N protection groups <i>This element is always shown.</i>

91 Equipment Status Commands

name	Type	Description
	Possible values: - one-plus-one : one to one - one-for-n : one to many	
prot-changes	Parameter type: <Counter> - 32 bit counter	wrap around counter which indicates the number of status changes in this protection group as well as the status changes for the protecting elements within this group <i>This element is only shown in detail mode.</i>
switchover-count	Parameter type: <Counter> - 32 bit counter	wrap around counter for the number of switchovers being performed <i>This element is only shown in detail mode.</i>
last-switchover-reason	Parameter type: <Equipm::SwitchOverReason> (no-switch-over forced-active board-not-present extender-chain-failure link-failure watchdog-timeout file-system-corrupt configuration-mismatch board-unplanned board-locked shelf-defense revertive-switchover shub-pollfailure shub-hwfailure shub-sdkfailure dpoe-appfailure dpoe-unreachable forced-switchover) Possible values: - no-switch-over : no switch over has been performed yet - forced-active : chain A is forced - board-not-present : board is removed or not reachable - extender-chain-failure: extender chain failure - link-failure : link failure - watchdog-timeout : redundancy watchdog - file-system-corrupt : corruption of file system - configuration-mismatch: mismatch in boardType or Swversion - board-unplanned : board has been unplanned - board-locked : board has been locked - shelf-defense : shelf-error detected by defense - revertive-switchover : switchover because protected board is operational again (in case of 1:N) - shub-pollfailure : shub failure - shub-hwfailure : active shub detected a hw failure - shub-sdkfailure : active shub detected a sdk failure - dpoe-appfailure : active dpoe detected application failure - dpoe-unreachable : active dpoe is not reachable - forced-switchover : forced switchover by user	contains the reason of the last switch over <i>This element is only shown in detail mode.</i>
alarm-bitmap	Parameter type: <Equipm::BitMapType>	status bitmap: bit 0 set means no

name	Type	Description
	(no-alarm stand-by-degrd) Possible values: - no-alarm : no-alarm - stand-by-degrd : standby degradation alarm	defect at all, bit 1 : if bit set, loss of switch-over capabilities alarm is set (excludes bit 0 setting), bit 2 .. 31 : reserved for future extensions <i>This element is only shown in detail mode.</i>
oper-prot-element	Parameter type: <SignedInteger> - a signed integer	only supported for 1:N protection groups, indicates which element is currently protected by the spare element, value 0 means that currently the spare element is not protecting any element <i>This element is only shown in detail mode.</i>

91.8 External-link-host Status Commands

Command Description

This command allows the operator to show the host shelf's external-links status. The following information is shown for each external-link:

- The SHub/IHub port which the host external link is connected to
- The downlink status
- The slot id of the expansion shelf that is cabled to the host expansion board.
- The output "none" for the display parameter "exp-slot" means the sfp is not connected to any rack/shelf/slot.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment external-link-host [ (index) ]
```

Command Parameters

Table 91.8-1 "External-link-host Status Commands" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: (<Eqpt::ExtSfpFaceplateType> nt : sfp : <Eqpt::ExtSfpFaceplateType> nt : xfp : <Eqpt::ExtSfpFaceplateType> lt : <Eqpt::HostRackId> / <Eqpt::HostShelfId> / <Eqpt::LtExtSlotId> / <Eqpt::ExtSfpFaceplateType> ntio-1 : sfp : <Eqpt::ExtSfpFaceplateType> ntio-1 : xfp : <Eqpt::ExtSfpFaceplateType> ntio-2 : sfp : <Eqpt::ExtSfpFaceplateType> ntio-2 : xfp : <Eqpt::ExtSfpFaceplateType>) Possible values: - nt : active nt slot - lt : lt-slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::HostRackId> - the rack number Field type <Eqpt::HostShelfId> - the shelf number Field type <Eqpt::LtExtSlotId> - the LT slot number Possible values: - sfp : SFP port - xfp : XFP port	the physical sfp or xfp cage position

Resource Identifier	Type	Description
	Field type <Eqpt::ExtSfpFaceplateType> - The faceplate on which remote LT is connected	

Command Output

Table 91.8-2 "External-link-host Status Commands" Display parameters

Specific Information		
name	Type	Description
shub-port	Parameter type: <Equipm::lanxPortNumber> - a signed integer	the shub port which the host external link is connected to <i>This element is always shown.</i>
downlink-status	Parameter type: <Equipm::HostSfpDownlinkStatus> (ok sfp-not-present los tx-fail invalid-nokia-id unknown sfp-control-fail uplink tx-fail-and-los) Possible values: - ok : the downlink is operational - sfp-not-present : no sfp present for the downlink - los : los is detected by the host for the downlink - tx-fail : the downlink tx failed - invalid-nokia-id : the downlink sfp plugged does not have a valid nokia id - unknown : the host expansion card is planned but not inserted - sfp-control-fail : sfp not responding or i2c failure - uplink : the sfp is configured as uplink - tx-fail-and-los : the downlink tx failed and los detected by the host for the downlink	the host expansion card's external downlink status <i>This element is always shown.</i>
exp-slot	Parameter type: <Equipm::ExpansionSlotIndex> <Eqpt::ExpRack> / <Eqpt::ExpShelf> / <Eqpt::ExpSlot> Field type <Eqpt::ExpRack> - the physical number of the expansion rack, 0 stands for no remote Field type <Eqpt::ExpShelf> - physical nbr of expansion shelf within expansion rack, 0 stands for no remote Field type <Eqpt::ExpSlot> - the physical number of the slot within expansion shelf, 0 stands for no remote	the slot id of the expansion shelf that is cabled to the host expansion board <i>This element is always shown.</i>
host-sfp-type	Parameter type: <Equipm::SfpType> (unknown 1000base-sx 1000base-lx 1000base-cx 1000base-t 100base-lx/lx10 100base-fx base-bx10 base-px reserved	the host shelf sfp type <i>This element is only shown in detail mode.</i>

91 Equipment Status Commands

name	Type	Description
	10gbase-ew 10gbase-lw 10gbase-sw 10gbase-lrm 10gbase-er 10gbase-lr 10gbase-sr 10gbase-sr-sw 10gbase-sr-lw 10gbase-sr-ew 10gbase-lr-sw 10gbase-lr-lw 10gbase-lr-ew 10gbase-er-sw 10gbase-er-lw 10gbase-er-ew 10gbase-lrm-sw 10gbase-lrm-lw 10gbase-lrm-ew 2500base-sx 2500base-lx 2500base-bx) Possible values: - unknown : the sfp ethernet type is not known - 1000base-sx : gigabit ethernet compliance code - 1000base-lx : gigabit ethernet compliance code - 1000base-cx : gigabit ethernet compliance code - 1000base-t : gigabit ethernet compliance code - 100base-lx/lx10 : gigabit ethernet compliance code - 100base-fx : gigabit ethernet compliance code - base-bx10 : gigabit ethernet compliance code - base-px : gigabit ethernet compliance code - reserved : reserved bit 8 - 10gbase-ew : 10 gigabit ethernet compliance code - 10gbase-lw : 10 gigabit ethernet compliance code - 10gbase-sw : 10 gigabit ethernet compliance code - 10gbase-lrm : 10 gigabit ethernet compliance code - 10gbase-er : 10 gigabit ethernet compliance code - 10gbase-lr : 10 gigabit ethernet compliance code - 10gbase-sr : 10 gigabit ethernet compliance code - 10gbase-sr-sw : 10 gigabit ethernet compliance code - 10gbase-sr-lw : 10 gigabit ethernet compliance code - 10gbase-sr-ew : 10 gigabit ethernet compliance code - 10gbase-lr-sw : 10 gigabit ethernet compliance code - 10gbase-lr-lw : 10 gigabit ethernet compliance code - 10gbase-lr-ew : 10 gigabit ethernet compliance code - 10gbase-er-sw : 10 gigabit ethernet compliance code - 10gbase-er-lw : 10 gigabit ethernet compliance code - 10gbase-er-ew : 10 gigabit ethernet compliance code - 10gbase-lrm-sw : 10 gigabit ethernet compliance code - 10gbase-lrm-lw : 10 gigabit ethernet compliance code - 10gbase-lrm-ew : 10 gigabit ethernet compliance code - 2500base-sx : gigabit ethernet compliance code - 2500base-lx : gigabit ethernet compliance code - 2500base-bx : gigabit ethernet compliance code	
cabling-status	Parameter type: <Equipm::SfpCableMismatch> (no-mismatch	the host shelf cabling mismatch <i>This element is always shown.</i>

name	Type	Description
	unexpected-lt assign-mismatch incompat-shelf) Possible values: - no-mismatch : no cabling mismatch is detected - unexpected-lt : remote LT is detected at an unassigned downlink SFP port - assign-mismatch : the detected remote LT does not match the LT assigned to this host SFP - incompat-shelf : the detected remote shelf does not match the shelf type assigned to this host SFP	
phy-address	Parameter type: <Ip::PhysicalAddress> - media dependent physical address - length: 8	the physical address of the remote interface cabled to host shelf SFP <i>This element is only shown in detail mode.</i>

91.9 External-link-remote Status Commands

Command Description

This command allows the operator to show the remote shelves external-links status. The following information is shown for each external-link:

- The slot id of the expansion shelf
- The link status
- The faceplate number of the host external-link device in which the expansion shelf's external-link device is cabled to

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment external-link-remote [ (exp-slot) ]
```

Command Parameters

Table 91.9-1 "External-link-remote Status Commands" Resource Parameters

Resource Identifier	Type	Description
(exp-slot)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::ExpSlotId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::ExpSlotId> - the expansion slot number	the physical expansion slot position

Command Output

Table 91.9-2 "External-link-remote Status Commands" Display parameters

Specific Information		
name	Type	Description

91.10 SFP/XFP Diagnostics Status Command

Command Description

This command allows the operator to read real-time diagnostic measurements from the A2 bank of a specified SFP or lower data bank of XFP. The following information is shown for each specified sfp/xfp:

- The slot index of the sfp
- The number of the sfp cage
- The diagnostics availability: For XFP, AO denotes the upper bank and A2 denotes the lower bank.
- The Loss of Signal status
- The Transmit Fault status
- The transmit power (tx-power): This parameter displays the transmit power of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing power value ranging from "-40.00 dBm" to "8.16 dBm", in 0.01 dBm increments.
 - "No Power" - When no optical power is being transmitted by an sfp.
 - "NotApplicable" - This is used for an electrical SFP.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The received power (rx-power): This parameter displays the received power of the SFP/XFP(not applicable for pon ports). It is a string that can be one of the following possible values:
 - A string containing power value ranging from "-40.00 dBm" to "8.16 dBm", in 0.01 dBm increments.
 - "No Power" - When no optical power is being received by an sfp.
 - "NotApplicable" - This is used for an electrical SFP.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The transmit bias current (tx-bias-current) : This parameter displays the transmit bias current of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing a current value ranging from "0.00 mA" to "262.00 mA", in 0.01 mA increments.
 - "NotApplicable" - This is used for an electrical SFP.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The transceiver supply voltage (supply-voltage) : This parameter displays the transceiver supply voltage of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing a voltage value ranging from "0.00 VDC" to "6.55 VDC", in 0.01 VDC increments.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The temperature : This parameter displays the temperature of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing a temperature value ranging from "-128.00 degrees Celsius" to "128.00 degrees Celsius" in 0.01 degrees Celsius increments.
 - "NotAvailable" - The measurement could not be obtained.
- temperature-tca : This parameter displays the freshly-measured temperature alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
- voltage-tca : This parameter displays the freshly-measured voltage alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:

- "not-available" - the measurement could not be obtained
- "normal-value" - No threshold crossing, present value is within the threshold
- "low-warning-th" - Present value is greater than the low warning level threshold
- "low-alarm-th" - Present value is greater than the low alarm level threshold
- "high-warning-th" - Present value is greater than the high warning level threshold
- "high-alarm-th" - Present value is greater than the high alarm level threshold
- *tx-power-tca* : This parameter displays the freshly-measured tx-power alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
- *bias-current-tca* : This parameter displays the freshly-measured bias-current alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
- *rx-power-tca* : This parameter displays the freshly-measured rx-power alarm/warning threshold crossing status of the specified SFP/SFP+/XFP(not applicable for pon ports). It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment diagnostics sfp [ (position) ]
```

Command Parameters

Table 91.10-1 "SFP/XFP Diagnostics Status Command" Resource Parameters

Resource Identifier	Type	Description

Specific Information		
name	Type	Description
diag-avail-status	Parameter type: <Eqpt::SfpDiagAvailable> (no-error cage-no-diag-supp cage-empty cage-no-a2-supp a0-read-failed a0-checksum-failed sfp-no-a2-supp a2-read-failed a2-checksum-failed optics-present) Possible values: - no-error : sfp diag is available - cage-no-diag-supp : cage does not support diag - cage-empty : cage is empty - cage-no-a2-supp : cage does not support A2 - a0-read-failed : A0 read failed - a0-checksum-failed : A0 checksum failed - sfp-no-a2-supp : SFP does not support A2 - a2-read-failed : A2 read failed - a2-checksum-failed : A2 checksum failed - optics-present : SFP/XFS inserted into cage	sfp/xfp diagnostics availability status. for xfp, a0 denotes the upper bank and a2 denotes the lower bank <i>This element is always shown.</i>
los	Parameter type: <PrintableString> - printable string	loss of signal <i>This element is always shown.</i>
tx-fault	Parameter type: <Eqpt::SfpDiagTxFault> (tx-fault no-tx-fault not-applicable not-available) Possible values: - tx-fault : transmit fault info - no-tx-fault : no tx fault - not-applicable : not applicable - not-available : not available	sfp/xfp tx fault <i>This element is always shown.</i>
tx-power	Parameter type: <PrintableString> - printable string	the transmit power. <i>This element is only shown in detail mode.</i>
rx-power	Parameter type: <PrintableString> - printable string	the received power - not applicable for PON ports <i>This element is only shown in detail mode.</i>
tx-bias-current	Parameter type: <PrintableString> - printable string	the transmit bias current. <i>This element is only shown in detail mode.</i>
supply-voltage	Parameter type: <PrintableString> - printable string	the transceiver supply voltage. <i>This element is only shown in detail mode.</i>
temperature	Parameter type: <PrintableString> - printable string	the temperature. <i>This element is only shown in detail mode.</i>
temperature-tca	Parameter type: <Eqpt::Tca> (high-alarm-th low-alarm-th high-warning-th	the temperature alarm or warning <i>This element is only shown in detail mode.</i>

91 Equipment Status Commands

name	Type	Description
	low-warning-th normal-value not-available) Possible values: - high-alarm-th : Present value is greater than the configured/pre-set alarm value - low-alarm-th : Present value is lower than the configured/pre-set alarm value - high-warning-th : Present value is greater than the configured/pre-set warning value - low-warning-th : Present value is lower than the configured/pre-set warning value - normal-value : Present value is under normal limits - not-available : Value is not available	
voltage-tca	Parameter type: <Eqpt::Tca> (high-alarm-th low-alarm-th high-warning-th low-warning-th normal-value not-available) Possible values: - high-alarm-th : Present value is greater than the configured/pre-set alarm value - low-alarm-th : Present value is lower than the configured/pre-set alarm value - high-warning-th : Present value is greater than the configured/pre-set warning value - low-warning-th : Present value is lower than the configured/pre-set warning value - normal-value : Present value is under normal limits - not-available : Value is not available	the voltage alarm or warning <i>This element is only shown in detail mode.</i>
bias-current-tca	Parameter type: <Eqpt::Tca> (high-alarm-th low-alarm-th high-warning-th low-warning-th normal-value not-available) Possible values: - high-alarm-th : Present value is greater than the configured/pre-set alarm value - low-alarm-th : Present value is lower than the configured/pre-set alarm value - high-warning-th : Present value is greater than the configured/pre-set warning value - low-warning-th : Present value is lower than the configured/pre-set warning value - normal-value : Present value is under normal limits - not-available : Value is not available	the bias-current alarm or warning <i>This element is only shown in detail mode.</i>
tx-power-tca	Parameter type: <Eqpt::Tca> (high-alarm-th low-alarm-th high-warning-th low-warning-th normal-value not-available)	the temperature alarm or warning <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - high-alarm-th : Present value is greater than the configured/pre-set alarm value - low-alarm-th : Present value is lower than the configured/pre-set alarm value - high-warning-th : Present value is greater than the configured/pre-set warning value - low-warning-th : Present value is lower than the configured/pre-set warning value - normal-value : Present value is under normal limits - not-available : Value is not available	
rx-power-tca	Parameter type: <Eqpt::Tca> (high-alarm-th low-alarm-th high-warning-th low-warning-th normal-value not-available) Possible values: - high-alarm-th : Present value is greater than the configured/pre-set alarm value - low-alarm-th : Present value is lower than the configured/pre-set alarm value - high-warning-th : Present value is greater than the configured/pre-set warning value - low-warning-th : Present value is lower than the configured/pre-set warning value - normal-value : Present value is under normal limits - not-available : Value is not available	the temperature alarm or warning-not applicable for PON ports <i>This element is only shown in detail mode.</i>
rsi-profile-id	Parameter type: <Eqpt::RssiShowProfileIndex> - an unique index value for the rsi profile(1-200 user-defined , 65535 - automode) - range: [1...65535]	an unique index of the rsi profile <i>This element is always shown.</i>
rsi-state	Parameter type: <Eqpt::RssiState> ((enable yes) (disable no)) Possible values: - enable : enable rsi functionality - yes : enable rsi functionality - disable : disable rsi functionality - no : disable rsi functionality	to enable or disable the rsi functionality on sfps for uplink ports <i>This element is always shown.</i>

91.11 SFP/XFP Diagnostics Status Command

Command Description

This command allows the operator to read real-time diagnostic measurements from the A2 bank of a specified SFP or lower data bank of XFP. The following information is shown for each specified sfp/xfp:

- The slot index of the sfp
- The number of the sfp cage
- The diagnostics availability: For XFP, AO denotes the upper bank and A2 denotes the lower bank.
- The Loss of Signal status
- The Transmit Fault status
- The transmit power (tx-power): This parameter displays the transmit power of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing power value ranging from "-40.00 dBm" to "8.16 dBm", in 0.01 dBm increments.
 - "No Power" - When no optical power is being transmitted by an sfp.
 - "NotApplicable" - This is used for an electrical SFP.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The received power (rx-power): This parameter displays the received power of the SFP/XFP(not applicable for pon ports). It is a string that can be one of the following possible values:
 - A string containing power value ranging from "-40.00 dBm" to "8.16 dBm", in 0.01 dBm increments.
 - "No Power" - When no optical power is being received by an sfp.
 - "NotApplicable" - This is used for an electrical SFP.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The transmit bias current (tx-bias-current) : This parameter displays the transmit bias current of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing a current value ranging from "0.00 mA" to "262.00 mA", in 0.01 mA increments.
 - "NotApplicable" - This is used for an electrical SFP.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The transceiver supply voltage (supply-voltage) : This parameter displays the transceiver supply voltage of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing a voltage value ranging from "0.00 VDC" to "6.55 VDC", in 0.01 VDC increments.
 - "NotAvailable" - The measurement could not be obtained.
 - "Invalid" - The calibration calculation returned an invalid result.
- The temperature : This parameter displays the temperature of the SFP/XFP. It is a string that can be one of the following possible values:
 - A string containing a temperature value ranging from "-128.00 degrees Celsius" to "128.00 degrees Celsius" in 0.01 degrees Celsius increments.
 - "NotAvailable" - The measurement could not be obtained.
- temperature-tca : This parameter displays the freshly-measured temperature alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
- voltage-tca : This parameter displays the freshly-measured voltage alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:

- "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
- *tx-power-tca* : This parameter displays the freshly-measured tx-power alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
 - *bias-current-tca* : This parameter displays the freshly-measured bias-current alarm/warning threshold crossing status of the specified SFP/SFP+/XFP. It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold
 - *rx-power-tca* : This parameter displays the freshly-measured rx-power alarm/warning threshold crossing status of the specified SFP/SFP+/XFP(not applicable for pon ports). It is a string that can be one of the following possible values:
 - "not-available" - the measurement could not be obtained
 - "normal-value" - No threshold crossing, present value is within the threshold
 - "low-warning-th" - Present value is greater than the low warning level threshold
 - "low-alarm-th" - Present value is greater than the low alarm level threshold
 - "high-warning-th" - Present value is greater than the high warning level threshold
 - "high-alarm-th" - Present value is greater than the high alarm level threshold

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment diagnostics sfp-threshold [ (position) ]
```

Command Parameters

91.12 Sfp RSSI Configuration Command

Command Description

This command allows the operator to create and configure the RSSI parameters on SFPs.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment rssiprof [(index)]

Command Parameters

Table 91.12-1 "Sfp RSSI Configuration Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - an unique index value for the rssi profile(1-200:userdefined,65535:automode) - range: [1...200,65535]	an unique index of the rssi profile

Command Output

Table 91.12-2 "Sfp RSSI Configuration Command" Display parameters

Specific Information		
name	Type	Description
name	Parameter type: <Eqpt::DisplayString> - string to identify the rssi profile - length: 1<=x<=16	A unique profile name <i>This element is always shown.</i>
ref-count	Parameter type: <Eqpt::rssiRefCount> - number of entities using this particular profile - range: [0...65535]	rssi profile reference count <i>This element is always shown.</i>

91.13 Board Temperature Status Command

Command Description

This command shows the board temperature status. The following information is shown for each thermal sensor:

- *act-temp* : actual temperature of thermal sensor; expressed in degrees Celsius.
- *tca-low*: low thresholds for the alarm "Temperature Exceeded"; expressed in degrees Celsius.
- *tca-high*: high thresholds for the alarm "Temperature Exceeded"; expressed in degrees Celsius.
- *shut-low*: low threshold for the alarm "Temperature Shutdown"; expressed in degrees Celsius.
- *shut-high*: high threshold for the alarm "Temperature Shutdown"; expressed in degrees Celsius.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment temperature [ (slot) [ sensor-id <Equipm::SensorId> ] ]
```

Command Parameters

Table 91.13-1 "Board Temperature Status Command" Resource Parameters

Resource Identifier	Type	Description
(slot)	Format: (lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> nt-a nt-b nt iont : <Eqpt::RackId> / <Eqpt::ShelfId> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::EqSlotId> ctrl : <Eqpt::RackId> / <Eqpt::ShelfId> ntio-1 ntio-2) Possible values: - lt : lt-slot - nt-a : nt-a slot - nt-b : nt-b slot - nt : nt slot - iont : an nt applique slot - ctrl : ctrl-slot - ntio-1 : an nt applique slot in a single or multiple-ntio-shelf - ntio-2 : an nt applique slot in a multiple-ntio-shelf Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId>	the physical slot position

Resource Identifier	Type	Description
	- the LT slot number Field type <Eqpt::EqSlotId> - the equipment slot number	
sensor-id	Parameter type: <Equipm::SensorId> Format: - the sensor id of a board - range: [1...15]	the sensor id of a board

Command Output

Table 91.13-2 "Board Temperature Status Command" Display parameters

Specific Information		
name	Type	Description
actual-temperature short name: act-temp	Parameter type: <SignedInteger> - a signed integer	actual temperature of thermal sensor; expressed in degrees Celsius. <i>This element is always shown.</i>
tca-threshold-low short name: tca-low	Parameter type: <SignedInteger> - a signed integer	Low thresholds for the alarm "Temperature Exceeded"; expressed in degrees Celsius. <i>This element is always shown.</i>
tca-threshold-high short name: tca-high	Parameter type: <SignedInteger> - a signed integer	High thresholds for the alarm "Temperature Exceeded"; expressed in degrees Celsius. <i>This element is always shown.</i>
shut-threshold-low short name: shut-low	Parameter type: <SignedInteger> - a signed integer	Low threshold for the alarm "Temperature Shutdown"; expressed in degrees Celsius. <i>This element is always shown.</i>
shut-threshold-high short name: shut-high	Parameter type: <SignedInteger> - a signed integer	High threshold for the alarm "Temperature Shutdown"; expressed in degrees Celsius. <i>This element is always shown.</i>

91.14 Board Planned Resource Command

Command Description

This commands shows the actual values of configured hardware resources on boards.. The following information is shown for each resource:

- *current*: The actual planned value for the resource
- *max-value*: The maximum value that the board supports for this resource.
- *description*: A string describing the planned resource for this board.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment planned-resource [ (slot) [ resource-id <SignedInteger> ] ]
```

Command Parameters

Table 91.14-1 "Board Planned Resource Command" Resource Parameters

Resource Identifier	Type	Description
(slot)	Format: lt : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> Possible values: - lt : lt-slot Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number	the physical slot position
resource-id	Parameter type: <SignedInteger> Format: - a signed integer	the planned resource id of a board

Command Output

Table 91.14-2 "Board Planned Resource Command" Display parameters

Specific Information		
name	Type	Description
current-value short name: cur-val	Parameter type: <SignedInteger> - a signed integer	The actual planned value for the resource. <i>This element is always shown.</i>
maximum-value	Parameter type: <SignedInteger>	The maximum value that the

91 Equipment Status Commands

name	Type	Description
short name: max-val	- a signed integer	board supports for this resource. <i>This element is always shown.</i>
description short name: description	Parameter type: <PrintableString> - printable string	A string describing the planned resource for this board. <i>This element is always shown.</i>

91.15 Transceiver Inventory Status Command

Command Description

This command retrieves the configuration data associated with SFP/SFP+/XFP. The following information is shown for each specified sfp/sfp+/xfp:

- For the following data, output "not-Available" implies that the the measurement could not be obtained.
- *inventory-status* - the transceiver inventory status. For XFP, AO denotes the upper bank and A2 denotes the lower bank.
- *nokia-part-num* - the nokia part number available in sfp or xfp eeprom
- *clei-code* - the clei code available in sfp or xfp eeprom
- *tx-wavelength* - the transmission wavelength available in sfp or xfp eeprom
- *fiber-type* - the fiber type available in sfp or xfp eeprom
- *additional-info* - the customer specific additional information of the specified sfp or sfp+ or xfp
- *mfg-name* - the manufacturer name available in sfp or xfp eeprom
- *mfg-oui* - the manufacturer code available in sfp or xfp eeprom
- *mfg-date* - the manufacturer date available in sfp or xfp eeprom
- *vendor-serial-num* - the vendor serial number available in sfp or xfp eeprom

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment transceiver-inventory [ (index) ]
```

Command Parameters

Table 91.15-1 "Transceiver Inventory Status Command" Resource Parameters

Resource Identifier	Type	Description

91.16 NE Status Command

Command Description

This command displays the status of the NE.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment isam

Command Output

Table 91.16-2 "NE Status Command" Display parameters

Specific Information		
name	Type	Description
planned-type	Parameter type: <Equipm::SystemType> (laus laeu leeu maus leus lneu leww lnww) Possible values: - laus : large ASAM US / ANSI market (6 racks, 3 shelves per rack) - laeu : large ASAM EU / ETSI market (6 racks, 3 shelves per rack) - leeu : large ISAM for EU / ETSI market - maus : mini RAM ASAM for US / ANSI market - leus : large ISAM for US / ANSI market - lneu : new equipment practice (NEP) - leww : large ISAM World wide - lnww : large ISAM World wide	Specifies the planned isam type. <i>This element is only shown in detail mode.</i>
actual-type	Parameter type: <Equipm::SystemType> (laus laeu leeu maus leus lneu leww	A string representing the system type that is actually present. <i>This element is always shown.</i>

name	Type	Description
	lnww) Possible values: - laus : large ASAM US / ANSI market (6 racks, 3 shelves per rack) - laeu : large ASAM EU / ETSI market (6 racks, 3 shelves per rack) - leeu : large ISAM for EU / ETSI market - maus : mini RAM ASAM for US / ANSI market - leus : large ISAM for US / ANSI market - lneu : new equipment practice (NEP) - leww : large ISAM World wide - lnww : large ISAM World wide	
description	Parameter type: <Description-127> - description to help the operator to identify the object - length: x<=127	Specifies the location of the system. <i>This element is only shown in detail mode.</i>

91.17 Rack Status Command

Command Description

This command shows the rack status.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment rack [ (rack) ]
```

Command Parameters

Table 91.17-1 "Rack Status Command" Resource Parameters

Resource Identifier	Type	Description
(rack)	Format: <Eqpt::RackId> Field type <Eqpt::RackId> - the rack number	the rack identifier

Command Output

Table 91.17-2 "Rack Status Command" Display parameters

Specific Information		
name	Type	Description
planned-type	Parameter type: <Equipm::RackType> (altr-e altr-a not-planned not-allowed empty) Possible values: - altr-e : ISAM ETSI DSL line termination rack (2200mm) - altr-a : ISAM ANSI DSL line termination rack - not-planned : holder is not planned - not-allowed : shelf is not allowed in this position - empty : shelf is empty in this position	Specifies the planned rack type. <i>This element is only shown in detail mode.</i>
actual-type	Parameter type: <Equipm::RackType> (altr-e altr-a not-planned not-allowed	A string representing the racktype that is actually present. <i>This element is always shown.</i>

name	Type	Description
	empty) Possible values: - altr-e : ISAM ETSI DSL line termination rack (2200mm) - altr-a : ISAM ANSI DSL line termination rack - not-planned : holder is not planned - not-allowed : shelf is not allowed in this position - empty : shelf is empty in this position	
description	Parameter type: <Description-127> - description to help the operator to identify the object - length: x<=127	Specifies the location of the rack. <i>This element is only shown in detail mode.</i>

91.18 Shelf Status Command

Command Description

This command shows the shelf status. The following information is shown in addition to configuration information:

- *oper-status: describes whether the board is able to perform its normal operation.*
- *error-status: provides the reason why the board is not operational. These values correspond to the alarms generated in case of a failure.*
- *available-status: provides further information regarding the state of the board.*

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment shelf [ (shelf) ]
```

Command Parameters

Table 91.18-1 "Shelf Status Command" Resource Parameters

Resource Identifier	Type	Description
(shelf)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number	a shelf identifier: <rack>/<shelf>

Command Output

Table 91.18-2 "Shelf Status Command" Display parameters

Specific Information		
name	Type	Description
planned-type	Parameter type: <Equipm::ShelfType> Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	Specifies the planned shelf type. <i>This element is only shown in detail mode.</i>
actual-type	Parameter type: <Equipm::ShelfType> Data driven field type Possible values are depending on the actual configuration and software. The currently allowed values can be shown with online-help.	A string representing the shelftype that is actually present in the rack. <i>This element is always shown.</i>
admin-status	Parameter type: <Equipm::HolderAdminStatus>	Specifies the shelf is locked or

name	Type	Description
short name: locked	((lock yes) (unlock no)) Possible values: - lock : the holder is locked - yes : the holder is locked - unlock : the holder is unlocked - no : the holder is unlocked	not. <i>This element is only shown in detail mode.</i>
oper-status short name: enabled	Parameter type: <Equipm::OperStatus> ((enabled yes) (disabled no)) Possible values: - enabled : - yes : - disabled : - no :	Specifies whether or not the shelf is capable of performing its normal functions. <i>This element is always shown.</i>
error-status	Parameter type: <Equipm::OperError> (no-error type-mismatch board-missing no-installation no-planned-board waiting-for-sw init-boot-failed init-download-failed init-connection-failed configuration-failed board-reset-protection invalid-parameter temperature-alarm tempshutdown defense board-not-licensed sem-power-fail sem-ups-fail incompatible-slot download-ongoing upgrade-via-sby board-shelf-mismatch unknown-error) Possible values: - no-error : - type-mismatch : - board-missing : - no-installation : - no-planned-board : - waiting-for-sw : - init-boot-failed : - init-download-failed : - init-connection-failed : - configuration-failed : - board-reset-protection : - invalid-parameter : - temperature-alarm : - tempshutdown : - defense : - board-not-licensed : - sem-power-fail :	Specifies for what reason the shelf is not operational. <i>This element is always shown.</i>

91 Equipment Status Commands

name	Type	Description
	- sem-ups-fail : - incompatible-slot : - download-ongoing : - upgrade-via-sby : - board-shelf-mismatch : - unknown-error :	
availability	Parameter type: <Equipm::AvailStatus> (available in-test failed power-off not-installed offline dependency ext-managed) Possible values: - available : - in-test : - failed : - power-off : - not-installed : - offline : - dependency : - ext-managed :	Specifies whether the shelf is available or not. <i>This element is always shown.</i>
shelf-mode	Parameter type: <Equipm::HolderModeForShow> (no-extended-lt-slots extended-lt-slots no-ntb-slot no-extended-slots no-ntio-slots ngpon gpon ngpon-port-reduced gpon-mng-ngpon gpon-mng-reduced) Possible values: - no-extended-lt-slots : no extended lt slots - extended-lt-slots : change to extended lt slots - no-ntb-slot : use ntb slot as lt slot - no-extended-slots : no extended slots - no-ntio-slots : not changeable - ngpon : use universal ngpon lt (supports NG-PON2, XGS-PON and XG-PON1 currently) - gpon : use gpon lt - ngpon-port-reduced : use ngpon port reduced mode lt (supports ERPS) - gpon-mng-ngpon : use gpon managed ngpon management model - gpon-mng-reduced : use gpon managed ngpon port reduced mode lt(supports ERPS)	the shelf mode <i>This element is only shown in detail mode.</i>
class	Parameter type: <Equipm::ShelfClass> (main-iq-hcl ext-iq ext-hcl main-ethernet ext-ethernet) Possible values:	Specifies classification of shelves. <i>This element is only shown in detail mode.</i>

name	Type	Description
	- main-iq-hcl : main shelf - supports iq- and hcl-based traffic - ext-iq : extension shelf - supports only iq-based traffic - ext-hcl : extension shelf - support only hcs-based traffic - main-ethernet : main shelf - supports ethernet-based traffic - ext-ethernet : extension shelf - supports ethernet-based traffic	
serial-no	Parameter type: <Equipm::ShelfSerial> - printable string	Specifies the serial number of the shelf. <i>This element is only shown in detail mode.</i>
variant	Parameter type: <Equipm::ShelfVariant> - printable string	the Nokia code of the shelf. <i>This element is only shown in detail mode.</i>
ics-code	Parameter type: <Equipm::ShelfICS> - printable string	the item change status iteration code of the shelf. <i>This element is only shown in detail mode.</i>
description	Parameter type: <Description-127> - description to help the operator to identify the object - length: x<=127	Specifies the location of the shelf. <i>This element is only shown in detail mode.</i>

91.19 Power Supply Status Command

Command Description

This command shows the status of the power supply installed on the system.

- *psu-num:* shows the power supply's number.
- *part-num:* shows the power supply's part number.
- *v-in:* shows incoming voltage arriving at the power supply.
- *i-in:* shows incoming current arriving at the power supply.
- *v-out:* shows outgoing voltage provided by the power supply.
- *i-out:* shows outgoing current provided by the power supply.
- *temperature:* shows the temperature of the power supply.
- *present:* shows the presence status of the power supply
- *fault:* shows the fault status of the power supply. If a fault is detected, more information can be retrieved with the 'detail' version of this command
- *clei-code:* shows the power supply's clei code
- *ser-num:* shows the power supply's serial number
- *v-in-err:* report the fault or error happening at the incoming voltage level.
- *i-in-err:* report the fault or error happening at the incoming current level.
- *v-out-err:* report the fault or error happening at the outgoing voltage level.
- *i-out-err:* report the fault or error happening at the outgoing current level.
- *temperature-err:* report the fault or error happening at the temperature level.
- *cml-err:* report the fault or error happening at the communication, memory or logic (cml) level.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment power-supply [ (psu-num) ]
```

Command Parameters

Table 91.19-1 "Power Supply Status Command" Resource Parameters

Resource Identifier	Type	Description
(psu-num)	Format: - Power supply ID	The power supply unit number

Command Output

Table 91.19-2 "Power Supply Status Command" Display parameters

Specific Information		
name	Type	Description
part-number	Parameter type: <PrintableString>	The part number of the installed

name	Type	Description
	- printable string	power supply <i>This element is always shown.</i>
v-in	Parameter type: <Equipm::MilliVoltType> - Millivolt converter to volt	The incoming voltage arriving at the power supply <i>This element is always shown.</i>
i-in	Parameter type: <Equipm::MilliAmpereType> - Milliampere converter to ampere	The incoming current arriving at the power supply <i>This element is always shown.</i>
v-out	Parameter type: <Equipm::MilliVoltType> - Millivolt converter to volt	The output voltage provided by the power supply <i>This element is always shown.</i>
i-out	Parameter type: <Equipm::MilliAmpereType> - Milliampere converter to ampere	The outgoing current provided by the power supply <i>This element is always shown.</i>
temperature	Parameter type: <Equipm::MilliTemperatureType> - Milli converter to y.x value	The current temperature of the power supply <i>This element is always shown.</i>
present	Parameter type: <Equipm::PowerSupplyPresent> (yes no) Possible values: - yes : PSU connector is plugged in - no : PSU connector is not plugged in	The presence of the power supply <i>This element is always shown.</i>
fault	Parameter type: <Equipm::PowerSupplyFaultDetected> (yes no) Possible values: - yes : The power supply has a fault - no : The power supply does not have a fault	The fault status of the power supply <i>This element is always shown.</i>

Only Show Details: identification

name	Type	Description
clei-code	Parameter type: <PrintableString> - printable string	The CLEI code of the installed power supply <i>This element is only shown in detail mode.</i>
ser-num	Parameter type: <PrintableString> - printable string	The serial number of the installed power supply <i>This element is only shown in detail mode.</i>

Only Show Details: fault

name	Type	Description
v-in-err	Parameter type: <Equipm::PowerSupplyFaultVin> (no-error (overvoltage-fault ov fault) (overvoltage-warning ov warn) (undervoltage-warning un warn) (undervoltage-fault un fault) (ac-nok-fault ac fault) (ac-nok-warning ac warning) (not-enough-in-vol unit off insuf volt)) Possible values: - no-error : no error - overvoltage-fault : overvoltage fault - ov fault : overvoltage fault - overvoltage-warning : overvoltage warning - ov warn : overvoltage warning	The error/fault status of the incoming voltage <i>This element is only shown in detail mode.</i>

91 Equipment Status Commands

name	Type	Description
	- undervoltage-warning : undervoltage warning - un warn : undervoltage warning - undervoltage-fault : undervoltage fault - un fault : undervoltage fault - ac-nok-fault : ac nok fault - ac fault : ac nok fault - ac-nok-warning : ac nok warning - ac warning : ac nok warning - not-enough-in-vol : unit off for insufficient input voltage - unit off insuf volt : unit off for insufficient input voltage	
v-out-err	Parameter type: <Equipm::PowerSupplyFaultVout> (no-error (overvoltage-fault ov-fault) (overvoltage-warning ov-warn) (undervoltage-warning un-warn) (undervoltage-fault un-fault)) Possible values: - no-error : no error - overvoltage-fault : overvoltage fault - ov-fault : overvoltage fault - overvoltage-warning : overvoltage warning - ov-warn : overvoltage warning - undervoltage-warning : undervoltage warning - un-warn : undervoltage warning - undervoltage-fault : undervoltage fault - un-fault : undervoltage fault	The error/fault status of the outgoing voltage <i>This element is only shown in detail mode.</i>
i-in-err	Parameter type: <Equipm::PowerSupplyFaultIin> (no-error (overcurrent-fault oc-fault) (overcurrent-warning oc-warn) (overpower-warning op-warn)) Possible values: - no-error : no error - overcurrent-fault : overcurrent fault - oc-fault : overcurrent fault - overcurrent-warning : overcurrent warning - oc-warn : overcurrent warning - overpower-warning : overpower warning - op-warn : overpower warning	The error/fault status of the incoming current <i>This element is only shown in detail mode.</i>
i-out-err	Parameter type: <Equipm::PowerSupplyFaultIout> (no-error (overcurrent-fault oc-fault) (overcurrent-warning oc-warn) (undercurrent-warning uc-warn) (undercurrent-fault uc-fault)) Possible values: - no-error : no error - overcurrent-fault : overcurrent fault - oc-fault : overcurrent fault - overcurrent-warning : overcurrent warning - oc-warn : overcurrent warning - undercurrent-warning : undercurrent warning - uc-warn : undercurrent warning - undercurrent-fault : undercurrent fault - uc-fault : undercurrent fault	The error/fault status of the outgoing current <i>This element is only shown in detail mode.</i>
temperature-err	Parameter type: <Equipm::PowerSupplyFaultTemperature> (no-error	The error/fault status on the temperature

name	Type	Description
	(overtemper-fault oc-fault) (overtemper-warning oc-warn) (undertemper-warning uc-warn) (undertemper-fault uc-fault)) Possible values: - no-error : no error - overtemper-fault : overtemperature fault - oc-fault : overtemperature fault - overtemper-warning : overtemperature warning - oc-warn : overtemperature warning - undertemper-warning : undertemperature warning - uc-warn : undertemperature warning - undertemper-fault : undertemperature fault - uc-fault : undertemperature fault	<i>This element is only shown in detail mode.</i>
cml-err	Parameter type: <Equipm::PowerSupplyFaultCml> (no-error inv-unsup-cmd-rcvd inv-unsup-data-rcvd pkt-err-chk (memory-fault mem-fault) (processor-fault proc-fault) oth-com-fault oth-mem-log-fault) Possible values: - no-error : no error - inv-unsup-cmd-rcvd : an invalid or unsupported command has been received - inv-unsup-data-rcvd : an invalid or unsupported data has been received - pkt-err-chk : packet error check has failed - memory-fault : a memory fault happened into the power supply - mem-fault : a memory fault happened into the power supply - processor-fault : a processor fault happened into the power supply - proc-fault : a processor fault happened into the power supply - oth-com-fault : a communication fault has been detected - oth-mem-log-fault : a memory or logic fault has been detected	The error/fault status on the Communication, Logic and Memory <i>This element is only shown in detail mode.</i>

92.2 ONT Interface Command

Command Description

This command reports Interface parameters for the ont.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont interface [ (ont-idx) ]
```

Command Parameters

Table 92.2-1 "ONT Interface Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ont

Command Output

Table 92.2-2 "ONT Interface Command" Display parameters

Specific Information

92 ONT Status Commands

name	Type	Description
eqpt-ver-num	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	version number of the ont <i>This element is always shown.</i>
sw-ver-act	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	active software version in the ont <i>This element is always shown.</i>
sw-ver-psv	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	passive software version in the ont <i>This element is only shown in detail mode.</i>
vendor-id	Parameter type: <Gpon::VendorId> - vendor id - 4 ASCII characters - range: [a-zA-Z0-9] - length: 4	vendor id <i>This element is only shown in detail mode.</i>
equip-id	Parameter type: <Gpon::EquipId> - ont equip Id - length: x<=20	equipment id <i>This element is only shown in detail mode.</i>
actual-num-slots	Parameter type: <Gpon::ActualOntSlotId> - Gpon Ont Slot - range: [0...16]	actual number of slots on ont <i>This element is always shown.</i>
version-number	Parameter type: <Gpon::OntVersion> - the version number of a card - length: x<=14	version number of ont <i>This element is always shown.</i>
num-tconts	Parameter type: <Gpon::Tconts> - tconts - range: [0...4095]	number of t-conts supported <i>This element is only shown in detail mode.</i>
num-trf-sched	Parameter type: <Gpon::TrafficSched> - traffic schedule - range: [0...255]	number of traffic schedulers supported <i>This element is only shown in detail mode.</i>
num-prio-queues	Parameter type: <Gpon::PrioQueues> - priority queues - range: [0...4095]	number of priority queues supported <i>This element is only shown in detail mode.</i>
auto-sw-planned-ver	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	planned software of ont <i>This element is only shown in detail mode.</i>
auto-sw-download-ver	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	download software version of ont <i>This element is only shown in detail mode.</i>
sernum	Parameter type: <Gpon::SerNum2> <Gpon::VendorIdNum> : <Gpon::SerialNo> Field type <Gpon::VendorIdNum> - vendor id -4 ASCII characters - length: 4 Field type <Gpon::SerialNo> - serial num - 8 ASCII characters - range: [a-fA-F0-9] - length: 8	Serial number of ont <i>This element is always shown.</i>
yp-serial-no	Parameter type: <Gpon::YpSerialNumber> (unknown <PrintableString>) Possible values: - unknown : yp serial number not supported for this ONT Field type <PrintableString> - printable string	Yp Serial number of ont <i>This element is always shown.</i>
oper-spec-ver	Parameter type: <Gpon::OperSpecVer>	the ctc spec version supported by

name	Type	Description
	(ctc-v2.0 unknown <Gpon::OperSpecVer>) Possible values: - ctc-v2.0 : ctc version 2.0 - unknown : the version is unknown Field type <Gpon::OperSpecVer> - the ctc spec version supported by the ont - range: [0...256]	the ont <i>This element is only shown in detail mode.</i>
act-ont-type	Parameter type: <Gpon::ActOntType> (sfu hgu sbu cbu mdu mtu unknown <Gpon::ActOntType>) Possible values: - sfu : the ont type is sfu - hgu : the ont type is hgu - sbu : the ont type is sbu - cbu : the ont type is cbu - mdu : the ont type is mdu - mtu : the ont type is mtu - unknown : the ont type is unknown Field type <Gpon::ActOntType> - the ctc ont type - range: [0...256]	the ctc ont type <i>This element is only shown in detail mode.</i>
act-txpower-ctrl	Parameter type: <Gpon::ActTxPwrCtrl> (not-supported tx-only tx-rx unknown <Gpon::ActTxPwrCtrl>) Possible values: - not-supported : not supported - tx-only : only supporting tx control - tx-rx : tx and rx power supplies can be controlled independently - unknown : the power supply ctrl mode is unknown Field type <Gpon::ActTxPwrCtrl> - whether power supply of ONT transmitter can be independently controlled - range: [0...256]	whether power supply of ONT transmitter can be independently controlled <i>This element is only shown in detail mode.</i>
sn-bundle-status	Parameter type: <Gpon::SnBundleStatus> (idle bundling bundled) Possible values: - idle : the sn currently is not bundled - bundling : the sn currently is not bundled while auto-bundle timer has been started - bundled : the sn currently is bundled	sn with loid/sluid bundling status <i>This element is only shown in detail mode.</i>
cfgfile1-ver-act	Parameter type: <Gpon::CfgFile> - ont configure file version - length: 1<=x<=14	active configure file 1 version in the ont <i>This element is always shown.</i>

92 ONT Status Commands

name	Type	Description
cfgfile1-ver-psv	Parameter type: <Gpon::CfgFile> - ont configure file version - length: 1<=x<=14	passive configure file 1 version in the ont <i>This element is only shown in detail mode.</i>
cfgfile2-ver-act	Parameter type: <Gpon::CfgFile> - ont configure file version - length: 1<=x<=14	active configure file 2 version in the ont <i>This element is always shown.</i>
cfgfile2-ver-psv	Parameter type: <Gpon::CfgFile> - ont configure file version - length: 1<=x<=14	passive configure file 2 version in the ont <i>This element is only shown in detail mode.</i>
actual-us-rate	Parameter type: <Gpon::ActualUsRate> (2.5g 10g 1.25g 25g) Possible values: - : unknown - 2.5g : 2.5 GBit/sec - 10g : 10 GBit/sec - 1.25g : 1.25 GBit/sec - 25g : 25 GBit/sec	actual upstream rate. <i>This element is always shown.</i>
template-name	Parameter type: <Gpon::OnuProvTemplateName> - Template name to be used for ONU auto provisioning - range: [a-zA-Z0-9-_ - length: x<=20	ONT Semi-Auto Provision template name <i>This element is only shown in detail mode.</i>
auto-prov-status	Parameter type: <Gpon::OnuAutoProvStatus> (not-applicable failed success) Possible values: - not-applicable : ONU semi-auto provisioning is not applicable - failed : ONU semi-auto provisioning failed - success : ONU semi-auto provisioning is success	ONT Semi-Auto provisioning status <i>This element is only shown in detail mode.</i>

92.3 ONT Interface Operational Status Command

Command Description

this command reports current operational parameters for the ont.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont operational-data [ (ont-idx) ]
```

Command Parameters

Table 92.3-1 "ONT Interface Operational Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ont

Command Output

Table 92.3-2 "ONT Interface Operational Status Command" Display parameters

Specific Information

92 ONT Status Commands

name	Type	Description
loss-of-signal	Parameter type: <Gpon::LossOfSignal> (no yes) Possible values: - no : no loss of signal - yes : loss of signal	loss of signal alarm (los). <i>This element is always shown.</i>
loss-of-ack	Parameter type: <Gpon::LossOfAck> (no yes) Possible values: - no : no loss of acknowledgement - yes : loss of acknowledgement	loss of acknowledge alarm (loa). <i>This element is always shown.</i>
loss-of-gem	Parameter type: <Gpon::LossOfGem> (no yes) Possible values: - no : no loss of gem channel delineation - yes : loss of gem channel delineation	loss of gem channel delineation (lcd). <i>This element is always shown.</i>
physical-eqpt-err	Parameter type: <Gpon::PhysicalEqptErr> (no yes) Possible values: - no : no physical equipment error - yes : physical equipment error	physical equipment error (pee). <i>This element is only shown in detail mode.</i>
startup-failure	Parameter type: <Gpon::StartupFailure> (no yes) Possible values: - no : no startup failure - yes : startup failure	startup failure (suf). <i>This element is only shown in detail mode.</i>
signal-degrade	Parameter type: <Gpon::SignalDegrade> (no yes) Possible values: - no : no signal degrade - yes : signal degrade	signal degrade (sd). <i>This element is only shown in detail mode.</i>
ont-disabled	Parameter type: <Gpon::OntDisabled> (no yes) Possible values: - no : ont not disabled - yes : ont disabled	ont disabled (ontdisabled). <i>This element is always shown.</i>
msg-error-msg	Parameter type: <Gpon::MsgErrorMsg> (no yes) Possible values: - no : no message error message - yes : message error message	message error message (mem). <i>This element is only shown in detail mode.</i>
inactive	Parameter type: <Gpon::Inactive> (no yes) Possible values: - no : active - yes : inactive	inactive (inact). <i>This element is always shown.</i>
loss-of-frame	Parameter type: <Gpon::LossOfFrame> (no yes)	loss of frame (lof). <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - no : no loss of frame - yes : loss of frame	
signal-fail	Parameter type: <Gpon::SignalFail> (no yes) Possible values: - no : no signal failure - yes : signal failure	signal fail (sf). <i>This element is only shown in detail mode.</i>
dying-gasp	Parameter type: <Gpon::DyingGasp> (no yes) Possible values: - no : no dying gasp - yes : dying gasp	dying gasp (dg). <i>This element is always shown.</i>
deactivate-fail	Parameter type: <Gpon::DeactivateFail> (no yes) Possible values: - no : no deactivate failure - yes : deactivate failure	deactivate failure (df). <i>This element is only shown in detail mode.</i>
loss-of-ploam	Parameter type: <Gpon::LossOfPloam> (no yes) Possible values: - no : no loss of ploam - yes : loss of ploam	loss of ploam(lop). <i>This element is only shown in detail mode.</i>
drift-of-window	Parameter type: <Gpon::DriftOfWindow> (no yes) Possible values: - no : no drift of window - yes : drift of window	drift of window (dow). <i>This element is only shown in detail mode.</i>
remote-defect-ind	Parameter type: <Gpon::RemoteDefectInd> (no yes) Possible values: - no : no remote defect indication - yes : remote defect indication	remote defect indication (rdi). <i>This element is only shown in detail mode.</i>
loss-of-key-sync	Parameter type: <Gpon::LossOfKeySync> (no yes) Possible values: - no : no loss of key synchronization - yes : loss of key synchronization	loss of key synchronization (loks). <i>This element is only shown in detail mode.</i>
rogue-ont-disabled	Parameter type: <Gpon::RogueOntDis> (no yes) Possible values: - no : no rogue ont disable - yes : rogue ont disable	rogue ont disable (rogueontdis). <i>This element is only shown in detail mode.</i>
diff-reach	Parameter type: <Gpon::DiffReach> (no yes) Possible values: - no : differential reach capability not exceeded - yes : differential reach capability exceeded	differential reach capability exceeded (difreach). <i>This element is only shown in detail mode.</i>

name	Type	Description
ont-olt-distance	Parameter type: <Gpon::OntOltDist> (invalid not-supported <Gpon::DistOntOlt>) Possible values: - invalid : valid measurement is currently unattainable for some reason - not-supported : the measurement functionality is not supported by this particular unit. Field type <Gpon::DistOntOlt> - estimate of the distance between this ont and the olt - unit: km - range: [0...6550,6553.4...6553.5]	estimate of the distance between this ont and the olt. <i>This element is always shown.</i>
tod-sync	Parameter type: <Gpon::OntSyncStatus> (no yes) Possible values: - no : ont Clock not synced to olt - yes : ont Clock synced to olt	the ont clock tod synchronized status. <i>This element is always shown.</i>
sw-ver-act	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	active software version in the ont. <i>This element is only shown in detail mode.</i>
sw-ver-psv	Parameter type: <Gpon::SwVer> - ont sw version - length: 1<=x<=14	passive software version in the ont. <i>This element is only shown in detail mode.</i>
last-restart-reason	Parameter type: <Gpon::OntLatestRestartReason> (unspecified-other software-restart hardware-restart timer-expiration hardware-error hardware-auto-restart over-temperature software-out-of-memory software-auto-restart user-software-restart n/a) Possible values: - unspecified-other : Unspecified other - software-restart : User initiated software restart remotely by OMCI/PLOAM - hardware-restart : User initiated hardware restart - timer-expiration : Self-monitor timer expiration - hardware-error : Hardware error (bus time-out, misaligned memory access, etc.) - hardware-auto-restart : Hardware auto-restart (on-board voltage monitor auto-restart, etc.) - over-temperature : Over temperature - software-out-of-memory: Software out of memory - software-auto-restart : Software auto-restart (unresolvable references, critical internal inconsistency) - user-software-restart : User initiated software restart locally by CLI/WEB - n/a : unknown	show ont latest restart reason <i>This element is always shown.</i>
down-reason	Parameter type: <Gpon::OntLastDownReason> (loss-of-signal	down cause of ont form OLT perspective

name	Type	Description
	loss-of-acknowledge channel-delineation equipment-error start-up-failure signal-degrade ont-disabled error-message ploam-inactive loss-of-frame signal-failure dying-gasp deactivate-failure loss-of-oam drift-of-window remote-defect loss-of-key-signal roque-ont-disabled pon-exceeds-diff-reach loss-of-omci-channel ont-omci-failure ont-equipment-failure sw-activation-failure password-auth-failure equipment-mismatch invalid-active-version upstream-rate-mismatch me-mismatch-alarm voip-config-error ont-temperature-rise ont-tuning-failed user-software-restart admin-down pon-down not-yet-detected lt-reboot n/a) Possible values: - loss-of-signal : PLOAM Loss Of Signal - loss-of-acknowledge : PLOAM Loss of Acknowledgement - channel-delineation : PLOAM Loss of Channel Delineation - equipment-error : PLOAM Physical Equipment Error - start-up-failure : PLOAM Start Up Failure - signal-degrade : PLOAM Signal Degrade - ont-disabled : PLOAM Misbehaved ONT Disabled - error-message : PLOAM Message Error Message - ploam-inactive : PLOAM Inactive - loss-of-frame : PLOAM Loss of Frame - signal-failure : PLOAM Signal Fail - dying-gasp : PLOAM Dying Gasp - deactivate-failure : PLOAM Deactivate Failure - loss-of-oam : PLOAM Loss of Operations, Administrations and Maintenance - drift-of-window : PLOAM Drift of Window - remote-defect : PLOAM Remote Defect Indication - loss-of-key-signal : PLOAM Loss of Key Signal - roque-ont-disabled : PLOAM Roque ONT Disabled	<i>This element is always shown.</i>

92 ONT Status Commands

name	Type	Description
	- pon-exceeds-diff-reach: PLOAM PON exceeds differential reach capability - loss-of-omci-channel : PLOAM Loss of OMCI Channel on ONT - ont-omci-failure : ONT OMCI Failure - ont-equipment-failure : ONT Equipment Failure - sw-activation-failure : ONT Software Activation Failed - password-auth-failure : ONT Password Authentication Failed - equipment-mismatch : ONT Equipment Mismatch Alarm - invalid-active-version: ONT Invalid active version - upstream-rate-mismatch: ONT Planned and active Upstream Rate Mismatch - me-mismatch-alarm : ONT ME Mismatch Alarm - voip-config-error : VOIP Configuration File Error - ont-temperature-rise : ONT Temperature Rise - ont-tuning-failed : ONT Tuning Failed - user-software-restart : User initiated software restart locally by CLI/WEB - admin-down : Admin down - pon-down : Pon down - not-yet-detected : Not Yet Detected - lt-reboot : Down by LT - ONT went down due to LT reboot - n/a : Unknown	

92.4 ONT Card Status Command

Command Description

This command show ont card holder actual information.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont slot [ (ont-slot-idx) ]
```

Command Parameters

Table 92.4-1 "ONT Card Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-slot-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Gpon::OntSlotId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId> / <Gpon::OntSlotId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier Field type <Gpon::OntSlotId> - Gpon Ont Slot - range: [1...14]	current operational parameters for the ont

Command Output

Table 92.4-2 "ONT Card Status Command" Display parameters

Specific Information		
name	Type	Description
act-num-data-ports	Parameter type: <Gpon::OntCardNoOfPorts> - the actual number of ports - range: [0...24]	the actual number of data ports for the ont card. <i>This element is always shown.</i>
act-num-voice-ports	Parameter type: <Gpon::OntCardNoOfPotsPorts> - the actual number of ports - range: [0...24]	the actual number of voice ports for the ont card. <i>This element is always shown.</i>
actual-card-type	Parameter type: <Gpon::OntCardType> (ethernet 10_100baset pots 802_11 vdsl2pots vdsl2 ethpots none video veip ds1/e1 hpna 2488_1244 moca unknown) Possible values: - ethernet : 10/100/1000/10000 base-t - 10_100baset : 10/100 base-t or 10/100/1000 base-t card - pots : pots card - 802_11 : 80211 card - vdsl2pots : vdsl2/pots combo card - vdsl2 : vdsl2 only card - ethpots : ethernet/pots combo card - none : no card is present - video : video card - veip : VEIP card - ds1/e1 : configurable ds1/e1 card - hpna : hpna card - 2488_1244 : GPON24881244 card - moca : moca - unknown : an unknown card type is present	the type of card that is present in the ont. <i>This element is always shown.</i>
actual-ont-integ	Parameter type: <Gpon::OntInteg> (nonintegrated integrated unknown) Possible values: - nonintegrated : non-integrated interfaces (pluggable units) - integrated : integrated interfaces (no pluggable units) - unknown : not known	how the interfaces at the ont are modeled. <i>This element is only shown in detail mode.</i>
actual-serial-num	Parameter type: <Gpon::OntSerial> - significant 8 characters of the serial number - length: x<=8	the least significant 8 characters of the serial number of a card that is present in the ont. <i>This element is always shown.</i>
actual-version-num	Parameter type: <Gpon::OntVersion> - the version number of a card - length: x<=14	the version number of a card that is present in the ont. <i>This element is only shown in detail mode.</i>

name	Type	Description
actual-vendorid	Parameter type: <Gpon::OntVendor> - the vendor id of a card - length: x<=4	the vendor id of a card that is present in the ont. <i>This element is only shown in detail mode.</i>
actual-cardid	Parameter type: <Gpon::OntCardId> - the identifier of a card - length: x<=20	the identifier of a card (such as clei code) that is present in the ont. <i>This element is only shown in detail mode.</i>
state	Parameter type: <Gpon::OntOperState> (enabled disabled) Possible values: - enabled : enabled - disabled : disabled	operation state of ont. <i>This element is always shown.</i>

92.5 ONT Software Control Status Command

Command Description

This command shows an association between an ont hardware version/variant and an ont software version.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont sw-ctrl [ (sw-ctrl-idx) ]
```

Command Parameters

Table 92.5-1 "ONT Software Control Status Command" Resource Parameters

Resource Identifier	Type	Description
(sw-ctrl-idx)	Format: - ont software control table index - range: [1...250]	ont software control table index

Command Output

Table 92.5-2 "ONT Software Control Status Command" Display parameters

Specific Information		
name	Type	Description
last-update-time	Parameter type: <Gpon::OntLastUpdateTime> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	last update time of ont software control table. <i>This element is always shown.</i>
num-ref-onts	Parameter type: <Gpon::OntNoOfRefONTs> - number of onts that are referencing - range: [0...4608]	the number of onts that are referencing this ont software control entry. <i>This element is always shown.</i>
pre-plan-swver	Parameter type: <Gpon::OntVersion> - the version number of a card - length: x<=14	the previous planned ont software version used when swverplan=auto . <i>This element is always shown.</i>

92.6 ONT Software Version Status Command

Command Description

This command reports the ont software version files that are currently resident on the nt file system.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont sw-version [(sw-ver-id)]

Command Parameters

Table 92.6-1 "ONT Software Version Status Command" Resource Parameters

Resource Identifier	Type	Description
(sw-ver-id)	Format: - software version info index - range: [1...250]	index of software version file

Command Output

Table 92.6-2 "ONT Software Version Status Command" Display parameters

Specific Information		
name	Type	Description
sw-ver	Parameter type: <Gpon::OntVersion> - the version number of a card - length: x<=14	ont software version identifier. <i>This element is always shown.</i>
sw-ver-size	Parameter type: <Gpon::OntSwVerSize> - ont software file size - range: [0...4294967295]	this attribute contains the ont software file size (in bytes). <i>This element is always shown.</i>

92.7 ONT Software Download Status Command

Command Description

This command shows individual ont fine-grain status associated with any sw download activity.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont sw-download [(ont-idx)]

Command Parameters

Table 92.7-1 "ONT Software Download Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	current operational parameters for the ont

Command Output

Table 92.7-2 "ONT Software Download Status Command" Display parameters

Specific Information

name	Type	Description
planned	Parameter type: <Gpon::notPlnd> (no yes) Possible values: - no : ont is planned - yes : ont is not planned	ont is not planned. <i>This element is always shown.</i>
inactive	Parameter type: <Gpon::inAct> (no yes) Possible values: - no : ont is active - yes : ont is not active	ont is not active. <i>This element is only shown in detail mode.</i>
planned-notok	Parameter type: <Gpon::nokPlnd> (no yes) Possible values: - no : planned sw is active - yes : planned sw is not active	planned did not equal to active. <i>This element is only shown in detail mode.</i>
download-notok	Parameter type: <Gpon::nokDld> (no yes) Possible values: - no : download software is in active or passive - yes : download software is not active or passive	download did not equal to active / passive. <i>This element is only shown in detail mode.</i>
download-inprogress	Parameter type: <Gpon::dldInProg> (no yes) Possible values: - no : download not started - yes : download started	download activity in progress. <i>This element is always shown.</i>
ntlt-inprogress	Parameter type: <Gpon::ntltInProg> (no yes) Possible values: - no : ntlt file transfer not in progress - yes : ntlt file transfer in progress	ntlt file transfer in progress. <i>This element is always shown.</i>
omci-inprogress	Parameter type: <Gpon::omciInProg> (no yes) Possible values: - no : omci file transfer not in progress - yes : omci file transfer in progress	omci file transfer in progress. <i>This element is always shown.</i>
ontflash-inprogress	Parameter type: <Gpon::ontFlashInProg> (no yes) Possible values: - no : ont write not in progress - yes : ont flash in progress	ont flash in progress. <i>This element is only shown in detail mode.</i>
ontswact-inprogress	Parameter type: <Gpon::ontSwActInProg> (no yes) Possible values: - no : ont software activation not in progress - yes : ont software activation in progress	ont software activation is progress. <i>This element is always shown.</i>
ntlt-failure	Parameter type: <Gpon::ntltFailure> (no yes)	ntlt file transfer failure. <i>This element is only shown in detail mode.</i>

name	Type	Description
	Possible values: - no : ntl file transfer not failed - yes : ntl file transfer failed	
omci-failure	Parameter type: <Gpon::omciFailure> (no yes) Possible values: - no : omci file transfer not failed - yes : omci file transfer failed	omci file transfer failure. <i>This element is only shown in detail mode.</i>
ontflash-failure	Parameter type: <Gpon::ontFlashFail> (no yes) Possible values: - no : ont flash writing not failed - yes : ont flash writing failed	ont flash write failure. <i>This element is only shown in detail mode.</i>
ontswact-failure	Parameter type: <Gpon::ontSwActFail> (no yes) Possible values: - no : ont software activate not failed - yes : ont software activate failed	ont software activation failure. <i>This element is only shown in detail mode.</i>
download-file-notfound	Parameter type: <Gpon::noDldFile> (no yes) Possible values: - no : download file found - yes : download file not found	download file not found. <i>This element is always shown.</i>
no-matching-software	Parameter type: <Gpon::noMatch> (no yes) Possible values: - no : sw entry found in ctrl table - yes : sw entry not found in table	entry match not found in sw ctrl table. <i>This element is only shown in detail mode.</i>
sw-version-mismatch	Parameter type: <Gpon::swVerMisMatch> (no yes) Possible values: - no : software version match - yes : software version mismatch	software version mismatch. <i>This element is always shown.</i>
sw-download-failure	Parameter type: <Gpon::swDlFail> (no yes) Possible values: - no : software download not failed - yes : software download failed	software download failed. <i>This element is always shown.</i>
sw-delayactivate	Parameter type: <Gpon::swDelayActivate> (no yes) Possible values: - no : no delay activation pending - yes : delay activation pending	software activation delayed. <i>This element is always shown.</i>
sw-download-pending	Parameter type: <Gpon::downloadPending> (no yes) Possible values: - no : no download activity pending - yes : download activity pending	sw download activity is pending. <i>This element is only shown in detail mode.</i>

92.8 ONT Data Store Status Command

Command Description

This command reports information on the latest ont data dump/save.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont data-store [(ont-idx)]

Command Parameters

Table 92.8-1 "ONT Data Store Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	access identifier for the ont

Command Output

Table 92.8-2 "ONT Data Store Status Command" Display parameters

Specific Information

name	Type	Description
ont-status	Parameter type: <Gpon::OntDataStatus> (unknown notsupported reported) Possible values: - unknown : unknown (olt has not yet communicated with ont) - notsupported : ont does not support data store feature - reported : dumpdate and dumptime reported by the ont	current status ont data save. <i>This element is always shown.</i>
last-dump-time	Parameter type: <Gpon::OntLastUpdateTime> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	date of the last data dump/save. <i>This element is always shown.</i>

92.9 ONT Optics Status Command

Command Description

This command reports a summary of current optical power levels between the olt and a specific ont.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont optics [(ont-idx)]

Command Parameters

Table 92.9-1 "ONT Optics Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	access identifier for the ont

Command Output

Table 92.9-2 "ONT Optics Status Command" Display parameters

Specific Information

name	Type	Description
rx-signal-level	Parameter type: <Gpon::OntOpticalSignalLevel> (unknown unsupported <Gpon::OpticalSignalLevel>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OpticalSignalLevel> - ont receive / transmit optical signal level - unit: dbm - range: [-65.536...65.538]	indicates the current measurement of the ont receive optical signal level in dBm . <i>This element is always shown.</i>
tx-signal-level	Parameter type: <Gpon::OntOpticalSignalLevel> (unknown unsupported <Gpon::OpticalSignalLevel>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OpticalSignalLevel> - ont receive / transmit optical signal level - unit: dbm - range: [-65.536...65.538]	indicates the current measurement of the ont transmit optical signal level in dBm . <i>This element is always shown.</i>
ont-temperature	Parameter type: <Gpon::OntTemperature> (unknown unsupported <Gpon::OntTemperature>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OntTemperature> - temperature of ont optical module - unit: degree C - range: [-128...128.004]	indicates the current temperature of the optics module associated with this ont. <i>This element is always shown.</i>
ont-voltage	Parameter type: <Gpon::OntVoltage> (unknown unsupported <Gpon::OntVoltage>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OntVoltage> - power feed voltage of ont optical module - unit: Volts - range: [-655.36...655.38]	indicates the current voltage of the optics module associated with this ont. <i>This element is always shown.</i>
laser-bias-curr	Parameter type: <Gpon::OntLaserBias> (unknown unsupported <Gpon::LaserBias>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::LaserBias>	indicates the current bias current of the laser associated with this ont. <i>This element is always shown.</i>

92 ONT Status Commands

name	Type	Description
	- indicates the bias current of the laser - unit: uA - range: [0...131074]	
olt-rx-sig-level	Parameter type: <Gpon::OntOltRxSignalLevel> (invalid unsupported <Gpon::OltRxSignalLevel>) Possible values: - invalid : valid measurement is currently unattainable for some reason - unsupported : measurement functionality is not supported Field type <Gpon::OltRxSignalLevel> - measurement of the ont receive optical signal level in dBm - unit: dbm - range: [-50...0,6553.4...6553.5]	indicates the current level of the ONT's optical signal(as measured at olt-side) <i>This element is always shown.</i>

92.10 ONT Optics History Status Command

Command Description

This command reports the history of optical power levels between the olt and a specific ont.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont optics-history [ (ont-idx) ]
```

Command Parameters

Table 92.10-1 "ONT Optics History Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	access identifier for the ont

Command Output

Table 92.10-2 "ONT Optics History Status Command" Display parameters

Specific Information

92 ONT Status Commands

name	Type	Description
last-update-time	Parameter type: <Gpon::OntLastUpdateTime> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	date of the last data dump/save. <i>This element is always shown.</i>
ont-rx-signal-level	Parameter type: <Gpon::OntOpticalSignalLevel> (unknown unsupported <Gpon::OpticalSignalLevel>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OpticalSignalLevel> - ont receive / transmit optical signal level - unit: dbm - range: [-65.536...65.538]	indicates the daily measurement of the ont receive optical signal level in dBm . <i>This element is always shown.</i>
ont-tx-signal-level	Parameter type: <Gpon::OntOpticalSignalLevel> (unknown unsupported <Gpon::OpticalSignalLevel>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OpticalSignalLevel> - ont receive / transmit optical signal level - unit: dbm - range: [-65.536...65.538]	indicates the daily measurement of the ont transmit optical signal level in dBm . <i>This element is always shown.</i>
ont-temperature	Parameter type: <Gpon::OntTemperature> (unknown unsupported <Gpon::OntTemperature>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OntTemperature> - temperature of ont optical module - unit: degree C - range: [-128...128.004]	indicates the daily temperature of the optics module associated with this ont. <i>This element is always shown.</i>
ont-voltage	Parameter type: <Gpon::OntVoltage> (unknown unsupported <Gpon::OntVoltage>) Possible values: - unknown : olt has not yet communicated with ont - unsupported : ont does not support the measurement of this attribute Field type <Gpon::OntVoltage> - power feed voltage of ont optical module - unit: Volts - range: [-655.36...655.38]	indicates the daily voltage of the optics module associated with this ont. <i>This element is always shown.</i>
ont-laser-bias-curr	Parameter type: <Gpon::OntLaserBias> (unknown unsupported <Gpon::LaserBias>) Possible values: - unknown : olt has not yet communicated with ont	indicates the daily bias current of the laser associated with this ont. <i>This element is always shown.</i>

name	Type	Description
	- unsupported : ont does not support the measurement of this attribute - Field type <Gpon::LaserBias> - indicates the bias current of the laser - unit: uA - range: [0...131074]	
olt-rx-signal-level	Parameter type: <Gpon::OntOltRxSignalLevel> (invalid unsupported <Gpon::OltRxSignalLevel>) Possible values: - invalid : valid measurement is currently unattainable for some reason - unsupported : measurement functionality is not supported Field type <Gpon::OltRxSignalLevel> - measurement of the ont receive optical signal level in dBm - unit: dbm - range: [-50...0,6553.4...6553.5]	indicates the daily measurement of the ont receive optical signal level in dBm. <i>This element is always shown.</i>
olt-tx-signal-level	Parameter type: <Gpon::OntOltTxSignalLevel> (invalid unsupported <Gpon::OltTxSignalLevel>) Possible values: - invalid : valid measurement is currently unattainable for some reason - unsupported : measurement functionality is not supported Field type <Gpon::OltTxSignalLevel> - measurement of the ont transmit optical signal level in dBm - unit: dbm - range: [-30...30,6553.4...6553.5]	indicates the daily measurement of the ont transmit optical signal level in dBm. <i>This element is always shown.</i>
olt-temperature	Parameter type: <Gpon::OntOltTemp> (invalid unsupported <Gpon::OltTemp>) Possible values: - invalid : valid measurement is currently unattainable for some reason - unsupported : measurement functionality is not supported Field type <Gpon::OltTemp> - temperature of the optics module - unit: degree C - range: [-100...100,655.34...655.35]	Indicates the daily temperature of the optics module associated with this pon. <i>This element is always shown.</i>
olt-voltage	Parameter type: <Gpon::OntOltPwrFeedVoltage> (invalid unsupported <Gpon::OntOltVoltage>) Possible values: - invalid : valid measurement is currently unattainable for some reason - unsupported : measurement functionality is not supported Field type <Gpon::OntOltVoltage> - temperature of the optics module - unit: Volts - range: [0...20,655.34...655.35]	indicates the daily voltage of the optics module associated with this pon. <i>This element is always shown.</i>
olt-laser-bias-curr	Parameter type: <Gpon::OntOltLaserBias> (invalid	indicates the daily bias current of the laser associated with this pon.

92 ONT Status Commands

name	Type	Description
	notsupported <Gpon::OntOltLaserBias>) Possible values: - invalid : valid measurement is currently unattainable for some reason - notsupported : measurement functionality is not supported Field type <Gpon::OntOltLaserBias> - bias current of the laser - unit: mA - range: [0...500,65534...65535]	This element is always shown.

92.11 ONT Power Shedding Status Command

Command Description

This command shows the power shedding status information of an ont.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont pwr-shed [ (ont-idx) ]
```

Command Parameters

Table 92.11-1 "ONT Power Shedding Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	access identifier for the ont

Command Output

Table 92.11-2 "ONT Power Shedding Status Command" Display parameters

Specific Information

92 ONT Status Commands

name	Type	Description
ont-status	Parameter type: <Gpon::OntPwrStatus> (unknown notsupported supported) Possible values: - unknown : unknown (olt has not yet communicated with ont) - notsupported : ont does not support power shedding feature - supported : ont supports power shedding status feature and status is known	indication of power shedding status feature of the ont. <i>This element is always shown.</i>
data-class	Parameter type: <Gpon::DataClass> (not-in-effect in-effect) Possible values: - not-in-effect : power shedding not in effect - in-effect : power shedding in effect	power shedding of data-class. <i>This element is always shown.</i>
voice-class	Parameter type: <Gpon::VoiceClass> (not-in-effect in-effect) Possible values: - not-in-effect : power shedding not in effect - in-effect : power shedding in effect	power shedding of voice-class. <i>This element is always shown.</i>
video-class	Parameter type: <Gpon::VideoClass> (not-in-effect in-effect) Possible values: - not-in-effect : power shedding not in effect - in-effect : power shedding in effect	power shedding of video-class. <i>This element is always shown.</i>
dsl-class	Parameter type: <Gpon::DslClass> (not-in-effect in-effect) Possible values: - not-in-effect : power shedding not in effect - in-effect : power shedding in effect	power shedding of dsl-class. <i>This element is always shown.</i>
ces-class	Parameter type: <Gpon::CesClass> (not-in-effect in-effect) Possible values: - not-in-effect : power shedding not in effect - in-effect : power shedding in effect	power shedding of ces-class. <i>This element is always shown.</i>

92.12 GPON ont Olt-side on-demand Aggregate gem Current-Interval Performance Monitoring Command

Command Description

This command retrieves OLT-side TC layer (GEM-based) current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont tc-layer olt-side-on-demand current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.12-1 "GPON ont Olt-side on-demand Aggregate gem Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	

Command Output

Table 92.12-2 "GPON ont Olt-side on-demand Aggregate gem Current-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
lost-frags-down	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments downstream <i>This element is always shown.</i>
lost-frags-up	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments upstream <i>This element is always shown.</i>
receive-frags	Parameter type: <Counter> - 32 bit counter	count of receive gem fragments <i>This element is always shown.</i>
transmit-frags	Parameter type: <Counter> - 32 bit counter	count of transmitted gem fragments <i>This element is always shown.</i>
receive-blocks	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of receive gem blocks <i>This element is always shown.</i>
transmit-blocks	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of transmitted gem blocks <i>This element is always shown.</i>

92.13 GPON ont Olt-side on-demand aggregate gem Previous-Interval Performance Monitoring Command

Command Description

This command retrieves OLT-side TC layer (GEM-based) previous interval performance monitoring data for the ONT.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont tc-layer olt-side-on-demand previous-interval [ (ont-idx) [ interval-num <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.13-1 "GPON ont Olt-side on-demand aggregate gem Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId>	identification of ont

Resource Identifier	Type	Description
	- the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
interval-num	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

Table 92.13-2 "GPON ont Olt-side on-demand aggregate gem Previous-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
lost-frags-down	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments downstream <i>This element is always shown.</i>
lost-frags-up	Parameter type: <Counter> - 32 bit counter	count of lost gem Fragments upstream <i>This element is always shown.</i>
receive-frags	Parameter type: <Counter> - 32 bit counter	count of recieve gem fragments <i>This element is always shown.</i>
transmit-frags	Parameter type: <Counter> - 32 bit counter	count of transmitted gem fragments <i>This element is always shown.</i>
receive-blocks	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of recieve gem blocks <i>This element is always shown.</i>
transmit-blocks	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of transmitted gem blocks <i>This element is always shown.</i>

92.14 GPON ont Ont-side aggregate gem Current-Interval Performance Monitoring Command

Command Description

This command retrieves ONT-side TC layer (GEM-based) current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont tc-layer ont-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.14-1 "GPON ont Ont-side aggregate gem Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	

Command Output

Table 92.14-2 "GPON ont Ont-side aggregate gem Current-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
lost-frags-down	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments downstream <i>This element is always shown.</i>
lost-frags-up	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments upstream <i>This element is always shown.</i>
receive-frags	Parameter type: <Counter> - 32 bit counter	count of receive gem fragments <i>This element is always shown.</i>
transmit-frags	Parameter type: <Counter> - 32 bit counter	count of transmitted gem fragments <i>This element is always shown.</i>
receive-blocks	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of receive gem blocks <i>This element is always shown.</i>
transmit-blocks	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of transmitted gem blocks <i>This element is always shown.</i>
bad-headers	Parameter type: <Counter> - 32 bit counter	count of received gem headers that are bad <i>This element is always shown.</i>

92.15 GPON ont Ont-side Aggregate gem Previous-Interval Performance Monitoring Command

Command Description

This command retrieves ONT-side TC layer (GEM-based) previous interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont tc-layer ont-side previous-interval [ (ont-idx) [ interval-num <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.15-1 "GPON ont Ont-side Aggregate gem Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	
interval-num	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

Table 92.15-2 "GPON ont Ont-side Aggregate gem Previous-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
lost-frags-down	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments downstream <i>This element is always shown.</i>
lost-frags-up	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments upstream <i>This element is always shown.</i>
receive-frags	Parameter type: <Counter> - 32 bit counter	count of recieve gem fragments <i>This element is always shown.</i>
transmit-frags	Parameter type: <Counter> - 32 bit counter	count of transmitted gem fragments <i>This element is always shown.</i>
receive-blocks	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of recieve gem blocks <i>This element is always shown.</i>
transmit-blocks	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of transmitted gem blocks <i>This element is always shown.</i>
bad-headers	Parameter type: <Counter> - 32 bit counter	count of received gem headers that are bad <i>This element is always shown.</i>

92.16 GPON ont Olt-side Always-on Aggregate gem Current-Interval Performance Monitoring Command

Command Description

This command reports OLT-side TC layer (GEM-based) current interval performance monitoring data for errored fragments

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont tc-layer olt-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.16-1 "GPON ont Olt-side Always-on Aggregate gem Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	

Command Output

Table 92.16-2 "GPON ont Olt-side Always-on Aggregate gem Current-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
err-frags-up	Parameter type: <Counter> - 32 bit counter	a count of errored gem fragments (upstream) <i>This element is always shown.</i>

92.17 GPON Ont Olt-side Always-on Aggregate gem Previous-Interval Performance Monitoring Command

Command Description

This command reports command reports OLT-side TC layer (GEM-based)previous interval performance monitoring data for errored fragments for ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont tc-layer olt-side previous-interval [ (ont-idx) [ interval-num <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.17-1 "GPON Ont Olt-side Always-on Aggregate gem Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	
interval-num	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

Table 92.17-2 "GPON Ont Olt-side Always-on Aggregate gem Previous-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
err-frags-up	Parameter type: <Counter> - 32 bit counter	count of errored gem fragments (upstream) <i>This element is always shown.</i>

92.18 Multicast TC-layer Current Interval Performance Data Status Command

Command Description

This command displays various statistics collected for Multicast ONT TC-layer during the current 15 minute interval of operation.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont mcast-tc-layer ont-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.18-1 "Multicast TC-layer Current Interval Performance Data Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Command Output

Table 92.18-2 "Multicast TC-layer Current Interval Performance Data Status Command" Display parameters

Specific Information		
name	Type	Description
lost-frags-dn	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments in downstream direction <i>This element is always shown.</i>
receive-frags	Parameter type: <Counter> - 32 bit counter	count of received gem fragments <i>This element is always shown.</i>
receive-blocks	Parameter type: <Counter> - 32 bit counter	count of received gem blocks <i>This element is always shown.</i>

92.19 Multicast TC-layer Previous Interval Performance Data Status Command

Command Description

This command displays various statistics collected for Multicast ONT TC-layer over the previous 8 hours of operations which is broken in to 32 completed 15 minute intervals.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont mcast-tc-layer ont-side previous-interval [ (ont-idx) [ interval-no <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.19-1 "Multicast TC-layer Previous Interval Performance Data Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index
interval-no	Parameter type: <Gpon::IntervalNo>	identifies prev 15min intvls, val 1

Resource Identifier	Type	Description
	Format: - a number of a previous interval number - range: [1...32]	as the latest intvl

Command Output

Table 92.19-2 "Multicast TC-layer Previous Interval Performance Data Status Command" Display parameters

Specific Information		
name	Type	Description
lost-frags-dn	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments in downstream direction <i>This element is always shown.</i>
receive-frags	Parameter type: <Counter> - 32 bit counter	count of received gem fragments <i>This element is always shown.</i>
receive-blocks	Parameter type: <Counter> - 32 bit counter	count of received gem blocks <i>This element is always shown.</i>

92.20 Fec TC-layer Current Interval Counters Command

Command Description

This command displays various statistics collected for Fec ONT TC-layer during the current 15 minute interval of operation.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont fec-tc-layer ont-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.20-1 "Fec TC-layer Current Interval Counters Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Command Output

Table 92.20-2 "Fec TC-layer Current Interval Counters Command" Display parameters

Specific Information		
name	Type	Description
corrected-bytes	Parameter type: <Counter> - 32 bit counter	A count of number of bytes that were corrected by the FEC function <i>This element is always shown.</i>
corrected-code-words	Parameter type: <Counter> - 32 bit counter	A count of number of code words that were corrected by the FEC function. <i>This element is always shown.</i>
uncorrected-words	Parameter type: <Counter> - 32 bit counter	A count of number of errored code words that could not be corrected by the FEC function. <i>This element is always shown.</i>
total-code-words	Parameter type: <Counter> - 32 bit counter	A count of total number of received code words. <i>This element is always shown.</i>
fec-seconds	Parameter type: <Counter> - 32 bit counter	A count seconds during which there was a forward error correction anomaly. <i>This element is always shown.</i>

92.21 Olt-side FEC TC-layer Current Interval Counters Command

Command Description

This command displays various statistics collected for olt-side FEC ONT TC-layer during the current 15 minute interval of operation.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont fec-tc-layer olt-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.21-1 "Olt-side FEC TC-layer Current Interval Counters Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Command Output

Table 92.21-2 "Olt-side FEC TC-layer Current Interval Counters Command" Display parameters

Specific Information		
name	Type	Description
corrected-bytes	Parameter type: <Counter> - 32 bit counter	A count of number of bytes that were corrected by the FEC function <i>This element is always shown.</i>
corrected-code-words	Parameter type: <Counter> - 32 bit counter	A count of number of code words that were corrected by the FEC function. <i>This element is always shown.</i>
uncorrected-words	Parameter type: <Counter> - 32 bit counter	A count of number of errored code words that could not be corrected by the FEC function. <i>This element is always shown.</i>
total-code-words	Parameter type: <Counter> - 32 bit counter	A count of total number of received code words. <i>This element is always shown.</i>

92.22 ONT Software Control List Status Command

Command Description

This command shows an list of ONT associated with the given particular ont software control id. Index is mandatory parameter.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont sw-ctrl-list [ (sw-ctrl-idx) ]
```

Command Parameters

Table 92.22-1 "ONT Software Control List Status Command" Resource Parameters

Resource Identifier	Type	Description
(sw-ctrl-idx)	Format: - ont software control table index - range: [1...250]	ont software control table index

Command Output

Table 92.22-2 "ONT Software Control List Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup>	aid of associated onts. <i>This element is always shown.</i>

92 ONT Status Commands

name	Type	Description
	- subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

92.23 GPON ont pon aggregate ethernet

Current-Interval Performance Monitoring

Command

Command Description

This command retrieves ONT-side ethernet current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ethernet current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.23-1 "GPON ont pon aggregate ethernet Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId>	identification of ont

Resource Identifier	Type	Description
	- the ONT identifier	

Command Output

Table 92.23-2 "GPON ont pon aggregate ethernet Current-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
eth-errors-down	Parameter type: <Counter> - 32 bit counter	count of ethernet errors downstream <i>This element is always shown.</i>
eth-errors-up	Parameter type: <Counter> - 32 bit counter	count of ethernet errors upstream <i>This element is always shown.</i>
eth-frames-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	total count of ethernet packets downstream <i>This element is always shown.</i>
eth-frames-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	total count of ethernet packets upstream <i>This element is always shown.</i>
eth-bytes-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet bytes downstream <i>This element is always shown.</i>
eth-bytes-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet bytes upstream <i>This element is always shown.</i>
eth-unicast-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet unicast downstream <i>This element is only shown in detail mode.</i>
eth-unicast-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet unicast upstream <i>This element is only shown in detail mode.</i>
eth-multicast-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet multicast downstream <i>This element is only shown in detail mode.</i>
eth-multicast-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet multicast upstream <i>This element is only shown in detail mode.</i>
eth-broadcast-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet broadcast downstream <i>This element is only shown in detail mode.</i>
eth-broadcast-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet broadcast upstream <i>This element is only shown in detail mode.</i>
eth-rate-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet rate downstream <i>This element is always shown.</i>
eth-rate-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet rate upstream <i>This element is always shown.</i>

92.24 GPON ont pon Aggregate ethernet Previous-Interval Performance Monitoring Command

Command Description

This command retrieves ONT-side ethernet previous interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ethernet previous-interval [ (ont-idx) [ interval-num <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.24-1 "GPON ont pon Aggregate ethernet Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId>	identification of ont

Resource Identifier	Type	Description
	- the ONT identifier	
interval-num	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

Table 92.24-2 "GPON ont pon Aggregate ethernet Previous-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
eth-errors-down	Parameter type: <Counter> - 32 bit counter	count of ethernet errors downstream <i>This element is always shown.</i>
eth-errors-up	Parameter type: <Counter> - 32 bit counter	count of ethernet errors upstream <i>This element is always shown.</i>
eth-frames-down	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	total count of ethernet packets downstream <i>This element is always shown.</i>
eth-frames-up	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	total count of ethernet packets upstream <i>This element is always shown.</i>
eth-bytes-down	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet bytes downstream <i>This element is always shown.</i>
eth-bytes-up	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet bytes upstream <i>This element is always shown.</i>
eth-unicast-down	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet unicast downstream <i>This element is only shown in detail mode.</i>
eth-unicast-up	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet unicast upstream <i>This element is only shown in detail mode.</i>
eth-multicast-down	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet multicast downstream <i>This element is only shown in detail mode.</i>
eth-multicast-up	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet multicast upstream <i>This element is only shown in detail mode.</i>
eth-broadcast-down	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet broadcast downstream <i>This element is only shown in detail mode.</i>
eth-broadcast-up	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet broadcast upstream <i>This element is only shown in detail mode.</i>
eth-rate-down	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet rate downstream <i>This element is always shown.</i>
eth-rate-up	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of ethernet rate upstream <i>This element is always shown.</i>

92.25 GPON ont pon aggregate ethernet total Performance Monitoring Command

Command Description

This command retrieves ONT-side ethernet total performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ethernet total [ (ont-idx) ]
```

Command Parameters

Table 92.25-1 "GPON ont pon aggregate ethernet total Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ont

Command Output

Display parameters**

Specific Information		
name	Type	Description
eth-frames-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	total count of ethernet packets downstream <i>This element is always shown.</i>
eth-frames-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	total count of ethernet packets upstream <i>This element is always shown.</i>
eth-bytes-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet bytes downstream <i>This element is always shown.</i>
eth-bytes-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet bytes upstream <i>This element is always shown.</i>
eth-unicast-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet unicast downstream <i>This element is only shown in detail mode.</i>
eth-unicast-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet unicast upstream <i>This element is only shown in detail mode.</i>
eth-multicast-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet multicast downstream <i>This element is only shown in detail mode.</i>
eth-multicast-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet multicast upstream <i>This element is only shown in detail mode.</i>
eth-broadcast-down	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet broadcast downstream <i>This element is only shown in detail mode.</i>
eth-broadcast-up	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of ethernet broadcast upstream <i>This element is only shown in detail mode.</i>

92.26 Olt-side Physical-layer Current Interval Counters Command

Command Description

This command displays various statistics collected at the ONT for olt-side physical-layer during the current 15 minute interval of operation.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont phy-layer olt-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.26-1 "Olt-side Physical-layer Current Interval Counters Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Command Output

Table 92.26-2 "Olt-side Physical-layer Current Interval Counters Command" Display parameters

Specific Information		
name	Type	Description
bip32-prot-words	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	A count of total number of BIP32 words on physical-layer <i>This element is always shown.</i>
bip32-bit-errors	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	A count of number of BIP32 errors on physical-layer <i>This element is always shown.</i>

92.27 XGPON ONT Ont-side tc-layer

Current-Interval Performance Monitoring

Command

Command Description

This command retrieves XGPON ONT-side TC layer (GEM-based) current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont xg-tc-layer ont-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.27-1 "XGPON ONT Ont-side tc-layer Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	

Command Output

Table 92.27-2 "XGPON ONT Ont-side tc-layer Current-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
hec-errs	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments downstream <i>This element is always shown.</i>
key-errs	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments upstream <i>This element is always shown.</i>
psb-hec	Parameter type: <Counter> - 32 bit counter	This attribute counts HEC errors in any of the fields of the downstream physical sync block. <i>This element is always shown.</i>
xh-tc	Parameter type: <Counter> - 32 bit counter	HEC errors detected in the XGTC header. <i>This element is always shown.</i>
unknow-prof	Parameter type: <Counter> - 32 bit counter	the number of grants received whose specified profile was not known to the ONU <i>This element is always shown.</i>
tr-xgem-frame	Parameter type: <Counter> - 32 bit counter	the number of non-idle XGEM frames transmitted <i>This element is always shown.</i>
frag-xgem-fram	Parameter type: <Counter> - 32 bit counter	counts the number of non-idle XGEM frames transmitted <i>This element is always shown.</i>
xgem-lostword	Parameter type: <Counter> - 32 bit counter	counts the number of non-idle XGEM frames transmitted <i>This element is always shown.</i>

92.28 XGPON ONT Ont-side tc-layer Previous-Interval Performance Monitoring Command

Command Description

This command retrieves XGPON ONT-side TC layer (GEM-based) previous interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont xg-tc-layer ont-side previous-interval [ (ont-idx) [ interval-no <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.28-1 "XGPON ONT Ont-side tc-layer Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	ont index

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	
interval-no	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

Table 92.28-2 "XGPON ONT Ont-side tc-layer Previous-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
hec-errs	Parameter type: <Counter> - 32 bit counter	count of hec errors <i>This element is always shown.</i>
key-errs	Parameter type: <Counter> - 32 bit counter	count of key errors <i>This element is always shown.</i>
psb-hec	Parameter type: <Counter> - 32 bit counter	This attribute counts HEC errors in any of the fields of the downstream physical sync block. <i>This element is always shown.</i>
xg-tc	Parameter type: <Counter> - 32 bit counter	This attribute counts HEC errors detected in the XGTC header . <i>This element is always shown.</i>
unknow-prof	Parameter type: <Counter> - 32 bit counter	This attribute counts the number of grants received whose specified profile was not known to the ONU. <i>This element is always shown.</i>
tr-xgem-frame	Parameter type: <Counter> - 32 bit counter	This attribute counts the number of non-idle XGEM frames transmitted. If an SDU is fragmented, each fragment is an XGEM frame and is counted as such. <i>This element is always shown.</i>
frag-xgem-fram	Parameter type: <Counter> - 32 bit counter	This attribute counts the number of XGEM frames that represent fragmented SDUs, as indicated by the LF bit =0. <i>This element is always shown.</i>
xgem-lostword	Parameter type: <Counter> - 32 bit counter	This attribute counts the number of four-byte words lost because of an XGEM frame HEC error. In general, all XGTC payload following the error is lost, until the next PSBd event. <i>This element is always shown.</i>

92.29 XGPON ONT Olt-side tc-layer Current-Interval Performance Monitoring Command

Command Description

This command retrieves XGPON OLT-side TC layer (GEM-based) current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont xg-tc-layer olt-side current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.29-1 "XGPON ONT Olt-side tc-layer Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ont

Command Output

Table 92.29-2 "XGPON ONT Olt-side tc-layer Current-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
hec-errs	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments downstream <i>This element is always shown.</i>
key-errs	Parameter type: <Counter> - 32 bit counter	count of lost gem fragments upstream <i>This element is always shown.</i>
rng-time-msgs	Parameter type: <Counter> - 32 bit counter	count of recieve gem fragments <i>This element is always shown.</i>

92.30 XGPON ONT Olt-side tc-layer Previous-Interval Performance Monitoring Command

Command Description

This command retrieves XGPON OLT-side TC layer (GEM-based) previous interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont xg-tc-layer olt-side previous-interval [ (ont-idx) [ interval-no <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.30-1 "XGPON ONT Olt-side tc-layer Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier	ont index

Resource Identifier	Type	Description
	Field type <Ng2::OntId> - the ONT identifier	
interval-no	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

Table 92.30-2 "XGPON ONT Olt-side tc-layer Previous-Interval Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
hec-errs	Parameter type: <Counter> - 32 bit counter	count of hec errors <i>This element is always shown.</i>
key-errs	Parameter type: <Counter> - 32 bit counter	count of key errors <i>This element is always shown.</i>
rng-time-msgs	Parameter type: <Counter> - 32 bit counter	A count of number of ranging time messages that were sent for this ONT. <i>This element is always shown.</i>

92.31 ONT Utilization Current Interval PM Command

Command Description

This command retrieves ONT utilization current interval performance monitoring data.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont utilization current-interval [(ont-idx)]

Command Parameters

Table 92.31-1 "ONT Utilization Current Interval PM Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ONT

Command Output

Specific Information		
name	Type	Description
txucfrm	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast frames transmitted downstream on the PON or channel-pair for that ONT <i>This element is always shown.</i>
rxucfrm	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast frames transmitted upstream on the PON or channel-pair for that ONT <i>This element is always shown.</i>
txucdropfrm	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast frames dropped on the PON or channel-pair destined for that ONT <i>This element is always shown.</i>
rxucdropfrm	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast bytes dropped on the PON or channel-pair from that ONT <i>This element is always shown.</i>
txucbyte	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast bytes transmitted downstream on the PON or channel-pair for that ONT <i>This element is only shown in detail mode.</i>
rxucbyte	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast bytes transmitted upstream on the PON or channel-pair for that ONT <i>This element is only shown in detail mode.</i>
txucdropbyte	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast bytes dropped on the PON or channel-pair destined for that ONT <i>This element is only shown in detail mode.</i>
rxucdropbyte	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of total unicast bytes dropped on the PON or channel-pair from that ONT <i>This element is only shown in detail mode.</i>

92.32 ONT Utilization Previous Interval PM Command

Command Description

This command retrieves ONT utilization previous interval performance monitoring data.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont utilization previous-interval [ (ont-idx) [ interval-num <Gpon::FiveMinIntvlNo> ] ]
```

Command Parameters

Table 92.32-1 "ONT Utilization Previous Interval PM Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ONT
interval-num	Parameter type: <Gpon::FiveMinIntvlNo> Format: - a number of a previous five minute interval number	identifies prev five-min interval (1 is the most recent)

Resource Identifier	Type	Description
	- range: [1...288]	

Command Output

92.33 ONT Configure File Download Status Command

Command Description

This command shows individual ont fine-grain status associated with any configure file download activity.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont cfg-download [(ont-idx)]

Command Parameters

Table 92.33-1 "ONT Configure File Download Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	current operational parameters for the ont

Command Output

Table 92.33-2 "ONT Configure File Download Status Command" Display parameters

Specific Information		
name	Type	Description
planned	Parameter type: <Gpon::notPlnd> (no yes) Possible values: - no : ont is planned - yes : ont is not planned	ont is not planned. <i>This element is always shown.</i>
inactive	Parameter type: <Gpon::inAct> (no yes) Possible values: - no : ont is active - yes : ont is not active	ont is not active. <i>This element is only shown in detail mode.</i>
cfg1-planned-notok	Parameter type: <Gpon::cfgNokPlnd> (no yes) Possible values: - no : planned configure file is active - yes : planned configure file is not active	planned configure file 1 did not equal to active. <i>This element is only shown in detail mode.</i>
cfg1-dld-notok	Parameter type: <Gpon::cfgNokDld> (no yes) Possible values: - no : download configure file is in active or passive - yes : download configure file is not active or passive	download configure file 1 did not equal to active / passive. <i>This element is only shown in detail mode.</i>
cfg1-dld-inprogress	Parameter type: <Gpon::dldInProg> (no yes) Possible values: - no : download not started - yes : download started	configure file 1 download activity in progress. <i>This element is always shown.</i>
cfg1-ntlt-inprogress	Parameter type: <Gpon::ntltInProg> (no yes) Possible values: - no : ntlt file transfer not in progress - yes : ntlt file transfer in progress	configure file 1 ntlt file transfer in progress. <i>This element is always shown.</i>
cfg1-omci-inprogress	Parameter type: <Gpon::omciInProg> (no yes) Possible values: - no : omci file transfer not in progress - yes : omci file transfer in progress	configure file 1 omci file transfer in progress. <i>This element is always shown.</i>
cfg1-flash-inprogress	Parameter type: <Gpon::ontFlashInProg> (no yes) Possible values: - no : ont write not in progress - yes : ont flash in progress	configure file 1 ont flash in progress. <i>This element is only shown in detail mode.</i>
cfg1-act-inprogress	Parameter type: <Gpon::ontCfgActInProg> (no yes) Possible values: - no : ont configure file activation not in progress - yes : ont configure file activation in progress	ont configure file 1 activation is progress. <i>This element is always shown.</i>

92 ONT Status Commands

name	Type	Description
cfg1-ntlt-failure	Parameter type: <Gpon::ntltFailure> (no yes) Possible values: - no : ntlt file transfer not failed - yes : ntlt file transfer failed	configure file 1 ntlt file transfer failure. <i>This element is only shown in detail mode.</i>
cfg1-omci-failure	Parameter type: <Gpon::omciFailure> (no yes) Possible values: - no : omci file transfer not failed - yes : omci file transfer failed	configure file 1 omci file transfer failure. <i>This element is only shown in detail mode.</i>
cfg1-ontflash-failure	Parameter type: <Gpon::ontFlashFail> (no yes) Possible values: - no : ont flash writing not failed - yes : ont flash writing failed	configure file 1 ont flash write failure. <i>This element is only shown in detail mode.</i>
ontcfg1act-failure	Parameter type: <Gpon::ontCfgActFail> (no yes) Possible values: - no : ont configure file activate not failed - yes : ont configure file activate failed	ont configure file 1 activation failure. <i>This element is only shown in detail mode.</i>
dld-cfgfile1-notfound	Parameter type: <Gpon::noDldFile> (no yes) Possible values: - no : download file found - yes : download file not found	download configure file 1 not found. <i>This element is only shown in detail mode.</i>
no-matching-cfgfile1	Parameter type: <Gpon::cfgNoMatch> (no yes) Possible values: - no : configure file entry found in ctrl table - yes : configure file entry not found in table	entry match not found in sw ctrl table. <i>This element is only shown in detail mode.</i>
cfgfile1-mismatch	Parameter type: <Gpon::cfgFileMisMatch> (no yes) Possible values: - no : configure file match - yes : configure file mismatch	configure file 1 mismatch. <i>This element is only shown in detail mode.</i>
cfgfile1-dld-failure	Parameter type: <Gpon::cfgDlFail> (no yes) Possible values: - no : configure file download not failed - yes : configure file download failed	configure file 1 download failed. <i>This element is only shown in detail mode.</i>
cfgfile1-delayactivate	Parameter type: <Gpon::cfgDelayActivate> (no yes) Possible values: - no : no delay activation pending - yes : delay activation pending	configure file 1 activation delayed. <i>This element is only shown in detail mode.</i>
cfgfile1-dld-pending	Parameter type: <Gpon::downloadPending> (no yes)	configure file 1 download activity is pending. <i>This element is only shown in</i>

name	Type	Description
	Possible values: - no : no download activity pending - yes : download activity pending	<i>detail mode.</i>
cfg2-planned-notok	Parameter type: <Gpon::cfgNokPlnd> (no yes) Possible values: - no : planned configure file is active - yes : planned configure file is not active	planned configure file 2 did not equal to active. <i>This element is only shown in detail mode.</i>
cfg2-dld-notok	Parameter type: <Gpon::cfgNokDld> (no yes) Possible values: - no : download configure file is in active or passive - yes : download configure file is not active or passive	download configure file 2 did not equal to active / passive. <i>This element is only shown in detail mode.</i>
cfg2-dld-inprogress	Parameter type: <Gpon::dldInProg> (no yes) Possible values: - no : download not started - yes : download started	configure file 2 download activity in progress. <i>This element is always shown.</i>
cfg2-ntlt-inprogress	Parameter type: <Gpon::ntltInProg> (no yes) Possible values: - no : ntl file transfer not in progress - yes : ntl file transfer in progress	configure file 2 ntl file transfer in progress. <i>This element is always shown.</i>
cfg2-omci-inprogress	Parameter type: <Gpon::omciInProg> (no yes) Possible values: - no : omci file transfer not in progress - yes : omci file transfer in progress	configure file 2 omci file transfer in progress. <i>This element is always shown.</i>
cfg2-flash-inprogress	Parameter type: <Gpon::ontFlashInProg> (no yes) Possible values: - no : ont write not in progress - yes : ont flash in progress	configure file 2 ont flash in progress. <i>This element is only shown in detail mode.</i>
cfg2-act-inprogress	Parameter type: <Gpon::ontCfgActInProg> (no yes) Possible values: - no : ont configure file activation not in progress - yes : ont configure file activation in progress	ont configure file 2 activation is progress. <i>This element is always shown.</i>
cfg2-ntlt-failure	Parameter type: <Gpon::ntltFailure> (no yes) Possible values: - no : ntl file transfer not failed - yes : ntl file transfer failed	configure file 2 ntl file transfer failure. <i>This element is only shown in detail mode.</i>
cfg2-omci-failure	Parameter type: <Gpon::omciFailure> (no yes) Possible values: - no : omci file transfer not failed - yes : omci file transfer failed	configure file 2 omci file transfer failure. <i>This element is only shown in detail mode.</i>

92 ONT Status Commands

name	Type	Description
cfg2-ontflash-failure	Parameter type: <Gpon::ontFlashFail> (no yes) Possible values: - no : ont flash writing not failed - yes : ont flash writing failed	configure file 2 ont flash write failure. <i>This element is only shown in detail mode.</i>
ontcfg2act-failure	Parameter type: <Gpon::ontCfgActFail> (no yes) Possible values: - no : ont configure file activate not failed - yes : ont configure file activate failed	ont configure file 2 activation failure. <i>This element is only shown in detail mode.</i>
dld-cfgfile2-notfound	Parameter type: <Gpon::noDldFile> (no yes) Possible values: - no : download file found - yes : download file not found	download configure file 2 not found. <i>This element is only shown in detail mode.</i>
no-matching-cfgfile2	Parameter type: <Gpon::cfgNoMatch> (no yes) Possible values: - no : configure file entry found in ctrl table - yes : configure file entry not found in table	entry match not found in sw ctrl table. <i>This element is only shown in detail mode.</i>
cfgfile2-mismatch	Parameter type: <Gpon::cfgFileMisMatch> (no yes) Possible values: - no : configure file match - yes : configure file mismatch	configure file 2 mismatch. <i>This element is only shown in detail mode.</i>
cfgfile2-dld-failure	Parameter type: <Gpon::cfgDlFail> (no yes) Possible values: - no : configure file download not failed - yes : configure file download failed	configure file 2 download failed. <i>This element is only shown in detail mode.</i>
cfgfile2-delayactivate	Parameter type: <Gpon::cfgDelayActivate> (no yes) Possible values: - no : no delay activation pending - yes : delay activation pending	configure file 2 activation delayed. <i>This element is only shown in detail mode.</i>
cfgfile2-dld-pending	Parameter type: <Gpon::downloadPending> (no yes) Possible values: - no : no download activity pending - yes : download activity pending	configure file 2 download activity is pending. <i>This element is only shown in detail mode.</i>

92.34 ONT Configure File Download Status Command

Command Description

This command shows individual ngpon2 ont fine-grain status associated with any configure file download activity.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ng2-cfg-download
```

92.35 ONT Config File Download Status Per Channel Group/Sub Channel Group Command

Command Description

show individual ont fine-grain status associated with any config file download activity.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ng2-cfg-download channel-group [ (channel-group) [ subchannel-group
<Ng2::SubchannelGroupId> ] [ ont-id <Ng2::OntNum> ] ]
```

Command Parameters

Table 92.35-1 "ONT Config File Download Status Per Channel Group/Sub Channel Group Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	channel group id
subchannel-group	Parameter type: <Ng2::SubchannelGroupId> Format: - subchannel group number - range: [1...4]	subchannel group id
ont-id	Parameter type: <Ng2::OntNum> Format: - ont id in a subchannel group - range: [1...256]	ont id

Command Output

92.36 ONT Index Lookup Command

Command Description

This command is to look for ONT AID based on the given search string.

Usage: show equipment ont index {search mode : search string}

search mode is the type of search string, only support "sn" at current

search string is used to look for ONT AID, only support serial number at current

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont index [ (ont-search-string) ]
```

Command Parameters

Table 92.36-1 "ONT Index Lookup Command" Resource Parameters

Resource Identifier	Type	Description
(ont-search-string)	Format: sn : <Gpon::VendorId> : <Gpon::SerialNo> Possible values: - sn : search ONT AID by SN Field type <Gpon::VendorId> - vendor id - 4 ASCII characters - range: [a-zA-Z0-9] - length: 4 Field type <Gpon::SerialNo> - serial num - 8 ASCII characters - range: [a-fA-F0-9] - length: 8	gpon ont search string:search mode and search string

Command Output

92.37 ONT Gis Info Command

Command Description

This command reports the GIS info of the ONT.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont gis [ (ont-idx) ]
```

Command Parameters

Table 92.37-1 "ONT Gis Info Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	access identifier for the ont

Command Output

Table 92.37-2 "ONT Gis Info Command" Display parameters

Specific Information

name	Type	Description
longitude	Parameter type: <Gpon::OltLongitude> - longitude of the GIS info - unit: degree - range: [-180.00000...180.00000]	indicates the gis longitude of the ont. <i>This element is always shown.</i>
latitude	Parameter type: <Gpon::OltLatitude> - latitude of the GIS info - unit: degree - range: [-90.00000...90.00000]	indicates the gis latitude of the ont. <i>This element is always shown.</i>
elevation	Parameter type: <Gpon::OltElevation> - latitude of the GIS info - unit: meter - range: [-32768...32767]	indicates the gis latitude of the ont. <i>This element is always shown.</i>
horizontal-error	Parameter type: <Gpon::OltHrzErr> - horizontal error of the GIS info - unit: meter - range: [0...65535]	indicates the gis horizontal error of the ont. <i>This element is always shown.</i>
altitude-error	Parameter type: <Gpon::OltAltErr> - altitude error of the GIS info - unit: meter - range: [0...65535]	indicates the gis altitude error of the ont. <i>This element is always shown.</i>
area-code	Parameter type: <Gpon::OltAreaCode> - altitude error of the GIS info - 12 Decimal charaters - length: 12	indicates the gis area code of the ont. <i>This element is always shown.</i>
timestamp	Parameter type: <Gpon::OltTimestamp> - the seconds eclapsed since 1970-01-01:00:00:00 - unit: Seconds - range: [0...4294967295]	indicates the gis timestamp of the ont. <i>This element is always shown.</i>
gis-digest	Parameter type: <Gpon::OltGisDigest> - digest of the GIS info - 16 hex characters - length: 16	indicates the gis digest of the ont. <i>This element is always shown.</i>

92.38 XGPON ONT Olt-side Performance Monitoring Command

Command Description

This command retrieves XGPON ont-side current-interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment ont xg-mgmt ont-side current-interval [(ont-idx)]

Command Parameters

Table 92.38-1 "XGPON ONT Olt-side Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index

Command Output

Table 92.38-2 "XGPON ONT Olt-side Performance Monitoring Command" Display parameters

Specific Information		
name	Type	Description
ploammic-errmsgs	Parameter type: <Counter> - 32 bit counter	Count of MIC errors detected in downstream PLOAM messages <i>This element is only shown in detail mode.</i>
downsploam-msgs	Parameter type: <Counter> - 32 bit counter	count of received gem fragments <i>This element is always shown.</i>
profrece-msgs	Parameter type: <Counter> - 32 bit counter	count of received gem blocks <i>This element is always shown.</i>
rangtime-recemsgs	Parameter type: <Counter> - 32 bit counter	Count of downstream ranging_time messages received <i>This element is only shown in detail mode.</i>
deactonuid-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream deactivate_ONU-ID messages received <i>This element is only shown in detail mode.</i>
disablesn-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream disable_serial_number messages received <i>This element is only shown in detail mode.</i>
req-registration	Parameter type: <Counter> - 32 bit counter	Count of downstream request_registration messages received <i>This element is only shown in detail mode.</i>
allocid-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream assign_alloc-ID messages received <i>This element is only shown in detail mode.</i>
keycontrol-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream key_control messages received <i>This element is only shown in detail mode.</i>
sleepallow-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream sleep_allow messages received <i>This element is only shown in detail mode.</i>
baseomci-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream baseline messages received <i>This element is only shown in detail mode.</i>
extendomci-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream extended messages received <i>This element is only shown in detail mode.</i>
assonuid-msgs	Parameter type: <Counter> - 32 bit counter	Count of downstream assign_ONU-ID messages received <i>This element is only shown in detail mode.</i>
omcimic-errmsgs	Parameter type: <Counter>	Count of MIC errors detected in

92 ONT Status Commands

name	Type	Description
	- 32 bit counter	downstream OMCI messages <i>This element is only shown in detail mode.</i>
usploam-msgs	Parameter type: <Counter> - 32 bit counter	Count of upstream PLOAM messages transmitted, excluding acknowledge messages <i>This element is always shown.</i>
serinumonu-msgs	Parameter type: <Counter> - 32 bit counter	Count of upstream Serial_number_ONU PLOAM messages transmitted <i>This element is always shown.</i>
registr-msgs	Parameter type: <Counter> - 32 bit counter	Count of upstream registration PLOAM messages transmitted <i>This element is always shown.</i>
keyreport-msgs	Parameter type: <Counter> - 32 bit counter	Count of upstream key_report PLOAM messages transmitted <i>This element is always shown.</i>
acknow-msgs	Parameter type: <Counter> - 32 bit counter	Count of upstream acknowledge PLOAM messages transmitted <i>This element is only shown in detail mode.</i>
sleepreq-msgs	Parameter type: <Counter> - 32 bit counter	Count of upstream sleep_request PLOAM messages transmitted <i>This element is only shown in detail mode.</i>

92.39 XGPON ONT Previous-Interval Performance Monitoring Command

Command Description

This command retrieves XGPON ONT previous interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont xg-mgmt ont-side previous-interval [ (ont-idx) [ interval-no <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 92.39-1 "XGPON ONT Previous-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	ont index
interval-no	Parameter type: <Gpon::IntervalNo> Format:	identifies prev 15min intvls, val 1 as the latest intvl

Resource Identifier	Type	Description
	- a number of a previous interval number - range: [1...32]	

Command Output

92.40 GPON ONT Memory Usage Current-Interval Performance Monitoring Command

Command Description

This command retrieves ONT-side memory usage current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont memory-usage current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.40-1 "GPON ONT Memory Usage Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ont

Command Output

Specific Information		
name	Type	Description
total(kbytes)	Parameter type: <Gpon::OntMemory> (unknown <Gpon::OntMemory>) Possible values: - unknown : olt has not yet communicated with ont or ont doesn't support Field type <Gpon::OntMemory> - ont memory usage - range: [0...4294967295]	the size of the total memory on this ONT <i>This element is always shown.</i>
used(kbytes)	Parameter type: <Gpon::OntMemory> (unknown <Gpon::OntMemory>) Possible values: - unknown : olt has not yet communicated with ont or ont doesn't support Field type <Gpon::OntMemory> - ont memory usage - range: [0...4294967295]	the size of the memory actually in use <i>This element is always shown.</i>
used-portion(%)	Parameter type: <Gpon::OntMemoryUsage> (unknown <Gpon::OntMemoryUsage>) Possible values: - unknown : olt has not yet communicated with ont or ont doesn't support Field type <Gpon::OntMemoryUsage> - the size of the memory actually in use, expressed as a portion of the total memory - range: [0...4294967295]	the size of the memory actually in use, expressed as a portion of the total memory <i>This element is always shown.</i>

92.41 GPON ONT Memory Usage Previous-Interval Performance Monitoring Command

Command Description

This command retrieves ONT-side memory usage previous interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont memory-usage previous-interval [ (ont-idx) [ interval-num <Gpon::DayIntervalNo> ] ]
```

Command Parameters

92.42 GPON ONT CPU Load Current-Interval Performance Monitoring Command

Command Description

This command retrieves ONT-side cpu load current interval performance monitoring data for the ONT

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont cpu-load current-interval [ (ont-idx) ]
```

Command Parameters

Table 92.42-1 "GPON ONT CPU Load Current-Interval Performance Monitoring Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	identification of ont

Command Output

average(%)	Parameter type: <Gpon::OntCPULoad> (unknown <Gpon::OntCPULoad>) Possible values: - unknown : olt has not yet communicated with ont or ont doesn't support Field type <Gpon::OntCPULoad> - cpu load average of ont during a 15-min interval, expressed as a percentage - range: [0...4294967295]	average CPU load for the measurement period , expressed in percentage <i>This element is always shown.</i>

93- ONT Ranging Status Commands

93.1 ONT Ranging Status Command Tree	93-2129
93.2 ONT Channel-group Ranging Status Command	93-2130
93.3 ONT Channel-pair Ranging Status Command	93-2133

93.1 ONT Ranging Status Command Tree

Description

This chapter gives an overview of nodes that are handled by "ONT Ranging Status Commands".

Command Tree

```
----show
  ----equipment
    ----ont
      ----ranging-status
        ----channel-group
          - (channel-group)
          - subchannel-group
          - ont-id
        ----channel-pair
          - (chpair)
          - ont
```

93.2 ONT Channel-group Ranging Status Command

Command Description

This command reports the onts in a channel group and their preferred and ranged channel-pair along with ranging status

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ranging-status channel-group [ (channel-group) [ subchannel-group
<Ng2::SubchannelGroupId> ] [ ont-id <Ng2::OntNum> ] ]
```

Command Parameters

Table 93.2-1 "ONT Channel-group Ranging Status Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	channel group id
subchannel-group	Parameter type: <Ng2::SubchannelGroupId> Format: - subchannel group number - range: [1...4]	subchannel group id
ont-id	Parameter type: <Ng2::OntNum> Format: - ont id in a subchannel group - range: [1...256]	ont id

Command Output

Table 93.2-2 "ONT Channel-group Ranging Status Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> /	ont ifindex <i>This element is always shown.</i>

name	Type	Description
	<Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
ranging status	Parameter type: <Ng2::OntRangedStatusChanGroup> (ranged-on-pref ranged-on-prot not-ranged ranged-parked rng-on-altpref) Possible values: - ranged-on-pref : Ranged on Preferred Channel Pair - ranged-on-prot : Ranged on Protection Channel Pair - not-ranged : NOT Ranged - ranged-parked : Ranged/parked - rng-on-altpref : Ranged on Alternative Preferred Channel Pair	ont ranging status <i>This element is always shown.</i>
ranged-on chpair short name: rngd on-chpair	Parameter type: <Ng2::ChannelPairIndexOrZero> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> -) Possible values: - - : ont not ranged Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	ranged channel pair <i>This element is always shown.</i>
backup-chpair status	Parameter type: <Ng2::OntBackupChPairStatusChanGroup> (pref-ready pref-not-ready prot-ready prot-not-ready not-ready none altpref-ready altpref-not-rdy) Possible values: - pref-ready : Preferred Channel Pair ready	backup channel pair status <i>This element is always shown.</i>

name	Type	Description
	- pref-not-ready : Preferred Channel Pair NOT ready - prot-ready : Protection Channel Pair ready - prot-not-ready : Protection Channel Pair NOT ready - not-ready : NOT ready - none : None - altpref-ready : Alternative Preferred Channel Pair ready - altpref-not-rdy : Alternative Preferred Channel Pair NOT ready	
preferred-chpair short name: prefer-chpair	Parameter type: <Ng2::ChannelPairIndexOrZero> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> -) Possible values: - - : ont not ranged Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	preferred channel pair <i>This element is always shown.</i>
protection-chpair short name: protect-chpair	Parameter type: <Ng2::ChannelPairIndexOrZero> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> -) Possible values: - - : ont not ranged Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	protection channel pair <i>This element is always shown.</i>
alt-pref-chpair short name: altpref-chpair	Parameter type: <Ng2::ChannelPairIndexOrZero> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> -) Possible values: - - : ont not ranged Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	alternative preferred channel pair <i>This element is always shown.</i>

93.3 ONT Channel-pair Ranging Status Command

Command Description

This command reports the onts on a channel pair and their ranging status

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ranging-status channel-pair [ (chpair) [ ont <Gpon::OntIndex> ] ]
```

Command Parameters

Table 93.3-1 "ONT Channel-pair Ranging Status Command" Resource Parameters

Resource Identifier	Type	Description
(chpair)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	channel pair ifindex
ont	Parameter type: <Gpon::OntIndex> Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number	ont ifindex

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier

94- ONT Software Download Status Command

94.1 ONT Software Download Status Command Tree	94-2136
94.2 ONT Software Download Status Per Channel Group/Sub Channel Group Command	94-2137

94.1 ONT Software Download Status Command Tree

Description

This chapter gives an overview of nodes that are handled by "ONT Software Download Status Command".

Command Tree

```
----show
  ----equipment
    ----ont
      ----ng2-sw-download
        ----channel-group
          - (channel-group)
          - subchannel-group
          - ont-id
```

94.2 ONT Software Download Status Per Channel Group/Sub Channel Group Command

Command Description

show individual ont fine-grain status associated with any sw download activity.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont ng2-sw-download channel-group [ (channel-group) [ subchannel-group
<Ng2::SubchannelGroupId> ] [ ont-id <Ng2::OntNum> ] ]
```

Command Parameters

Table 94.2-1 "ONT Software Download Status Per Channel Group/Sub Channel Group Command" Resource Parameters

Resource Identifier	Type	Description
(channel-group)	Format: <Ng2::ChannelGroup> Field type <Ng2::ChannelGroup> - channel group number	channel group id
subchannel-group	Parameter type: <Ng2::SubchannelGroupId> Format: - subchannel group number - range: [1...4]	subchannel group id
ont-id	Parameter type: <Ng2::OntNum> Format: - ont id in a subchannel group - range: [1...256]	ont id

Command Output

Table 94.2-2 "ONT Software Download Status Per Channel Group/Sub Channel Group Command" Display parameters

Specific Information		
name	Type	Description
ont	Parameter type: <Gpon::OntIndex> (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId>	ont ifindex <i>This element is always shown.</i>

94 ONT Software Download Status Command

name	Type	Description
	ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	
planned	Parameter type: <Gpon::notPlnd> (no yes) Possible values: - no : ont is planned - yes : ont is not planned	ont is not planned. <i>This element is always shown.</i>
inactive	Parameter type: <Gpon::inAct> (no yes) Possible values: - no : ont is active - yes : ont is not active	ont is not active. <i>This element is only shown in detail mode.</i>
planned-notok	Parameter type: <Gpon::nokPlnd> (no yes) Possible values: - no : planned sw is active - yes : planned sw is not active	planned did not equal to active. <i>This element is only shown in detail mode.</i>
download-notok	Parameter type: <Gpon::nokDld> (no yes) Possible values: - no : download software is in active or passive - yes : download software is not active or passive	download did not equal to active / passive. <i>This element is only shown in detail mode.</i>
download-inprogress	Parameter type: <Gpon::dldInProg> (no yes) Possible values: - no : download not started - yes : download started	download activity in progress. <i>This element is always shown.</i>
ntlt-inprogress	Parameter type: <Gpon::ntltInProg> (no yes) Possible values: - no : ntlt file transfer not in progress - yes : ntlt file transfer in progress	ntlt file transfer in progress. <i>This element is always shown.</i>
omci-inprogress	Parameter type: <Gpon::omciInProg>	omci file transfer in progress.

name	Type	Description
	(no yes) Possible values: - no : omci file transfer not in progress - yes : omci file transfer in progress	<i>This element is always shown.</i>
ontflash-inprogress	Parameter type: <Gpon::ontFlashInProg> (no yes) Possible values: - no : ont write not in progress - yes : ont flash in progress	ont flash in progress. <i>This element is only shown in detail mode.</i>
ontswact-inprogress	Parameter type: <Gpon::ontSwActInProg> (no yes) Possible values: - no : ont software activation not in progress - yes : ont software activation in progress	ont software activation is progress. <i>This element is always shown.</i>
ntlt-failure	Parameter type: <Gpon::ntltFailure> (no yes) Possible values: - no : ntlt file transfer not failed - yes : ntlt file transfer failed	ntlt file transfer failure. <i>This element is only shown in detail mode.</i>
omci-failure	Parameter type: <Gpon::omciFailure> (no yes) Possible values: - no : omci file transfer not failed - yes : omci file transfer failed	omci file transfer failure. <i>This element is only shown in detail mode.</i>
ontflash-failure	Parameter type: <Gpon::ontFlashFail> (no yes) Possible values: - no : ont flash writing not failed - yes : ont flash writing failed	ont flash write failure. <i>This element is only shown in detail mode.</i>
ontswact-failure	Parameter type: <Gpon::ontSwActFail> (no yes) Possible values: - no : ont software activate not failed - yes : ont software activate failed	ont software activation failure. <i>This element is only shown in detail mode.</i>
download-file-notfound	Parameter type: <Gpon::noDldFile> (no yes) Possible values: - no : download file found - yes : download file not found	download file not found. <i>This element is always shown.</i>
no-matching-software	Parameter type: <Gpon::noMatch> (no yes) Possible values: - no : sw entry found in ctrl table - yes : sw entry not found in table	entry match not found in sw ctrl table. <i>This element is only shown in detail mode.</i>
sw-version-mismatch	Parameter type: <Gpon::swVerMisMatch> (no yes) Possible values:	software version mismatch. <i>This element is always shown.</i>

94 ONT Software Download Status Command

name	Type	Description
	- no : software version match - yes : software version mismatch	
sw-download-failure	Parameter type: <Gpon::swDIFail> (no yes) Possible values: - no : software download not failed - yes : software download failed	software download failed. <i>This element is always shown.</i>
sw-delayactivate	Parameter type: <Gpon::swDelayActivate> (no yes) Possible values: - no : no delay activation pending - yes : delay activation pending	software activation delayed. <i>This element is always shown.</i>
sw-download-pending	Parameter type: <Gpon::downloadPending> (no yes) Possible values: - no : no download activity pending - yes : download activity pending	sw download activity is pending. <i>This element is only shown in detail mode.</i>

95- ONT Status Commands

95.1 ONT Status Command Tree	95-2142
95.2 GPON ONT Status Command	95-2143
95.3 GPON ONT Status Command	95-2146
95.4 GPON ONT Status Command	95-2149
95.5 NGPON ONT Status Command	95-2152

95.1 ONT Status Command Tree

Description

This chapter gives an overview of nodes that are handled by "ONT Status Commands".

Command Tree

```
----show
  ----equipment
    ----ont
      ----status
        ----pon
          - (pon)
          - ont
        ----x-pon
          - (x-pon)
          - ont
        ----twenty-five-g
          - (twenty-five-g)
          - ont
        ----channel-pair
          - (chanpair)
          - ont
```

95.2 GPON ONT Status Command

Command Description

This command reports a summary of ont parameters under a given pon

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont status pon [ (pon) [ ont <Gpon::OntIndex> ] ]
```

Command Parameters

Table 95.2-1 "GPON ONT Status Command" Resource Parameters

Resource Identifier	Type	Description
(pon)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	access identifier for the pon
ont	Parameter type: <Gpon::OntIndex> Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Command Output

Table 95.2-2 "GPON ONT Status Command" Display parameters

Specific Information		
name	Type	Description
sernum	Parameter type: <Gpon::SerNum2> <Gpon::VendorIdNum> : <Gpon::SerialNo> Field type <Gpon::VendorIdNum> - vendor id -4 ASCII characters - length: 4 Field type <Gpon::SerialNo> - serial num - 8 ASCII characters - range: [a-fA-F0-9] - length: 8	Serial number of ont <i>This element is always shown.</i>
admin-status	Parameter type: <Itf::ifAdminStatus> (not-appl up down testing) Possible values: - not-appl : not-applicable - up : admin status is up - down : admin status is down - testing : no operational packets can be passed	Specifies admin state of the interface. <i>This element is always shown.</i>
oper-status	Parameter type: <Itf::ifAdminStatus> (not-appl up down testing) Possible values: - not-appl : not-applicable - up : admin status is up - down : admin status is down - testing : no operational packets can be passed	Specifies oper state of the interface. <i>This element is always shown.</i>
olt-rx-sig-level(dbm)	Parameter type: <Gpon::OntOltRxSignalLevel> (invalid unsupported <Gpon::OltRxSignalLevel>) Possible values: - invalid : valid measurement is currently unattainable for some reason - unsupported : measurement functionality is not supported Field type <Gpon::OltRxSignalLevel> - measurement of the ont receive optical signal level in dBm - unit: dbm - range: [-50...0,6553.4...6553.5]	indicates the current level of the ONT's optical signal(as measured at olt-side) <i>This element is always shown.</i>
ont-olt-distance(km)	Parameter type: <Gpon::OntOltDist> (invalid not-supported	estimate of the distance between this ont and the olt. <i>This element is always shown.</i>

name	Type	Description
	<Gpon::DistOntOlt>) Possible values: - invalid : valid measurement is currently unattainable for some reason - not-supported : the measurement functionality is not supported by this particular unit. Field type <Gpon::DistOntOlt> - estimate of the distance between this ont and the olt - unit: km - range: [0...6550,6553.4...6553.5]	
desc1	Parameter type: <Gpon::Desc> - desc - length: x<=64	free-form textual field for user to describe the ONT <i>This element is always shown.</i>
desc2	Parameter type: <Gpon::Desc> - desc - length: x<=64	free-form textual field for user to describe the ONT <i>This element is always shown.</i>
hostname	Parameter type: <Gpon::HostName> (undefined unknown <Gpon::hostname>) Possible values: - undefined : DHCP is unavailable or ONT returns null string - unknown : OLT could not communicate with ONT for discovery Field type <Gpon::hostname> - host name address - length: x<=255	the host name <i>This element is always shown.</i>

95.3 GPON ONT Status Command

Command Description

This command reports a summary of ont parameters under a given x-pon

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont status x-pon [ (x-pon) [ ont <Gpon::OntIndex> ] ]
```

Command Parameters

Table 95.3-1 "GPON ONT Status Command" Resource Parameters

Resource Identifier	Type	Description
(x-pon)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::XPonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::XPonId> - the XGS PON identifier	access identifier for the pon
ont	Parameter type: <Gpon::OntIndex> Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Command Output

95.4 GPON ONT Status Command

Command Description

This command reports a summary of ont parameters under a given 25g-pon

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont status twenty-five-g [ (twenty-five-g) [ ont <Gpon::OntIndex> ] ]
```

Command Parameters

Table 95.4-1 "GPON ONT Status Command" Resource Parameters

Resource Identifier	Type	Description
(twenty-five-g)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::M25GPonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::M25GPonId> - the 25G PON identifier	access identifier for the pon
ont	Parameter type: <Gpon::OntIndex> Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Command Output

Table 95.4-2 "GPON ONT Status Command" Display parameters

Specific Information		
name	Type	Description
sernum	Parameter type: <Gpon::SerNum2> <Gpon::VendorIdNum> : <Gpon::SerialNo> Field type <Gpon::VendorIdNum> - vendor id -4 ASCII characters - length: 4 Field type <Gpon::SerialNo> - serial num - 8 ASCII characters - range: [a-fA-F0-9] - length: 8	Serial number of ont <i>This element is always shown.</i>
admin-status	Parameter type: <Itf::ifAdminStatus> (not-appl up down testing) Possible values: - not-appl : not-applicable - up : admin status is up - down : admin status is down - testing : no operational packets can be passed	Specifies admin state of the interface. <i>This element is always shown.</i>
oper-status	Parameter type: <Itf::ifAdminStatus> (not-appl up down testing) Possible values: - not-appl : not-applicable - up : admin status is up - down : admin status is down - testing : no operational packets can be passed	Specifies oper state of the interface. <i>This element is always shown.</i>

95.5 NGPON ONT Status Command

Command Description

This command reports a summary of ont parameters under a given channel pair

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment ont status channel-pair [ (chanpair) [ ont <Gpon::OntIndex> ] ]
```

Command Parameters

Table 95.5-1 "NGPON ONT Status Command" Resource Parameters

Resource Identifier	Type	Description
(chanpair)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::ChannelPairId> - the channel pair identifier	access identifier for the channel pair
ont	Parameter type: <Gpon::OntIndex> Format: (<Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> ng2 : <Ng2::ChannelGroup> / <Ng2::SubchannelGroup> / <Ng2::OntId>) Possible values: - ng2 : ngpon2 style identification Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Ng2::ChannelGroup> - channel group number	identification of ont

Resource Identifier	Type	Description
	Field type <Ng2::SubchannelGroup> - subchannel group number Field type <Eqpt::OntId> - the ONT identifier Field type <Ng2::OntId> - the ONT identifier	

Command Output

```

96.2 EONT Interface Status Command

Command Description

This command displays current operational parameters for the eont.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont interface [ (ont-idx) ]
```

Command Parameters

Table 96.2-1 "EONT Interface Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont index

Command Output

Table 96.2-2 "EONT Interface Status Command" Display parameters

Specific Information		
name	Type	Description
vendor-id	Parameter type: <Epon::OntIden> - Octet String - length: x<=4	ONT vendor ID <i>This element is always shown.</i>
model-id	Parameter type: <Epon::OntIden> - Octet String - length: x<=4	ONT model ID <i>This element is always shown.</i>
hw-version	Parameter type: <Epon::HwVer> - Octet String	ONT hardware version <i>This element is always shown.</i>

name	Type	Description
	- length: 1<=x<=8	
chip-vendorid	Parameter type: <Epon::ChipId> - Octet String - length: 1<=x<=2	chip vendor id <i>This element is only shown in detail mode.</i>
chip-moduleid	Parameter type: <Epon::ChipId> - Octet String - length: 1<=x<=2	chip module ID <i>This element is only shown in detail mode.</i>
chip-version	Parameter type: <Epon::ChipVer> - Octet String - length: x<=3	chip version <i>This element is only shown in detail mode.</i>
battery-bkup	Parameter type: <Epon::BttryBkup> (yes no) Possible values: - yes : it has backup battery - no : no backup battery	whether the ONT is equipped with battery backup <i>This element is always shown.</i>
sw-ver-act	Parameter type: <Epon::SwVer> - eont sw version - length: x<=16	the active software version in the ONT <i>This element is always shown.</i>
firmware-version	Parameter type: <Epon::FwVer> - Octet String - length: x<=4	firmware version <i>This element is only shown in detail mode.</i>
fec-capability	Parameter type: <Epon::fec> (unknown support nosupport) Possible values: - unknown : - support : - nosupport :	FEC ability of the ONT <i>This element is always shown.</i>
fastleave-capability	Parameter type: <Epon::FLCap> (unknown snoop nfl snoop fl snoop nfl, snoop fl ctc non ctc nfl,snoop nfl ctc nfl,snoop fl ctc-snoop nfl,snoop fl ctc fl ctc fl,snooping nfl ctc fl,snoop fl ctc-snoop fl,snoop nfl ctc fl,ctc nfl ctc fl,ctc-snoop nfl ctc-snoop fl,ctc nfl ctc-snoop fl, nfl) Possible values: - unknown : unknown - snoop nfl : IGMP snooping non-fast-leave - snoop fl : IGMP snooping fast-leave - snoop nfl, snoop fl : IGMP snooping non-fast-leave, IGMP snooping fast-leave - ctc non : CTC non-fast-leave - ctc nfl,snoop nfl : CTC non-fast-leave, IGMP snooping non-fast-leave - ctc nfl,snoop fl : CTC non-fast-leave, IGMP snooping	Fastleave ability of the ont <i>This element is always shown.</i>

name	Type	Description
	fast-leave - ctc-snoop nfl,snoop fl: CTC non-fast-leave, IGMP snooping fast-leave, IGMP snooping non-fast-leave - ctc fl : CTC fast-leave - ctc fl,snooping nfl : CTC fast-leave, IGMP snooping non-fast-leave - ctc fl,snoop fl : CTC fast-leave, IGMP snooping fast-leave - ctc-snoop fl,snoop nfl: CTC fast-leave, IGMP snooping fast-leave, IGMP snooping non-fast-leave - ctc fl,ctc nfl : CTC fast-leave, CTC non-fast-leave - ctc fl,ctc-snoop nfl : CTC fast-leave, CTC non-fast-leave, IGMP snooping non-fast-leave - ctc-snoop fl,ctc nfl : CTC fast-leave, CTC non-fast-leave, IGMP snooping fast-leave - ctc-snoop fl, nfl : CTC fast-leave, CTC non-fast-leave, IGMP snooping fast-leave, IGMP snooping non-fast-leave	
rtt	Parameter type: <Epon::rtt> - round trip time - unit: 16ns - range: [0...27111]	round trip time <i>This element is only shown in detail mode.</i>
maxllid-num	Parameter type: <SignedInteger> - a signed integer	max supported logical link. <i>This element is only shown in detail mode.</i>
assgnqueueup-num	Parameter type: <SignedInteger> - a signed integer	assigned queue number upstream <i>This element is only shown in detail mode.</i>
assgnqueuedown-num	Parameter type: <SignedInteger> - a signed integer	assigned queue number downstream <i>This element is only shown in detail mode.</i>
maxqueueupnum-llid	Parameter type: <SignedInteger> - a signed integer	max queue number per logical link <i>This element is only shown in detail mode.</i>
maxqueuedownnum-port	Parameter type: <SignedInteger> - a signed integer	max queue number per uni-port <i>This element is only shown in detail mode.</i>
fe-num	Parameter type: <SignedInteger> - a signed integer	number of FE ports per ONT <i>This element is only shown in detail mode.</i>
fe-bitmap	Parameter type: <Epon::BitMap> - Octet String - length: 1<=x<=8	FE port bitmap <i>This element is only shown in detail mode.</i>
ge-num	Parameter type: <SignedInteger> - a signed integer	number of GE ports per ONT <i>This element is only shown in detail mode.</i>
ge-bitmap	Parameter type: <Epon::BitMap> - Octet String - length: 1<=x<=8	GE port bitmap <i>This element is only shown in detail mode.</i>
pots-num	Parameter type: <SignedInteger> - a signed integer	number of POTS port per ONT <i>This element is only shown in detail mode.</i>
e1-num	Parameter type: <SignedInteger> - a signed integer	number of E1 port per ONT <i>This element is only shown in detail mode.</i>
adsl2-num	Parameter type: <SignedInteger> - a signed integer	number of ADSL2+ port per ONT

name	Type	Description
		<i>This element is only shown in detail mode.</i>
vdsl-num	Parameter type: <SignedInteger> - a signed integer	number of VDSL2 port per ONT <i>This element is only shown in detail mode.</i>
actual-mac	Parameter type: <Epon::MacAddr> - mac-address (example : 01:02:03:04:05:06) - length: 6	actual ONT Mac address <i>This element is always shown.</i>
ipv6-aware	Parameter type: <Epon::Ipv6Aware> (nosupport support) Possible values: - nosupport : - support :	support IPV6 or not <i>This element is only shown in detail mode.</i>
power-control-cap	Parameter type: <Epon::PowerControlCap> (nosupport tx tx and rx) Possible values: - nosupport : - tx : - tx and rx :	the Ont power control capability <i>This element is only shown in detail mode.</i>
ont-type	Parameter type: <Epon::OntType> (sfu hgu sbu box_model_mdu mini_modular_mdu box_modular_mdu frame_modular_mdu modular_mdu mtu) Possible values: - sfu : - hgu : - sbu : - box_model_mdu : - mini_modular_mdu : - box_modular_mdu : - frame_modular_mdu : - modular_mdu : - mtu :	the Ont type <i>This element is only shown in detail mode.</i>
ont-protection-type	Parameter type: <Epon::Ont ProtecType> (nosupport typec typed) Possible values: - nosupport : - typec : - typed :	the Ont protection type <i>This element is only shown in detail mode.</i>
pon-port-num	Parameter type: <SignedInteger> - a signed integer	Pon port number <i>This element is only shown in detail mode.</i>
ont-slot-num	Parameter type: <SignedInteger> - a signed integer	ont slot number <i>This element is only shown in detail mode.</i>
wlan-port-num	Parameter type: <SignedInteger>	ont WLAN port number

96 Epon Ont Status Command

name	Type	Description
	- a signed integer	<i>This element is only shown in detail mode.</i>
usb-port-num	Parameter type: <SignedInteger> - a signed integer	ont USB port number <i>This element is only shown in detail mode.</i>
rf-port-num	Parameter type: <SignedInteger> - a signed integer	ont RF port number <i>This element is only shown in detail mode.</i>
alarm-profile	Parameter type: <Epon::EponAlrmCtrlProfileName> - name of the Alarm Control profile - length: 1<=x<=32	name of the alarm control profile <i>This element is only shown in detail mode.</i>

96.3 Epon Ont Optics Status Command

Command Description

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont optics [ (ont-idx) ]
```

Command Parameters

Table 96.3-1 "Epon Ont Optics Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont index

Command Output

Table 96.3-2 "Epon Ont Optics Status Command" Display parameters

Specific Information		
name	Type	Description
ont-tx-sig-lvl 0.1uw	Parameter type: <Epon::OpticalSignalLevel> (unknown <Epon::OpticalSignalLevel>) Possible values: - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::OpticalSignalLevel> - olt optical signal level - unit: 0.1 uW - range: [0...65535]	This attribute indicates the current measurement of the ONT transmit optical signal level in 0.1 uW steps <i>This element is always shown.</i>

96 Epon Ont Status Command

name	Type	Description
ont-tx-sig-lvl dbm	Parameter type: <Epon::OpticalPwrDbm> (-inf unknown <Epon::OpticalPwrDbm>) Possible values: - -inf : - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::OpticalPwrDbm> - power of optical unit - unit: dbm - range: [-99.0...9.0]	This attribute indicates the current measurement of the ONT transmit optical signal level in dBm <i>This element is only shown in detail mode.</i>
ont-rx-sig-lvl 0.1uw	Parameter type: <Epon::OpticalSignalLevel> (unknown <Epon::OpticalSignalLevel>) Possible values: - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::OpticalSignalLevel> - olt optical signal level - unit: 0.1 uW - range: [0...65535]	This attribute indicates the current measurement of the ONT receive optical signal level in 0.1 uW steps <i>This element is always shown.</i>
ont-rx-sig-lvl dbm	Parameter type: <Epon::OpticalPwrDbm> (-inf unknown <Epon::OpticalPwrDbm>) Possible values: - -inf : - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::OpticalPwrDbm> - power of optical unit - unit: dbm - range: [-99.0...9.0]	This attribute indicates the current measurement of the ONT receive optical signal level in dBm <i>This element is only shown in detail mode.</i>
ont-temperature 1/256c short name: ont-temperature 1//256c	Parameter type: <Epon::Temperature> (unknown <Epon::Temperature>) Possible values: - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::Temperature> - temperature of olt optical module - unit: 1/256 Celsius - range: [-32768...32768]	This attribute indicates the current temperature of the optics module associated with this ONT <i>This element is always shown.</i>
ont-temperature c	Parameter type: <Epon::OpticalTempC> - temperature of optical unit - unit: degree C - range: [-128...128]	This attribute indicates the current temperature of the optics module associated with this ONT <i>This element is only shown in detail mode.</i>
ont-voltage 0.1mv short name: ont-voltage-0.1mv	Parameter type: <Epon::Voltage> (unknown <Epon::Voltage>) Possible values: - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::Voltage> - power feed voltage of olt optical module	This attribute indicates the current voltage of the optics module associated with this ONT <i>This element is always shown.</i>

name	Type	Description
	- unit: 100u Volts - range: [0...65500]	
ont-voltage v	Parameter type: <Epon::OpticalVoltageV> - voltage of optical unit - unit: volts - range: [0...6.55]	This attribute indicates the current voltage of the optics module associated with this ONT <i>This element is only shown in detail mode.</i>
ont-bias 2ua	Parameter type: <Epon::LaserBias> (unknown <Epon::LaserBias>) Possible values: - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::LaserBias> - indicates the current bias current of the laser - unit: 2uA - range: [0...131000]	This attribute indicates the current bias current in 2 uA steps of the laser associated with this ONT <i>This element is always shown.</i>
ont-bias ma	Parameter type: <Epon::OpticalBiasMa> - bias of optical unit - unit: mA - range: [0...262]	This attribute indicates the current bias current in mA of the laser associated with this ONT <i>This element is only shown in detail mode.</i>
olt-rx-sig-lvl 0.1uw	Parameter type: <Epon::OpticalSignalLevel> (unknown <Epon::OpticalSignalLevel>) Possible values: - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::OpticalSignalLevel> - olt optical signal level - unit: 0.1 uW - range: [0...65535]	This attribute indicates the current measurement of the ONT receive optical signal level in 0.1 uW steps for the specific ONT <i>This element is always shown.</i>
olt-rx-sig-lvl dbm	Parameter type: <Epon::OpticalPwrDbm> (-inf unknown <Epon::OpticalPwrDbm>) Possible values: - -inf ; - unknown : a valid measurement is currently unattainable for some reason Field type <Epon::OpticalPwrDbm> - power of optical unit - unit: dbm - range: [-99.0...9.0]	This attribute indicates the current measurement of the ONT receive optical signal level in dBm for the specific ONT <i>This element is only shown in detail mode.</i>

96.4 Epon Ont LLID Status Command

Command Description

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont llid [ (llid-idx) ]
```

Command Parameters

Table 96.4-1 "Epon Ont LLID Status Command" Resource Parameters

Resource Identifier	Type	Description
(llid-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Epon::llid> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Epon::llid> - Ont llid number, range 1 for EPON, range 1-8 for DPOE - range: [1...8]	Ont llid index

Command Output

Table 96.4-2 "Epon Ont LLID Status Command" Display parameters

Specific Information		
name	Type	Description
up-queue-num	Parameter type: <Epon::QNum> - a signed integer	This attribute indicates the queue number upstream for LLID. <i>This element is always shown.</i>
assigned-serial-num	Parameter type: <Epon::SerialNum> - a signed integer	This attribute indicates the assigned serial number of LLID. <i>This element is always shown.</i>

96.5 EONT Software Version Status Command

Command Description

This command reports the ont software version files that are currently resident on the nt file system.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show equipment eont sw-version [(sw-ver-id)]

Command Parameters

Table 96.5-1 "EONT Software Version Status Command" Resource Parameters

Resource Identifier	Type	Description
(sw-ver-id)	Format: - software version info index - range: [1...250]	index of software version file

Command Output

Table 96.5-2 "EONT Software Version Status Command" Display parameters

Specific Information		
name	Type	Description
sw-ver	Parameter type: <Epon::EontVersion> - eont sw version - length: x<=16	eont software version identifier. <i>This element is always shown.</i>
sw-ver-size	Parameter type: <Epon::EontSwVerSize> - eont software file size - unit: bytes - range: [0...4294967295]	this attribute contains the eont software file size (in bytes). <i>This element is always shown.</i>

96.6 Epon Pon Performance Statistics Command

Command Description

This command indicates the Epon performance counters specific to a PON port on ONT side.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont tc-layer
```

96.7 Epon Ont Current 15min Status Command

Command Description

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont tc-layer current-15min [ (ont-idx) ]
```

Command Parameters

Table 96.7-1 "Epon Ont Current 15min Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont index

Command Output

Table 96.7-2 "Epon Ont Current 15min Status Command" Display parameters

Specific Information		
name	Type	Description
elapsed-time	Parameter type: <SignedInteger> - a signed integer	Elapsed time in interval <i>This element is always shown.</i>
measure-time	Parameter type: <SignedInteger> - a signed integer	Measured time in interval <i>This element is always shown.</i>
octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in upstream direction <i>This element is always shown.</i>
frames-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in upstream direction <i>This element is always shown.</i>

name	Type	Description
segment1octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment2octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment3octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment4octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment5octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment6octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment7octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in downstream direction <i>This element is always shown.</i>
frames-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in downstream direction <i>This element is always shown.</i>
segment1octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment2octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment3octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment4octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment5octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment6octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in downstream direction <i>This element is only shown in</i>

96 Epon Ont Status Command

name	Type	Description
		<i>detail mode.</i>
segment7octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
unicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
unicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
multicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
multicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in upstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in downstream direction <i>This element is only shown in detail mode.</i>
drpframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in upstream direction <i>This element is only shown in detail mode.</i>
drpframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in downstream direction <i>This element is only shown in detail mode.</i>
errframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in upstream direction <i>This element is only shown in detail mode.</i>
errframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in downstream direction <i>This element is only shown in detail mode.</i>
crcerrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	CRC error Frames in downstream direction <i>This element is only shown in detail mode.</i>
undframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in upstream direction <i>This element is only shown in detail mode.</i>
undframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in downstream direction <i>This element is only shown in detail mode.</i>

name	Type	Description
ovrframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in upstream direction <i>This element is only shown in detail mode.</i>
ovrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in downstream direction <i>This element is only shown in detail mode.</i>
dropevents-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
dropevents-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
statuschange	Parameter type: <Epon::OctetCounter> - Epon Frames counter	the number of status change on a ONT PON port <i>This element is only shown in detail mode.</i>

96.8 Epon Ont Current 1day Status Command

Command Description

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont tc-layer current-1day [ (ont-idx) ]
```

Command Parameters

Table 96.8-1 "Epon Ont Current 1day Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont index

Command Output

Table 96.8-2 "Epon Ont Current 1day Status Command" Display parameters

Specific Information		
name	Type	Description
elapsed-time	Parameter type: <SignedInteger> - a signed integer	Elapsed time in interval <i>This element is always shown.</i>
measure-time	Parameter type: <SignedInteger> - a signed integer	Measured time in interval <i>This element is always shown.</i>
octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in upstream direction <i>This element is always shown.</i>
frames-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in upstream direction <i>This element is always shown.</i>

name	Type	Description
segment1octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment2octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment3octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment4octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment5octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment6octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment7octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in downstream direction <i>This element is always shown.</i>
frames-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in downstream direction <i>This element is always shown.</i>
segment1octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment2octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment3octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment4octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment5octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment6octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in downstream direction <i>This element is only shown in</i>

96 Epon Ont Status Command

name	Type	Description
		<i>detail mode.</i>
segment7octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
unicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
unicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
multicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
multicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in upstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in downstream direction <i>This element is only shown in detail mode.</i>
drpframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in upstream direction <i>This element is only shown in detail mode.</i>
drpframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in downstream direction <i>This element is only shown in detail mode.</i>
errframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in upstream direction <i>This element is only shown in detail mode.</i>
errframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in downstream direction <i>This element is only shown in detail mode.</i>
crcerrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	CRC error Frames in downstream direction <i>This element is only shown in detail mode.</i>
undframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in upstream direction <i>This element is only shown in detail mode.</i>
undframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in downstream direction <i>This element is only shown in detail mode.</i>

name	Type	Description
ovrframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in upstream direction <i>This element is only shown in detail mode.</i>
ovrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in downstream direction <i>This element is only shown in detail mode.</i>
dropevents-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
dropevents-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
statuschange	Parameter type: <Epon::OctetCounter> - Epon Frames counter	the number of status change on a ONT PON port <i>This element is only shown in detail mode.</i>

96.9 Epon Ont Previous 15min Status Command

Command Description

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont tc-layer previous-15min (ont-idx) interval-num [ (interval-num) ]
```

Command Parameters

Table 96.9-1 "Epon Ont Previous 15min Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont index
(interval-num)	Format: - Previous interval reference - range: [1...192]	Previous interval reference

Command Output

Table 96.9-2 "Epon Ont Previous 15min Status Command" Display parameters

Specific Information		
name	Type	Description
measure-time	Parameter type: <SignedInteger> - a signed integer	Measured time in interval <i>This element is always shown.</i>
octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in upstream direction <i>This element is always shown.</i>
frames-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in upstream direction

name	Type	Description
		<i>This element is always shown.</i>
segment1octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment2octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment3octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment4octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment5octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment6octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment7octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in downstream direction <i>This element is always shown.</i>
frames-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in downstream direction <i>This element is always shown.</i>
segment1octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment2octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment3octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment4octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment5octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment6octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in downstream direction

96 Epon Ont Status Command

name	Type	Description
		<i>This element is only shown in detail mode.</i>
segment7octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
unicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
unicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
multicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
multicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in upstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in downstream direction <i>This element is only shown in detail mode.</i>
drpframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in upstream direction <i>This element is only shown in detail mode.</i>
drpframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in downstream direction <i>This element is only shown in detail mode.</i>
errframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in upstream direction <i>This element is only shown in detail mode.</i>
errframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in downstream direction <i>This element is only shown in detail mode.</i>
crcerrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	CRC error Frames in downstream direction <i>This element is only shown in detail mode.</i>
undframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in upstream direction <i>This element is only shown in detail mode.</i>
undframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in downstream direction <i>This element is only shown in</i>

name	Type	Description
		<i>detail mode.</i>
ovrframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in upstream direction <i>This element is only shown in detail mode.</i>
ovrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in downstream direction <i>This element is only shown in detail mode.</i>
dropevents-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
dropevents-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
statuschange	Parameter type: <Epon::OctetCounter> - Epon Frames counter	the number of status change on a ONT PON port <i>This element is only shown in detail mode.</i>

96.10 Epon Ont Previous 1day Status Command

Command Description

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont tc-layer previous-1day (ont-idx) interval-num [ (interval-num) ]
```

Command Parameters

Table 96.10-1 "Epon Ont Previous 1day Status Command" Resource Parameters

Resource Identifier	Type	Description
(ont-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	Ont index
(interval-num)	Format: - Previous interval reference - range: [1...2]	Previous interval reference

Command Output

Table 96.10-2 "Epon Ont Previous 1day Status Command" Display parameters

Specific Information		
name	Type	Description
measure-time	Parameter type: <SignedInteger> - a signed integer	Measured time in interval <i>This element is always shown.</i>
octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in upstream direction <i>This element is always shown.</i>
frames-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in upstream direction

name	Type	Description
		<i>This element is always shown.</i>
segment1octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment2octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment3octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment4octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment5octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment6octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
segment7octets-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in upstream direction <i>This element is only shown in detail mode.</i>
octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	octets transferred in downstream direction <i>This element is always shown.</i>
frames-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	Total Frames transferred in downstream direction <i>This element is always shown.</i>
segment1octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	64 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment2octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	65-127 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment3octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	128-255 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment4octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	256-511 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment5octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	512-1023 Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
segment6octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1024-1518 Octet Frames in downstream direction

96 Epon Ont Status Command

name	Type	Description
		<i>This element is only shown in detail mode.</i>
segment7octets-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1519+ Octet Frames in downstream direction <i>This element is only shown in detail mode.</i>
unicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
unicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	unicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
multicastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in upstream direction <i>This element is only shown in detail mode.</i>
multicastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	multicast Frames in downstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in upstream direction <i>This element is only shown in detail mode.</i>
broadcastframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	boardcast Frames in downstream direction <i>This element is only shown in detail mode.</i>
drpframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in upstream direction <i>This element is only shown in detail mode.</i>
drpframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	discard Frames in downstream direction <i>This element is only shown in detail mode.</i>
errframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in upstream direction <i>This element is only shown in detail mode.</i>
errframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	error Frames in downstream direction <i>This element is only shown in detail mode.</i>
crcerrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	CRC error Frames in downstream direction <i>This element is only shown in detail mode.</i>
undframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in upstream direction <i>This element is only shown in detail mode.</i>
undframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	less than 64 bytes Frames in downstream direction <i>This element is only shown in</i>

name	Type	Description
		<i>detail mode.</i>
ovrframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in upstream direction <i>This element is only shown in detail mode.</i>
ovrframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	1526+ Frames in downstream direction <i>This element is only shown in detail mode.</i>
dropevents-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
dropevents-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	drop event in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
fragments-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	fragment frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-up	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in upstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
jabberframes-down	Parameter type: <Epon::OctetCounter> - Epon Frames counter	jabber frames in downstream direction on a ONT PON port <i>This element is only shown in detail mode.</i>
statuschange	Parameter type: <Epon::OctetCounter> - Epon Frames counter	the number of status change on a ONT PON port <i>This element is only shown in detail mode.</i>

96.11 Epon Ont Mac Mapping Command

Command Description

This command displays ont mac mapping

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont mac-mapping [ (epon-idx) [ mac-address <Epon::MacAddr> ] ]
```

Command Parameters

Table 96.11-1 "Epon Ont Mac Mapping Command" Resource Parameters

Resource Identifier	Type	Description
(epon-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	epon ifIndex
mac-address	Parameter type: <Epon::MacAddr> Format: - mac-address (example : 01:02:03:04:05:06) - length: 6	epon ont mac address

Command Output

Table 96.11-2 "Epon Ont Mac Mapping Command" Display parameters

Specific Information		
name	Type	Description
ontid	Parameter type: <Epon::OntIdx> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	epon ont ifIndex <i>This element is always shown.</i>

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	

96.12 Epon Ont Loid Mapping Command

Command Description

This command displays ont loid mapping

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show equipment eont loid-mapping [ (epon-idx) [ loid <Epon::LoidId> ] ]
```

Command Parameters

Table 96.12-1 "Epon Ont Loid Mapping Command" Resource Parameters

Resource Identifier	Type	Description
(epon-idx)	Format: <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier	epon ifIndex
loid	Parameter type: <Epon::LoidId> Format: - Authentication ID - length: 1<=x<=24	epon ont loid

Command Output

Table 96.12-2 "Epon Ont Loid Mapping Command" Display parameters

Specific Information		
name	Type	Description
ontid	Parameter type: <Epon::OntIdx> <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId>	epon ont ifIndex <i>This element is always shown.</i>

name	Type	Description
	- the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::OntId> - the ONT identifier	

97- *show tc-layer pm data*

97.1 show tc-layer pm data Tree	97-2191
97.2 show TC-layer ONT side Current Interval Performance Data Status Command	97-2192
97.3 show TC-layer ONT side Previous Interval Performance Data Status Command	97-2194

97.1 show tc-layer pm data Tree

Description

This chapter gives an overview of nodes that are handled by "show tc-layer pm data".

Command Tree

```
----show
  ----tc-layer
    ----ont-side
      ----current-interval
        - (index)
      ----previous-interval
        - (index)
        - interval-no
```

97.2 show TC-layer ONT side Current Interval Performance Data Status Command

Command Description

This command displays various statistics collected for Multicast ONT TC-layer during the current 15 minute interval of operation.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show tc-layer ont-side current-interval [ (index) ]
```

Command Parameters

Table 97.2-1 "show TC-layer ONT side Current Interval Performance Data Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: (uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> voip:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> mcast : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> voip : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> mcast:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId>) Possible values: - mcast : multicast - mcast:ng2 : ngpon2 multicast style identification - uni : uni - uni:ng2 : ngpon2 UNI style identification - voip : voip - voip:ng2 : voip Field type <Eqpt::RackId> - the rack number	pm index

Resource Identifier	Type	Description
	Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	

Command Output

**Table 97.2-2 "show TC-layer ONT side Current Interval Performance Data Status Command"
Display parameters**

Specific Information		
name	Type	Description
tx-gem-frames	Parameter type: <Counter> - 32 bit counter	count of transmit gem frames direction <i>This element is always shown.</i>
rx-gem-frames	Parameter type: <Counter> - 32 bit counter	count of received gem frames <i>This element is always shown.</i>
tx-payload-bytes	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of transmit payload bytes <i>This element is always shown.</i>
rx-payload-bytes	Parameter type: <OctetCounter64> - 64 bit counter,range:[0-9223372036854775808]	count of recieved payload bytes <i>This element is always shown.</i>
encrypkey-errors	Parameter type: <Counter> - 32 bit counter	count of get encrypt key errors <i>This element is always shown.</i>

97.3 show TC-layer ONT side Previous Interval Performance Data Status Command

Command Description

This command displays various statistics collected for Multicast ONT TC-layer over the previous 8 hours of operations which is broken in to 32 completed 15 minute intervals.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

```
> show tc-layer ont-side previous-interval [ (index) [ interval-no <Gpon::IntervalNo> ] ]
```

Command Parameters

Table 97.3-1 "show TC-layer ONT side Previous Interval Performance Data Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: (uni:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> / <Eqpt::Ng2OntSlotId> / <Eqpt::Ng2OntPortId> voip:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId> mcast : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> uni : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> / <Eqpt::OntSlotId> / <Eqpt::OntPortId> voip : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> / <Eqpt::OntId> mcast:ng2 : <Eqpt::ChannelGroupId> / <Eqpt::SubChannelGroupId> / <Eqpt::Ng2OntId>) Possible values: - mcast : multicast - mcast:ng2 : ngpon2 multicast style identification - uni : uni - uni:ng2 : ngpon2 UNI style identification - voip : voip - voip:ng2 : voip Field type <Eqpt::RackId> - the rack number	pm index

Resource Identifier	Type	Description
	Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelGroupId> - the channel group identifier Field type <Eqpt::SubChannelGroupId> - the subchannel group identifier Field type <Eqpt::OntId> - the ONT identifier Field type <Eqpt::Ng2OntId> - the NG2 ONT identifier Possible values: - vuni : virtual NGPON2 uni identifier Field type <Eqpt::OntSlotId> - the ONT SLOT identifier Field type <Eqpt::OntPortId> - the ONT PORT identifier Field type <Eqpt::Ng2OntSlotId> - the NGPON2 ONT SLOT identifier Field type <Eqpt::Ng2OntPortId> - the NGPON2 ONT PORT identifier	
interval-no	Parameter type: <Gpon::IntervalNo> Format: - a number of a previous interval number - range: [1...32]	identifies prev 15min intvls, val 1 as the latest intvl

Command Output

**Table 97.3-2 "show TC-layer ONT side Previous Interval Performance Data Status Command"
Display parameters**

Specific Information		
name	Type	Description
tx-gem-frames	Parameter type: <Counter> - 32 bit counter	count of transmit gem frames direction <i>This element is always shown.</i>
rx-gem-frames	Parameter type: <Counter> - 32 bit counter	count of received gem frames <i>This element is always shown.</i>
tx-payload-bytes	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of transmit payload bytes <i>This element is always shown.</i>
rx-payload-bytes	Parameter type: <OctetCounter64> - 64 bit counter, range: [0-9223372036854775808]	count of recieved payload bytes <i>This element is always shown.</i>
encrypkey-errors	Parameter type: <Counter> - 32 bit counter	count of get encrypt key errors <i>This element is always shown.</i>

98- Protection Group Status Commands

98.1 Protection Group Status Command Tree	98-2197
98.2 Protection Group Status Command	98-2198

98.1 Protection Group Status Command Tree

Description

This chapter gives an overview of nodes that are handled by "Protection Group Status Commands".

Command Tree

```
----show
  ----port-protection
    - (port)
```

98.2 Protection Group Status Command

Command Description

This command shows the protection group status. The following information is shown for each group :

- *first-port*: describes the port index of the first port in the protection group.
- *paired-port*: describes the port index of the paired port in the protection group.
- *first-state*: describes the operational status of the first port.
- *paired-state*: describes the operational status of the paired port.
- *swo-reason*: describes the reason for the last switchover.
- *num-swo*: describes the number of switchovers that have occurred.

User Level

The command can be accessed by operators with equipment privileges.

Command Syntax

The command has the following syntax:

> show port-protection (port)

Command Parameters

Table 98.2-1 "Protection Group Status Command" Resource Parameters

Resource Identifier	Type	Description
(port)	Format: (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	the port identifier of the first port in the protection group.

Command Output

Table 98.2-2 "Protection Group Status Command" Display parameters

Specific Information		
name	Type	Description
paired-port	Parameter type: <RedPort::PairedPortIndex> (pon : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::PonId> chpair : <Eqpt::RackId> / <Eqpt::ShelfId> / <Eqpt::SlotId> / <Eqpt::ChannelPairId>) Possible values: - pon : pon-aid - chpair : chpair-aid Field type <Eqpt::RackId> - the rack number Field type <Eqpt::ShelfId> - the shelf number Field type <Eqpt::SlotId> - the LT slot number Field type <Eqpt::PonId> - the PON identifier Field type <Eqpt::ChannelPairId> - the channel pair identifier	the port identifier of the paired port in the protection group. <i>This element is always shown.</i>
port-state	Parameter type: <RedPort::ProtectionStatus> ((active-up act-up) (active-down act-down) (inactive-up inact-up) (inactive-down inact-down)) Possible values: - active-up : - act-up : - active-down : - act-down : - inactive-up : - inact-up : - inactive-down : - inact-down :	specifies the status of the first port in the protection group. <i>This element is always shown.</i>
paired-state	Parameter type: <RedPort::ProtectionStatus> ((active-up act-up) (active-down act-down) (inactive-up inact-up) (inactive-down inact-down)) Possible values: - active-up : - act-up : - active-down : - act-down : - inactive-up : - inact-up : - inactive-down : - inact-down :	specifies the status of the paired port in the protection group. <i>This element is always shown.</i>
swo-reason	Parameter type: <RedPort::SwitchReason> (no-switch-over port-admin-change forced-switch-over link-failure board-failure) Possible values: - no-switch-over : no switch over has been performed yet - port-admin-change : port was set admin down - forced-switch-over : operator requested switchover	specifies the last switchover reason. <i>This element is always shown.</i>

98 Protection Group Status Commands

name	Type	Description
	- link-failure : link failure - board-failure : board failure	
num-swo	Parameter type: <SignedInteger> - a signed integer	specifies the number of times a switchover occurred. <i>This element is always shown.</i>

99- *Trap Status Commands*

99.1 Trap Status Command Tree	99-2202
99.2 Trap Manager Queue Status Command	99-2203
99.3 Trap Manager Queue Status Command	99-2204

99.1 Trap Status Command Tree

Description

This chapter gives an overview of nodes that are handled by "Trap Status Commands".

Command Tree

```
----show
  ----trap
    ----v6manager
      - (ipv6address)
    ----manager
      - (address)
```

99.2 Trap Manager Queue Status Command

Command Description

This command displays the status of the trap manager queue.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show trap v6manager [ (ipv6address) ]
```

Command Parameters

Table 99.2-1 "Trap Manager Queue Status Command" Resource Parameters

Resource Identifier	Type	Description
(ipv6address)	Format: <ipv6::Prefix> / <Trap::Port> Field type <ipv6::Prefix> - IPv6-address Field type <Trap::Port> - trap port number - range: [1...65535]	the IPv6 address of the manager

Command Output

Table 99.2-2 "Trap Manager Queue Status Command" Display parameters

Specific Information		
name	Type	Description
last-reset-time	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	time when the buffer has been reset. <i>This element is always shown.</i>
buffer-status	Parameter type: <Trap::QueueStatus> (no-traps-lost traps-lost) Possible values: - no-traps-lost : the queue did not overflow - no traps were lost - traps-lost : the queue did overflow - traps were lost	specifies whether the trap buffer is overflowed or not. <i>This element is always shown.</i>

99.3 Trap Manager Queue Status Command

Command Description

This command displays the status of the trap manager queue.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show trap manager [ (address) ]
```

Command Parameters

Table 99.3-1 "Trap Manager Queue Status Command" Resource Parameters

Resource Identifier	Type	Description
(address)	Format: <Ip::V4Address> : <Trap::Port> Field type <Ip::V4Address> - IPv4-address Field type <Trap::Port> - trap port number - range: [1...65535]	the IP address of the manager

Command Output

Table 99.3-2 "Trap Manager Queue Status Command" Display parameters

Specific Information		
name	Type	Description
last-reset-time	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	time when the buffer has been reset. <i>This element is always shown.</i>
buffer-status	Parameter type: <Trap::QueueStatus> (no-traps-lost traps-lost) Possible values: - no-traps-lost : the queue did not overflow - no traps were lost - traps-lost : the queue did overflow - traps were lost	specifies whether the trap buffer is overflowed or not. <i>This element is always shown.</i>

100- Alarm Delta Log Status Commands

100.1 Alarm Delta Log Status Command Tree	100-2206
100.2 Alarm Generic Delta Alarm Log Status Command	100-2207
100.3 Indeterminate Alarm Delta Log Status Command	100-2209
100.4 Warning Alarm Delta Log Status Command	100-2264
100.5 Minor Alarm Delta Log Status Command	100-2319
100.6 Major Alarm Delta Log Status Command	100-2374
100.7 Critical Alarm Delta Log Status Command	100-2429

100.1 Alarm Delta Log Status Command Tree

Description

This chapter gives an overview of nodes that are handled by "Alarm Delta Log Status Commands".

Command Tree

```
----show
  ----alarm
    ----delta-log
      ----alarm-changes
      ----indeterminate
        - (index)
      ----warning
        - (index)
      ----minor
        - (index)
      ----major
        - (index)
      ----critical
        - (index)
```

100.2 Alarm Generic Delta Alarm Log Status Command

Command Description

This command displays the number of reported alarm changes per severity level and in total.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm delta-log alarm-changes

Command Output

Table 100.2-2 "Alarm Generic Delta Alarm Log Status Command" Display parameters

Specific Information		
name	Type	Description
all	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms since startup and is independent of the alarm severity level. <i>This element is always shown.</i>
indeterminate	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level indeterminate since startup. <i>This element is always shown.</i>
warning	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level warning since startup. <i>This element is always shown.</i>
minor	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level minor since startup. <i>This element is always shown.</i>
major	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level major since startup. <i>This element is always shown.</i>
critical	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level critical since startup. <i>This element is always shown.</i>

100.3 Indeterminate Alarm Delta Log Status Command

Command Description

This command displays alarm values for all reported alarms with a severity level indeterminate.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

```
> show alarm delta-log indeterminate [ (index) ]
```

Command Parameters

Table 100.3-1 "Indeterminate Alarm Delta Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	delta log alarm table index

Command Output

100 Alarm Delta Log Status Commands

name	Type	Description
	- e1sip-emergency-call : Emergency call for ISDN PRA/CAS R2 is ongoing. - e1itf-ais-signal : Alarm Indication Signal detected at E1 interface. - e1itf-los-signal : Loss Of Signal detected at E1 interface. - e1itf-rai-signal : Remote Alarm Indication detected at E1 interface. - e1sip-misconfig-mgc10 : Configuration not conform with the core network entity. - e1sip-nsmprf-missed : The SIP termination requires a NSM profile. - e1t1itf-recv-ais : Alarm Indication Signal received at interface. - e1t1itf-recv-los : Loss Of Signal received at interface. - e1t1itf-recv-rai : Remote Alarm Indication received at interface. - transport-mismatch : Transport protocol mismatch - dns-lookup-failure : Dns look up failure - none-dns-srv : No reply for all DNS serverd - no-dns-srv : No DNS servers configured - none-srv : No reply for all SIP First Hops - no-srv : No SIP First Hop configured - reg-srv-unreach : All SIP register servers are unreachable - proxy-srv-unreach : All SIP proxy servers are unreachable - dhcp-srv-unreach : The DHCP server is unreachable on this board - fo-trigger : Fail Over Triggered - fb-trigger : Fail Back Triggered - du-trigger : Deliberate Update Triggered - ssp-missing : SSP Missing in CDE - dns-pool-exceed : Number of different SG associated DNS pools exceed - lsa-fo-trigger : SIP voice service degraded - fail-over to LSA server - reg-domainname-sec : Registration failure (resolving domain name). - reg-auth-sec : Registration failure (authentication). - reg-timeout-sec : Registration failure (message timeout). - reg-srvfailresp-sec : Registration failure (failure response from server). - inv-domainname-sec : Invitation failure (resolving domain name). - inv-auth-sec : Invitation failure (authentication). - inv-timeout-sec : Invitation failure (message timeout). - inv-srvfailresp-sec : Invitation failure (failure response from server). - subs-srvfailresp-sec : Subscribe failure (failure response from server). - subs-domainname-sec : Subscribe failure (resolving domain name). - subs-auth-sec : Subscribe failure (authentication). - subs-refreshfail-sec : Subscribe failure (refresh failure). - subs-inittimeout-sec : Subscribe failure (initial REQ timeout). - emergency-call-sec : Emergency call for Secondary Termination is ongoing. - fanout : Lt load overflow	

name	Type	Description
	- up-overflow : Upstream load overflow - upobc-overflow : Upstream load to OBC overflow - dwobc-overflow : Downstream load to OBC overflow - dw-overflow : Downstream load overflow - lwpri-overflow : The number of BE and CL pkts dropped exceed threshold - queue-drop : The number of pkts dropped by queue exceeds threshold - queue-load : The queue load exceeds threshold - queue-peak-usage : The queue peak usage exceeds threshold - mgc-unreachable : loss of contact with the media gateway controller - failover-to-esamgc : failover to esa mgc - sgc-unreachable : loss of contac with signaling gateway controller - lcard-unreach-srvcard : line card unreachable with server card - lcard-type-mismatch : associate board of wrong type - meg-unknown-sub : the megaco subscriber is unknown - meg-ground-key : voice port ground key - meg-high-temp : voice port high temperature - meg-act-fail : the first link layer for isdn subscriber activation failure - meg-over-current : voice port over current - line-showering : line showering - low-qos-packetloss : the total packet loss has exceeded the configured threshold - low-qos-jitter : the rtp jitter has exceeded the configured threshold - low-qos-delay : the rtp delay has exceeded the configured threshold - sig-brd-persist-loss : voice signaling board persistent data loss - sig-brd-disk-full : voice signaling board disk 90% full - sig-brd-db-rollback : voice signaling board db rollback - mg-overload : mg overload - meg-unknown-sub-sec : The Megaco subscriber exists in voice signaling board but not in media gateway controller. - line-showering-sec : A subscriber line exceeds 20 off-hook / on-hook events / minute. - loss-env-mon : env-monitor box lost or not alive - etca-los : loss of signal errors in 15 min - etca-fcs : frame check sequence errors in 15 min - etca-day-los : loss of signal errors in 1 day - etca-day-fcs : frame check sequence errors in 1 day - etca-rx-octets : received octets in 15 min - etca-tx-octets : transmitted octets in 15 min - etca-day-rx-octets : received octets in 1 day - etca-day-tx-octets : transmitted octets in 1 day - user-sfp-los : user sfp loss of signal - user-sfp-tx-fail : user sfp tx failure - user-sfp-not-prst : user sfp not detected - user-sfp-inv-id : user sfp invalid id - user-sfp-t-exceed : user sfp temperature exceed - user-sfp-mismatch : user sfp mismatch the configured type - uplink-sfp-los : uplink sfp loss of signal	

100 Alarm Delta Log Status Commands

name	Type	Description
	- uplink-sfp-tx-fail : uplink sfp tx failure - uplink-sfp-not-prst : uplink sfp not detected - uplink-sfp-inv-id : uplink sfp invalid id - uplink-sfp-t-exceed : uplink sfp temperature exceed - uplink-sfp-mismatch : uplink sfp mismatch the configured type - loss-lmswp-cap : lsm redundancy - inv-xvps-pair-data : invalid xvps pair redundancy data - network-power-loss : Loss of Network Power - hw-fault : Hardware Failure - bat-miss : Power Source Battery Missing - bat-fail : Power Source Battery Failure - bat-low : Power Source Battery Charge LOW - bat-a-fail : Power Source BAT-A Fail - bat-b-fail : Power Source BAT-B Fail - ac-vol-out-range : AC Input Voltage Value Out of Range - network-power-loss-b : Loss of Network Power B - sem-ac-power-fail : External AC power supply failure - sem-ups-low-volt : External power supply low voltage - dc-a-fail : Local DC A power failure - dc-b-fail : Local DC B power failure - plan-power-mismatch : Planned and detected power mode mismatch - water-seepage-in-box : Detected water seepage in enclosure - sealed-box-open : Sealed box open detected - dc-a-vol-out-range : DC A Input Voltage Value Out of Range - dc-b-vol-out-range : DC B Input Voltage Value Out of Range - inlet-temp-major : The inlet temperature has exceeded a major level - inlet-temp-critical : The inlet temperature has exceeded a critical level - psu-fail-crit : Power Supply failure - psu-a-fail-presence : Power Supply A is not present - psu-a-fail-vin-ac-nok : Power Supply A has Vin AC fault - psu-a-fail-vin-uv : Power Supply A has Vin undervoltage - psu-a-fail-vin-ov : Power Supply A has Vin overvoltage - psu-a-fail-vout-uv : Power Supply A has Vout undervoltage - psu-a-fail-vout-ov : Power Supply A has Vout overvoltage - psu-a-fail-iout-oc : Power Supply A has Iout overcurrent - psu-a-fail-ovtemp : Power Supply A has over temperature - psu-b-fail-presence : Power Supply B is not present - psu-b-fail-vin-ac-nok : Power Supply B has Vin AC fault - psu-b-fail-vin-uv : Power Supply B has Vin undervoltage - psu-b-fail-vin-ov : Power Supply B has Vin overvoltage - psu-b-fail-vout-uv : Power Supply B has Vout undervoltage - psu-b-fail-vout-ov : Power Supply B has Vout overvoltage - psu-b-fail-iout-oc : Power Supply B has Iout overcurrent - psu-b-fail-ovtemp : Power Supply B has over temperature - synce-fail : synce clock source failure - bits-fail : bits clock source failure	

name	Type	Description
	- bits-output-shutoff : bits output failure - ieee1588-fail : ieee1588 clock source failure - gnss-fail : gnss clock source failure - ieee1588-hybrid-fail : ieee1588 hybrid tod source failure - signal-loss : synce or bits clock signal loss - signal-efd : synce or bits clock signal exceed frequency deviation - esmc-loss : clock source loss SSM infomation - bits-output-exceed : exceed bits output threshold - ql-input-exceed : exceed input clock source threshold - holdover : clock system is in the holdover - lti : all clock source failed - tod-reference-fail : Timing ToD Reference failed - internal-clk-fail : Internal CLK failed - bgp-peer-down : peer operational state is down - bgp-routes-mid-limit : 90% of max nbr of routes BGP can learn from a peer is reached - isis-adjacency-down : isis adjacency is down - isis-adjacency-reject : isis adjacency is rejected - isis-instance-down : isis instance is down or not - ospf-lsa-limit : limit of received LSA's is reached - ospf-lsa-mid-limit : 90% of limit of received LSA's is reached - ospf-neighbor-down : OSPF neighbour is down - ospf-instance-down : OSPF instance is down or not - ospf3-lsa-limit : limit of received OSPFv3 LSAs is reached - ospf3-lsa-mid-limit : 90% of limit of received OSPFv3 LSAs is reached - ospf3-neighbor-down : OSPFv3 neighbour is down - ospf3-instance-down : OSPFv3 instance is down or not - rip-instance-down : rip instance down - lag-down : lag down - lagsubgrp-thresh-reach: lag subgroup threshold reached - lagsubgrp-switch-fail : lag subgroup switchover failed - no-unpinned-free-ports: No free ports available for unpinned traffic - general-arp-limit : arp limit exceeded - gen-switch-out-of-res : failure due to lack of resources on switch - ipv6-nc-limit : ipv6 neighbor cache limit exceeded - dhcp-session-oor : dhcp session out of resources - ihub-fdb-limit : layer 2 fdb limit reached - ihub-mac-limit : layer 2 mac limit reached - l2fw-stp-exception : STP exception condition is present in the SAP - l2fw-stp-root-guard : STP root guard violation is present - vprn-routes-limit : limit of ip is reached - vprn-ipv6-routes-limit: limit of ipv6 is reached - dhcpv6-lease-limit : limit of dhcpv6 leases is reached - dhcpv4-lease-limit : limit of dhcpv4 leases is reached - vpls-mfib-limit : limit of fib table is reached - ihub-ipv6-dad-own : duplicate IPV6 address is detected for IP address allotted to system - ihub-ipv6-dad : duplicate IPV6 address is detected for a user's IP address - ihub-ipv6-dup-pd-route: ipv6 duplicate pd detected - vpls-duplicate-mac : duplicate mac address is detected	

100 Alarm Delta Log Status Commands

name	Type	Description
	- vpls-fdb-limit : limit of fdb table is reached - vpls-self-duplic-mac : duplicate of a system owned mac address detected on a sap - vpls-sdp-self-dup-mac : duplicate of a system owned mac address detected on a sdp binding - link-down : link is down - link-lagport-add-fail : failure to add port to LAG - link-conf-mismatch : SFP+plugin-types does not match the planned speed and/or auto-negotiation for the port - ihub-peer-comm : ihub peer to peer communication failure - ihub-sw-fail : IHUB s/w error - ihub-hw-fail : IHUB h/w error - ihub-link-fail : IHUB link failure - ihub-proc-overload : IHUB processor exceeded - ihub-out-of-mem : IHUB processor out of memory - ntp-comm-lost : No response is received from the NTP servers - ldp-instance-down : ldp instance down - ldp-session-down : ldp session down - mpls-instance-down : mpls instance down - mpls-lsp-down : lsp down - mpls-lsp-path-down : lsp path down - sdp-instance-down : sdp instance down - sdp-binding-down : sdp binding down - epipe-instance-down : epipe instance down - lldpmed-portcfg-mis : config request failure for lldpmed portconfig - lldpmed-mediapl-mis : config request failure for lldpmed mediapolicy - vlanport-svc-mismatch : config request failure for the provisioned vlanport - mcsrc-stream-lost : multicast video stream lost - eqptsupl-syslog-upload: upload of log file to remote server failure - eqptsupl-ontsw-dnload : ont sw download in progress - cf-75%used : Compact flash exceeds 75% of life expectancy - cf-90%used : Compact flash exceeds 90% of life expectancy - olt-gen-pon-com-fail : pon communication failure on olt - olt-gen-tx-fail : transmitter failure on olt - olt-gen-unprov-ont : unprovisioned ont on pon - olt-gen-pon-eqpt-prov : mismatch btw equipment and provisioning pon attributes - olt-gen-pon-loss-sig : pon loss of signal - olt-gen-pon-diagnostic: pon diagnostic test active - olt-gen-loid-conflict : loid conflict ont on pon - olt-gen-loid-pwderr : loid password error ont on pon - olt-gen-pon-alien-test: pon alien diagnostic test active - olt-gen-alien-detect : pon alien detect active - olt-gen-rng-mism : pon ranging mismatch active - olt-gen-sfp-mism : pon sfp mismatch active - olt-gen-deact-hightca : deactivated ont hightca threshold crossed - olt-gen-deact-lowtca : deactivated ont lowtca threshold crossed - olt-gen-dp-integ : pon data path integrity failure

state	Parameter type: <Alarm::AlarmState> (active non-active) Possible values: - active : alarm is active - non-active : alarm is not active	reflect's the state of the alarm as either active or non-active. <i>This element is always shown.</i>
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
additional-info	Parameter type: <Alarm::AdditionalInfo> - string to identify the owner (example: Tom) - length: x<=512	AdditionalInfo <i>This element is always shown.</i>

Only Show Details: indeterminate alarm table related generic information		
name	Type	Description
total-changes	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level indeterminate since startup. <i>This element is only shown in detail mode.</i>
last-entry-id	Parameter type: <SignedInteger> - a signed integer	last entry that was added to the indeterminate delta log. <i>This element is only shown in detail mode.</i>
last-reset	Parameter type: <Sys::Time> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds indicating when the indeterminate delta log was last reset. <i>This element is only shown in detail mode.</i>
log-overflowed	Parameter type: <Alarm::OverflowStatus> (yes no) Possible values: - yes : buffer has overflowed - no : no buffer overflow	specifies whether the indeterminate delta log is overflowed or not. <i>This element is only shown in detail mode.</i>

100.4 Warning Alarm Delta Log Status Command

Command Description

This command displays alarm values for all reported alarms with a severity level warning.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm delta-log warning [(index)]

Command Parameters

Table 100.4-1 "Warning Alarm Delta Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	delta log alarm table index

Command Output

Table 100.4-2 "Warning Alarm Delta Log Status Command" Display parameters

	reception of the BACKWARD DISCONNECTION ACK signal - packet-loss : Pseudo Wire entered the Packet loss state - remote-packet-loss : Remote Packet loss detected - no-dsp-resource : DSP resource allocation failed - la-down : Link aggregation group link-status is down - la-standby-na : Cross-lt lag on standby slot part is not available - la-switch-fail : Cross-lt lag fail to do switchover - la-degrade : Link aggregation group degrade - melt-board-reset : MELT board reset - board-shelf-mismatch : board type and shelf type mismatch - fcs-thresh-exceed : FCS counter threshold exceeded	
state	Parameter type: <Alarm::AlarmState> (active non-active) Possible values: - active : alarm is active - non-active : alarm is not active	reflect's the state of the alarm as either active or non-active. <i>This element is always shown.</i>
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
additional-info	Parameter type: <Alarm::AdditionalInfo> - string to identify the owner (example: Tom) - length: x<=512	AdditionalInfo <i>This element is always shown.</i>

Only Show Details: warning alarm table related generic information		
name	Type	Description
changes	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level warning since startup. <i>This element is only shown in detail mode.</i>
last-entry-id	Parameter type: <SignedInteger> - a signed integer	last entry that was added to the warning delta log. <i>This element is only shown in detail mode.</i>
last-reset	Parameter type: <Sys::Time> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds indicating when the warning delta log was last reset. <i>This element is only shown in detail mode.</i>
log-overflowed	Parameter type: <Alarm::OverflowStatus> (yes no) Possible values: - yes : buffer has overflowed - no : no buffer overflow	specifies whether the warning delta log is overflowed or not. <i>This element is only shown in detail mode.</i>

100.5 Minor Alarm Delta Log Status Command

Command Description

This command displays alarm values for all reported alarms with a severity level minor.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm delta-log minor [(index)]

Command Parameters

Table 100.5-1 "Minor Alarm Delta Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	delta log alarm table index

Command Output

Table 100.5-2 "Minor Alarm Delta Log Status Command" Display parameters

state	Parameter type: <Alarm::AlarmState> (active non-active) Possible values: - active : alarm is active - non-active : alarm is not active	reflect's the state of the alarm as either active or non-active. <i>This element is always shown.</i>
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
additional-info	Parameter type: <Alarm::AdditionalInfo> - string to identify the owner (example: Tom) - length: x<=512	AdditionalInfo <i>This element is always shown.</i>

Only Show Details: minor alarm table related generic information		
name	Type	Description
changes	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level minor since startup. <i>This element is only shown in detail mode.</i>
last-entry-id	Parameter type: <SignedInteger> - a signed integer	last entry that was added to the minor delta log. <i>This element is only shown in detail mode.</i>
last-reset	Parameter type: <Sys::Time> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds indicating when the minor delta log was last reset. <i>This element is only shown in detail mode.</i>
log-overflowed	Parameter type: <Alarm::OverflowStatus> (yes no) Possible values: - yes : buffer has overflowed - no : no buffer overflow	specifies whether the minor delta log is overflowed or not. <i>This element is only shown in detail mode.</i>

100.6 Major Alarm Delta Log Status Command

Command Description

This command displays alarm values for all reported alarms with a severity level major.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm delta-log major [(index)]

Command Parameters

Table 100.6-1 "Major Alarm Delta Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	delta log alarm table index

Command Output

Table 100.6-2 "Major Alarm Delta Log Status Command" Display parameters

	reception of the BACKWARD DISCONNECTION ACK signal - packet-loss : Pseudo Wire entered the Packet loss state - remote-packet-loss : Remote Packet loss detected - no-dsp-resource : DSP resource allocation failed - la-down : Link aggregation group link-status is down - la-standby-na : Cross-lt lag on standby slot part is not available - la-switch-fail : Cross-lt lag fail to do switchover - la-degrade : Link aggregation group degrade - melt-board-reset : MELT board reset - board-shelf-mismatch : board type and shelf type mismatch - fcs-thresh-exceed : FCS counter threshold exceeded	
state	Parameter type: <Alarm::AlarmState> (active non-active) Possible values: - active : alarm is active - non-active : alarm is not active	reflect's the state of the alarm as either active or non-active. <i>This element is always shown.</i>
last-updated-on	Parameter type: <Sys::timeInSecs> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds when the alarm was logged. <i>This element is always shown.</i>
additional-info	Parameter type: <Alarm::AdditionalInfo> - string to identify the owner (example: Tom) - length: x<=512	AdditionalInfo <i>This element is always shown.</i>

Only Show Details: major alarm table related generic information		
name	Type	Description
changes	Parameter type: <Counter> - 32 bit counter	total number of changes of all reported alarms with a severity level major since startup. <i>This element is only shown in detail mode.</i>
last-entry-id	Parameter type: <SignedInteger> - a signed integer	last entry that was added to the major delta log. <i>This element is only shown in detail mode.</i>
last-reset	Parameter type: <Sys::Time> - the time (yyyy-mm-dd:hour:minutes:secs) - unit: UTC	network time in seconds indicating when the major delta log was last reset. <i>This element is only shown in detail mode.</i>
log-overflowed	Parameter type: <Alarm::OverflowStatus> (yes no) Possible values: - yes : buffer has overflowed - no : no buffer overflow	specifies whether the major delta log is overflowed or not. <i>This element is only shown in detail mode.</i>

100.7 Critical Alarm Delta Log Status Command

Command Description

This command displays alarm values for all reported alarms with a severity level critical.

User Level

The command can be accessed by operators with alarm privileges.

Command Syntax

The command has the following syntax:

> show alarm delta-log critical [(index)]

Command Parameters

Table 100.7-1 "Critical Alarm Delta Log Status Command" Resource Parameters

Resource Identifier	Type	Description
(index)	Format: - index of a current alarm entry	delta log alarm table index

Command Output

Table 100.7-2 "Critical Alarm Delta Log Status Command" Display parameters

Specific Information		
name	Type	Description
type	Parameter type: <Alarm::alarmIndexExt> (all xtca-ne-es xtca-ne-ses xtca-ne-uas xtca-ne-day-es xtca-ne-day-ses xtca-ne-day-uas xtca-fe-es xtca-fe-ses xtca-fe-uas xtca-fe-day-es xtca-fe-day-ses xtca-fe-day-uas xtca-leftrs xtca-day-leftrs xtca-fe-leftrs xtca-fe-day-leftrs xtca-auto-port-reset xtca-reinit	unique id for an alarm. <i>This element is always shown.</i>
